specifies that the empirical Bayes estimates of the random effects that are computed for each value of the CROSSSECTION variables during the optimization process be computed by performing a nonlinear optimization. When you specify this option, the optimizer that you specify in the OPTIMIZER= option in the FIT statement is used to compute the empirical Bayes estimates. By default, a Newton search algorithm computes the empirical Bayes estimates.

**NOPSD**
specifies that the covariance matrix of random effects not be constrained to be positive semidefinite. This option might improve convergence properties for certain parameterizations of the random-effects covariance matrix.

**NUMQUADPTS=***n*
specifies the number of quadrature points to use in the adaptive Gaussian quadrature approximation of the likelihood function. Each random effect is evaluated at *n* points during the approximation of the likelihood function, so if there are *r* random effects, the likelihood function is evaluated at $n^r$ points. By default, NUMQUADPTS=1.

**PSD**
specifies that the covariance matrix of random effects be constrained to be positive semidefinite. PSD is the default.

## SOLVE Statement

**SOLVE** *variables* < **SATISFY=** *equations* > < */options* > **;**

PROC TMODEL includes additional *options* in the SOLVE statement to provide more control of the solution process than PROC MODEL provides. For a complete description of the syntax of the SOLVE statement, see the section "SOLVE Statement" on page 1481 in Chapter 25, "The MODEL Procedure."

You can specify the following *options* after the slash.

### Options to Control the Solution of a System of Linear Equations

**LUSOLVER=NUMPIVOT | STRUCTPIVOT | OLD |** *n*
specifies the method to use to factor and solve systems of linear equations. These linear systems are encountered when the FIML option (which requests that the FIML method be used to estimate models) is specified in the FIT statement or the PROC TMODEL statement. These linear systems are also encountered when either the NEWTON or OPTIMIZE option is specified in the SOLVE statement (these options specify the numerical solution method). Also, model programs that include differential equations require the solution of linear systems of equations. You can specify the following values:

| | |
|---|---|
| *n* | considers numerical values of matrix elements only every *n*th time a lower triangular times upper triangular (LU) matrix factorization is computed. |
| **NUMPIVOT** | considers numerical values of matrix elements each time an LU factorization is computed. |
| **OLD** | uses the factorization and solution algorithm that the MODEL procedure uses. |

**STRUCTPIVOT** considers only the structure of nonzero elements in the linear system for ordering equations in the LU factorization.

By default, LUSOLVER=NUMPIVOT.

# Details: TMODEL Procedure

## Panel Data

Panel data, also known as longitudinal data, consist of observations made over time for multiple subjects or cross sections. Data that are recorded in this form are often used to analyze dynamic models, which use past information to model the relationships among variables. In PROC TMODEL, you can analyze dynamic models that use panel data by identifying the cross-sectional variables in a CROSSSECTION statement. The following example illustrates how to use the CROSSSECTION statement to estimate an autoregressive model that has one parameter shared among five time series:

```
data d;
   length cs $ 8;
   array csname{5} $ _temporary_ ( 'first' 'second' 'third' 'fourth' 'fifth' );
   call streaminit (1);
   do pp = 1 to dim(csname);
      lagx = 0;
      do t = 1 to 10;
         x = 0.8*lagx + rand('normal');
         lagx = x;
         cs = csname[pp];
         output;
      end;
   end;
run;

proc tmodel data=d;
   endo x;
   crosssection cs;
   parms p;

   x = p*lag(x);
   fit;
quit;
```

In this example, PROC TMODEL skips the first observation in each time series because the first lag of *x* is not available. Figure 40.2 shows that only 45 of the 50 observations contribute to the estimation, because the first observation in each series is skipped.

**Figure 40.2** Observation Counts in a Dynamic Model Estimation

**The TMODEL Procedure**

| Number of Observations | | Statistics for System | |
|---|---|---|---|
| **Used** | 45 | **Objective** | 0.9694 |
| **Missing** | 0 | **Objective*N** | 43.623 |

Panel data are also treated differently from ordinary observational data for the purpose of multithreading. When no cross-sectional variables are specified, the observations in the DATA= data set are partitioned in a round-robin fashion among computational threads. Figure 40.3 shows how observations are partitioned among threads in the presence and absence of a cross-sectional variable specification.

**Figure 40.3** Data Partitioning Strategies in a Multithreaded Environment

Original Data Set

| OBS | CS | TIME |
|---|---|---|
| 1 | A | 1 |
| 2 | A | 2 |
| 3 | A | 3 |
| 4 | A | 4 |
| 5 | B | 1 |
| 6 | B | 2 |
| 7 | B | 3 |
| 8 | B | 4 |
| 9 | B | 5 |
| 10 | B | 6 |

Round-Robin Partitioning

| Thread #1 | | | Thread #2 | | | Thread #3 | | | Thread #4 | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| OBS | CS | TIME | OBS | CS | TIME | OBS | CS | TIME | OBS | CS | TIME |
| 1 | A | 1 | 2 | A | 2 | 3 | A | 3 | 4 | A | 4 |
| 5 | B | 1 | 6 | B | 2 | 7 | B | 3 | 8 | B | 4 |
| 9 | B | 5 | 10 | B | 6 | | | | | | |

Partitioning with CROSSSECTION Statement

| Thread #1 | | | Thread #2 | | | Thread #3 | | | Thread #4 | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| OBS | CS | TIME | OBS | CS | TIME | OBS | CS | TIME | OBS | CS | TIME |
| 1 | A | 1 | 5 | B | 1 | | | | | | |
| 2 | A | 2 | 6 | B | 2 | | | | | | |
| 3 | A | 3 | 7 | B | 3 | | | | | | |
| 4 | A | 4 | 8 | B | 4 | | | | | | |
| | | | 9 | B | 5 | | | | | | |
| | | | 10 | B | 6 | | | | | | |

In the case where no cross sectional-variables are specified and a dynamic model with lag terms is being analyzed, all the observations are processed sequentially in a single thread.

Another use for panel data is in random-effects models, which model the variation among subjects in the data. In these models, the grouping of observations into subjects is achieved by specifying cross-sectional variables in the same manner as in the other panel data applications in PROC TMODEL.

## Random-Effects Models (Experimental)

The general nonlinear model that is estimated by PROC MODEL and PROC TMODEL can be extended to accommodate observations on $M$ subjects as follows,

$$\mathbf{q}(\mathbf{y}_{it}, \mathbf{x}_{it}, \boldsymbol{\phi}, \mathbf{u}_i) = \boldsymbol{\epsilon}_{it}, \qquad i = 1, \ldots, M \quad t = 1, \ldots, M_i$$

where $\mathbf{q} \in R^g$ is a real-vector-valued function of $\mathbf{y}_{it} \in R^g$, $\mathbf{x}_{it} \in R^l$, $\boldsymbol{\phi} \in R^p$, and $\mathbf{u}_i \in R^r$, where $g$ is the number of equations, $l$ is the number of exogenous variables (lagged endogenous variables are considered exogenous here), $p$ is the number of fixed parameters, $r$ is the number of random effects, $M$ is the number of subjects, and $M_i$ is the number of observations on the $i$th subject. The random effects, $\mathbf{u}_i$, that are associated with the $i$th subject are distributed as follows,

$$\begin{aligned}
\mathbf{u}_i &\sim N(\boldsymbol{\mu}, \mathbf{D}) \\
\boldsymbol{\mu} &= \boldsymbol{\mu}(\boldsymbol{\xi}) \\
\mathbf{D} &= \mathbf{D}(\boldsymbol{\xi})
\end{aligned}$$

where $\boldsymbol{\mu}$ is an $r \times 1$ vector of means of the random effects, $\mathbf{D}$ is an $r \times r$ covariance matrix of the random effects, and $\boldsymbol{\xi}$ is a vector of parameters of the random-effects distribution.

The vector of unknown parameters for the random-effects models is $\boldsymbol{\theta} = [\boldsymbol{\phi}, \boldsymbol{\xi}]$. PROC TMODEL performs a maximum likelihood estimation of $\boldsymbol{\theta}$ and the covariance of $\boldsymbol{\theta}$ by using the following marginal distribution of $\mathbf{y}$ based on the joint distribution of $\mathbf{y}$ and the random effects, $\mathbf{u}_i$,

$$p(\boldsymbol{\theta}) = \prod_{i=1}^{M} \int p(\mathbf{y}_i | \mathbf{x}_i, \boldsymbol{\phi}, \mathbf{u}_i)\, p(\mathbf{u}_i | \boldsymbol{\xi})\, d\,\mathbf{u}_i$$

where $p(\mathbf{y}_i | \mathbf{x}_i, \boldsymbol{\phi}, \mathbf{u}_i)$ is the conditional distribution of $\mathbf{y}$ for the $i$th subject and $p(\mathbf{u}_i | \boldsymbol{\xi})$ is the conditional distribution of the random effects.

### Random-Effects Estimation

Estimating the maximum likelihood values of $\boldsymbol{\theta}$ requires computation of an integral over the random effects. PROC TMODEL approximates this integral by using the adaptive Gaussian quadrature method described in Pinheiro and Bates (1995).

PROC TMODEL minimizes the following negative log-likelihood function to estimate the parameters in random-effects models,

$$-\log p(\boldsymbol{\theta}) \approx \sum_{i=1}^{M} \left( \frac{1}{2} \log |\mathbf{G}_i| - \log \sum_{q=1}^{Q} e^{\mathrm{obj}_{i,q}} \right) + \frac{M}{2} \left( \log |\mathbf{D}| + r \log 2\pi \right)$$

where

$$\begin{aligned}
\mathrm{obj}_{i,q} &= -\frac{1}{2} \sum_{j=1}^{M_i} \mathbf{q}_j'(\mathbf{v}_q) \mathbf{H}^{-1} \mathbf{q}_j(\mathbf{v}_q) + \mathbf{z}_q' \mathbf{z}_q + \sum_{k=1}^{r} \log w_k - \frac{1}{2} \mathbf{v}_q' \mathbf{D}^{-1} \mathbf{v}_q \\
\mathbf{H} &= \mathrm{diag}(h_1, \ldots, h_g) \\
\mathbf{v}_q &= \hat{\mathbf{u}}_i + \sqrt{2} \mathbf{G}_i^{-1/2} \mathbf{z}_q \\
\mathbf{G}_i &= -\nabla^2_{\mathbf{u}_i} \mathrm{obj}_i + \mathbf{D}^{-1}
\end{aligned}$$

where $Q$ is the number of quadrature points used to approximate the integral, $M_i$ is the number of observations on the $i$th subject, $\mathrm{obj}_i$ is the $i$th-subject-specific objective function evaluated at the empirical Bayes estimate of the random effects, $\mathrm{obj}_{i,q}$ is the objective function evaluated at the $q$th quadrature point, $\mathbf{q}_j$ is the vector of equation residuals, $h_i$ is the variance specified for the $i$th equation, $\mathbf{z}_q$ is the $q$th quadrature point, $w_k$ is the weight for the $k$th element of the quadrature point vector, $\mathbf{v}_q$ is the random-effects vector evaluated at the $q$th quadrature point, $\hat{\mathbf{u}}_i$ is the empirical Bayes estimate of the random effects for the $i$th subject, $\mathbf{G}_i$ is the random-effects scale matrix for the $i$th subject, and $\nabla^2_{\mathbf{u}_i}\mathrm{obj}_i$ is the Hessian of the empirical Bayes estimate of the random effects for the $i$th subject. The gradient of the negative log-likelihood function is computed analytically, and the Hessian is computed numerically.

This approach is also used by PROC NLMIXED. For more information about the implementation of the adaptive Gaussian quadrature method, see Chapter 89, "The NLMIXED Procedure" (*SAS/STAT User's Guide*).

The estimation of random-effects models in PROC TMODEL differs from that in PROC NLMIXED in the following ways:

- PROC TMODEL supports only the adaptive Gaussian quadrature method to compute the integral over random effects.
- PROC TMODEL does not compute the number of quadrature points adaptively.
- PROC TMODEL does not support models that contain variance parameters.
- PROC TMODEL constrains the covariance matrix of the random effects to be positive definite by imposing the nonlinear constraint $|\mathbf{D}| > 0$ in the optimization.
- PROC TMODEL does not support hierarchical random effects.
- PROC TMODEL supports models that have more than one endogenous variable.

## Nonlinear Optimization

PROC TMODEL provides two numerical optimization systems, ZOPT and ORMP, to minimize the objective function associated with each of the available estimation methods. The ZOPT system is the same optimization system that PROC MODEL uses, and the nonlinear programming solver, ORMP, is the same optimization system that PROC OPTMODEL uses. The following sections summarize how both optimization systems address issues particular to the problem of estimating model parameters in PROC TMODEL.

### Nonlinear Objective Function

The nonlinear dependence of model programs on parameters complicates the optimization process because it can cause the objective function to become a less predictable function of the parameters. The ZOPT optimizer provides the Gauss and Marquardt minimization methods to manage this nonlinear dependency during the numerical search for a minimum. The Gauss method implements a line search during the search process, and the Marquardt method improves the conditioning of the search for an optimum. The ORMP optimizer uses similar techniques to address nonlinearity and ill-conditioning of the minimization problem. In the ORMP optimizer, these techniques are implemented in a hybrid trust region and line-search algorithm.

### Constraints on Parameters

Another difficulty occurs during the optimization process when constraints are placed on the parameters. In PROC TMODEL, linear and nonlinear constraints can be introduced through the use of the BOUNDS, RESTRICT, and TEST statements. The ZOPT optimizer handles constraints in the minimization by using an active set algorithm to keep track of and enforce constraints. The ORMP optimizer provides two algorithms to handle constraints, an active set algorithm and an interior point algorithm. The active set algorithm manages constraints during the optimization, which is similar to the approach used by the ZOPT optimizer. The interior point algorithm imposes constraints by using barrier functions.

### Multiple Local Minima

Occasionally, characteristics of the data or model program can cause there to be more than one local minimum in the minimization problem. In such cases the optimization process must choose the best minimum from among multiple local minima. In PROC TMODEL, you can specify a grid of initial parameter estimates by using the START= option in the FIT statement, and PROC TMODEL solves the minimization problem by using each point in the grid as an initial estimate. The grid point optimization that converges to the smallest minimum is then selected as the global minimum. Either the ZOPT system or the ORMP system can be used in the grid search approach to solving the global minimization problem.

The ORMP system also supports a multistart algorithm for finding the global minimum. The multistart algorithm chooses the best global minimum from among many local minima, as in the grid search approach; however, the multistart algorithm does not require you to specify the initial grid point estimates.

### Choosing an Optimizer

For most problems, there is no need to choose between the ZOPT and ORMP optimizers, because they both converge quickly to the same optimum. However, in cases where the optimizers yield different results, the following general guidelines can help you choose which optimizer to use for a particular problem.

Some considerations for choosing the ZOPT optimizer follow:

- compatibility with PROC MODEL estimation results, because the ZOPT system is also used in PROC MODEL
- faster solutions for smaller problems and for problems that are subject to neither extreme nonlinearities nor ill-conditioning

Some considerations for choosing the ORMP optimizer follow:

- more robust convergence properties for larger problems
- faster and more reliable convergence when there are many constraints on the parameters
- improved estimates in the presence of multiple local minima, or when there is insufficient information to choose initial grid point estimates

## Hessian Evaluation (Experimental)

PROC MODEL uses a linear approximation to the Hessian for all estimation methods by default. In most cases, this linear approximation to the Hessian matrix is sufficient to ensure convergence of the optimization. However, for some combinations of models, data, estimation methods, and optimization methods, the estimates that PROC MODEL produces are sensitive to the linear approximation error in the Hessian. To correct for this shortcoming, PROC TMODEL computes an exact analytical representation of the Hessian for many of the estimation methods by default. The exact Hessian that PROC TMODEL uses also improves convergence properties of the ORMP optimizer for some problems. Table 40.2 summarizes estimation methods and exact analytical representations of the Hessian that are available in PROC TMODEL.

**Table 40.2** PROC TMODEL Hessians for Estimation Methods

| Method | Exact Hessian |
|---|---|
| OLS<br>ITOLS | $\mathbf{X}'(\mathrm{diag}(\mathbf{S})^{-1}\otimes\mathbf{I})\mathbf{X}+\frac{1}{2}(\mathbf{Q}'(\mathrm{diag}(\mathbf{S})^{-1}\otimes\mathbf{I})\mathbf{r}+\mathbf{r}'(\mathrm{diag}(\mathbf{S})^{-1}\otimes\mathbf{I})\mathbf{Q})$ |
| SUR<br>ITSUR | $\mathbf{X}'(\mathbf{S}^{-1}\otimes\mathbf{I})\mathbf{X}+\frac{1}{2}(\mathbf{Q}'(\mathbf{S}^{-1}\otimes\mathbf{I})\mathbf{r}+\mathbf{r}'(\mathbf{S}^{-1}\otimes\mathbf{I})\mathbf{Q})$ |
| N2SLS<br>ITN2SLS | $\mathbf{X}'(\mathrm{diag}(\mathbf{S})^{-1}\otimes\mathbf{W})\mathbf{X}+\frac{1}{2}(\mathbf{Q}'(\mathrm{diag}(\mathbf{S})^{-1}\otimes\mathbf{W})\mathbf{r}+\mathbf{r}'(\mathrm{diag}(\mathbf{S})^{-1}\otimes\mathbf{W})\mathbf{Q})$ |
| N3SLS<br>ITN3SLS | $\mathbf{X}'(\mathbf{S}^{-1}\otimes\mathbf{W})\mathbf{X}+\frac{1}{2}(\mathbf{Q}'(\mathbf{S}^{-1}\otimes\mathbf{W})\mathbf{r}+\mathbf{r}'(\mathbf{S}^{-1}\otimes\mathbf{W})\mathbf{Q})$ |

The variables in this table are defined as follows:

- $n$ the number of nonmissing observations
- $g$ the number of equations
- $k$ the number of instrumental variables
- $p$ the number of parameters
- $\mathbf{r}$ the $ng \times 1$ vector of residuals for the $g$ equations stacked together
- $\mathbf{S}$ a $g \times g$ matrix that estimates $\mathbf{\Sigma}$, the covariances of the errors across equations (referred to as the $\mathbf{S}$ matrix)
- $\mathbf{I}$ an $n \times n$ identity matrix
- $\mathbf{X}$ an $ng \times p$ matrix of partial derivatives of the residuals with respect to the parameters
- $\mathbf{Q}$ an $ng \times p \times p$ vector of matrices of second-order partial derivatives of the residuals with respect to the parameters
- $\mathbf{W}$ an $n \times n$ matrix, $\mathbf{Z}(\mathbf{Z}'\mathbf{Z})^{-1}\mathbf{Z}'$
- $\mathbf{Z}$ an $n \times k$ matrix of instruments

The exact analytic Hessians are not currently available for the FIML or GMM estimation methods or for models with random effects.

## Multithreaded Calculations

PROC TMODEL uses concurrent computation threads to reduce the time it takes to perform estimation and simulation tasks. Because the characteristics of the input data, model program, and task can vary, PROC TMODEL uses different strategies for breaking its calculations into pieces that can be executed concurrently. For example, when you are estimating a simple model by using a data set with many observations, the most efficient multithreading strategy is to partition the observations and to evaluate the objective function concurrently across the partitions. However, for a highly nonlinear estimation problem with many parameters and fewer observations, the best strategy might be to execute the minimization problem concurrently for multiple regions of the parameter space and then choose the region that yields the optimal estimates.

PROC TMODEL automatically determines which threading strategy to use for each estimation or simulation modeling task by default. Alternatively, you can specify the threading strategy manually by specifying priority options in the PERFORMANCE statement. For each modeling task, the threading strategy is determined by the number of threads allocated to each job in the task. A job is an aspect or dimension of the task that can be executed concurrently with another job. The total number of threads that are used to complete each modeling task is determined as follows,

$$n^* = \prod_{i \in J} \text{ceil}(n \frac{p_i}{p_{\text{tot}}}) \qquad \text{for } p_{\text{tot}} = \sum_{k \in J} p_k$$

where $n^*$ is the actual number of threads used, $n$ is the number of threads specified, $p_i = \max(\text{priority}_i, 10^{-8})$, $\text{priority}_i \in [0, 1]$ is the priority specified for the $i$th job, and $J$ is the set of all jobs in the modeling task. The allocation of threads to jobs in modeling tasks creates the same number or more threads than the number specified in the PERFORMANCE statement and CPUCOUNT= system option.

### Multithreading Estimation Calculations

The following jobs in estimation tasks can be executed currently:

- BY-group processing
- grid search for optimal parameters specified using the START= option in the FIT statement, or multistart global optimization specified by the MULTISTART suboption of the OPTIMIZER= option in the FIT statement
- evaluation of the objective function across partitions of the DATA= data set

For model programs that use lagging functions, the observations in the DATA= data set must be processed sequentially to compute the objective function. In these cases, multithreading across partitions of the data is not possible unless you specify a CROSSSECTION statement or a RANDOM statement. The priority of each estimation job can be specified in the PERFORMANCE statement. When no priorities are specified, PROC TMODEL assigns jobs priorities based on the number of BY groups in the input data set, the number of observations in the input data set, the presence of a START= or MULTISTART option in the FIT statement, and the lag length of the model program.

### Multithreading Simulation Calculations

The following jobs in simulation tasks can be executed concurrently:

- BY-group processing
- processing repetitions in Monte Carlo simulations that are specified using the RANDOM= option in the SOLVE statement

The priority of each simulation job can be specified in the PERFORMANCE statement. When no priorities are specified, PROC TMODEL assigns jobs priorities based on the number of BY groups in the input data set, the presence of a RANDOM= option, and the lag length of the model program.

# Examples: TMODEL Procedure

## Example 40.1: Thread Allocation Using the Performance Statement

This example illustrates how you can use the PERFORMANCE statement to improve the performance of parameter estimation for a data set that contains multiple BY groups. For clarity, a small data set and a simple model are used. In practice, the benefits of configuring the thread allocation strategy are realized only for larger data sets and more computationally demanding models.

In the following PROC TMODEL step, a linear model is estimated for 20 BY groups, each of which contains 1,001 observations:

```
data d;
   call streaminit(1);
   do iby = 1 to 2;
      do jby = 1 to 10;
         do x = -500 to 500;
            y = 2*x + 1 + rand('normal');
            output;
         end;
      end;
   end;
run;

proc tmodel data=d;
   performance nthreads=4 bypriority=1 partpriority=1 / threadconfig timings;
   y = a*x + b;
   by iby jby;
   fit y;
quit;
```

In this example, PROC TMODEL performs the estimations in two concurrent threads, where each thread performs the estimation for 10 BY groups. Also, within the estimation of each BY group, the 1,001 observations are processed concurrently in two partitions, one with 501 observations and the other with 500 observations. Figure 40.1.1 shows how PROC TMODEL divides this estimation problem into threads and the time it takes to complete all 20 estimations.

**Output 40.1.1** Multithreading Performance for Two BY-Group Threads

**The TMODEL Procedure**

| Multithreading Configuration | | |
|---|---|---|
| Calculation Type | Concurrency Factor | Priority |
| BY Group Processing | 2 | 1.00 |
| Nonlinear Optimization | 1 | 0 |
| Data Partitioning | 2 | 1.00 |

| Performance Summary | |
|---|---|
| Threads Used | 4 |
| Task Time (sec) | 4.41974 |
| Program Run Time (sec) | 0.233087 |
| Data Time (sec) | 0.223164 |

Another way to perform these estimation tasks is to divide the 20 BY groups into four concurrent threads, where the estimation of each BY group is performed on a single partition that contains all 1,001 observations. You can do this by setting the PARTPRIORITY= option to 0 in the following PERFORMANCE statement:

```
proc tmodel data=d;
   performance nthreads=4 bypriority=1 partpriority=0 / threadconfig timings;
   y = a*x + b;
   by iby jby;
   fit y;
quit;
```

Figure 40.1.2 shows that maximizing the number of BY-group threads improves the performance of this model and data set.

**Output 40.1.2** Multithreading Performance for Four BY-Group Threads

**The TMODEL Procedure**

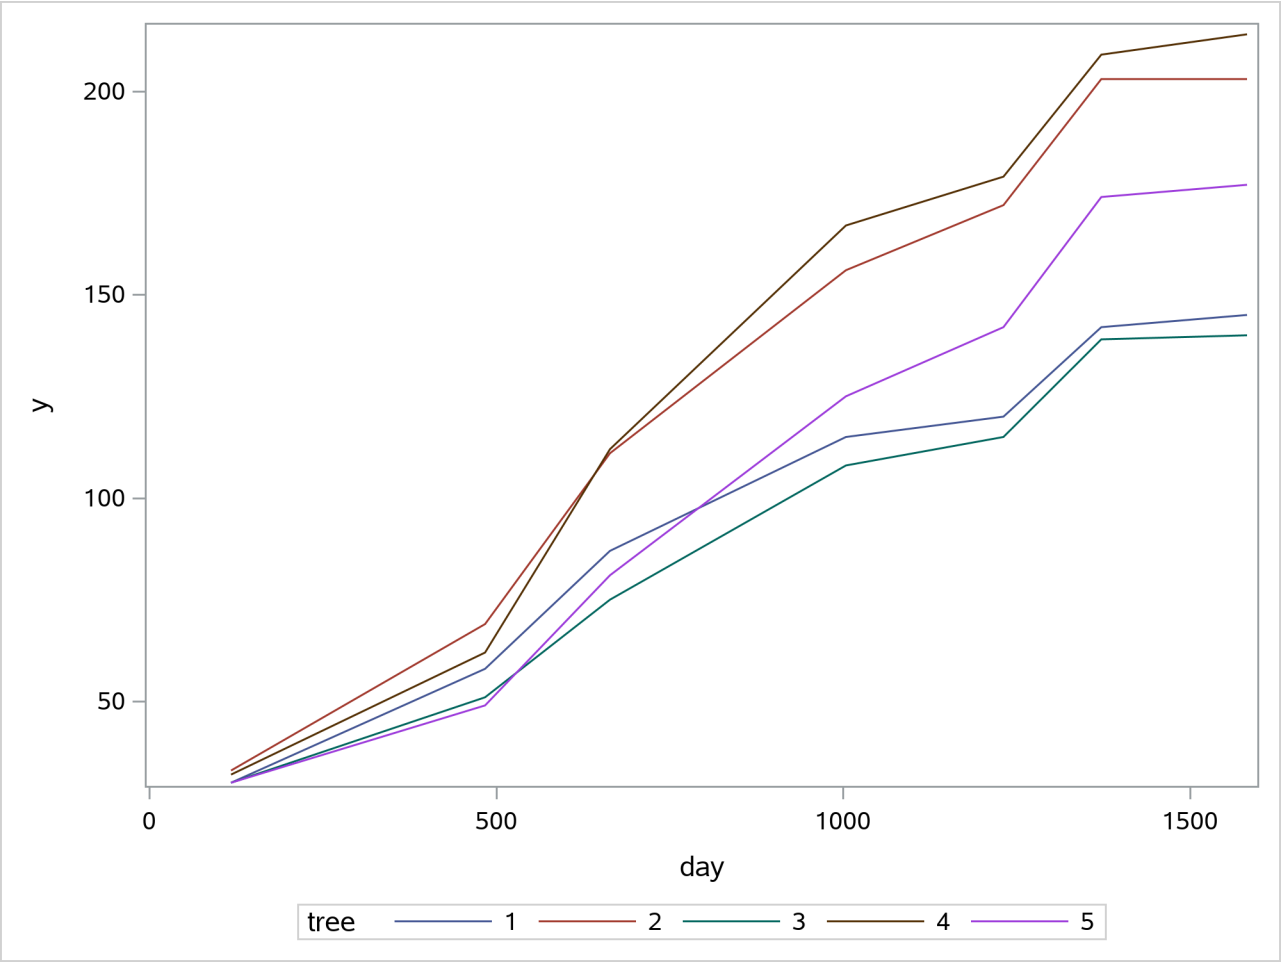
| Multithreading Configuration | | |
|---|---|---|
| Calculation Type | Concurrency Factor | Priority |
| BY Group Processing | 4 | 1.00 |
| Nonlinear Optimization | 1 | 0 |
| Data Partitioning | 1 | 0 |

| Performance Summary | |
|---|---|
| Threads Used | 4 |
| Task Time (sec) | 4.874322 |
| Program Run Time (sec) | 0.248641 |
| Data Time (sec) | 0.224331 |

## Example 40.2: Random-Effects Parameter Estimation (Experimental)

This example models the circumference of five orange trees over 1,600 days by using a logistic curve to represent the growth of each tree over time in conjunction with a random-effects parameter that accounts for variation among the trees. The tree data for this example come from Draper and Smith (1981) and are displayed in Output 40.2.1.

**Output 40.2.1** Orange Tree Growth Curves



Lindstrom and Bates (1990) and Pinheiro and Bates (1995) propose the following logistic nonlinear mixed model for these data:

$$y_{ij} = \frac{b_1 + u_{i1}}{1 + \exp[-(d_{ij} - b_2)/b_3]} + e_{ij}$$

Here, $y_{ij}$ represents the $j$th circumference measurement on the $i$th tree ($i = 1, \ldots, 5$; $j = 1, \ldots, 7$); $d_{ij}$ is the corresponding day; $b_1, b_2$, and $b_3$ are the fixed-effects parameters; $u_{i1}$ are the random-effect parameters assumed to be iid $N(0, \sigma_u^2)$; and $e_{ij}$ are the residual errors assumed to be iid $N(0, \sigma_e^2)$ and independent of the $u_{i1}$. The random-effect parameters $u_{i1}$ enter the model linearly.

The following PROC TMODEL step estimates the fixed-effects and random-effect parameters in this model:

```
proc tmodel data=tree;
   parms    b1  200
            b2  800
            b3  800
            s2u;
   num = b1 + u1;
   ex  = exp(-(day-b2)/b3);
   den = 1 + ex;
   y = num/den;
   crosssection tree;
   random u1 ~ normal(0,s2u);
   fit y;
quit;
```

The four SAS programming statements in this PROC TMODEL step specify the logistic model for tree growth. The variable u1 identifies the random effect in this model.

The CROSSSECTION statement defines a variable that indicates when new realizations of the random effect are encountered in the DATA= data set; in this case the variable tree is used.

The RANDOM statement defines the single random effect to be u1 and specifies that it follow a normal distribution with mean 0 and variance s2u. For models that have a nonlinear dependence on the random-effects variables, you can use the NUMQUADPTS= option to specify the number of Gaussian quadrature points to use in the approximation of the likelihood function. In this example, the model has a linear dependence on u1, so the default (NUMQUADPTS=1) is used.

For this example, as with many nonlinear random-effects models, the parameter optimization is sensitive to the selection of initial estimates. Therefore, in the PARMS statement, the values for the fixed-effects parameters are initialized with values based on a cursory examination of Output 40.2.1 to assure convergence. The parameter b1 represents an asymptotic limit for the circumference of an average tree. The parameters b2 and b3 are characteristic of the growth period for the orange trees.

Figure 40.2.2 shows the estimates for the fixed-effects and random-effect parameters together with their standard errors and approximate *t*-values.

**Output 40.2.2** Fixed-Effects and Random-Effect Parameters for the Orange Tree Model

**The TMODEL Procedure**

**Nonlinear Random Effects Estimates**

| Parameter | Estimate | Approx Std Err | t Value | Approx Pr > \|t\| |
|---|---|---|---|---|
| **b1** | 192.0409 | 13.6457 | 14.07 | <.0001 |
| **b2** | 727.8899 | 4.4899 | 162.12 | <.0001 |
| **b3** | 347.9685 | 3.4501 | 100.86 | <.0001 |
| **s2u** | 1016.531 | 535.2 | 1.90 | 0.0669 |

## Overview: The TSCSREG Procedure

The TSCSREG (time series cross section regression) procedure analyzes a class of linear econometric models that commonly arise when time series and cross-sectional data are combined. The TSCSREG procedure deals with panel data sets that consist of time series observations on each of several cross-sectional units.

The TSCSREG procedure is very similar to the PANEL procedure; for a full description, syntax details, models, and estimation methods, see Chapter 26, "The PANEL Procedure." The TSCSREG procedure is no longer being updated, and it shares the code base with the PANEL procedure.

The original TSCSREG procedure was developed by Douglas J. Drummond and A. Ronald Gallant, and contributed to the Version 5 SUGI Supplemental Library in 1979. The original code was changed substantially over the years. Additional new methods as well as other new features are currently included in the PANEL PROCEDURE. SAS Institute would like to thank Dr. Drummond and Dr. Gallant for their contribution of the original version of the TSCSREG procedure.

# Getting Started: The TSCSREG Procedure

## Specifying the Input Data

The input data set used by the TSCSREG procedure must be sorted by cross section and by time within each cross section. Therefore, the first step in using PROC TSCSREG is to make sure that the input data set is sorted. Normally, the input data set contains a variable that identifies the cross section for each observation and a variable that identifies the time period for each observation.

To illustrate, suppose that you have a data set A that contains data over time for each of several states. You want to regress the variable Y on regressors X1 and X2. Cross sections are identified by the variable STATE, and time periods are identified by the variable DATE. The following statements sort the data set A appropriately:

```
proc sort data=a;
   by state date;
run;
```

The next step is to invoke the TSCSREG procedure and specify the cross section and time series variables in an ID statement. List the variables in the ID statement exactly as they are listed in the BY statement.

```
proc tscsreg data=a;
   id state date;
```

Alternatively, you can omit the ID statement and use the CS= and TS= options in the PROC TSCSREG statement to specify the number of cross sections in the data set and the number of time series observations in each cross section.

## Unbalanced Data

In the case of fixed-effects and random-effects models, the TSCSREG procedure is capable of processing data with different numbers of time series observations across different cross sections. You must specify the ID statement to estimate models that use unbalanced data. The missing time series observations are recognized by the absence of time series ID variable values in some of the cross sections in the input data set. Moreover, if an observation with a particular time series ID value and cross-sectional ID value is present in the input data set, but one or more of the model variables are missing, that time series point is treated as missing for that cross section.

## Specifying the Regression Model

Next, specify the linear regression model with a MODEL statement, as shown in the following statements:

```
proc tscsreg data=a;
   id state date;
   model y = x1 x2;
run;
```

The MODEL statement in PROC TSCSREG is specified like the MODEL statement in other SAS regression procedures: the dependent variable is listed first, followed by an equal sign, followed by the list of regressor variables.

The reason for using PROC TSCSREG instead of other SAS regression procedures is that you can incorporate a model for the structure of the random errors. It is important to consider what kind of error structure model is appropriate for your data and to specify the corresponding option in the MODEL statement.

The error structure options supported by the TSCSREG procedure are FIXONE, FIXTWO, RANONE, RANTWO, FULLER, PARKS, and DASILVA. For more information about these methods and the error structures they assume, see the section "Details: The TSCSREG Procedure" on page 2846.

By default, the two-way random-effects error model structure is used while Fuller-Battese and Wansbeek-Kapteyn methods are used for the estimation of variance components in balanced data and unbalanced data, respectively. Thus, the preceding example is the same as specifying the RANTWO option, as shown in the following statements:

```
proc tscsreg data=a;
   id state date;
   model y = x1 x2 / rantwo;
run;
```

You can specify more than one error structure option in the MODEL statement; the analysis is repeated using each method specified. You can use any number of MODEL statements to estimate different regression models or estimate the same model by using different options.

In order to aid in model specification within this class of models, the procedure provides two specification test statistics. The first is an $F$ statistic that tests the null hypothesis that the fixed-effects parameters are all zero. The second is a Hausman $m$-statistic that provides information about the appropriateness of the random-effects specification. It is based on the idea that, under the null hypothesis of no correlation between the effects variables and the regressors, OLS and GLS are consistent, but OLS is inefficient. Hence, a test can be based on the result that the covariance of an efficient estimator with its difference from an inefficient estimator is zero. Rejection of the null hypothesis might suggest that the fixed-effects model is more appropriate.

The procedure also provides the Buse R-square measure, which is the most appropriate goodness-of-fit measure for models estimated by using GLS. This number is interpreted as a measure of the proportion of the transformed sum of squares of the dependent variable that is attributable to the influence of the independent variables. In the case of OLS estimation, the Buse R-square measure is equivalent to the usual R-square measure.

## Estimation Techniques

If the effects are fixed, the models are essentially regression models with dummy variables that correspond to the specified effects. For fixed-effects models, ordinary least squares (OLS) estimation is equivalent to best linear unbiased estimation.

The output from PROC TSCSREG is identical to what one would obtain from creating dummy variables to represent the cross-sectional and time (fixed) effects. The output is presented in this manner to facilitate comparisons to the least squares dummy variables estimator (LSDV). As such, the inclusion of a intercept term implies that one dummy variable must be dropped. The actual estimation of the fixed-effects models is not LSDV. LSDV is much too cumbersome to implement. Instead, PROC TSCSREG operates in a two-step fashion. In the first step, the following occurs:

- *One-way fixed-effects model*: In the one-way fixed-effects model, the data are transformed by removing the cross-sectional means from the dependent and independent variables. The following is true:

$$\tilde{y}_{it} = y_{it} - \bar{y}_{i\cdot}$$

$$\tilde{\mathbf{x}}_{it} = \mathbf{x}_{it} - \bar{\mathbf{x}}_{i\cdot}$$

- *Two-way fixed-effects model*: In the two-way fixed-effects model, the data are transformed by removing the cross-sectional and time means and adding back the overall means,

$$\tilde{y}_{it} = y_{it} - \bar{y}_{i\cdot} - \bar{y}_{\cdot t} + \bar{\bar{y}}$$

$$\tilde{\mathbf{x}}_{it} = \mathbf{x}_{it} - \bar{\mathbf{x}}_{i\cdot} - \bar{\mathbf{x}}_{\cdot t} + \bar{\bar{\mathbf{x}}}$$

where $y_{it}$ and $\mathbf{x}_{it}$ are the dependent variable (a scalar) and the explanatory variables (a vector whose columns are the explanatory variables, not including a constant), respectively; $\bar{y}_{i\cdot}$ and $\bar{\mathbf{x}}_{i\cdot}$ are cross section means; $\bar{y}_{\cdot t}$ and $\bar{\mathbf{x}}_{\cdot t}$ are time means; and $\bar{\bar{y}}$ and $\bar{\bar{\mathbf{x}}}$ are the overall means.

The second step consists of running OLS on the properly de-meaned series, provided that the data are balanced. The unbalanced case is slightly more difficult, because the structure of the missing data must be retained. For this case, PROC TSCSREG uses a slight specialization on Wansbeek and Kapteyn.

The other alternative is to assume that the effects are random. In the one-way case, $E(v_i) = 0$, $E(v_i^2) = \sigma_v^2$, and $E(v_i v_j) = 0$ for $i \neq j$, and $v_i$ is uncorrelated with $\epsilon_{it}$ for all $i$ and $t$. In the two-way case, in addition to all of the preceding, $E(e_t) = 0$, $E(e_t^2) = \sigma_e^2$, and $E(e_t e_s) = 0$ for $t \neq s$, and the $e_t$ are uncorrelated with the $v_i$ and the $\epsilon_{it}$ for all $i$ and $t$. Thus, the model is a variance components model, with the variance components $\sigma_v^2$, $\sigma_e^2$, and $\sigma_\epsilon^2$, to be estimated. A crucial implication of such a specification is that the effects are independent of the regressors. For random-effects models, the estimation method is an estimated generalized least squares (EGLS) procedure that involves estimating the variance components in the first stage and using the estimated variance covariance matrix thus obtained to apply generalized least squares (GLS) to the data.

## Introductory Example

This example uses the cost function data from Greene (1990) to estimate the variance components model. The variable OUTPUT is the log of output in millions of kilowatt-hours, and the variable COST is the log of cost in millions of dollars. For more information, see Greene (1990).

```
title1;
data greene;
   input firm year output cost @@;
   df1 = firm = 1;
   df2 = firm = 2;
   df3 = firm = 3;
   df4 = firm = 4;
   df5 = firm = 5;
   d60 = year = 1960;
   d65 = year = 1965;
   d70 = year = 1970;
datalines;
    1 1955   5.36598   1.14867  1 1960   6.03787   1.45185

... more lines ...
```

Usually you cannot explicitly specify all the explanatory variables that affect the dependent variable. The omitted or unobservable variables are summarized in the error disturbances. The TSCSREG procedure used with the RANTWO option specifies the two-way random-effects error model where the variance components are estimated by the Fuller-Battese method, because the data are balanced and the parameters are efficiently estimated by using the GLS method. The variance components model used by the Fuller-Battese method is

$$y_{it} = \sum_{k=1}^{K} X_{itk}\boldsymbol{\beta}_k + v_i + e_t + \epsilon_{it} \quad i = 1, \ldots, N, \;\; t = 1, \ldots, T$$

The following statements fit this model:

```
proc sort data=greene;
   by firm year;
run;

proc tscsreg data=greene;
   model cost = output / rantwo;
   id firm year;
run;
```

The TSCSREG procedure output is shown in Figure 41.1. A model description is printed first; it reports the estimation method used and the number of cross sections and time periods. The variance components estimates are printed next. Finally, the table of regression parameter estimates shows the estimates, standard errors, and $t$ tests.

# Syntax: The TSCSREG Procedure

The following statements are used with the TSCSREG procedure:

**PROC TSCSREG** *options* ;
  **BY** *variables* ;
  **ID** *cross-section-id-variable time-series-id-variable* ;
  **MODEL** *dependent = regressor-variables / options* ;
  **TEST** *equation1 < ,equation2. . . >* ;

## Functional Summary

The statements and options used with the TSCSREG procedure are summarized in Table 41.1.

**Table 41.1** Functional Summary

| Description | Statement | Option |
|---|---|---|
| **Data Set Options** | | |
| Specify the input data set | PROC TSCSREG | DATA= |
| Write parameter estimates to an output data set | PROC TSCSREG | OUTEST= |
| Include correlations in the OUTEST= data set | PROC TSCSREG | CORROUT |
| Include covariances in the OUTEST= data set | PROC TSCSREG | COVOUT |
| Specify number of time series observations | PROC TSCSREG | TS= |
| Specify number of cross sections | PROC TSCSREG | CS= |
| **Declaring the Role of Variables** | | |
| Specify BY-group processing | BY | |
| Specify the cross section and time ID variables | ID | |
| **Printing Control Options** | | |
| Print correlations of the estimates | MODEL | CORRB |
| Print covariances of the estimates | MODEL | COVB |
| Suppress printed output | MODEL | NOPRINT |
| Perform tests of linear hypotheses | TEST | |
| **Model Estimation Options** | | |
| Specify the one-way fixed-effects model | MODEL | FIXONE |
| Specify the two-way fixed-effects model | MODEL | FIXTWO |
| Specify the one-way random-effects model | MODEL | RANONE |
| Specify the two-way random-effects model | MODEL | RANTWO |
| Specify Da Silva method | MODEL | DASILVA |
| Specify Fuller-Battese method | MODEL | FULLER |
| Specify Parks method | MODEL | PARKS |
| Specify order of the moving-average error process for Da Silva method | MODEL | M= |
| Print $\Phi$ matrix for Parks method | MODEL | PHI |

**Table 41.1** *continued*

| Description | Statement | Option |
|---|---|---|
| Print autocorrelation coefficients for Parks method | MODEL | RHO |
| Suppress the intercept term | MODEL | NOINT |
| Control check for singularity | MODEL | SINGULAR= |

## PROC TSCSREG Statement

**PROC TSCSREG** *options* **;**

The following options can be specified in the PROC TSCSREG statement:

**DATA=***SAS-data-set*
names the input data set. The input data set must be sorted by cross section and by time period within cross section. If you omit the DATA= option, the most recently created SAS data set is used.

**TS=***number*
specifies the number of observations in the time series for each cross section. The TS= option value must be greater than 1. The TS= option is required unless an ID statement is used. Note that the number of observations for each time series must be the same for each cross section and must cover the same time period.

**CS=***number*
specifies the number of cross sections. The CS= option value must be greater than 1. The CS= option is required unless an ID statement is used.

**OUTEST=***SAS-data-set*
the parameter estimates. When the OUTEST= option is not specified, the OUTEST= data set is not created.

**OUTCOV**
**COVOUT**
writes the covariance matrix of the parameter estimates to the OUTEST= data set.

**OUTCORR**
**CORROUT**
writes the correlation matrix of the parameter estimates to the OUTEST= data set.

In addition, any of the following MODEL statement options can be specified in the PROC TSCSREG statement: CORRB, COVB, FIXONE, FIXTWO, RANONE, RANTWO, FULLER, PARKS, DASILVA, NOINT, NOPRINT, M=, PHI, RHO, and SINGULAR=. When specified in the PROC TSCSREG statement, these options are equivalent to specifying the options for every MODEL statement.

## BY Statement

**BY** *variables* **;**

A BY statement can be used with PROC TSCSREG to obtain separate analyses on observations in groups defined by the BY variables. When a BY statement appears, the input data set must be sorted by the BY variables as well as by cross section and time period within the BY groups.

When both an ID statement and a BY statement are specified, the input data set must be sorted first with respect to BY variables and then with respect to the cross section and time series ID variables. For example:

```
proc sort data=a;
   by byvar1 byvar2 csid tsid;
run;

proc tscsreg data=a;
   by byvar1 byvar2;
   id csid tsid;
   ...
run;
```

When both a BY statement and an ID statement are used, the data set might have a different number of cross sections or a different number of time periods in each BY group. If no ID statement is used, the CS=$N$ and TS=$T$ options must be specified and each BY group must contain $N \times T$ observations.

## ID Statement

**ID** *cross-section-id-variable time-series-id-variable* **;**

The ID statement is used to specify variables in the input data set that identify the cross section and time period for each observation.

When an ID statement is used, the TSCSREG procedure verifies that the input data set is sorted by the cross section ID variable and by the time series ID variable within each cross section. The TSCSREG procedure also verifies that the time series ID values are the same for all cross sections.

To make sure the input data set is correctly sorted, use PROC SORT with a BY statement with the variables listed exactly as they are listed in the ID statement to sort the input data set. For example:

```
proc sort data=a;
   by csid tsid;
run;

proc tscsreg data=a;
   id csid tsid;
   ... etc. ...
run;
```

If the ID statement is not used, the TS= and CS= options must be specified in the PROC TSCSREG statement. Note that the input data must be sorted by time within cross section, regardless of whether the cross section structure is given by an ID statement or by the options TS= and CS=.

If an ID statement is specified, the time series length $T$ is set to the minimum number of observations for any cross section, and only the first $T$ observations in each cross section are used. If both the ID statement and the TS= and CS= options are specified, the TS= and CS= options are ignored.

## MODEL Statement

**MODEL** *response = regressors / options* **;**

The MODEL statement specifies the regression model and the error structure assumed for the regression residuals. The response variable on the left side of the equal sign is regressed on the independent variables listed after the equal sign. Any number of MODEL statements can be used. For each model statement, only one response variable can be specified on the left side of the equal sign.

The error structure is specified by the FIXONE, FIXTWO, RANONE, RANTWO, FULLER, PARKS, and DASILVA options. More than one of these options can be used, in which case the analysis is repeated for each error structure model specified.

Models can be given labels up to 32 characters in length. Model labels are used in the printed output to identify the results for different models. If no label is specified, the response variable name is used as the label for the model. The model label is specified as follows:

*label:* **MODEL** *response = regressors / options* **;**

The following options can be specified in the MODEL statement after a slash (/):

**CORRB**

**CORR**
prints the matrix of estimated correlations between the parameter estimates.

**COVB**

**VAR**
prints the matrix of estimated covariances between the parameter estimates.

**FIXONE**
specifies that a one-way fixed-effects model be estimated with the one-way model that corresponds to group effects only.

**FIXTWO**
specifies that a two-way fixed-effects model be estimated.

**RANONE**
specifies that a one-way random-effects model be estimated.

**RANTWO**
specifies that a two-way random-effects model be estimated.

**FULLER**
specifies that the model be estimated by using the Fuller-Battese method, which assumes a variance components model for the error structure.

**PARKS**
specifies that the model be estimated by using the Parks method, which assumes a first-order autoregressive model for the error structure.

**DASILVA**
specifies that the model be estimated by using the Da Silva method, which assumes a mixed variance-component moving-average model for the error structure.

**M=***number*
specifies the order of the moving-average process in the Da Silva method. The M= value must be less than $T - 1$. The default is M=1.

**PHI**
prints the $\Phi$ matrix of estimated covariances of the observations for the Parks method. The PHI option is relevant only when the PARKS option is used.

**RHO**
prints the estimated autocorrelation coefficients for the Parks method.

**NOINT**
**NOMEAN**
suppresses the intercept parameter from the model.

**NOPRINT**
suppresses the normal printed output.

**SINGULAR=***number*
specifies a singularity criterion for the inversion of the matrix. The default depends on the precision of the computer system.

## TEST Statement

**TEST** *equation* < , *equation . . .* > < / *options* > ;

The TEST statement performs $F$ tests of linear hypotheses about the regression parameters in the preceding MODEL statement. Each equation specifies a linear hypothesis to be tested. All hypotheses in one TEST statement are tested jointly. Variable names in the equations must correspond to regressors in the preceding MODEL statement, and each name represents the coefficient of the corresponding regressor. The keyword INTERCEPT refers to the coefficient of the intercept.

The following statements illustrate the use of the TEST statement:

```
proc tscsreg;
   model y = x1 x2 x3;
   test x1 = 0, x2 * .5 + 2 * x3= 0;
   test_int: test intercept=0, x3 = 0;
```

Note that a test of the following form is not permitted:

```
test_bad: test x2 / 2 + 2 * x3= 0;
```

Do not use the division sign in the TEST statement.

# Details: The TSCSREG Procedure

Models, estimators, and methods are covered in detail in Chapter 26, "The PANEL Procedure."

## ODS Table Names

PROC TSCSREG assigns a name to each table it creates. You can use these names to reference the table when you use the Output Delivery System (ODS) to select tables and create output data sets. These names are listed in Table 41.2.

**Table 41.2** ODS Tables Produced in PROC TSCSREG

| ODS Table Name | Description | Options |
|---|---|---|
| **ODS Tables Created by the MODEL Statement** | | |
| ModelDescription | Model description | Default |
| FitStatistics | Fit statistics | Default |
| FixedEffectsTest | *F* test for no fixed effects | FIXONE, FIXTWO, RANONE, RANTWO |
| ParameterEstimates | Parameter estimates | Default |
| CovB | Covariance of parameter estimates | COVB |
| CorrB | Correlations of parameter estimates | CORRB |
| VarianceComponents | Variance component estimates | FULLER, DASILVA, M=, RANONE, RANTWO |
| RandomEffectsTest | Hausman test for random effects | FULLER, DASILVA, M=, RANONE, RANTWO |
| AR1Estimates | First-order autoregressive parameter estimates | PARKS, RHO |

# Overview: UCM Procedure

The UCM procedure analyzes and forecasts equally spaced univariate time series data by using an unobserved components model (UCM). The UCMs are also called *structural models* in the time series literature. A UCM decomposes the response series into components such as trend, seasonals, cycles, and the regression effects due to predictor series. The components in the model are supposed to capture the salient features of the series that are useful in explaining and predicting its behavior. Harvey (1989) and Pelagatti (2015) are good references for time series modeling that use the UCMs. Harvey calls the components in a UCM the "stylized facts" about the series under consideration. Traditionally, the ARIMA models and, to some limited extent, the exponential smoothing models have been the main tools in the analysis of this type of time series data. It is fair to say that the UCMs capture the versatility of the ARIMA models while possessing the interpretability of the smoothing models. A thorough discussion of the correspondence between the ARIMA models and the UCMs, and the relative merits of UCM and ARIMA modeling, is given in Harvey (1989). The UCMs are also very similar to another set of models, called the *dynamic models*, that are popular in the Bayesian time series literature (West and Harrison 1999). In SAS/ETS, you can use PROC SSM for multivariate (and more general univariate) UCMs (see Chapter 34, "The SSM Procedure"), PROC ARIMA for ARIMA modeling (see Chapter 8, "The ARIMA Procedure"), PROC ESM for exponential smoothing modeling (see Chapter 15, "The ESM Procedure"), and the Time Series Forecasting System for a point-and-click interface to ARIMA and exponential smoothing modeling.

You can use the UCM procedure to fit a wide range of UCMs that can incorporate complex trend, seasonal, and cyclical patterns and can include multiple predictors. It provides a variety of diagnostic tools to assess the fitted model and to suggest the possible extensions or modifications. The components in the UCM provide a succinct description of the underlying mechanism governing the series. You can print, save, or plot the estimates of these component series. Along with the standard forecast and residual plots, the study of these

component plots is an essential part of time series analysis using the UCMs. Once a suitable UCM is found for the series under consideration, it can be used for a variety of purposes. For example, it can be used for the following:

- forecasting the values of the response series and the component series in the model
- obtaining a model-based seasonal decomposition of the series
- obtaining a "denoised" version and interpolating the missing values of the response series in the historical period
- obtaining the full sample or "smoothed" estimates of the component series in the model

# Getting Started: UCM Procedure

The analysis of time series using the UCMs involves recognizing the salient features present in the series and modeling them suitably. The UCM procedure provides a variety of models for estimating and forecasting the commonly observed features in time series. These models are discussed in detail later in the section "An Introduction to Unobserved Component Models" on page 2891. First the procedure is illustrated using an example.

## A Seasonal Series with Linear Trend

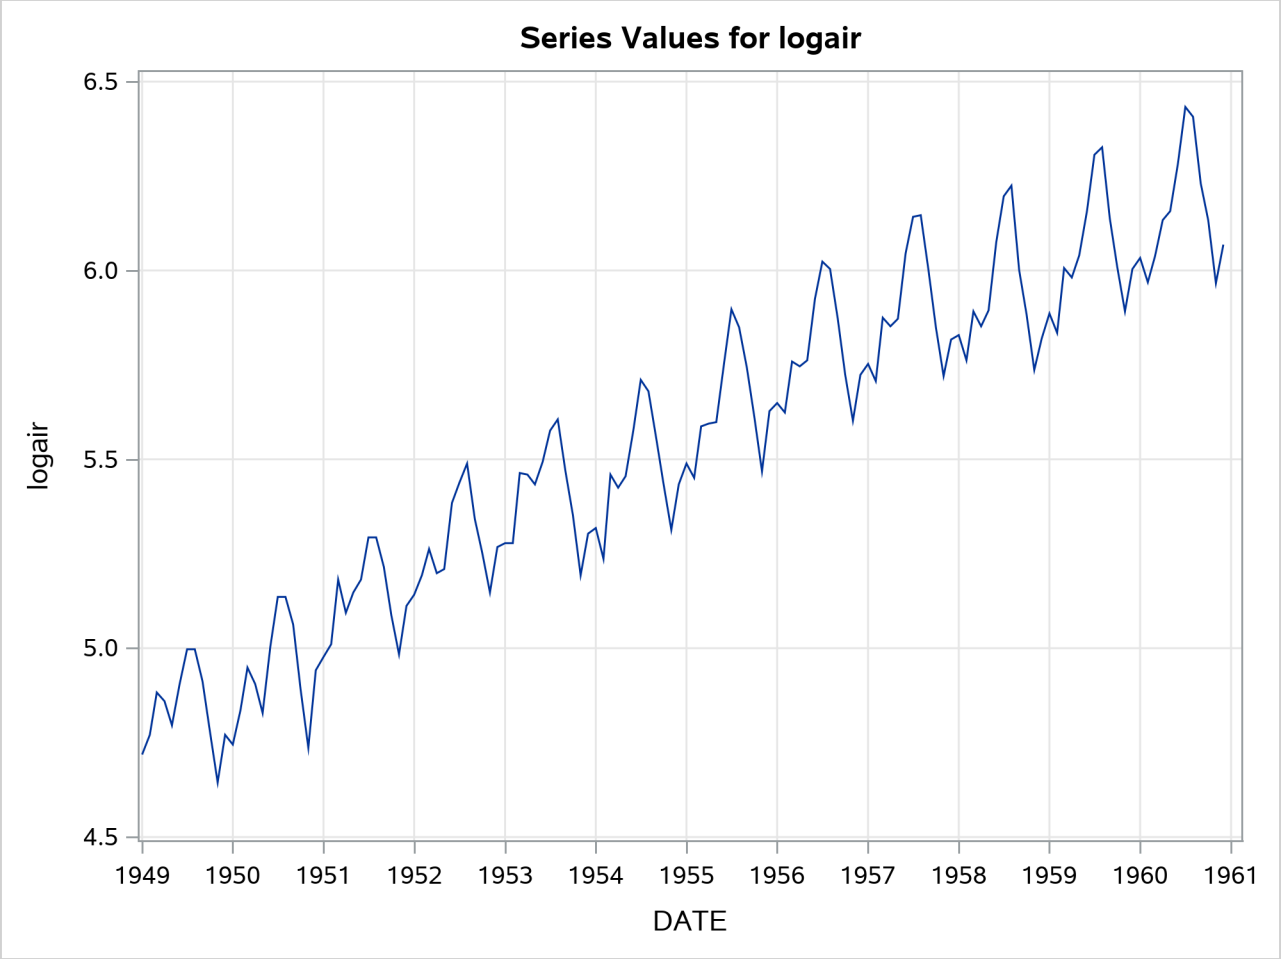
The airline passenger series, given as Series G in Box and Jenkins (1976), is often used in time series literature as an example of a nonstationary seasonal time series. This series is a monthly series consisting of the number of airline passengers who traveled during the years 1949 to 1960. Its main features are a steady rise in the number of passengers from year to year and the seasonal variation in the numbers during any given year. It also exhibits an increase in variability around the trend. A log transformation is used to stabilize this variability. The following DATA step prepares the log-transformed passenger series analyzed in this example:

```
data seriesG;
   set sashelp.air;
   logair = log( air );
run;
```

The following statements produce a time series plot of the series by using the TIMESERIES procedure (see Chapter 39, "The TIMESERIES Procedure"). The trend and seasonal features of the series are apparent in the plot in Figure 42.1.

```
proc timeseries data=seriesG plot=series;
   id date interval=month;
   var logair;
run;
```

**Figure 42.1** Series Plot of Log-Transformed Airline Passenger Series



In this example this series is modeled using an unobserved component model called the basic structural model (BSM). The BSM models a time series as a sum of three stochastic components: a trend component $\mu_t$, a seasonal component $\gamma_t$, and random error $\epsilon_t$. Formally, a BSM for a response series $y_t$ can be described as

$$y_t = \mu_t + \gamma_t + \epsilon_t$$

Each of the stochastic components in the model is modeled separately. The random error $\epsilon_t$, also called the *irregular component*, is modeled simply as a sequence of independent, identically distributed (iid) zero-mean Gaussian random variables. The trend and the seasonal components can be modeled in a few different ways. The model for trend used here is called a *locally linear time trend*. This trend model can be written as follows:

$$\begin{aligned} \mu_t &= \mu_{t-1} + \beta_{t-1} + \eta_t, \quad & \eta_t &\sim \text{iid } N(0, \sigma_\eta^2) \\ \beta_t &= \beta_{t-1} + \xi_t, & \xi_t &\sim \text{iid } N(0, \sigma_\xi^2) \end{aligned}$$

These equations specify a trend where the level $\mu_t$ as well as the slope $\beta_t$ is allowed to vary over time. This variation in slope and level is governed by the variances of the disturbance terms $\eta_t$ and $\xi_t$ in their respective equations. Some interesting special cases of this model arise when you manipulate these disturbance variances.

For example, if the variance of $\xi_t$ is zero, the slope will be constant (equal to $\beta_0$); if the variance of $\eta_t$ is also zero, $\mu_t$ will be a deterministic trend given by the line $\mu_0 + \beta_0 t$. The seasonal model used in this example is called a trigonometric seasonal. The stochastic equations governing a trigonometric seasonal are explained later (see the section "Modeling Seasons" on page 2893). However, it is interesting to note here that this seasonal model reduces to the familiar regression with deterministic seasonal dummies if the variance of the disturbance terms in its equations is equal to zero. The following statements specify a BSM with these three components:

```
proc ucm data=seriesG;
   id date interval=month;
   model logair;
   irregular;
   level;
   slope;
   season length=12 type=trig print=smooth;
   estimate;
   forecast lead=24 print=decomp;
run;
```

The PROC UCM statement signifies the start of the UCM procedure, and the input data set, seriesG, containing the dependent series is specified there. The optional ID statement is used to specify a date, datetime, or time identification variable, date in this example, to label the observations. The INTERVAL=MONTH option in the ID statement indicates that the measurements were collected on a monthly basis. The model specification begins with the MODEL statement, where the response series is specified (logair in this case). After this the components in the model are specified using separate statements that enable you to control their individual properties. The irregular component $\epsilon_t$ is specified using the IRREGULAR statement and the trend component $\mu_t$ is specified using the LEVEL and SLOPE statements. The seasonal component $\gamma_t$ is specified using the SEASON statement. The specifics of the seasonal characteristics such as the season length, its stochastic evolution properties, etc., are specified using the options in the SEASON statement. The seasonal component used in this example has a season length of 12, corresponding to the monthly seasonality, and is of the *trigonometric* type. Different types of seasonals are explained later (see the section "Modeling Seasons" on page 2893).

The parameters of this model are the variances of the disturbance terms in the evolution equations of $\mu_t$, $\beta_t$, and $\gamma_t$ and the variance of the irregular component $\epsilon_t$. These parameters are estimated by maximizing the likelihood of the data. The ESTIMATE statement options can be used to specify the span of data used in parameter estimation and to display and save the results of the estimation step and the model diagnostics. You can use the estimated model to obtain the forecasts of the series as well as the components. The options in the individual component statements can be used to display the component forecasts—for example, PRINT=SMOOTH option in the SEASON statement requests the displaying of smoothed forecasts of the seasonal component $\gamma_t$. The series forecasts and forecasts of the sum of components can be requested using the FORECAST statement. The option PRINT=DECOMP in the FORECAST statement requests the printing of the smoothed trend $\mu_t$ and the trend plus seasonal component $(\mu_t + \gamma_t)$.

The parameter estimates for this model are displayed in Figure 42.2.

**Figure 42.2** BSM for the Logair Series

**The UCM Procedure**

**Final Estimates of the Free Parameters**

| Component | Parameter | Estimate | Approx Std Error | t Value | Approx Pr > \|t\| |
|---|---|---|---|---|---|
| Irregular | Error Variance | 0.00023436 | 0.0001079 | 2.17 | 0.0298 |
| Level | Error Variance | 0.00029828 | 0.0001057 | 2.82 | 0.0048 |
| Slope | Error Variance | 8.47922E-13 | 6.2271E-10 | 0.00 | 0.9989 |
| Season | Error Variance | 0.00000356 | 1.32347E-6 | 2.69 | 0.0072 |

The estimates suggest that except for the slope component, the disturbance variances of all the components are significant—that is, all these components are *stochastic*. The slope component, however, appears to be deterministic because its error variance is quite insignificant. It might then be useful to check if the slope component can be dropped from the model—that is, if $\beta_0 = 0$. This can be checked by examining the significance analysis table of the components given in Figure 42.3.

**Figure 42.3** Component Significance Analysis for the Logair Series

**Significance Analysis of Components (Based on the Final State)**

| Component | DF | Chi-Square | Pr > ChiSq |
|---|---|---|---|
| Irregular | 1 | 0.08 | 0.7747 |
| Level | 1 | 117867 | <.0001 |
| Slope | 1 | 43.78 | <.0001 |
| Season | 11 | 507.75 | <.0001 |

This table provides the significance of the components in the model at the end of the estimation span. If a component is deterministic, this analysis is equivalent to checking whether the corresponding regression effect is significant. However, if a component is stochastic, then this analysis pertains only to the portion of the series near the end of the estimation span. In this example the slope appears quite significant and should be retained in the model, possibly as a deterministic component. Note that, on the basis of this table, the irregular component's contribution appears insignificant toward the end of the estimation span; however, since it is a stochastic component, it cannot be dropped from the model on the basis of this analysis alone. The slope component can be made deterministic by holding the value of its error variance fixed at zero. This is done by modifying the SLOPE statement as follows:

```
slope variance=0 noest;
```

After a tentative model is fit, its adequacy can be checked by examining different goodness-of-fit measures and other diagnostic tests and plots that are based on the model residuals. Once the model appears satisfactory, it can be used for forecasting. An interesting feature of the UCM procedure is that, apart from the series forecasts, you can request the forecasts of the individual components in the model. The plots of component forecasts can be useful in understanding their contributions to the series. The following statements illustrate some of these features:

```
proc ucm data=seriesG;
   id date interval = month;
   model logair;
   irregular;
```

```
   level plot=smooth;
   slope variance=0 noest;
   season length=12 type=trig
       plot=smooth;
   estimate;
   forecast lead=24 plot=decomp;
run;
```

The table given in Figure 42.4 shows the goodness-of-fit statistics that are computed by using the one-step-ahead prediction errors (see the section "Statistics of Fit" on page 2931). These measures indicate a good agreement between the model and the data. Additional diagnostic measures are also printed by default but are not shown here.

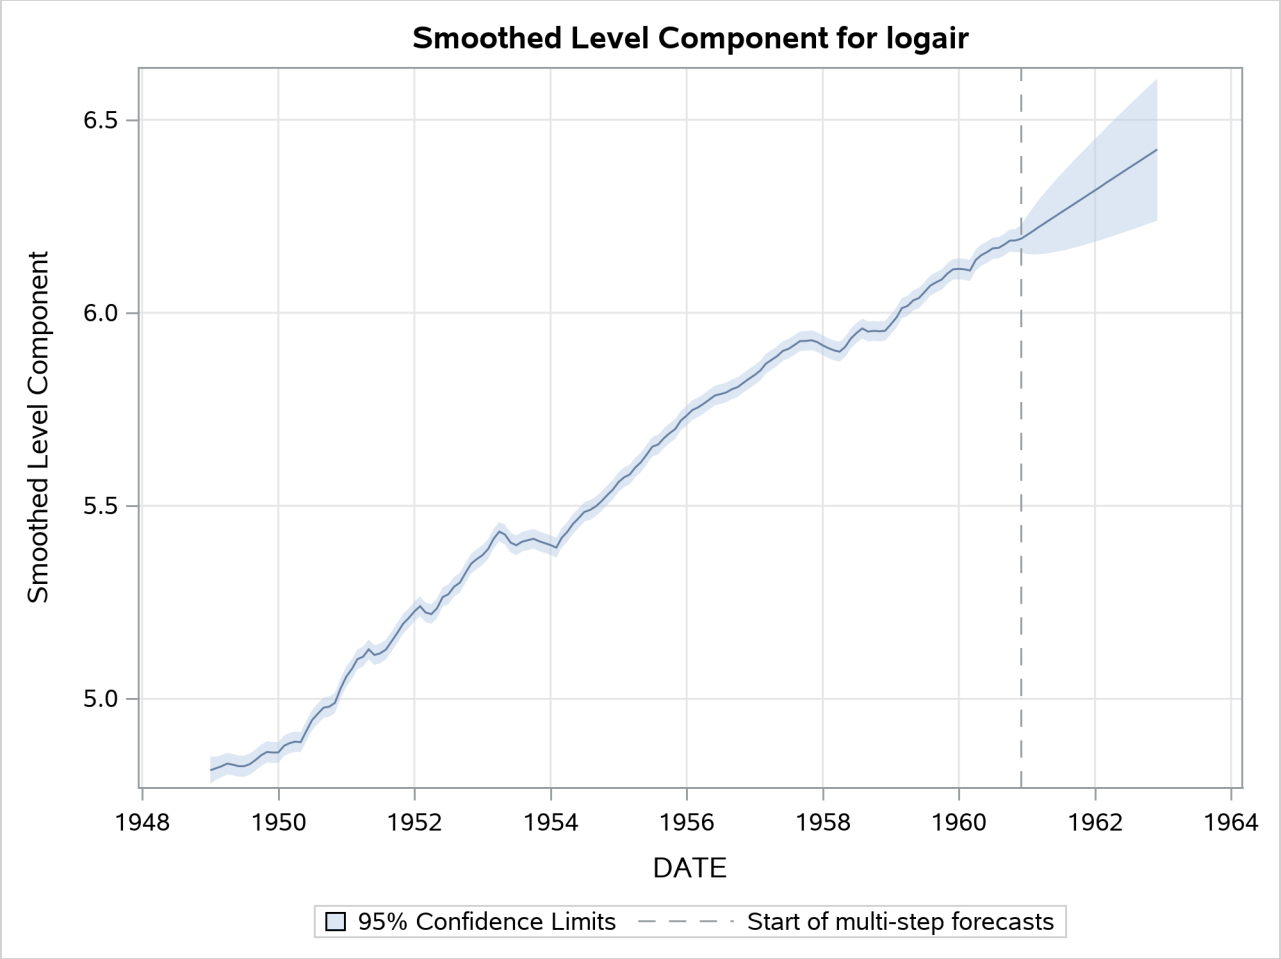
**Figure 42.4** Fit Statistics for the Logair Series

**The UCM Procedure**

| Fit Statistics Based on Residuals | |
|---|---|
| Mean Squared Error | 0.00147 |
| Root Mean Squared Error | 0.03830 |
| Mean Absolute Percentage Error | 0.54132 |
| Maximum Percent Error | 2.19097 |
| R-Square | 0.99061 |
| Adjusted R-Square | 0.99046 |
| Random Walk R-Square | 0.87288 |
| Amemiya's Adjusted R-Square | 0.99017 |
| Number of non-missing residuals used for computing the fit statistics = 131 | |

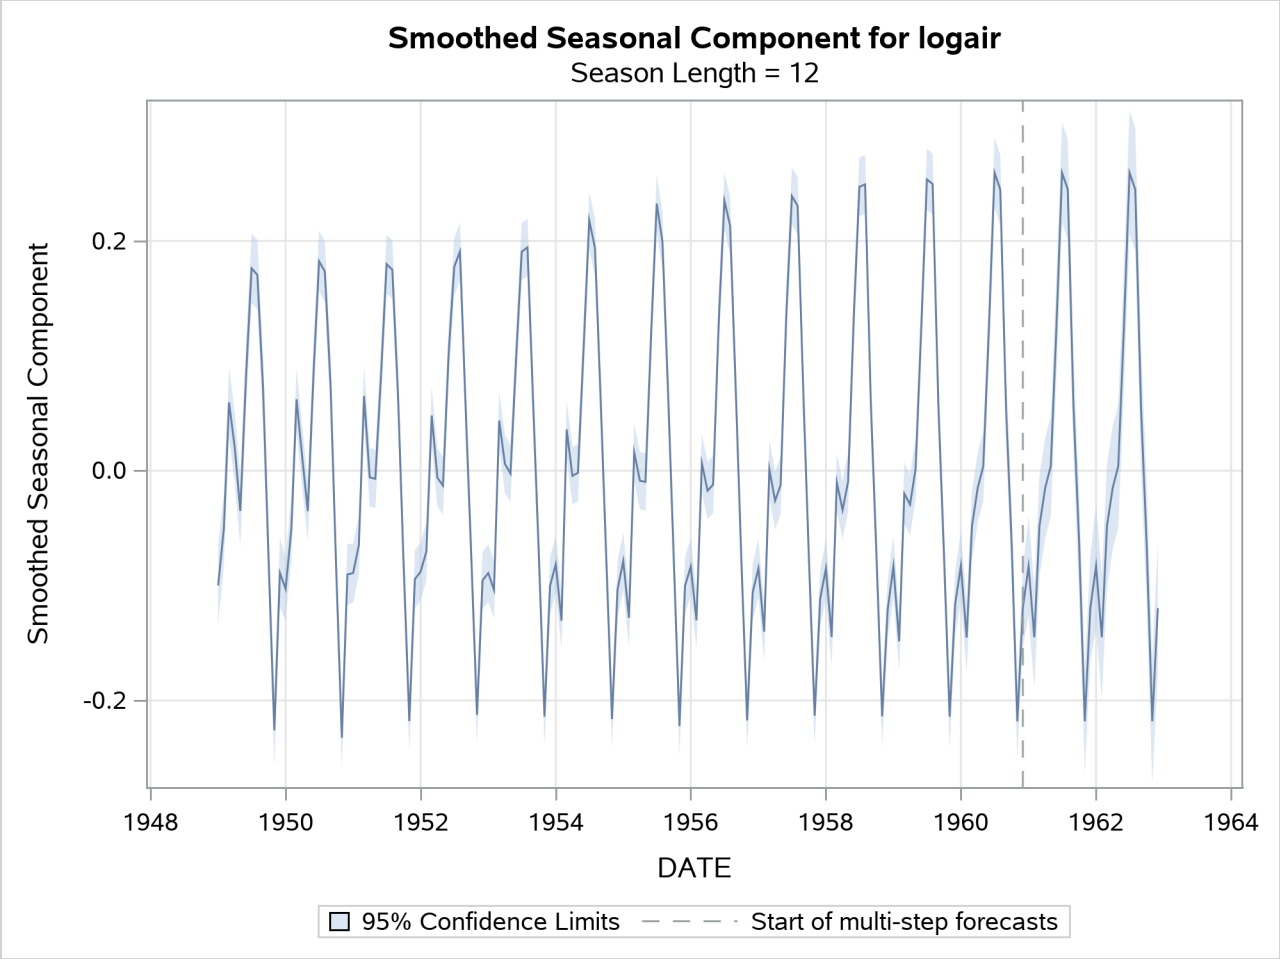
The first plot, shown in Figure 42.5, is produced by the PLOT=SMOOTH option in the LEVEL statement, it shows the smoothed level of the series.

**Figure 42.5** Smoothed Trend in the Logair Series



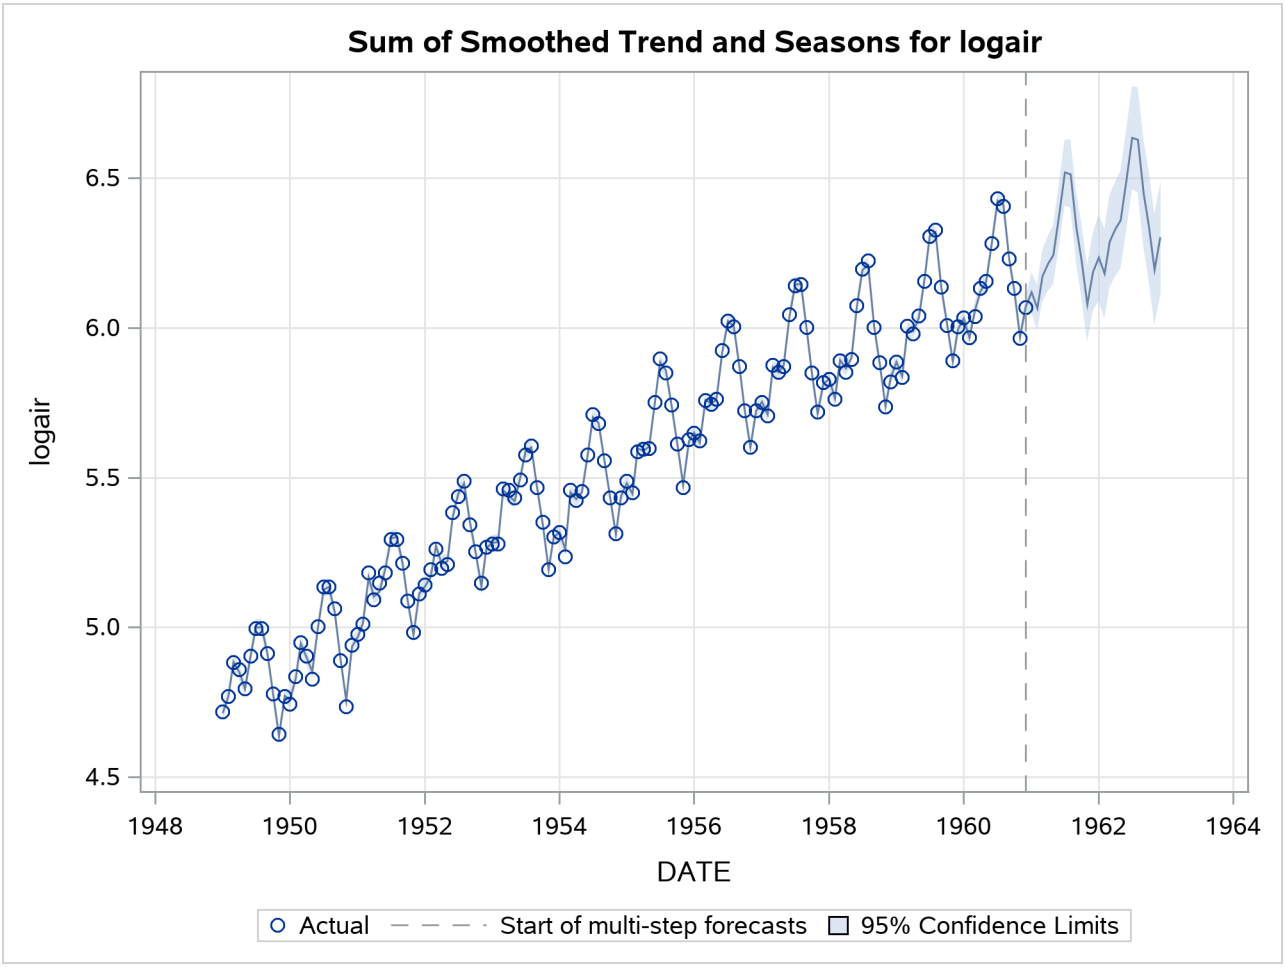
The second plot (Figure 42.6), produced by the PLOT=SMOOTH option in the SEASON statement, shows the smoothed seasonal component by itself.

**Figure 42.6** Smoothed Seasonal in the Logair Series



The plot of the sum of the trend and seasonal component, produced by the PLOT=DECOMP option in the FORECAST statement, is shown in Figure 42.7. You can see that, at least visually, the model seems to fit the data well. In all these decomposition plots the component estimates are extrapolated for two years in the future based on the LEAD=24 option specified in the FORECAST statement.

**Figure 42.7** Smoothed Trend plus Seasonal in the Logair Series



# Syntax: UCM Procedure

The UCM procedure uses the following statements:

**PROC UCM** < *options* > ;
**AUTOREG** < *options* > ;
**BLOCKSEASON** *options* ;
**BY** *variables* ;
**CYCLE** < *options* > ;
**DEPLAG** *options* ;
**ESTIMATE** < *options* > ;
**FORECAST** < *options* > ;
**ID** *variable options* ;
**IRREGULAR** < *options* > ;
**LEVEL** < *options* > ;
**MODEL** *dependent variable* < **=** *regressors* > ;
**NLOPTIONS** *options* ;
**PERFORMANCE** *options* ;
**OUTLIER** *options* ;
**RANDOMREG** *regressors* < / *options* > ;
**SEASON** *options* ;
**SLOPE** < *options* > ;
**SPLINEREG** *regressor* < *options* > ;
**SPLINESEASON** *options* ;
**TF** *regressor* < *options* > ;

The PROC UCM and MODEL statements are required. In addition, the model must contain at least one component with nonzero disturbance variance.

## Functional Summary

The statements and options controlling the UCM procedure are summarized in Table 42.1. Most commonly needed scenarios are listed; see the individual statements for additional details. You can use the PRINT= and PLOT= options in the individual component statements for printing and plotting the corresponding component forecasts.

**Table 42.1** Functional Summary

| Description | Statement | Option |
|---|---|---|
| **Data Set Options** | | |
| Specify the input data set | PROC UCM | DATA= |
| Write parameter estimates to an output data set | ESTIMATE | OUTEST= |
| Write series and component forecasts to an output data set | FORECAST | OUTFOR= |

**Table 42.1** *continued*

| Description | Statement | Option |
|---|---|---|
| **Model Specification** | | |
| Specify the dependent variable and simple predictors | MODEL | |
| Specify predictors with time-varying coefficients | RANDOMREG | |
| Specify a nonlinear predictor | SPLINEREG | |
| Specify the irregular component | IRREGULAR | |
| Specify the random walk trend | LEVEL | |
| Specify the locally linear trend | LEVEL and SLOPE | |
| Specify a cycle component | CYCLE | |
| Specify a dummy seasonal component | SEASON | TYPE=DUMMY |
| Specify a trigonometric seasonal component | SEASON | TYPE=TRIG |
| Drop some harmonics from a trigonometric seasonal component | SEASON | DROPH= |
| Specify a list of harmonics to keep in a trigonometric seasonal component | SEASON | KEEPH= |
| Specify a spline-season component | SPLINESEASON | |
| Specify a block-season component | BLOCKSEASON | |
| Specify an autoreg component | AUTOREG | |
| Specify the lags of the dependent variable | DEPLAG | |
| Specify a transfer function component | TF | |
| **Controlling the Likelihood Optimization Process** | | |
| Request optimization of the profile likelihood | ESTIMATE | PROFILE |
| Request optimization of the usual likelihood | ESTIMATE | NOPROFILE |
| Specify the optimization technique | NLOPTIONS | TECH= |
| Limit the number of iterations | NLOPTIONS | MAXITER= |
| **Outlier Detection** | | |
| Turn on the search for additive outliers | | Default |
| Turn on the search for level shifts | LEVEL | CHECKBREAK |
| Specify the significance level for outlier tests | OUTLIER | ALPHA= |
| Limit the number of outliers | OUTLIER | MAXNUM= |
| Limit the number of outliers to a percentage of the series length | OUTLIER | MAXPCT= |
| **Controlling the Series Span** | | |
| Exclude some initial observations from analysis during the parameter estimation | ESTIMATE | SKIPFIRST= |
| Exclude some observations at the end from analysis during the parameter estimation | ESTIMATE | BACK= |
| Exclude some initial observations from analysis during forecasting | FORECAST | SKIPFIRST= |

**Table 42.1** *continued*

| Description | Statement | Option |
|---|---|---|
| Exclude some observations at the end from analysis during forecasting | FORECAST | BACK= |
| **Graphical Residual Analysis** | | |
| Get a panel of plots consisting of residual autocorrelation plots and residual normality plots | ESTIMATE | PLOT=PANEL |
| Get the residual CUSUM plot | ESTIMATE | PLOT=CUSUM |

|---|---|---|
| **ID**<br>Specify a variable that provides the time index for the series values | ID | |

## PROC UCM Statement

**PROC UCM** < *options* > **;**

The PROC UCM statement is required. The following options can be used in the PROC UCM statement:

**DATA=***SAS-data-set*
specifies the name of the SAS data set containing the time series. If the DATA= option is not specified in the PROC UCM statement, the most recently created SAS data set is used.

**NOPRINT**
turns off all the printing for the procedure. The subsequent print options in the procedure are ignored.

**PLOTS< (***global-plot-options***) > < = ***plot-request* < **(***options***) > >**

**PLOTS< (***global-plot-options***) > < = (***plot-request* < **(***options***) > < . . .** *plot-request* < **(***options***) > >) >**
controls the plots produced with ODS Graphics. When you specify only one plot request, you can omit the parentheses around the plot request.

Here are some examples:

```
plots=none
plots=all
plots=residuals(acf loess)
plots(noclm)=(smooth(decomp) residual(panel loess))
```

For general information about ODS Graphics, see Chapter 24, "Statistical Graphics Using ODS" (*SAS/STAT User's Guide*).

```
proc ucm;
   model y = x;
   irregular;
   level;
run;

proc ucm plots=all;
   model y = x;
   irregular;
   level;
run;
```

The first PROC UCM step does not specify the PLOTS= option, so the default plot that displays the series forecasts in the forecast region is produced. The PLOTS=ALL option in the second PROC UCM step produces all the plots that are appropriate for the specified model.

In addition to the PLOTS= option in the PROC UCM statement, you can request plots by using the PLOT= option in other statements of the UCM procedure. This way of requesting plots provides finer control over the plot production. If you do not specify any specific plot request, then PROC UCM produces the plot of series forecasts in the forecast horizon by default.

### Global Plot Options

The *global-plot-options* apply to all relevant plots generated by the UCM procedure. The following *global-plot-option* is supported:

**NOCLM**
suppresses the confidence limits in all the component and forecast plots.

### Specific Plot Options

The following list describes the specific plots and their options:

**ALL**
produces all plots appropriate for the particular analysis.

**NONE**
suppresses all plots.

**FILTER (<** *filter-plot-options* **>)**
produces time series plots of the filtered component estimates. The following *filter-plot-options* are available:

**ALL**
produces all the filtered component estimate plots appropriate for the particular analysis.

**LEVEL**
produces a time series plot of the filtered level component estimate, provided the model contains the level component.

**SLOPE**
produces a time series plot of the filtered slope component estimate, provided the model contains the slope component.

**CYCLE**
produces time series plots of the filtered cycle component estimates for all cycle components in the model, if there are any.

**SEASON**
produces time series plots of the filtered season component estimates for all seasonal components in the model, if there are any.

**DECOMP**
produces time series plots of the filtered estimates of the series decomposition.

**RESIDUAL ( <** *residual-plot-options* **>)**
produces the residuals plots. The following *residual-plot-options* are available:

**ALL**
produces all the residual diagnostics plots appropriate for the particular analysis.

**ACF**
produces the autocorrelation plot of residuals.

**CUSUM**
produces the plot of cumulative residuals against time.

**CUSUMSQ**
produces the plot of cumulative squared residuals against time.

**HISTOGRAM**
produces the histogram of residuals.

**LOESS**
produces a scatter plot of residuals against time, which has an overlaid loess-fit.

**PACF**
produces the partial-autocorrelation plot of residuals.

**PANEL**
produces a summary panel of the residual diagnostics consisting of the following:

- histogram of residuals
- normal quantile plot of residuals
- the residual-autocorrelation-plot
- the residual-partial-autocorrelation-plot

**QQ**
produces a normal quantile plot of residuals.

**RESIDUAL**
produces a needle plot of residuals against time.

**WN**
produces the plot of Ljung-Box white-noise test $p$-values at different lags (in log scale).

**SMOOTH ( < *smooth-plot-options* >)**
produces time series plots of the smoothed component estimates. The following *smooth-plot-options* are available:

**ALL**
produces all the smoothed component estimate plots appropriate for the particular analysis.

**LEVEL**
produces time series plot of the smoothed level component estimate, provided the model contains the level component.

**SLOPE**
produces time series plot of the smoothed slope component estimate, provided the model contains the slope component.

**CYCLE**
produces time series plots of the smoothed cycle component estimates for all cycle components in the model, if there are any.

**SEASON**
produces time series plots of the smoothed season component estimates for all season components in the model, if there are any.

**DECOMP**
produces time series plots of the smoothed estimates of the series decomposition.

**PRINTALL**
turns on all the printing options for the procedure. The subsequent NOPRINT options in the procedure are ignored.

## AUTOREG Statement

**AUTOREG** < *options* > **;**

The AUTOREG statement specifies an autoregressive component in the model. An autoregressive component is a special case of cycle that corresponds to the frequency of zero or $\pi$. It is modeled separately for easier interpretation. A stochastic equation for an autoregressive component $r_t$ can be written as follows:

$$r_t = \rho r_{t-1} + \nu_t, \quad \nu_t \sim \text{iid } N(0, \sigma_\nu^2)$$

The damping factor $\rho$ can take any value in the interval (–1, 1), including –1 but excluding 1. If $\rho = 1$, the autoregressive component cannot be distinguished from the random walk level component. If $\rho = -1$, the autoregressive component corresponds to a seasonal component with a season length of 2, or a nonstationary cycle with period 2. If $|\rho| < 1$, then the autoregressive component is stationary. The following example illustrates the AUTOREG statement. This statement includes an autoregressive component in the model. The damping factor $\rho$ and the disturbance variance $\sigma_\nu^2$ are estimated from the data.

```
autoreg;
```

**NOEST=RHO**

**NOEST=VARIANCE**

**NOEST=(RHO VARIANCE)**
fixes the values of $\rho$ and $\sigma_v^2$ to those specified in the RHO= and VARIANCE= options.

**PLOT=FILTER**

**PLOT=SMOOTH**

**PLOT=( <FILTER> <SMOOTH> )**
requests plotting of the filtered or smoothed estimate of the autoreg component.

**PRINT=FILTER**

**PRINT=SMOOTH**

**PRINT=(<FILTER> <SMOOTH>)**
requests printing of the filtered or smoothed estimate of the autoreg component.

**RHO=***value*
specifies an initial value for the damping factor $\rho$ during the parameter estimation process. The value of $\rho$ must be in the interval (–1, 1), including –1 but excluding 1.

**VARIANCE=***value*
specifies an initial value for the disturbance variance $\sigma_v^2$ during the parameter estimation process. Any nonnegative value, including zero, is an acceptable starting value.

## BLOCKSEASON Statement

**BLOCKSEASON NBLOCKS=***integer* **BLOCKSIZE=***integer* <*options*> **;**

The BLOCKSEASON or BLOCKSEASONAL statement is used to specify a seasonal component $\gamma_t$ that has a special block structure. The seasonal $\gamma_t$ is called a *block seasonal* of block size *m* and number of blocks *k* if its season length, *s*, can be factored as $s = m * k$ and its seasonal effects have a block form—that is, the first *m* seasonal effects are all equal to some number $\tau_1$, the next *m* effects are all equal to some number $\tau_2$, and so on.

This type of seasonal structure can be appropriate in some cases; for example, consider a series that is recorded on an hourly basis. Further assume that, in this particular case, the hour-of-the-day effect and the day-of-the-week effect are additive. In this situation the hour-of-the-week seasonality, having a season length of 168, can be modeled as a sum of two components. The hour-of-the-day effect is modeled using a simple seasonal of season length 24, while the day-of-the-week is modeled as a block seasonal component that has the days of the week as blocks. This day-of-the-week block seasonal component has seven blocks, each of size 24.

A block seasonal specification requires, at the minimum, the block size *m* and the number of blocks in the seasonal *k*. These are specified using the BLOCKSIZE= and NBLOCKS= option, respectively. In addition, you might need to specify the position of the first observation of the series by using the OFFSET= option if it is not at the beginning of one of the blocks. In the example just considered, this corresponds to a situation

where the first series measurement is not at the start of the day. Suppose that the first measurement of the series corresponds to the hour between 6:00 and 7:00 a.m., which is the seventh hour within that day or at the seventh position within that block. This is specified as OFFSET=7.

The other options in this statement are very similar to the options in the SEASON statement; for example, a block seasonal can also be of one of the two types, DUMMY and TRIG. There can be more than one block seasonal component in the model, each specified using a separate BLOCKSEASON statement. No two block seasonals in the model can have the same NBLOCKS= and BLOCKSIZE= specifications. The following example illustrates the use of the BLOCKSEASON statement to specify the additive, hour-of-the-week seasonal model:

```
season length=24 type=trig;
blockseason nblocks=7 blocksize=24;
```

**BLOCKSIZE=***integer*
: specifies the block size, *m*. This is a required option in this statement. The block size can be any integer larger than or equal to two. Typical examples of block sizes are 24, corresponding to the hours of the day when a day is being used as a block in hourly data, or 60, corresponding to the minutes in an hour when an hour is being used as a block in data recorded by minutes, etc.

**NBLOCKS=***integer*
: specifies the number of blocks, *k*. This is a required option in this statement. The number of blocks can be any integer greater than or equal to two.

**NOEST**
: fixes the value of the disturbance variance parameter to the value specified in the VARIANCE= option.

**OFFSET=***integer*
: specifies the position of the first measurement within the block, if the first measurement is not at the start of a block. The OFFSET= value must be between one and the block size. The default value is one. The first measurement refers to the start of the estimation span and the forecast span. If these spans differ, their starting measurements must be separated by an integer multiple of the block size.

**PLOT=FILTER**

**PLOT=SMOOTH**

**PLOT=F_ANNUAL**

**PLOT=S_ANNUAL**

**PLOT=( <** *plot-request* **> . . . <** *plot-request* **> )**
: requests plots of the season component. When you specify only one *plot-request*, you can omit the parentheses around it. You can use the FILTER and SMOOTH options to plot the filtered and smoothed estimates of the season component $\gamma_t$. You can use the F_ANNUAL and S_ANNUAL options to get the plots of "annual" variation in the filtered and smoothed estimates of $\gamma_t$. The annual plots are useful to see the change in the contribution of a particular month over the span of years. Here "month" and "year" are generic terms that change appropriately with the interval type being used to label the observations and the season length. For example, for monthly data with a season length of 12, the usual meaning applies, while for daily data with a season length of 7, the days of the week serve as months and the weeks serve as years. The first period in each block is plotted over the years.

**PRINT=FILTER**

**PRINT=SMOOTH**

**PRINT=( < FILTER > < SMOOTH > )**
requests the printing of the filtered or smoothed estimate of the block seasonal component $\gamma_t$.

**TYPE=DUMMY | TRIG**
specifies the type of the block seasonal component. The default type is DUMMY.

**VARIANCE=***value*
specifies an initial value for the disturbance variance, $\sigma_\omega^2$, in the $\gamma_t$ equation at the start of the parameter estimation process. Any nonnegative value, including zero, is an acceptable starting value.

## BY Statement

**BY** *variables* **;**

A BY statement can be used in the UCM procedure to process a data set in groups of observations defined by the BY variables. The model specified using the MODEL and other component statements is applied to all the groups defined by the BY variables. When a BY statement appears, the procedure expects the input data set to be sorted in order of the BY variables. The variables are one or more variables in the input data set.

## CYCLE Statement

**CYCLE** < *options* > **;**

The CYCLE statement is used to specify a cycle component, $\psi_t$, in the model. The stochastic equation governing a cycle component of period $p$ and damping factor $\rho$ is

$$\begin{bmatrix} \psi_t \\ \psi_t^* \end{bmatrix} = \rho \begin{bmatrix} \cos\lambda & \sin\lambda \\ -\sin\lambda & \cos\lambda \end{bmatrix} \begin{bmatrix} \psi_{t-1} \\ \psi_{t-1}^* \end{bmatrix} + \begin{bmatrix} \nu_t \\ \nu_t^* \end{bmatrix}$$

where $\nu_t$ and $\nu_t^*$ are independent, zero-mean, Gaussian disturbances with variance $\sigma_\nu^2$ and $\lambda = 2 * \pi / p$ is the angular frequency of the cycle. Any $p$ strictly greater than two is an admissible value for the period, and the damping factor $\rho$ can be any value in the interval (0, 1), including one but excluding zero. The cycles with frequency zero and $\pi$, which correspond to the periods equal to infinity and two, respectively, can be specified using the AUTOREG statement. The values of $\rho$ less than one give rise to a stationary cycle, while $\rho = 1$ gives rise to a nonstationary cycle. As a default, values of $\rho$, $p$, and $\sigma_\nu^2$ are estimated from the data. However, if necessary, you can fix the values of some or all of these parameters.

There can be multiple cycles in a model, each specified using a separate CYCLE statement. The examples that follow illustrate the use of the CYCLE statement.

The following statements request including two cycles in the model. The parameters of each of these cycles are estimated from the data.

```
cycle;
cycle;
```

The following statement requests inclusion of a nonstationary cycle in the model. The cycle period $p$ and the disturbance variance $\sigma_\nu^2$ are estimated from the data.

```
cycle rho=1 noest=rho;
```

In the following statement, a nonstationary cycle with a fixed period of 12 is specified. Moreover, a starting value is supplied for $\sigma_\nu^2$.

```
cycle period=12 rho=1 variance=4 noest=(rho period);
```

**NOEST=PERIOD**

**NOEST=RHO**

**NOEST=VARIANCE**

**NOEST=( <RHO> <PERIOD> <VARIANCE> )**

fixes the values of the component parameters to those specified in the RHO=, PERIOD=, and VARIANCE= options. This option enables you to fix any combination of parameter values.

**ORDER=***integer* (Experimental)

enables you to specify a higher-order cycle. A higher-order cycle (a cycle whose order is greater than 1) is a generalization of the stochastic cycle described at the beginning of this section, which can be thought of as a first-order cycle. Higher-order cycles are well explained in Trimbur (2005) and Pelagatti (2015, sect. 3.3.3). A cycle whose order is greater than 2 is rarely needed, and specifying cycles of large orders (for example, an order greater than 4) can lead to computational instability. See Example 42.9 for an example of the use of higher-order cycles.

**PERIOD=***value*

specifies an initial value for the cycle period during the parameter estimation process. Period value must be strictly greater than 2.

**PLOT=FILTER**

**PLOT=SMOOTH**

**PLOT=( <FILTER> <SMOOTH> )**

requests plotting of the filtered or smoothed estimate of the cycle component.

**PRINT=FILTER**

**PRINT=SMOOTH**

**PRINT=( <FILTER> <SMOOTH> )**

requests the printing of a filtered or smoothed estimate of the cycle component $\psi_t$.

**RHO=***value*

specifies an initial value for the damping factor in this component during the parameter estimation process. Any value in the interval (0, 1), including one but excluding zero, is an acceptable initial value for the damping factor.

**VARIANCE=***value*

specifies an initial value for the disturbance variance parameter, $\sigma_v^2$, to be used during the parameter estimation process. Any nonnegative value, including zero, is an acceptable starting value.

## DEPLAG Statement

**DEPLAG LAGS=***order* < **PHI=***value* ... > < **NOEST** > **;**

The DEPLAG statement is used to specify the lags of the dependent variable to be included as predictors in the model. The following examples illustrate the use of the DEPLAG statement.

If the dependent series is denoted by $y_t$, the following statement specifies the inclusion of $\phi_1 y_{t-1} + \phi_2 y_{t-2}$ in the model. The parameters $\phi_1$ and $\phi_2$ are estimated from the data.

```
deplag lags=2;
```

The following statement requests including $\phi_1 y_{t-1} + \phi_2 y_{t-4} - \phi_1\phi_2 y_{t-5}$ in the model. The values of $\phi_1$ and $\phi_2$ are fixed at 0.8 and –1.2.

```
deplag lags=(1)(4) phi=0.8 -1.2 noest;
```

The dependent lag parameters are not constrained to lie in any particular region. In particular, this implies that a UCM that contains only an irregular component and dependent lags, resulting in a traditional autoregressive model, is not constrained to be a stationary model. In the DEPLAG statement, if an initial value is supplied for any one of the parameters, the initial values must also be supplied for all other parameters.

**LAGS=***order*

**LAGS=(***lag, ..., lag* **) ... (***lag, ..., lag* **)**

is a required option in this statement. LAGS=($l_1, l_2, \ldots, l_k$) defines a model with specified lags of the dependent variable included as predictors. LAGS=*order* is equivalent to LAGS=(1, 2, ..., *order* ).

A concatenation of parenthesized lists specifies a factored model. For example, LAGS=(1)(12) specifies that the lag values, 1, 12, and 13, corresponding to the following polynomial in the backward shift operator, be included in the model:

$$(1 - \phi_{1,1} B)(1 - \phi_{2,1} B^{12})$$

Note that, in this case, the coefficient of the thirteenth lag is constrained to be the product of the coefficients of the first and twelfth lags.

**NOEST**

fixes the values of the parameters to those specified in PHI= option.

**PHI=***value* **...**

lists starting values for the coefficients of the lagged dependent variable. The order of the values listed corresponds with the order of the lags specified in the LAGS= option.

## ESTIMATE Statement

**ESTIMATE** < *options* > **;**

The ESTIMATE statement is an optional statement used to control the overall model-fitting environment. Using this statement, you can control the span of observations used to fit the model by using the SKIPFIRST= and BACK= options. This can be useful in model diagnostics. You can request a variety of goodness-of-fit statistics and other model diagnostic information including different residual diagnostic plots. Note that the ESTIMATE statement is not used to control the nonlinear optimization process itself. That is done using the NLOPTIONS statement, where you can control the number of iterations, choose between the different optimization techniques, and so on. You can save the estimated parameters and other related information in a data set by using the OUTEST= option. You can request the optimization of the profile likelihood, the likelihood obtained by concentrating out a disturbance variance, for parameter estimation by using the PROFILE option. The following example illustrates the use of this statement:

```
estimate skipfirst=12 back=24;
```

This statement requests that the initial 12 measurements and the last 24 measurements be excluded during the model-fitting process. The actual observation span used to fit the model is decided as follows: Suppose that $n_0$ and $n_1$ are the observation numbers of the first and the last nonmissing values of the response variable, respectively. As a result of SKIPFIRST=12 and BACK=24, the measurements between observation numbers $n_0 + 12$ and $n_1 - 24$ form the estimation span. Of course, the model fitting might not take place if there are insufficient data in the resulting span. The model fitting does not take place if there are regressors in the model that have missing values in the estimation span.

**BACK=***integer*

**SKIPLAST=***integer*

indicates that some ending part of the data needs to be ignored during the parameter estimation. This can be useful when you want to study the forecasting performance of a model on the observed data. BACK=10 results in skipping the last 10 measurements of the response series during the parameter estimation. The default is BACK=0.

**LIKE=DIFFUSE | MARGINAL** (Experimental )

specifies the type of likelihood to use for parameter estimation. You can specify the following values:

**DIFFUSE** uses diffuse likelihood.

**MARGINAL** uses marginal likelihood.

For more information about likelihood types, see the section "Likelihood Computation and Model-Fitting Phase" on page 2447 in Chapter 34, "The SSM Procedure." For an example of the use of LIKE=MARGINAL option, see Example 42.10. By default, LIKE=DIFFUSE.

**EXTRADIFFUSE=***k*

enables continuation of the diffuse filtering iterations for $k$ additional iterations beyond the first instance where the initialization of the diffuse state would have otherwise taken place. If the specified $k$ is larger than the sample size, the diffuse iterations continue until the end of the sample. Note that one-step-ahead residuals are produced only after the diffuse state is initialized. Delaying the initialization leads to a reduction in the number of one-step-ahead residuals available for computing the residual diagnostic measures. This option is useful when you want to ignore the first few one-step-ahead residuals that often have large variance.

**NOPROFILE**
requests that the usual likelihood be optimized for parameter estimation. For more information, see the section "Parameter Estimation by Profile Likelihood Optimization" on page 2909.

**OUTEST=***SAS-data-set*
specifies an output data set for the estimated parameters.

In the ESTIMATE statement, the PLOT= option is used to obtain different residual diagnostic plots. The different possibilities are as follows:

**PLOT=ACF**
**PLOT=MODEL**
**PLOT=LOESS**
**PLOT=HISTOGRAM**
**PLOT=PACF**
**PLOT=PANEL**
**PLOT=QQ**
**PLOT=RESIDUAL**
**PLOT=WN**
**PLOT=(** *< plot-request >* **. . .** *< plot-request >* **)**
requests different residual diagnostic plots. The different options are as follows:

**ACF**
produces the residual-autocorrelation plot.

**CUSUM**
produces the plot of cumulative residuals against time.

**CUSUMSQ**
produces the plot of cumulative squared residuals against time.

**MODEL**
produces the plot of one-step-ahead forecasts in the estimation span.

**HISTOGRAM**
produces the histogram of residuals.

**LOESS**
produces a scatter plot of residuals against time, which has an overlaid loess-fit.

**PACF**
produces the residual-partial-autocorrelation plot.

**PANEL**
produces a summary panel of the residual diagnostics consisting of the following:

- histogram of residuals
- normal quantile plot of residuals
- the residual-autocorrelation-plot
- the residual-partial-autocorrelation-plot

**QQ**
produces a normal quantile plot of residuals.

**RESIDUAL**
produces a needle plot of residuals against time.

**WN**
produces a plot of *p*-values, in log-scale, at different lags for the Ljung-Box portmanteau white noise test statistics.

**PRINT=NONE**
suppresses all the printed output related to the model fitting, such as the parameter estimates, the goodness-of-fit statistics, and so on.

**PROFILE**
requests that the profile likelihood, obtained by concentrating out one of the disturbance variances from the likelihood, be optimized for parameter estimation. By default, the profile likelihood is not optimized if any of the disturbance variance parameters is held fixed to a nonzero value. For more information see the section "Parameter Estimation by Profile Likelihood Optimization" on page 2909.

**SKIPFIRST=***integer*
indicates that some early part of the data needs to be ignored during the parameter estimation. This can be useful if there is a reason to believe that the model being estimated is not appropriate for this portion of the data. SKIPFIRST=10 results in skipping the first 10 measurements of the response series during the parameter estimation. The default is SKIPFIRST=0.

## FORECAST Statement

**FORECAST** < *options* > **;**

The FORECAST statement is an optional statement that is used to specify the overall forecasting environment for the specified model. It can be used to specify the span of observations, the historical period, to use to compute the forecasts of the future observations. This is done using the SKIPFIRST= and BACK= options. The number of periods to forecast beyond the historical period, and the significance level of the forecast confidence interval, is specified using the LEAD= and ALPHA= options. You can request one-step-ahead series and component forecasts by using the PRINT= option. You can save the series forecasts, and the model-based decomposition of the series, in a data set by using the OUTFOR= option. You can use the BOOTSTRAP option to request the computation of bootstrap prediction standard errors and the associated confidence intervals. The following example illustrates the use of this statement:

```
forecast skipfirst=12 back=24 lead=30;
```

This statement requests that the initial 12 and the last 24 response values be excluded during the forecast computations. The forecast horizon, specified using the LEAD= option, is 30 periods; that is, multistep forecasting begins at the end of the historical period and continues for 30 periods. The actual observation span used to compute the multistep forecasting is decided as follows: Suppose that $n_0$ and $n_1$ are the observation numbers of the first and the last nonmissing values of the response variable, respectively. As a result of SKIPFIRST=12 and BACK=24, the historical period, or the forecast span, begins at $n_0 + 12$ and ends at $n_1 - 24$. Multistep forecasts are produced for the next 30 periods—that is, for the observation numbers

$n_1 - 23$ to $n_1 + 6$. Of course, the forecast computations can fail if the model has regressor variables that have missing values in the forecast span. If the regressors contain missing values in the forecast horizon—that is, between the observations $n_1 - 23$ and $n_1 + 6$—the forecast horizon is reduced accordingly.

**ALPHA=***value*

specifies the significance level of the forecast confidence intervals; for example, ALPHA=0.05, which is the default, results in a 95% confidence interval.

**BACK=***integer*

**SKIPLAST=***integer*

specifies the holdout sample for the evaluation of the forecasting performance of the model. For example, BACK=10 results in treating the last 10 observed values of the response series as unobserved. A post-sample-prediction-analysis table is produced for comparing the predicted values with the actual values in the holdout period. The default is BACK=0.

**BOOTSTRAP(NREP=***integer* **< SEED=***integer* **>)** (Experimental )

enables the computation of bootstrap prediction standard errors based on the specified number of replications (NREP). The value of NREP must be at least 2. Optionally, you can specify the random number seed that is associated with the first replication by using the SEED= option. The seeds for the subsequent replications are assigned sequentially. The default seed value that is associated with the first replication is 123. The BOOTSTRAP option has no effect if the number of parameters to be estimated is zero (that is, all the model parameters are known). Note that this option is computationally expensive. The computational cost of NREP replications is comparable to the cost of estimating parameters NREP times.

**EXTRADIFFUSE=***k*

enables continuation of the diffuse filtering iterations for $k$ additional iterations beyond the first instance where the initialization of the diffuse state would have otherwise taken place. If the specified $k$ is larger than the sample size, the diffuse iterations continue until the end of the sample. Note that one-step-ahead forecasts are produced only after the diffuse state is initialized. Delaying the initialization leads to reduction in the number of one-step-ahead forecasts. This option is useful when you want to ignore the first few one-step-ahead forecasts that often have large variance.

**LEAD=***integer*

specifies the number of periods to forecast beyond the historical period defined by the SKIPFIRST= and BACK= options; for example, LEAD=10 results in the forecasting of 10 future values of the response series. The default is LEAD=12.

**OUTFOR=***SAS-data-set*

specifies an output data set for the forecasts. The output data set contains the ID variable (if specified), the response and predictor series, the one-step-ahead and out-of-sample response series forecasts, the forecast confidence intervals, the smoothed values of the response series, and the smoothed forecasts produced as a result of the model-based decomposition of the series.

**PLOT=DECOMP**

**PLOT=DECOMPVAR**

**PLOT=FDECOMP**

**PLOT=FDECOMPVAR**

**PLOT=FORECASTS**

**PLOT=TREND**

**PLOT=( <** *plot-request* **> . . . <** *plot-request* **> )**

requests forecast and model decomposition plots. The FORECASTS option provides the plot of the series forecasts, the TREND and DECOMP options provide the plots of the smoothed trend and other decompositions, the DECOMPVAR option can be used to plot the variance of these components, and the FDECOMP and FDECOMPVAR options provide the same plots for the filtered decomposition estimates and their variances.

**PRINT=DECOMP**

**PRINT=FDECOMP**

**PRINT=FORECASTS**

**PRINT=NONE**

**PRINT=( <** *print-request* **> . . . <** *print-request* **> )**

controls the printing of the series forecasts and the printing of smoothed model decomposition estimates. By default, the series forecasts are printed only for the forecast horizon specified by the LEAD= option; that is, the one-step-ahead predicted values are not printed. You can request forecasts for the entire forecast span by specifying the PRINT=FORECASTS option. Using PRINT=DECOMP, you can get smoothed estimates of the following effects: trend, trend plus regression, trend plus regression plus cycle, and sum of all components except the irregular. If some of these effects are absent in the model, then they are ignored. Similarly, you can get filtered estimates of these effects by using PRINT=FDECOMP. You can use PRINT=NONE to suppress the printing of all the forecast output.

**SKIPFIRST=***integer*

indicates that some early part of the data needs to be ignored during the forecasting calculations. This can be useful if there is a reason to believe that the model being used for forecasting is not appropriate for this portion of the data. SKIPFIRST=10 results in skipping the first 10 measurements of the response series during the forecast calculations. The default is SKIPFIRST=0.

## ID Statement

**ID** *variable* **INTERVAL**=*value* < **ALIGN=***value* > **;**

The ID statement names a numeric variable that identifies observations in the input and output data sets. The ID variable's values are assumed to be SAS date, time, or datetime values. In addition, the ID statement specifies the frequency associated with the time series. The ID statement options also specify how the observations are aligned to form the time series. If the ID statement is specified, the INTERVAL= option must also be specified. If the ID statement is not specified, the observation number, with respect to the BY group, is used as the time ID. The values of the ID variable are extrapolated for the forecast observations based on the values of the INTERVAL= option.

**ALIGN=***value*
controls the alignment of SAS dates used to identify output observations. The ALIGN= option has the following possible values: BEGINNING | BEG | B, MIDDLE | MID | M, and ENDING | END | E. The default is BEGINNING. The ALIGN= option is used to align the ID variable with the beginning, middle, or end of the time ID interval specified by the INTERVAL= option.

**INTERVAL=***value*
specifies the time interval between observations. This option is required in the ID statement. INTERVAL=*value* is used in conjunction with the ID variable to check that the input data are in order and have no gaps. The INTERVAL= option is also used to extrapolate the ID values past the end of the input data. For a complete discussion of the intervals supported, see Chapter 5, "Date Intervals, Formats, and Functions."

## IRREGULAR Statement

**IRREGULAR** < *options* > **;**

The IRREGULAR statement includes an irregular component in the model. There can be at most one IRREGULAR statement in the model specification. The irregular component corresponds to the overall random error $\epsilon_t$ in the model. By default the irregular component is modeled as white noise—that is, as a sequence of independent, identically distributed, zero-mean, Gaussian random variables. However, you can also model it as an autoregressive moving average (ARMA) process. The options for specifying an ARMA model for the irregular component are given in a separate subsection: "ARMA Specification" on page 2877.

The options in this statement enable you to specify the model for the irregular component and to output its estimates. Two examples of the IRREGULAR statement are given next. In the first example the statement is in its simplest form, resulting in the inclusion of an irregular component that is white noise with unknown variance:

```
irregular;
```

The following statement provides a starting value for the white noise variance $\sigma_\epsilon^2$ to be used in the nonlinear parameter estimation process. It also requests the printing of smoothed estimates of $\epsilon_t$. The smoothed irregulars are useful in model diagnostics.

```
irregular variance=4 print=smooth;
```

**NOEST**
fixes the value of $\sigma_\epsilon^2$ to the value specified in the VARIANCE= option. Also see the NOEST= option in the subsection "ARMA Specification" on page 2877.

**PLOT=FILTER**

**PLOT=SMOOTH**

**PLOT=( < FILTER > < SMOOTH > )**
requests plotting of the filtered or smoothed estimate of the irregular component.

**PRINT=FILTER**

**PRINT=SMOOTH**

**PRINT=( < FILTER > < SMOOTH > )**

requests printing of the filtered or smoothed estimate of the irregular component.

**VARIANCE=***value*

specifies an initial value for $\sigma_\epsilon^2$ during the parameter estimation process. Any nonnegative value, including zero, is an acceptable starting value.

## ARMA Specification

This section details the options for specifying an ARMA model for the irregular component. The specification of ARMA models requires some notation, which is explained first.

Let $B$ denote the backshift operator—that is, for any sequence $\epsilon_t$, $B\epsilon_t = \epsilon_{t-1}$. The higher powers of $B$ represent larger shifts (for example, $B^3\epsilon_t = \epsilon_{t-3}$). A random sequence $\epsilon_t$ follows a zero-mean ARMA($p$,$q$)×($P$,$Q$)$_s$ model with nonseasonal autoregressive order $p$, seasonal autoregressive order $P$, nonseasonal moving average order $q$, and seasonal moving average order $Q$, if it satisfies the following difference equation specified in terms of the polynomials in the backshift operator where $a_t$ is a white noise sequence and $s$ is the season length:

$$\phi(B)\Phi(B^s)\epsilon_t = \theta(B)\Theta(B^s)a_t$$

The polynomials $\phi, \Phi, \theta$, and $\Theta$ are of orders $p$, $P$, $q$, and $Q$, respectively, which can be any nonnegative integers. The season length $s$ must be a positive integer. For example, $\epsilon_t$ satisfies an ARMA(1,1) model (that is, $p = 1, q = 1, P = 0$, and $Q = 0$) if

$$\epsilon_t = \phi_1\epsilon_{t-1} + a_t - \theta_1 a_{t-1}$$

for some coefficients $\phi_1$ and $\theta_1$ and a white noise sequence $a_t$. Similarly, $\epsilon_t$ satisfies an ARMA(1,1)×(1,1)$_{12}$ model if

$$\epsilon_t = \phi_1\epsilon_{t-1} + \Phi_1\epsilon_{t-12} - \phi_1\Phi_1\epsilon_{t-13} + a_t - \theta_1 a_{t-1} - \Theta_1 a_{t-12} + \theta_1\Theta_1 a_{t-13}$$

for some coefficients $\phi_1$, $\Phi_1$, $\theta_1$, and $\Theta_1$ and a white noise sequence $a_t$. The ARMA process is stationary and invertible if the defining polynomials $\phi, \Phi, \theta$, and $\Theta$ have all their roots outside the unit circle—that is, their absolute values are strictly larger than 1.0. It is assumed that the ARMA model specified for the irregular component is stationary and invertible—that is, the coefficients of the polynomials $\phi, \Phi, \theta$, and $\Theta$ are constrained so that the stationarity and invertibility conditions are satisfied. The unknown coefficients of these polynomials become part of the model parameter vector that is estimated using the data.

The notation for a closely related class of models, autoregressive integrated moving average (ARIMA) models, is also given here. A random sequence $y_t$ is said to follow an ARIMA($p$,$d$,$q$)×($P$,$D$,$Q$)$_s$ model if, for some nonnegative integers $d$ and $D$, the differenced series $\epsilon_t = (1-B)^d(1-B^s)^D y_t$ follows an ARMA($p$,$q$)×($P$,$Q$)$_s$ model. The integers $d$ and $D$ are called nonseasonal and seasonal differencing orders, respectively. You can specify ARIMA models by using the DEPLAG statement for specifying the differencing orders and by using the IRREGULAR statement for the ARMA specification. For an example of ARIMA(0,1,1)×(0,1,1)$_{12}$ model specification, see Example 42.8. Brockwell and Davis (1991) can be consulted for additional information about ARIMA models.

You can use options of the IRREGULAR statement to specify the desired ARMA model and to request printed and graphical output. A few examples of the IRREGULAR statement are given next.

The following statement specifies an irregular component that is modeled as an ARMA(1,1) process. It also requests plotting its smoothed estimate.

```
irregular p=1 q=1 plot=smooth;
```

The following statement specifies an ARMA(1,1)×(1,1)$_{12}$ model. It also fixes the coefficient of the first-order seasonal moving average polynomial to 0.1. The other coefficients and the white noise variance are estimated using the data.

```
irregular p=1 sp=1 q=1 sq=1 s=12 sma=0.1 noest=(sma);
```

**AR=**$\phi_1\ \phi_2\ \ldots\phi_p$
lists the starting values of the coefficients of the nonseasonal autoregressive polynomial

$$\phi(B) = 1 - \phi_1 B - \cdots - \phi_p B^p$$

where the order $p$ is specified in the P= option. The coefficients $\phi_i$ must define a stationary autoregressive polynomial.

**MA=**$\theta_1\ \theta_2\ \ldots\theta_q$
lists the starting values of the coefficients of the nonseasonal moving average polynomial

$$\theta(B) = 1 - \theta_1 B - \cdots - \theta_q B^q$$

where the order $q$ is specified in the Q= option. The coefficients $\theta_i$ must define an invertible moving average polynomial.

**NOEST=(<VARIANCE> <AR> <SAR> <MA> <SMA>)**
fixes the values of the ARMA parameters and the value of the white noise variance to those specified in the AR=, SAR=, MA=, SMA=, or VARIANCE= options.

**P=***integer*
specifies the order of the nonseasonal autoregressive polynomial. The order can be any nonnegative integer; the default value is 0. In practice the order is a small integer such as 1, 2, or 3.

**Q=***integer*
specifies the order of the nonseasonal moving average polynomial. The order can be any nonnegative integer; the default value is 0. In practice the order is a small integer such as 1, 2, or 3.

**S=***integer*
specifies the season length used during the specification of the seasonal autoregressive or seasonal moving average polynomial. The season length can be any positive integer; for example, S=4 might be an appropriate value for a quarterly series. The default value is S=1.

**SAR=**$\Phi_1\ \Phi_2\ \ldots\Phi_P$
lists the starting values of the coefficients of the seasonal autoregressive polynomial

$$\Phi(B^s) = 1 - \Phi_1 B^s - \cdots - \Phi_P B^{sP}$$

where the order $P$ is specified in the SP= option and the season length $s$ is specified in the S= option. The coefficients $\Phi_i$ must define a stationary autoregressive polynomial.

**SMA=**$\Theta_1\ \Theta_2\ \ldots\ \Theta_Q$
lists the starting values of the coefficients of the seasonal moving average polynomial

$$\Theta(B^s) = 1 - \Theta_1 B^s - \cdots - \Theta_Q B^{sQ}$$

where the order $Q$ is specified in the SQ= option and the season length $s$ is specified in the S= option. The coefficients $\Theta_i$ must define an invertible moving average polynomial.

**SP=***integer*
specifies the order of the seasonal autoregressive polynomial. The order can be any nonnegative integer; the default value is 0. In practice the order is a small integer such as 1 or 2.

**SQ=***integer*
specifies the order of the seasonal moving average polynomial. The order can be any nonnegative integer; the default value is 0. In practice the order is a small integer such as 1 or 2.

## LEVEL Statement

**LEVEL** < *options* > **;**

The LEVEL statement is used to include a level component in the model. The level component, either by itself or together with a slope component (see the SLOPE statement), forms the trend component, $\mu_t$, of the model. If the slope component is absent, the resulting trend is a random walk (RW) specified by the following equations:

$$\mu_t = \mu_{t-1} + \eta_t, \quad \eta_t \sim \text{iid}\ \ N(0, \sigma_\eta^2)$$

If the slope component is present, signified by the presence of a SLOPE statement, a locally linear trend (LLT) is obtained. The equations of LLT are as follows:

$$\begin{aligned} \mu_t &= \mu_{t-1} + \beta_{t-1} + \eta_t, \quad & \eta_t &\sim \text{iid}\ \ N(0, \sigma_\eta^2) \\ \beta_t &= \beta_{t-1} + \xi_t, & \xi_t &\sim \text{iid}\ \ N(0, \sigma_\xi^2) \end{aligned}$$

In either case, the options in the LEVEL statement are used to specify the value of $\sigma_\eta^2$ and to request forecasts of $\mu_t$. The SLOPE statement is used for similar purposes in the case of slope $\beta_t$. The following examples illustrate the use of the LEVEL statement. Assuming that a SLOPE statement is not added subsequently, a simple random walk trend is specified by the following statement:

```
level;
```

The following statements specify a locally linear trend with value of $\sigma_\eta^2$ fixed at 4. It also requests printing of filtered values of $\mu_t$. The value of $\sigma_\xi^2$, the disturbance variance in the slope equation, is estimated from the data.

```
level variance=4 noest print=filter;
slope;
```

**CHECKBREAK**
turns on the checking of breaks in the level component.

**NOEST**
fixes the value of $\sigma_\eta^2$ to the value specified in the VARIANCE= option.

**PLOT=FILTER**
**PLOT=SMOOTH**
**PLOT=( < FILTER > < SMOOTH > )**
requests plotting of the filtered or smoothed estimate of the level component.

**PRINT=FILTER**
**PRINT=SMOOTH**
**PRINT=( < FILTER > < SMOOTH > )**
requests printing of the filtered or smoothed estimate of the level component.

**VARIANCE=***value*
specifies an initial value for $\sigma_\eta^2$, the disturbance variance in the $\mu_t$ equation at the start of the parameter estimation process. Any nonnegative value, including zero, is an acceptable starting value.

## MODEL Statement

**MODEL** *dependent* < **=** *regressors* > **;**

The MODEL statement specifies the response variable and, optionally, the predictor or regressor variables for the UCM model. This is a required statement in the UCM procedure. The predictors specified in the MODEL statement are assumed to have a linear and time-invariant relationship with the response. The predictors that have time-varying regression coefficients are specified separately in the RANDOMREG statement. Similarly, the predictors that have a nonlinear effect on the response variable are specified separately in the SPLINEREG statement. Only one MODEL statement can be specified.

## NLOPTIONS Statement

**NLOPTIONS** < *options* > **;**

PROC UCM uses the nonlinear optimization (NLO) subsystem to perform the nonlinear optimization of the likelihood function during the estimation of model parameters. You can use the NLOPTIONS statement to control different aspects of this optimization process. For most problems the default settings of the optimization process are adequate. However, in some cases it might be useful to change the optimization technique or to change the maximum number of iterations. This can be done by using the TECH= and MAXITER= options in the NLOPTIONS statement as follows:

```
nloptions tech=dbldog maxiter=200;
```

This sets the maximum number of iterations to 200 and changes the optimization technique to DBLDOG rather than the default technique, TRUREG, used in PROC UCM. A discussion of the full range of options that can be used with the NLOPTIONS statement is given in Chapter 7, "Nonlinear Optimization Methods." In PROC UCM, all these options are available except the options related to the printing of the optimization history. In this version of PROC UCM all the printed output from the NLO subsystem is suppressed.

## OUTLIER Statement

**OUTLIER** < *options* > **;**

The OUTLIER statement enables you to control the reporting of the additive outliers (AO) and level shifts (LS) in the response series. The AOs are searched by default. You can turn on the search for LSs by using the CHECKBREAK option in the LEVEL statement.

**ALPHA=***significance-level*
specifies the significance level for reporting the outliers. The default is 0.05.

**MAXNUM=***number*
limits the number of outliers to search. The default is MAXNUM=5.

**MAXPCT=***number*
is similar to the MAXNUM= option. In the MAXPCT= option you can limit the number of outliers to search for according to a percentage of the series length. The default is MAXPCT=1. When both of these options are specified, the minimum of the two search numbers is used.

**PRINT=SHORT | DETAIL**
enables you to control the printed output of the outlier search. The PRINT=SHORT option, which is the default, produces an outlier summary table containing the most significant outliers, either AO or LS, discovered in the outlier search. The PRINT=DETAIL option produces, in addition to the outlier summary table, separate tables containing the AO and LS structural break chi-square statistics computed at each time point in the estimation span.

## PERFORMANCE Statement

**PERFORMANCE** *options* **;**

The PERFORMANCE statement defines performance parameters for distributed and multithreaded computing and passes variables that describe the distributed computing environment. In the UCM procedure, this statement is applicable only if you specify the BOOTSTRAP option in the FORECAST statement. In addition, the number of nodes that you specify in the NODES= option in the PERFORMANCE statement must be strictly smaller than the number of bootstrap replications that you specify in the BOOTSTRAP option. The following statements illustrate how you can use this statement to perform bootstrap computations that use 10 nodes on a grid named *hpa.sas.com*:

```
proc ucm data=seriesG;
   id date interval=month;
   model logair;
   irregular;
   level;
   forecast lead=24 bootstrap(nrep=50 seed=1234);
   performance nodes=10 host="hpa.sas.com";
run;
```

For more information about the PERFORMANCE statement, see the section "PERFORMANCE Statement" (Chapter 2, *SAS/ETS User's Guide: High-Performance Procedures*).

## RANDOMREG Statement

**RANDOMREG** *regressors* < / *options* > **;**

The RANDOMREG statement is used to specify regressors with time-varying regression coefficients. Each regression coefficient—for example, $\beta_t$—is assumed to evolve as a random walk:

$$\beta_t = \beta_{t-1} + \eta_t, \quad \eta_t \sim \text{iid } N(0, \sigma^2)$$

Of course, if the random walk disturbance variance $\sigma^2$ is zero, then the regression coefficient is not time varying, and it reduces to the standard regression setting. There can be multiple RANDOMREG statements, and each statement can contain one or more regressors. The regressors in a given RANDOMREG statement form a group that is assumed to share the same disturbance variance parameter. The random walks associated with different regressors are assumed to be independent. For an example of using this statement see Example 42.4. For additional information about the way parameter estimates are reported for this type of regressors, see the section "Reporting Parameter Estimates for Random Regressors" on page 2905.

**NOEST**
fixes the value of $\sigma^2$ to the value specified in the VARIANCE= option.

**PLOT=FILTER**
**PLOT=SMOOTH**
**PLOT=( < FILTER > < SMOOTH > )**
requests plotting of filtered or smoothed estimate of the time-varying regression coefficient.

**PRINT=FILTER**
**PRINT=SMOOTH**
**PRINT=( < FILTER > < SMOOTH > )**
requests printing of the filtered or smoothed estimate of the time-varying regression coefficient.

**VARIANCE=***value*
specifies an initial value for $\sigma^2$ during the parameter estimation process. Any nonnegative value, including zero, is an acceptable starting value.

## SEASON Statement

**SEASON LENGTH=***integer* < *options* > **;**

The SEASON or SEASONAL statement is used to specify a seasonal component, $\gamma_t$, in the model. A seasonal component can be one of the two types, DUMMY or TRIG. A DUMMY seasonal with season length $s$ satisfies the following stochastic equation:

$$\sum_{i=0}^{s-1} \gamma_{t-i} = \omega_t, \qquad \omega_t \sim \text{iid } N(0, \sigma_\omega^2)$$

The equations for a TRIG (short for trigonometric) seasonal component are as follows

$$\gamma_t = \sum_{j=1}^{[s/2]} \gamma_{j,t}$$

where $[s/2]$ equals $s/2$ if $s$ is even and $(s-1)/2$ if it is odd. The sinusoids, also called *harmonics*, $\gamma_{j,t}$ have frequencies $\lambda_j = 2\pi j/s$ and are specified by the matrix equation

$$\begin{bmatrix} \gamma_{j,t} \\ \gamma^*_{j,t} \end{bmatrix} = \begin{bmatrix} \cos\lambda_j & \sin\lambda_j \\ -\sin\lambda_j & \cos\lambda_j \end{bmatrix} \begin{bmatrix} \gamma_{j,t-1} \\ \gamma^*_{j,t-1} \end{bmatrix} + \begin{bmatrix} \omega_{j,t} \\ \omega^*_{j,t} \end{bmatrix}$$

where the disturbances $\omega_{j,t}$ and $\omega^*_{j,t}$ are assumed to be independent and, for fixed $j$, $\omega_{j,t}$ and $\omega^*_{j,t} \sim N(0, \sigma^2_\omega)$. If $s$ is even, then the equation for $\gamma^*_{s/2,t}$ is not needed and $\gamma_{s/2,t}$ is given by

$$\gamma_{s/2,t} = -\gamma_{s/2,t-1} + \omega_{s/2,t}$$

In the TRIG seasonal case, the option KEEPH= or DROPH= can be used to obtain *subset trigonometric* seasonals that contain only a subset of the full set of harmonics $\gamma_{j,t}$, $j = 1, 2, \ldots, [s/2]$. This is particularly useful when the season length $s$ is large and the seasonal pattern is relatively smooth.

Note that whether the seasonal type is DUMMY or TRIG, there is only one parameter, the disturbance variance $\sigma^2_\omega$, in the seasonal model.

There can be more than one seasonal component in the model, necessarily with different season lengths if the seasons are full. You can have multiple *subset* season components with the same season length, if you need to use separate disturbance variances for different sets of harmonics. Each seasonal component is specified using a separate SEASON statement. A model with multiple seasonal components can easily become quite complex and might need a large amount of data and computing resources for its estimation and forecasting. The examples that follow illustrate the use of SEASON statement.

The following statement specifies a DUMMY type (default) seasonal component with a season length of four, corresponding to the quarterly seasonality. The disturbance variance $\sigma^2_\omega$ is estimated from the data.

```
season length=4;
```

The following statement specifies a trigonometric seasonal with monthly seasonality. It also provides a starting value for $\sigma^2_\omega$.

```
season length=12 type=trig variance=4;
```

**DROPHARMONICS | DROPH=***number-list* **|** *n* **TO** *m* **BY** *p*
enables you to drop some harmonics $\gamma_{j,t}$ from the full set of harmonics used to obtain a trigonometric seasonal. The drop list can include any integer between 1 and $[s/2]$, $s$ being the season length. For example, the following specification results in a specification of a trigonometric seasonal with a season length 12 that consists of only the first four harmonics $\gamma_{j,t}$, $j = 1, 2, 3, 4$:

```
season length=12 type=trig DROPH=5 6;
```

The last two *high*-frequency harmonics are dropped. The DROPH= option cannot be used with the KEEPH= option.

**KEEPHARMONICS | KEEPH=***number-list* **|** *n* **TO** *m* **BY** *p*
enables you to keep only the harmonics $\gamma_{j,t}$ listed in the option to obtain a trigonometric seasonal. The keep list can include any integer between 1 and $[s/2]$, $s$ being the season length. For example, the following specification results in a specification of a trigonometric seasonal with a season length of 12 that consists of all six harmonics $\gamma_{j,t}$, $j = 1, \ldots, 6$:

```
season length=12 type=trig KEEPH=1 to 3;
season length=12 type=trig KEEPH=4 to 6;
```

However, these six harmonics are grouped into two groups, each having its own disturbance variance parameter. The DROPH= option cannot be used with the KEEPH= option.

**LENGTH=***integer*

specifies the season length, *s*. This is a required option in this statement. The season length can be any integer greater than or equal to 2. Typical examples of season lengths are 12, corresponding to the monthly seasonality, or 4, corresponding to the quarterly seasonality.

**NOEST**

fixes the value of the disturbance variance parameter to the value specified in the VARIANCE= option.

**PLOT=FILTER**

**PLOT=SMOOTH**

**PLOT=F_ANNUAL**

**PLOT=S_ANNUAL**

**PLOT=( <***plot-request***> . . . <***plot-request***> )**

requests plots of the season component. When you specify only one *plot-request*, you can omit the parentheses around it. You can use the FILTER and SMOOTH options to plot the filtered and smoothed estimates of the season component $\gamma_t$. You can use the F_ANNUAL and S_ANNUAL options to get the plots of "annual" variation in the filtered and smoothed estimates of $\gamma_t$. The annual plots are useful to see the change in the contribution of a particular month over the span of years. Here "month" and "year" are generic terms that change appropriately with the interval type being used to label the observations and the season length. For example, for monthly data with a season length of 12, the usual meaning applies, while for daily data with a season length of 7, the days of the week serve as months and the weeks serve as years.

**PRINT=HARMONICS**

requests printing of the summary of harmonics present in the seasonal component. This option is valid only for the trigonometric seasonal component.

**PRINT=FILTER**

**PRINT=SMOOTH**

**PRINT=( <** *print-request* **> . . . <** *print-request* **> )**

requests printing of the filtered or smoothed estimate of the seasonal component $\gamma_t$.

**TYPE=DUMMY | TRIG**

specifies the type of the seasonal component. The default type is DUMMY.

**VARIANCE=***value*

specifies an initial value for the disturbance variance, $\sigma_\omega^2$, in the $\gamma_t$ equation at the start of the parameter estimation process. Any nonnegative value, including zero, is an acceptable starting value.

## SLOPE Statement

**SLOPE** < *options* > **;**

The SLOPE statement is used to include a slope component in the model. The slope component cannot be used without the level component (see the LEVEL statement). The level and slope specifications jointly define the trend component of the model. A SLOPE statement without the accompanying LEVEL statement is ignored. The equations of the trend, defined jointly by the level $\mu_t$ and slope $\beta_t$, are as follows:

$$\begin{aligned} \mu_t &= \mu_{t-1} + \beta_{t-1} + \eta_t, \quad \eta_t \sim \text{iid } N(0, \sigma_\eta^2) \\ \beta_t &= \beta_{t-1} + \xi_t, \quad \xi_t \sim \text{iid } N(0, \sigma_\xi^2) \end{aligned}$$

The SLOPE statement is used to specify the value of the disturbance variance, $\sigma_\xi^2$, in the slope equation, and to request forecasts of $\beta_t$. The following examples illustrate this statement:

```
level;
slope;
```

The preceding statements fit a model with a locally linear trend. The disturbance variances $\sigma_\eta^2$ and $\sigma_\xi^2$ are estimated from the data. You can request a locally linear trend with fixed slope by using the following statements:

```
level;
slope variance=0 noest;
```

**NOEST**
fixes the value of the disturbance variance, $\sigma_\xi^2$, to the value specified in the VARIANCE= option.

**PLOT=FILTER**

**PLOT=SMOOTH**

**PLOT=( < FILTER > < SMOOTH > )**
requests plotting of the filtered or smoothed estimate of the slope component.

**PRINT=FILTER**

**PRINT=SMOOTH**

**PRINT=( < FILTER > < SMOOTH > )**
requests printing of the filtered or smoothed estimate of the slope component $\beta_t$.

**VARIANCE=***value*
specifies an initial value for the disturbance variance, $\sigma_\xi^2$, in the $\beta_t$ equation at the start of the parameter estimation process. Any nonnegative value, including zero, is an acceptable starting value.

## SPLINEREG Statement

**SPLINEREG** *regressor* < *options* > **;**

The SPLINEREG statement is used to specify a regressor that has a nonlinear relationship with the dependent series that can be approximated by a given B-spline. If the specified spline has degree $d$ and is based on $n$ internal knots, then it is known that it can be written as a linear combination of $(n + d + 1)$ regressors that are derived from the original regressor. The span of these $(n + d + 1)$ derived regressors includes constant; therefore, to avoid multicollinearity with the level component, one of these regressors is dropped. Specifying the SPLINEREG statement is equivalent to specifying a RANDOMREG statement with these derived regressors. There can be multiple SPLINEREG statements. You must specify at least one interior knot, either using the NKNOTS= option or the KNOTS= option. For more information about splines, see Chapter 126, "The TRANSREG Procedure" (*SAS/STAT User's Guide*). For an example of using this statement, see Example 42.6. For additional information about the way parameter estimates are reported for this type of regressors, see the section "Reporting Parameter Estimates for Random Regressors" on page 2905.

**DEGREE=***integer*

specifies the degree of the spline. It can be any integer larger than or equal to zero. The default value is 3. The polynomial degree should be a small integer, usually 0, 1, 2, or 3. Larger values are rarely useful. If you have any doubt as to what degree to specify, use the default.

**KNOTS=***number-list* | *n* **TO** *m* **BY** *p*

specifies the interior knots or break points. The values in the knot list must be nondecreasing and must lie between the minimum and the maximum of the spline regressor values in the input data set. The first time you specify a value in the knot list, it indicates a discontinuity in the $n$th (from DEGREE=$n$) derivative of the transformation function at the value of the knot. The second mention of a value indicates a discontinuity in the $(n - 1)$th derivative of the transformation function at the value of the knot. Knots can be repeated any number of times for decreasing smoothness at the break points, but the values in the knot list can never decrease.

You cannot use the KNOTS= option with the NKNOTS= option. You should keep the number of knots small.

**NKNOTS=***m*

creates $m$ knots, the first at the $100/(m + 1)$ percentile, the second at the $200/(m + 1)$ percentile, and so on. Knots are always placed at data values; there is no interpolation. For example, if NKNOTS=3, knots are placed at the 25th percentile, the median, and the 75th percentile. The value specified for the NKNOTS= option must be $\geq 1$. You cannot use the NKNOTS=option with the KNOTS= option.

**NOTE:** Specifying knots by using the NKNOTS= option can result in different sets of knots in the estimation and forecast stages if the distributions of regressor values in the estimation and forecast spans differ. The estimation span is based on the BACK= and SKIPFIRST= options in the ESTIMATE statement, and the forecast span is based on the BACK= and SKIPFIRST= options in the FORECAST statement.

**NOEST**
fixes the value of the regression coefficient random walk disturbance variance to the value specified in the VARIANCE= option.

**PLOT=FILTER**

**PLOT=SMOOTH**

**PLOT=( < FILTER > < SMOOTH > )**
requests plotting of filtered or smoothed estimate of the time-varying regression coefficient.

**PRINT=FILTER**

**PRINT=SMOOTH**

**PRINT=( < FILTER > < SMOOTH > )**
requests printing of filtered or smoothed estimate of the time-varying regression coefficient.

**VARIANCE=***value*
specifies an initial value for the regression coefficient random walk disturbance variance during the parameter estimation process. Any nonnegative value, including zero, is an acceptable starting value.

## SPLINESEASON Statement

**SPLINESEASON LENGTH=***integer* **KNOTS=***integer*$_1$ *integer*$_2$ **...** < *options* > **;**

The SPLINESEASON statement is used to specify a seasonal pattern that is to be approximated by a given B-spline. If the specified spline has degree $d$ and is based on $n$ internal knots, then it can be written as a linear combination of $(n + d)$ regressors that are derived from the seasonal dummy regressors. The SPLINESEASON specification is equivalent to specifying a RANDOMREG specification with these derived regressors. Such approximation is useful only if the season length is relatively large, at least larger than $(n+d)$. For additional information about splines, see Chapter 126, "The TRANSREG Procedure" (*SAS/STAT User's Guide*). For an example of using this statement, see Example 42.3.

**DEGREE=***integer*
specifies the degree of the spline. It can be any integer greater than or equal to zero. The default value is 3.

**KNOTS=***integer*$_1$ *integer*$_2$ **...**
lists the *internal* knots. This list of values must be a nondecreasing sequence of integers within the range of 2 to $(s - 1)$, where $s$ is the season length specified in the LENGTH= option. This is a required option in this statement.

**LENGTH=***integer*
specifies the season length, *s*. This is a required option in this statement. The length can be any integer greater than or equal to three.

**NOEST**
fixes the value of the regression coefficient random walk disturbance variance to the value specified in the VARIANCE= option.

**OFFSET=***integer*
specifies the position of the first measurement within the season, if the first measurement is not at the start of the season. The OFFSET= value must be between one and the season length. The default value is one. The first measurement refers to the start of the estimation span and the forecast span. If these spans differ, their starting measurements must be separated by an integer multiple of the season length.

**PLOT=FILTER**

**PLOT=SMOOTH**

**PLOT=( < FILTER > < SMOOTH > )**
requests plots of the season component. When you specify only one plot request, you can omit the parentheses around the plot request. You can use the FILTER and SMOOTH options to plot the filtered and smoothed estimates of the season component.

**PRINT=FILTER**

**PRINT=SMOOTH**

**PRINT=( < FILTER > < SMOOTH > )**
requests the printing of the filtered or smoothed estimate of the spline season component.

**RKNOTS=(***knot, . . . , knot* **) . . . (***knot, . . . , knot* **)**
specifies a grouping of knots such that the knots within the same group have identical seasonal values. The knots specified in this option must already be present in the list specified by the KNOTS= option. The knot groups must be non-overlapping and without any repeated knots.

**VARIANCE=***value*
specifies an initial value for the regression coefficient random walk disturbance variance during the parameter estimation process. Any nonnegative value, including zero, is an acceptable starting value.

## TF Statement (Experimental)

**TF** *regressor* < *options* > **;**

The TF statement specifies a regressor that has a transfer-function relationship with the dependent series. A transfer function is useful for capturing the contributions from lagged values of the regressor. Box and Jenkins (1976) popularized ARIMA models that have transfer-function inputs. In the UCM procedure, you can specify a transfer function of the following type (assuming the regression variable is x):

$$\frac{(\gamma_0 + \gamma_1 B^{l1} + \gamma_2 B^{l2} + \cdots) B^d}{(1 - \delta_1 B - \delta_2 B^2 - \cdots - \delta_m B^m)(1 - \omega_1 B^s - \omega_2 B^{2s} - \cdots - \omega_n B^{ns})} x_t$$

This transfer function is specified by using the ratio of polynomials in the backshift operator B. The numerator polynomial orders $(l1, l2, \cdots)$ are positive integers, possibly with gaps (for example, 1, 3). The numerator term $B^d$ signifies the *delay* of order $d$. The denominator polynomial can have two factors: a nonseasonal factor, $(1 - \delta_1 B - \delta_2 B^2 - \cdots - \delta_m B^m)$, and a seasonal factor whose season length is $s$, $(1 - \omega_1 B^s - \omega_2 B^{2s} - \cdots - \omega_n B^{ns})$. The orders of the terms in the denominator factors cannot have gaps;

that is, if 5 is the maximum order of the nonseasonal factor, then all terms of orders 1 through 5 are present. By design, the denominator factors are restricted to be stable polynomials (their roots are strictly larger than 1 in absolute value). As an example, consider the following transfer function specification:

$$\frac{(\gamma_0 + \gamma_1 B^1 + \gamma_2 B^2) B^3}{(1 - \delta_1 B - \delta_2 B^2)(1 - \omega_1 B^4)} x_t$$

You can specify this transfer function as follows:

```
tf x num=(1 2) den=2 sden=1 s=4 delay=3;
```

Since the numerator polynomial orders do not have any gaps, the following simpler specification is also available:

```
tf x num=2 den=2 sden=1 s=4 delay=3;
```

Because the denominator factors do not permit gaps in their orders, only the maximum orders need to be provided in their specification.

A state space representation of a transfer-function relationship is described in the section "State Space Form of a Transfer Function Relationship" on page 2905. You can specify multiple TF statements, each one with a separate regressor. A regressor that is specified in any transfer function specification must not appear in any other regression specifications, such as in the right-hand side of the MODEL statement or in the RANDOMREG and SPLINEREG statements.

**NOTE:** The mathematical form of the transfer function considered by PROC UCM is similar to the one considered in the ARIMA procedure (Chapter 8, "The ARIMA Procedure"). However, there are some differences:

- The sign convention of the coefficients of the nonzero-order terms in the numerator polynomial in the UCM procedure is opposite to that of the ARIMA procedure.
- The ARIMA procedure permits multiple polynomial factors in both the numerator and the denominator. The UCM procedure permits only one numerator factor and at most two denominator factors.
- The ARIMA procedure permits full control over the terms present in each of the polynomial factors. The UCM procedure does not permit such fine control over the terms in the polynomials.
- In the UCM procedure, you cannot fix the coefficients of the numerator polynomial. They are always estimated from the data.
- In the UCM procedure, if both nonseasonal and seasonal factors are present in the denominator, you must specify starting values for their coefficients either for both factors or for neither.

You can specify the following *options* in the TF statement:

**DELAY=***integer*
specifies the delay order, which must be a positive integer. By default, DELAY= 0.

**DEN=***integer*
specifies the maximum order of the nonseasonal factor of the denominator polynomial. By default, DEN=0.

**DENVAL=***val1 val2* **...**
specifies the starting values of the coefficients of the nonseasonal factor of the denominator polynomial. The number of values supplied in the DENVAL= option must match the value of the DEN= option. Moreover, the resulting polynomial must be stable.

**NOEST**
fixes the values of the denominator polynomial coefficients to those specified in the DENVAL= and SDENVAL= specifications.

**NUM=***argument*
specifies the positive orders of the terms in the numerator polynomial. You can specify the *argument* in either of the following forms:

| | |
|---|---|
| *integer* | includes all orders from 1 to *integer*. |
| (*lag1*, *lag2*, . . . ) | specifies a more general list of orders. |

**PLOT=FILTER**

**PLOT=SMOOTH**

**PLOT=( < FILTER > < SMOOTH > )**
requests plots of the transfer-function component. When you specify only one plot request, you can omit the parentheses around the plot request. You can use the FILTER and SMOOTH options to plot the filtered and smoothed estimates of the transfer-function component.

**PRINT=FILTER**

**PRINT=SMOOTH**

**PRINT=( < FILTER > < SMOOTH > )**
requests the printing of the filtered or smoothed estimate of the transfer-function component. When you specify only one print request, you can omit the parentheses around the print request. You can use the FILTER and SMOOTH options to print the filtered and smoothed estimates of the transfer-function component.

**S=***integer*
specifies the season length that is used in the specification of the seasonal factor of the denominator polynomial. The season length can be any positive integer; for example, S=4 might be an appropriate value for a quarterly series. By default, S=1.

**SDEN=***integer*
specifies the maximum order of the seasonal factor of the denominator polynomial. By default, SDEN=0.

**SDENVAL=***val1 val2* **...**
specifies the starting values of the coefficients of the seasonal factor of the denominator polynomial. The number of values supplied in this option must match the value of the SDEN= option. Moreover, the resulting polynomial must be stable.

**TFSTART=***value*
specifies the value of the transfer function at the start of the sample (the first time ID). By default, the value of this option is a missing value that is estimated from the data. This option is often used when the past values of the transfer function can be inferred because of the structure of the problem or when it is useful to set these values (usually to 0) to achieve identifiability of the overall model. For more information, see the section "State Space Form of a Transfer Function Relationship" on page 2905. See Example 42.10 for an example of the use of this option.

# Details: UCM Procedure

## An Introduction to Unobserved Component Models

A UCM decomposes the response series into components such as trend, seasons, cycles, and the regression effects due to predictor series. The following model shows a possible scenario:

$$\begin{aligned} y_t &= \mu_t + \gamma_t + \psi_t + \sum_{j=1}^{m} \beta_j x_{jt} + \epsilon_t \\ \epsilon_t &\sim \text{iid } N(0, \sigma_\epsilon^2) \end{aligned}$$

The terms $\mu_t, \gamma_t$, and $\psi_t$ represent the trend, seasonal, and cyclical components, respectively. In fact the model can contain multiple seasons and cycles, and the seasons can be of different types. For simplicity of discussion the preceding model contains only one of each of these components. The regression term, $\sum_{j=1}^{m} \beta_j x_{jt}$, includes contribution of regression variables with *fixed* regression coefficients. A model can also contain regression variables that have *time-varying* regression coefficients or that have a nonlinear or a transfer-function relationship with the dependent series (see "Incorporating Predictors of Different Types" on page 2904). The disturbance term $\epsilon_t$, also called the *irregular* component, is usually assumed to be Gaussian white noise. In some cases it is useful to model the irregular component as a stationary ARMA process. For additional information, see the section "Modeling the Irregular Component" on page 2895.

By controlling the presence or absence of various terms and by choosing the proper flavor of the included terms, the UCMs can generate a rich variety of time series patterns. A UCM can be applied to variables after transforming them by transforms such as *log* and *difference*.

The components $\mu_t, \gamma_t$, and $\psi_t$ model structurally different aspects of the time series. For example, the trend $\mu_t$ models the natural tendency of the series in the absence of any other perturbing effects such as seasonality, cyclical components, and the effects of exogenous variables, while the seasonal component $\gamma_t$ models the correction to the level due to the seasonal effects. These components are assumed to be statistically independent of each other and independent of the irregular component. All of the component models can be thought of as stochastic generalizations of the relevant deterministic patterns in time. This

way the deterministic cases emerge as special cases of the stochastic models. The different models available for these unobserved components are discussed next.

## Modeling the Trend

As mentioned earlier, the trend in a series can be loosely defined as the natural tendency of the series in the absence of any other perturbing effects. The UCM procedure offers two ways to model the trend component $\mu_t$. The first model, called the random walk (RW) model, implies that the trend remains roughly constant throughout the life of the series without any persistent upward or downward drift. In the second model the trend is modeled as a locally linear time trend (LLT). The RW model can be described as

$$\mu_t = \mu_{t-1} + \eta_t, \quad \eta_t \sim \text{iid } N(0, \sigma_\eta^2)$$

Note that if $\sigma_\eta^2 = 0$, then the model becomes $\mu_t = constant$. In the LLT model the trend is locally linear, consisting of both the *level* and *slope*. The LLT model is

$$\begin{aligned} \mu_t &= \mu_{t-1} + \beta_{t-1} + \eta_t, & \eta_t &\sim \text{iid } N(0, \sigma_\eta^2) \\ \beta_t &= \beta_{t-1} + \xi_t, & \xi_t &\sim \text{iid } N(0, \sigma_\xi^2) \end{aligned}$$

The disturbances $\eta_t$ and $\xi_t$ are assumed to be independent. There are some interesting special cases of this model obtained by setting one or both of the disturbance variances $\sigma_\eta^2$ and $\sigma_\xi^2$ equal to zero. If $\sigma_\xi^2$ is set equal to zero, then you get a linear trend model with fixed slope. If $\sigma_\eta^2$ is set to zero, then the resulting model usually has a smoother trend. If both the variances are set to zero, then the resulting model is the deterministic linear time trend: $\mu_t = \mu_0 + \beta_0 t$.

You can incorporate these trend patterns in your model by using the LEVEL and SLOPE statements.

## Modeling a Cycle

A deterministic cycle $\psi_t$ with frequency $\lambda$, $0 < \lambda < \pi$, can be written as

$$\psi_t = \alpha \cos(\lambda t) + \beta \sin(\lambda t)$$

If the argument $t$ is measured on a continuous scale, then $\psi_t$ is a periodic function with period $2\pi/\lambda$, amplitude $\gamma = (\alpha^2 + \beta^2)^{1/2}$, and phase $\phi = \tan^{-1}(\beta/\alpha)$. Equivalently, the cycle can be written in terms of the amplitude and phase as

$$\psi_t = \gamma \cos(\lambda t - \phi)$$

Note that when $\psi_t$ is measured only at the integer values, it is not exactly periodic, unless $\lambda = (2\pi j)/k$ for some integers $j$ and $k$. The cycles in their pure form are not used very often in practice. However, they are very useful as building blocks for more complex periodic patterns. It is well known that the periodic pattern of any complexity can be written as a sum of pure cycles of different frequencies and amplitudes. In time series situations it is useful to generalize this simple cyclical pattern to a stochastic cycle that has a fixed expected period but time-varying amplitude and phase. The stochastic cycle considered here is motivated by the following recursive formula for computing $\psi_t$,

$$\begin{bmatrix} \psi_t \\ \psi_t^* \end{bmatrix} = \begin{bmatrix} \cos\lambda & \sin\lambda \\ -\sin\lambda & \cos\lambda \end{bmatrix} \begin{bmatrix} \psi_{t-1} \\ \psi_{t-1}^* \end{bmatrix}$$

starting with $\psi_0 = \alpha$ and $\psi_0^* = \beta$. Note that $\psi_t$ and $\psi_t^*$ satisfy the relation

$$\psi_t^2 + \psi_t^{*2} = \alpha^2 + \beta^2 \quad \text{for all } t$$

A stochastic generalization of the cycle $\psi_t$ can be obtained by adding random noise to this recursion and by introducing a damping factor, $\rho$, for additional modeling flexibility. This model can be described as follows,

$$\begin{bmatrix} \psi_t \\ \psi_t^* \end{bmatrix} = \rho \begin{bmatrix} \cos\lambda & \sin\lambda \\ -\sin\lambda & \cos\lambda \end{bmatrix} \begin{bmatrix} \psi_{t-1} \\ \psi_{t-1}^* \end{bmatrix} + \begin{bmatrix} \nu_t \\ \nu_t^* \end{bmatrix}$$

where $0 \le \rho \le 1$, and the disturbances $\nu_t$ and $\nu_t^*$ are independent $N(0, \sigma_\nu^2)$ variables. The resulting stochastic cycle has a fixed expected period but time-varying amplitude and phase. The stationarity properties of the random sequence $\psi_t$ depend on the damping factor $\rho$. If $\rho < 1$, $\psi_t$ has a stationary distribution with mean zero and variance $\sigma_\nu^2/(1-\rho^2)$. If $\rho = 1$, $\psi_t$ is nonstationary.

You can incorporate a cycle in a UCM by specifying a CYCLE statement. You can include multiple cycles in the model by using separate CYCLE statements for each included cycle.

As mentioned before, the cycles are very useful as building blocks for constructing more complex periodic patterns. Periodic patterns of almost any complexity can be created by superimposing cycles of different periods and amplitudes. In particular, the seasonal patterns, general periodic patterns with integer periods, can be constructed as sums of cycles. This important topic of modeling the seasonal components is considered next.

## Modeling Seasons

Seasonal fluctuations are a common source of variation in time series data. These fluctuations arise because of the regular changes in seasons or some other periodic events. The seasonal effects are regarded as corrections to the general trend of the series due to the seasonal variations, and these effects sum to zero when summed over the full season cycle. Therefore the seasonal component $\gamma_t$ is modeled as a stochastic periodic pattern of an integer period $s$ such that the sum $\sum_{i=0}^{s-1} \gamma_{t-i}$ is always zero in the mean. The period $s$ is called the season length. Two different models for the seasonal component are considered here. The first model is called the *dummy* variable form of the seasonal component. It is described by the equation

$$\sum_{i=0}^{s-1} \gamma_{t-i} = \omega_t, \qquad \omega_t \sim \text{iid } N(0, \sigma_\omega^2)$$

The other model is called the *trigonometric* form of the seasonal component. In this case $\gamma_t$ is modeled as a sum of cycles of different frequencies. This model is given by

$$\gamma_t = \sum_{j=1}^{[s/2]} \gamma_{j,t}$$

where $[s/2]$ equals $s/2$ if $s$ is even and $(s-1)/2$ if it is odd. The cycles $\gamma_{j,t}$ have frequencies $\lambda_j = 2\pi j/s$ and are specified by the matrix equation

$$\begin{bmatrix} \gamma_{j,t} \\ \gamma_{j,t}^* \end{bmatrix} = \begin{bmatrix} \cos\lambda_j & \sin\lambda_j \\ -\sin\lambda_j & \cos\lambda_j \end{bmatrix} \begin{bmatrix} \gamma_{j,t-1} \\ \gamma_{j,t-1}^* \end{bmatrix} + \begin{bmatrix} \omega_{j,t} \\ \omega_{j,t}^* \end{bmatrix}$$

where the disturbances $\omega_{j,t}$ and $\omega^*_{j,t}$ are assumed to be independent and, for fixed $j$, $\omega_{j,t}$ and $\omega^*_{j,t} \sim N(0, \sigma^2_\omega)$. If $s$ is even, then the equation for $\gamma^*_{s/2,t}$ is not needed and $\gamma_{s/2,t}$ is given by

$$\gamma_{s/2,t} = -\gamma_{s/2,t-1} + \omega_{s/2,t}$$

The cycles $\gamma_{j,t}$ are called *harmonics*. If the seasonal component is deterministic, the decomposition of the seasonal effects into these harmonics is identical to its Fourier decomposition. In this case the sum of squares of the seasonal factors equals the sum of squares of the amplitudes of these harmonics. In many practical situations, the contribution of the high-frequency harmonics is negligible and can be ignored, giving rise to a simpler description of the seasonal. In the case of stochastic seasonals, the situation might not be so transparent; however, similar considerations still apply. Note that if the disturbance variance $\sigma^2_\omega = 0$, then both the dummy and the trigonometric forms of seasonal components reduce to constant seasonal effects. That is, the seasonal component reduces to a deterministic function that is completely determined by its first $s - 1$ values.

In the UCM procedure you can specify a seasonal component in a variety of ways, the SEASON statement being the simplest of these. The dummy and the trigonometric seasonal components discussed so far can be considered as *saturated* seasonal components that put no restrictions on the $s - 1$ seasonal values. In some cases a more parsimonious representation of the seasonal might be more appropriate. This is particularly useful for seasonal components with large season lengths. In the UCM procedure you can obtain parsimonious representations of the seasonal components by one of the following ways:

- Use a *subset* trigonometric seasonal component obtained by deleting a few of the $[s/2]$ harmonics used in its sum. For example, a slightly smoother seasonal component of length 12, corresponding to the monthly seasonality, can be obtained by deleting the highest-frequency harmonic of period 2. That is, such a seasonal component will be a sum of five stochastic cycles that have periods 12, 6, 4, 3, and 2.4. You can specify such subset seasonal components by using the KEEPH= or DROPH= option in the SEASON statement.

- Approximate the seasonal pattern by a suitable spline approximation. You can do this by using the SPLINESEASON statement.

- A *block-seasonal* pattern is a seasonal pattern where the pattern is divided into a few blocks of equal length such that the season values within a block are the same—for example, a monthly seasonal pattern that has only four different values, one for each quarter. In some situations a long seasonal pattern can be approximated by the sum of block season and a simple season, the length of the simple season being equal to the block length of the block season. You can obtain such approximation by using a combination of BLOCKSEASON and SEASON statements.

- Consider a seasonal component of a large season length as a sum of two or more seasonal components that are each of much smaller season lengths. This can be done by specifying more than one SEASON statements.

Note that the preceding techniques of obtaining parsimonious seasonal components can also enable you to specify seasonal components that are more *general* than the simple saturated seasonal components. For example, you can specify a saturated trigonometric seasonal component that has some of its harmonics evolving according to one disturbance variance parameter while the others evolve with another disturbance variance parameter.

## Modeling an Autoregression

An autoregression of order one can be thought of as a special case of a cycle when the frequency $\lambda$ is either 0 or $\pi$. Modeling this special case separately helps interpretation and parameter estimation. The autoregression component $r_t$ is modeled as

$$r_t = \rho r_{t-1} + \nu_t, \quad \nu_t \sim \text{iid } N(0, \sigma_\nu^2)$$

where $-1 \leq \rho < 1$. An autoregression can also provide an alternative to the IRREGULAR component when the model errors show some autocorrelation. You can incorporate an autoregression in your model by using the AUTOREG statement.

## Modeling Regression Effects

A predictor variable can affect the response variable in a variety of ways. The UCM procedure enables you to model several different types of predictor-response relationships:

- The predictor-response relationship is *linear*, and the regression coefficient does not change with time. This is the simplest kind of relationship and such predictors are specified in the MODEL statement.
- The predictor-response relationship is *linear*, but the regression coefficient does change with time. Such predictors are specified in the RANDOMREG statement. Here the regression coefficient is assumed to evolve as a random walk.
- The predictor-response relationship is *nonlinear* and the relationship can change with time. This type of relationship can be approximated by an appropriate time-varying spline. Such predictors are specified in the SPLINEREG statement.
- The response depends on contemporaneous and lagged values of the predictor. This type of relationship is called transfer-function relationship, which can be specified in the TF statement.

A response variable can depend on its own past values—that is, lagged dependent values. Such a relationship can be specified in the DEPLAG statement.

## Modeling the Irregular Component

The components—such as trend, seasonal and regression effects, and nonstationary cycles—are used to capture the structural dynamics of a response series. In contrast, the stationary cycles and the autoregression are used to capture the transient aspects of the response series that are important for its short-range prediction but have little impact on its long-term forecasts. The irregular component represents the residual variation remaining in the response series that is modeled using an appropriate selection of structural and transient effects. In most cases, the irregular component can be assumed to be simply Gaussian white noise. In some other cases, however, the residual variation can be more complicated. In such situations, it might be necessary to model the irregular component as a stationary ARMA process. Moreover, you can use the ARMA irregular component together with the dependent lag specification (see the DEPLAG statement) to specify an ARIMA$(p,d,q)\times(P,D,Q)_s$ model for the response series. For an explanation of the ARIMA notation, see the IRREGULAR statement. For an example of modeling a series by using an ARIMA$(0,1,1)\times(0,1,1)_{12}$ model, see Example 42.8.

## The Model Parameters

The parameter vector in a UCM consists of the variances of the disturbance terms of the unobserved components, the damping coefficients and frequencies in the cycles, the damping coefficient in the autoregression, and the regression coefficients in the regression terms. These parameters are estimated by maximizing the likelihood. It is possible to restrict the values of the model parameters to user-specified values.

## Model Specification

A UCM is specified by describing the components in the model. For example, consider the model

$$y_t = \mu_t + \gamma_t + \epsilon_t$$

consisting of the irregular, level, slope, and seasonal components. This model is called the basic structural model (BSM) by Harvey (1989). The syntax for a BSM with monthly seasonality of trigonometric type is as follows:

```
model y;
irregular;
level;
slope;
season length=12 type=trig;
```

Similarly, the following syntax specifies a BSM with a response variable $y$, a regressor $x$, and dummy-type monthly seasonality:

```
model y = x;
irregular;
level;
slope variance=0 noest;
season length=12 type=dummy;
```

Moreover, the disturbance variance of the slope component is restricted to zero, giving rise to a local linear trend with fixed slope.

A model can contain multiple cycle and seasonal components. In such cases the model syntax contains a separate statement for each of these multiple cycle or seasonal components; for example, the syntax for a model containing irregular and level components along with two cycle components could be as follows:

```
model y = x;
irregular;
level;
cycle;
cycle;
```

## The UCMs as State Space Models

The UCMs considered in PROC UCM are special cases of more general models, called (linear) state space models (SSM). The section "State Space Model and Notation" on page 2438 in Chapter 34, "The SSM Procedure," provides an elaborate notation for such models. However, for most of the UCMs considered in PROC UCM, much simpler notation suffices. This section describes a treatment of UCMs in terms of this simplified notation. At times the description and mathematical treatment (such as the expressions of likelihood) of state space models in PROC UCM and PROC SSM can appear different. However, these differences are only notational and the underlying mathematical quantities coincide. For example, the diffuse Kalman filter (DKF) described in this section is called the *exact initial* Kalman filter whereas the DKF described in the section "Filtering, Smoothing, Likelihood, and Structural Break Detection" on page 2446 in Chapter 34, "The SSM Procedure," is called the *augmented* Kalman filter. Both of these algorithms produce the same final output (see Durbin and Koopman (2012, chap. 5) for more information).

An SSM can be described as follows:

$$\begin{aligned} y_t &= Z_t \alpha_t \\ \alpha_{t+1} &= T_t \alpha_t + \zeta_{t+1}, \qquad \zeta_t \sim \mathrm{N}(0, Q_t) \\ \alpha_1 &\sim \mathrm{N}(0, P) \end{aligned}$$

The first equation, called the *observation equation*, relates the response series $y_t$ to a state vector $\alpha_t$ that is usually unobserved. The second equation, called the *state equation*, describes the evolution of the state vector in time. The system matrices $Z_t$ and $T_t$ are of appropriate dimensions and are known, except possibly for some unknown elements that become part of the parameter vector of the model. The noise series $\zeta_t$ consists of independent, zero-mean, Gaussian vectors with covariance matrices $Q_t$. For most of the UCMs considered here, the system matrices $Z_t$ and $T_t$, and the noise covariances $Q_t$, are time invariant—that is, they do not depend on time. In a few cases, however, some or all of them can depend on time. The initial state vector $\alpha_1$ is assumed to be independent of the noise series, and its covariance matrix $P$ can be partially diffuse. A random vector has a partially diffuse covariance matrix if it can be partitioned such that one part of the vector has a properly defined probability distribution, while the covariance matrix of the other part is infinite—that is, you have no prior information about this part of the vector. The covariance of the initial state $\alpha_1$ is assumed to have the form

$$P = P_* + \kappa P_\infty$$

where $P_*$ and $P_\infty$ are nonnegative definite, symmetric matrices and $\kappa$ is a constant that is assumed to be close to $\infty$. In the case of UCMs considered here, $P_\infty$ is always a diagonal matrix that consists of zeros and ones, and, if a particular diagonal element of $P_\infty$ is one, then the corresponding row and column in $P_*$ are zero.

The state space formulation of a UCM has many computational advantages. In this formulation there are convenient algorithms for estimating and forecasting the unobserved states $\{\alpha_t\}$ by using the observed series $\{y_t\}$. These algorithms also yield the in-sample and out-of-sample forecasts and the likelihood of $\{y_t\}$. The state space representation of a UCM does not need to be unique. In the representation used here, the unobserved components in the UCM often appear as elements of the state vector. This makes the elements of the state interpretable and, more important, the sample estimates and forecasts of these unobserved components are easily obtained. For additional information about the computational aspects of the state

space modeling, see Durbin and Koopman (2012). Next, some notation is developed to describe the essential quantities computed during the analysis of the state space models.

Let $\{y_t, t = 1, \ldots, n\}$ be the observed sample from a series that satisfies a state space model. Next, for $1 \leq t \leq n$, let the one-step-ahead forecasts of the series, the states, and their variances be defined as follows, using the usual notation to denote the conditional expectation and conditional variance:

$$\begin{aligned}
\hat{\alpha}_t &= \mathrm{E}(\alpha_t | y_1, y_2, \ldots, y_{t-1}) \\
\Gamma_t &= \mathrm{Var}(\alpha_t | y_1, y_2, \ldots, y_{t-1}) \\
\hat{y}_t &= \mathrm{E}(y_t | y_1, y_2, \ldots, y_{t-1}) \\
F_t &= \mathrm{Var}(y_t | y_1, y_2, \ldots, y_{t-1})
\end{aligned}$$

These are also called the *filtered* estimates of the series and the states. Similarly, for $t \geq 1$, let the following denote the full-sample estimates of the series and the state values at time $t$:

$$\begin{aligned}
\tilde{\alpha}_t &= \mathrm{E}(\alpha_t | y_1, y_2, \ldots, y_n) \\
\Delta_t &= \mathrm{Var}(\alpha_t | y_1, y_2, \ldots, y_n) \\
\tilde{y}_t &= \mathrm{E}(y_t | y_1, y_2, \ldots, y_n) \\
G_t &= \mathrm{Var}(y_t | y_1, y_2, \ldots, y_n)
\end{aligned}$$

If the time $t$ is in the historical period—that is, if $1 \leq t \leq n$—then the full-sample estimates are called the *smoothed* estimates, and if $t$ lies in the future then they are called out-of-sample forecasts. Note that if $1 \leq t \leq n$, then $\tilde{y}_t = y_t$ and $G_t = 0$, unless $y_t$ is missing.

All the filtered and smoothed estimates ($\hat{\alpha}_t, \tilde{\alpha}_t, \ldots, G_t$, and so on) are computed by using the Kalman filtering and smoothing (KFS) algorithm, which is an iterative process. If the initial state is diffuse, as is often the case for the UCMs, its treatment requires modification of the traditional KFS, which is called the diffuse KFS (DKFS). The details of DKFS implemented in the UCM procedure can be found in De Jong and Chu-Chun-Lin (2003). Additional information on the state space models can be found in Durbin and Koopman (2012). The likelihood formulas described in this section are taken from the latter reference.

In the case of diffuse initial condition, the effect of the improper prior distribution of $\alpha_1$ manifests itself in the first few filtering iterations. During these initial filtering iterations the distribution of the filtered quantities remains diffuse; that is, during these iterations the one-step-ahead series and state forecast variances $F_t$ and $\Gamma_t$ have the following form:

$$\begin{aligned}
F_t &= F_{*t} + \kappa F_{\infty t} \\
\Gamma_t &= \Gamma_{*t} + \kappa \Gamma_{\infty t}
\end{aligned}$$

The actual number of iterations—for example, $I$—affected by this improper prior depends on the nature of the vectors $Z_t$, the number of nonzero diagonal elements of $P_\infty$, and the pattern of missing values in the dependent series. After $I$ iterations, $\Gamma_{\infty t}$ and $F_{\infty t}$ become zero and the one-step-ahead series and state forecasts have proper distributions. These first $I$ iterations constitute the *initialization* phase of the DKFS algorithm. The post-initialization phase of the DKFS and the traditional KFS is the same. In the state space modeling literature the pre-initialization and post-initialization phases are some times called *pre-collapse* and *post-collapse* phases of the diffuse Kalman filtering. In certain missing value patterns it is possible for $I$ to

exceed the sample size; that is, the sample information can be insufficient to create a proper prior for the filtering process. In these cases, parameter estimation and forecasting is done on the basis of this improper prior, and some or all of the series and component forecasts can have infinite variances (or zero precision). The forecasts that have infinite variance are set to missing. The same situation can occur if the specified model contains components that are essentially multicollinear. In these situations no residual analysis is possible; in particular, no residuals-based goodness-of-fit statistics are produced.

The log likelihood of the sample ($L_\infty$), which takes account of this diffuse initialization step, is computed by using the one-step-ahead series forecasts as follows,

$$L_\infty(y_1,\ldots,y_n) = -\frac{(n-d)}{2}\log 2\pi - \frac{1}{2}\sum_{t=1}^{I} w_t - \frac{1}{2}\sum_{t=I+1}^{n}(\log F_t + \frac{v_t^2}{F_t})$$

where $d$ is the number of diffuse elements in the initial state $\alpha_1$, $v_t = y_t - Z_t\hat{\alpha}_t$ are the one-step-ahead residuals, and

$$\begin{aligned} w_t &= \log F_{\infty t} && \text{if } F_{\infty t} > 0 \\ &= \log F_{*t} + \frac{v_t^2}{F_{*t}} && \text{if } F_{\infty t} = 0 \end{aligned}$$

If $y_t$ is missing at some time $t$, then the corresponding summand in the log likelihood expression is deleted, and the constant term is adjusted suitably. Moreover, if the initialization step does not complete—that is, if $I$ exceeds the sample size—then the value of $d$ is reduced to the number of diffuse states that are successfully initialized.

The portion of the log likelihood that corresponds to the post-initialization period is called the nondiffuse log likelihood ($L_0$). The nondiffuse log likelihood is given by

$$L_0(y_1,\ldots,y_n) = -\frac{1}{2}\sum_{t=I+1}^{n}(\log F_t + \frac{v_t^2}{F_t})$$

In the case of UCMs considered in PROC UCM, it often happens that the diffuse part of the likelihood, $\sum_{t=1}^{I} w_t$, does not depend on the model parameters, and in these cases the maximization of nondiffuse and diffuse likelihoods is equivalent. However, in some cases, such as when the model consists of dependent lags, the diffuse part does depend on the model parameters. In these cases the maximization of the diffuse and nondiffuse likelihood can produce different parameter estimates.

In some situations it is convenient to reparameterize the nondiffuse initial state covariance $P_*$ as $\sigma^2 P_*$ and the state noise covariance $Q_t$ as $\sigma^2 Q_t$ for some common scalar parameter $\sigma^2$. In this case the preceding log-likelihood expression, up to a constant, can be written as

$$L_\infty(y_1,\ldots,y_n) = -\frac{1}{2}\sum_{t=1}^{I} w_t - \frac{1}{2}\sum_{t=I+1}^{n}\log F_t - \frac{1}{2\sigma^2}\sum_{t=I+1}^{n}\frac{v_t^2}{F_t} - \frac{(n-d)}{2}\log\sigma^2$$

Solving analytically for the optimum, the maximum likelihood estimate of $\sigma^2$ can be shown to be

$$\hat{\sigma}^2 = \frac{1}{(n-d)}\sum_{t=I+1}^{n}\frac{v_t^2}{F_t}$$

When this expression of $\sigma^2$ is substituted back into the likelihood formula, an expression called the *profile likelihood* ($L_{\text{profile}}$) of the data is obtained:

$$-2L_{\text{profile}}(y_1,\ldots,y_n) = \sum_{t=1}^{I} w_t + \sum_{t=I+1}^{n} \log F_t + (n-d)\log(\sum_{t=I+1}^{n} \frac{v_t^2}{F_t})$$

In some situations the parameter estimation is done by optimizing the profile likelihood (see the section "Parameter Estimation by Profile Likelihood Optimization" on page 2909 and the PROFILE option in the ESTIMATE statement).

A new experimental feature in this release enables you to request that parameter estimation be based on an alternate form of the likelihood, called the marginal likelihood ($\mathbf{L}_m(\mathbf{Y},\boldsymbol{\theta})$). You can switch to the marginal-likelihood-based parameter estimation by specifying LIKE=MARGINAL in the ESTIMATE statement. This alternate likelihood and two additional likelihoods are described in the section "Likelihood Computation and Model-Fitting Phase" on page 2447 in Chapter 34, "The SSM Procedure." The diffuse likelihood, $L_\infty$, described in this section is equivalent to the diffuse likelihood, $\mathbf{L}_d(\mathbf{Y},\boldsymbol{\theta})$, described in that section. However, do not confuse the profile likelihood, $L_{\text{profile}}$, described in this section with the profile likelihood, $\mathbf{L}_p(\mathbf{Y},\boldsymbol{\theta})$, described in that section. The profiling in $\mathbf{L}_p(\mathbf{Y},\boldsymbol{\theta})$ refers to the profiling of the diffuse effects, whereas the profiling in $L_{\text{profile}}$ refers to the profiling of a common scalar parameter $\sigma^2$. For each of the three likelihoods—diffuse, marginal and profile—that are described in that section, it is possible to profile out (also called concentrate out) a common scalar parameter $\sigma^2$ and obtain expressions similar to the $L_{\text{profile}}$ likelihood that is described in this section. In fact, when you request that parameter estimation be based on the marginal likelihood by specifying LIKE=MARGINAL in the ESTIMATE statement, the profile version of marginal likelihood ($\mathbf{L}_m(\mathbf{Y},\boldsymbol{\theta})$) is used if the PROFILE option is in effect (by default or when the PROFILE option is specified). The discussion in the section "Parameter Estimation by Profile Likelihood Optimization" on page 2909 also applies to marginal likelihood. As explained in the section "Likelihood Computation and Model-Fitting Phase" on page 2447 in Chapter 34, "The SSM Procedure," the estimates that are based on marginal likelihood and the estimates that are based on diffuse likelihood coincide in many cases. In PROC UCM, estimates that are based on marginal likelihood and diffuse likelihood will differ only if at least one of the following conditions holds:

- The DEPLAG statement is present and the NOEST option is not specified.
- In a TF statement, at least one denominator factor is present and the NOEST option is not specified.
- In a CYCLE statement, RHO is fixed at 1 and the period is to be estimated—that is, RHO=1 and NOEST=RHO or NOEST=(RHO VARIANCE).

Whenever you specify LIKE=MARGINAL in the ESTIMATE statement, the FitSummary table that displays the likelihood-based fit statistics includes fit statistics and information criteria that are based on the marginal likelihood in addition to fit statistics that are based on diffuse likelihood.

In the remainder of this section, the state space formulation of UCMs is further explained by using some particular UCMs as examples. The examples show that the state space formulation of the UCMs depends on the components in the model in a simple fashion; for example, the system matrix $T$ is usually a block diagonal matrix with blocks that correspond to the components in the model. The only exception to this pattern is the UCMs that consist of the lags of dependent variable. This case is considered at the end of the section.

In what follows, $\text{Diag}\,[a,b,\ldots]$ denotes a diagonal matrix with diagonal entries $[a,b,\ldots]$, and the transpose of a matrix $T$ is denoted as $T'$.

## Locally Linear Trend Model

Recall that the dynamics of the locally linear trend model are

$$\begin{aligned} y_t &= \mu_t + \epsilon_t \\ \mu_t &= \mu_{t-1} + \beta_{t-1} + \eta_t \\ \beta_t &= \beta_{t-1} + \xi_t \end{aligned}$$

Here $y_t$ is the response series and $\epsilon_t, \eta_t$, and $\xi_t$ are independent, zero-mean Gaussian disturbance sequences with variances $\sigma_\epsilon^2, \sigma_\eta^2$, and $\sigma_\xi^2$, respectively. This model can be formulated as a state space model where the state vector $\alpha_t = [\ \epsilon_t\ \mu_t\ \beta_t\ ]'$ and the state noise $\zeta_t = [\ \epsilon_t\ \eta_t\ \xi_t\ ]'$. Note that the elements of the state vector are precisely the unobserved components in the model. The system matrices $T$ and $Z$ and the noise covariance $Q$ corresponding to this choice of state and state noise vectors can be seen to be time invariant and are given by

$$Z = [\ 1\ 1\ 0\ ],\quad T = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{bmatrix} \text{ and } Q = \text{Diag}\left[\sigma_\epsilon^2, \sigma_\eta^2, \sigma_\xi^2\right]$$

The distribution of the initial state vector $\alpha_1$ is diffuse, with $P_* = \text{Diag}\left[\sigma_\epsilon^2, 0, 0\right]$ and $P_\infty = \text{Diag}\,[0, 1, 1]$. The parameter vector $\theta$ consists of all the disturbance variances—that is, $\theta = (\sigma_\epsilon^2, \sigma_\eta^2, \sigma_\xi^2)$.

## Basic Structural Model

The basic structural model (BSM) is obtained by adding a seasonal component, $\gamma_t$, to the local level model. In order to economize on the space, the state space formulation of a BSM with a relatively short season length, season length = 4 (quarterly seasonality), is considered here. The pattern for longer season lengths such as 12 (monthly) and 52 (weekly) is easy to see.

Let us first consider the dummy form of seasonality. In this case the state and state noise vectors are $\alpha_t = \left[\ \epsilon_t\ \mu_t\ \beta_t\ \gamma_{1,t}\ \gamma_{2,t}\ \gamma_{3,t}\ \right]'$ and $\zeta_t = [\ \epsilon_t\ \eta_t\ \xi_t\ \omega_t\ 0\ 0\ ]'$, respectively. The first three elements of the state vector are the irregular, level, and slope components, respectively. The remaining elements, $\gamma_{i,t}$, are lagged versions of the seasonal component $\gamma_t$. $\gamma_{1,t}$ corresponds to lag zero—that is, the same as $\gamma_t$, $\gamma_{2,t}$ to lag 1 and $\gamma_{3,t}$ to lag 2. The system matrices are

$$Z = [\ 1\ 1\ 0\ 1\ 0\ 0\ ],\quad T = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & -1 & -1 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \end{bmatrix}$$

and $Q = \text{Diag}\left[\sigma_\epsilon^2, \sigma_\eta^2, \sigma_\xi^2, \sigma_\omega^2, 0, 0\right]$. The distribution of the initial state vector $\alpha_1$ is diffuse, with $P_* = \text{Diag}\left[\sigma_\epsilon^2, 0, 0, 0, 0, 0\right]$ and $P_\infty = \text{Diag}\,[0, 1, 1, 1, 1, 1]$.

In the case of the trigonometric type of seasonality, $\alpha_t = \left[\ \epsilon_t\ \mu_t\ \beta_t\ \gamma_{1,t}\ \gamma_{1,t}^*\ \gamma_{2,t}\ \right]'$ and $\zeta_t = \left[\ \epsilon_t\ \eta_t\ \xi_t\ \omega_{1,t}\ \omega_{1,t}^*\ \omega_{2,t}\ \right]'$. The disturbance sequences, $\omega_{j,t}, 1 \le j \le 2$, and $\omega_{1,t}^*$, are independent, zero-

mean, Gaussian sequences with variance $\sigma^2_\omega$. The system matrices are

$$Z = [\,1\;1\;0\;1\;0\;1\,],\quad T = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & \cos\lambda_1 & \sin\lambda_1 & 0 \\ 0 & 0 & 0 & -\sin\lambda_1 & \cos\lambda_1 & 0 \\ 0 & 0 & 0 & 0 & 0 & \cos\lambda_2 \end{bmatrix}$$

and $Q = \mathrm{Diag}\left[\sigma^2_\epsilon, \sigma^2_\eta, \sigma^2_\xi, \sigma^2_\omega, \sigma^2_\omega, \sigma^2_\omega\right]$. Here $\lambda_j = (2\pi j)/4$. The distribution of the initial state vector $\alpha_1$ is diffuse, with $P_* = \mathrm{Diag}\left[\sigma^2_\epsilon, 0, 0, 0, 0, 0\right]$ and $P_\infty = \mathrm{Diag}\,[0, 1, 1, 1, 1, 1]$. The parameter vector in both the cases is $\theta = (\sigma^2_\epsilon, \sigma^2_\eta, \sigma^2_\xi, \sigma^2_\omega)$.

### Seasons with Blocked Seasonal Values

*Block seasonals* are special seasonal components that impose a special block structure on the seasonal effects. Let us consider a BSM with monthly seasonality that has a quarterly block structure—that is, months within the same quarter are assumed to have identical effects except for some random perturbation. Such a seasonal component is a block seasonal with block size $m$ equal to 3 and the number of blocks $k$ equal to 4. The state space structure for such a model with dummy-type seasonality is as follows: The state and state noise vectors are $\alpha_t = \left[\,\epsilon_t\;\mu_t\;\beta_t\;\gamma_{1,t}\;\gamma_{2,t}\;\gamma_{3,t}\,\right]'$ and $\zeta_t = [\,\epsilon_t\;\eta_t\;\xi_t\;\omega_t\;0\;0\,]'$, respectively. The first three elements of the state vector are the irregular, level, and slope components, respectively. The remaining elements, $\gamma_{i,t}$, are lagged versions of the seasonal component $\gamma_t$. $\gamma_{1,t}$ corresponds to lag zero—that is, the same as $\gamma_t$, $\gamma_{2,t}$ to lag $m$ and $\gamma_{3,t}$ to lag $2m$. All the system matrices are time invariant, except the matrix $T$. They can be seen to be $Z = [\,1\;1\;0\;1\;0\;0\,]$, $Q = \mathrm{Diag}\left[\sigma^2_\epsilon, \sigma^2_\eta, \sigma^2_\xi, \sigma^2_\omega, 0, 0\right]$, and

$$T_t = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & -1 & -1 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \end{bmatrix}$$

when $t$ is a multiple of the block size $m$, and

$$T_t = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

otherwise. Note that when $t$ is not a multiple of $m$, the portion of the $T_t$ matrix corresponding to the seasonal is identity. The distribution of the initial state vector $\alpha_1$ is diffuse, with $P_* = \mathrm{Diag}\left[\sigma^2_\epsilon, 0, 0, 0, 0, 0\right]$ and $P_\infty = \mathrm{Diag}\,[0, 1, 1, 1, 1, 1]$.

Similarly, in the case of the trigonometric form of seasonality, $\alpha_t = \left[\,\epsilon_t\;\mu_t\;\beta_t\;\gamma_{1,t}\;\gamma^*_{1,t}\;\gamma_{2,t}\,\right]'$ and $\zeta_t = \left[\,\epsilon_t\;\eta_t\;\xi_t\;\omega_{1,t}\;\omega^*_{1,t}\;\omega_{2,t}\,\right]'$. The disturbance sequences, $\omega_{j,t}, 1 \le j \le 2$, and $\omega^*_{1,t}$, are independent, zero-mean, Gaussian sequences with variance $\sigma^2_\omega$. $Z = [\,1\;1\;0\;1\;0\;1\,]$, $Q = \mathrm{Diag}\left[\sigma^2_\epsilon, \sigma^2_\eta, \sigma^2_\xi, \sigma^2_\omega, \sigma^2_\omega, \sigma^2_\omega\right]$,

and

$$T_t = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & \cos\lambda_1 & \sin\lambda_1 & 0 \\ 0 & 0 & 0 & -\sin\lambda_1 & \cos\lambda_1 & 0 \\ 0 & 0 & 0 & 0 & 0 & \cos\lambda_2 \end{bmatrix}$$

when $t$ is a multiple of the block size $m$, and

$$T_t = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

otherwise. As before, when $t$ is not a multiple of $m$, the portion of the $T_t$ matrix corresponding to the seasonal is identity. Here $\lambda_j = (2\pi j)/4$. The distribution of the initial state vector $\alpha_1$ is diffuse, with $P_* = \text{Diag}\left[\sigma_\epsilon^2, 0, 0, 0, 0, 0\right]$ and $P_\infty = \text{Diag}\left[0, 1, 1, 1, 1, 1\right]$. The parameter vector in both the cases is $\theta = (\sigma_\epsilon^2, \sigma_\eta^2, \sigma_\xi^2, \sigma_\omega^2)$.

## Cycles and Autoregression

The preceding examples have illustrated how to build a state space model corresponding to a UCM that includes components such as irregular, trend, and seasonal. There you can see that the state vector and the system matrices have a simple block structure with blocks corresponding to the components in the model. Therefore, here only a simple model consisting of a single cycle and an irregular component is considered. The state space form for more complex UCMs consisting of multiple cycles and other components can be easily deduced from this example.

Recall that a stochastic cycle $\psi_t$ with frequency $\lambda$, $0 < \lambda < \pi$, and damping coefficient $\rho$ can be modeled as

$$\begin{bmatrix} \psi_t \\ \psi_t^* \end{bmatrix} = \rho \begin{bmatrix} \cos\lambda & \sin\lambda \\ -\sin\lambda & \cos\lambda \end{bmatrix} \begin{bmatrix} \psi_{t-1} \\ \psi_{t-1}^* \end{bmatrix} + \begin{bmatrix} \nu_t \\ \nu_t^* \end{bmatrix}$$

where $\nu_t$ and $\nu_t^*$ are independent, zero-mean, Gaussian disturbances with variance $\sigma_\nu^2$. In what follows, a state space form for a model consisting of such a stochastic cycle and an irregular component is given.

The state vector $\alpha_t = \begin{bmatrix} \epsilon_t & \psi_t & \psi_t^* \end{bmatrix}'$, and the state noise vector $\zeta_t = \begin{bmatrix} \epsilon_t & \nu_t & \nu_t^* \end{bmatrix}'$. The system matrices are

$$Z = [\,1\;1\;0\,] \quad T = \begin{bmatrix} 0 & 0 & 0 \\ 0 & \rho\cos\lambda & \rho\sin\lambda \\ 0 & -\rho\sin\lambda & \rho\cos\lambda \end{bmatrix} \quad Q = \text{Diag}\left[\sigma_\epsilon^2, \sigma_\nu^2, \sigma_\nu^2\right]$$

The distribution of the initial state vector $\alpha_1$ is proper, with $P_* = \text{Diag}\left[\sigma_\epsilon^2, \sigma_\psi^2, \sigma_\psi^2\right]$, where $\sigma_\psi^2 = \sigma_\nu^2(1-\rho^2)^{-1}$. The parameter vector $\theta = (\sigma_\epsilon^2, \rho, \lambda, \sigma_\nu^2)$.

An autoregression $r_t$ can be considered as a special case of cycle with frequency $\lambda$ equal to 0 or $\pi$. In this case the equation for $\psi_t^*$ is not needed. Therefore, for a UCM consisting of an autoregressive component and an irregular component, the state space model simplifies to the following form.

The state vector $\alpha_t = [\ \epsilon_t\ r_t\ ]'$, and the state noise vector $\zeta_t = [\ \epsilon_t\ \nu_t\ ]'$. The system matrices are

$$Z = [\ 1\ 1\ ],\quad T = \begin{bmatrix} 0 & 0 \\ 0 & \rho \end{bmatrix} \text{ and } Q = \text{Diag}\left[\sigma_\epsilon^2, \sigma_\nu^2\right]$$

The distribution of the initial state vector $\alpha_1$ is proper, with $P_* = \text{Diag}\left[\sigma_\epsilon^2, \sigma_r^2\right]$, where $\sigma_r^2 = \sigma_\nu^2(1-\rho^2)^{-1}$. The parameter vector $\theta = (\sigma_\epsilon^2, \rho, \sigma_\nu^2)$.

## Incorporating Predictors of Different Types

In the UCM procedure, you can incorporate predictors in a UCM in a variety of ways: you can specify simple time-invariant linear predictors in the MODEL statement, you can specify predictors that have time-varying coefficients in the RANDOMREG statement, and you can specify predictors that have a nonlinear relationship with the response variable in the SPLINEREG statement. You can also specify a transfer-function relationship by using the TF statement. As with earlier examples, the first part of this section uses a simple special case to show how to obtain a state space form of a UCM that consists of a variety of predictors (except the transfer-function relationship). The state space form that is associated with a transfer-function relationship is described in the section "State Space Form of a Transfer Function Relationship" on page 2905.

Consider a random walk trend model that has predictors $x, u_1, u_2$, and $v$. Assume that $x$ is a simple regressor that is specified in the MODEL statement, $u_1$ and $u_2$ are random regressors with time-varying regression coefficients that are specified in the same RANDOMREG statement, and $v$ is a nonlinear regressor that is specified in a SPLINEREG statement. Further assume that the spline that is associated with $v$ has degree one and is based on two internal knots. As explained in the section "SPLINEREG Statement" on page 2886, using $v$ is equivalent to using $(n\ knots + degree) = (2+1) = 3$ derived (random) regressors: for example, $s_1, s_2, s_3$. There are $(1+2+3) = 6$ regressors in all, the first one being a simple regressor and the others being time-varying coefficient regressors. The time-varying regressors are in two groups: the first group consists of $u_1$ and $u_2$, and the other group consists of $s_1, s_2$, and $s_3$. The dynamics of this model are as follows:

$$\begin{aligned}
y_t &= \mu_t + \beta x_t + \kappa_{1t}u_{1t} + \kappa_{2t}u_{2t} + \sum_{i=1}^{3}\gamma_{it}s_{it} + \epsilon_t \\
\mu_t &= \mu_{t-1} + \eta_t \\
\kappa_{1t} &= \kappa_{1(t-1)} + \xi_{1t} \\
\kappa_{2t} &= \kappa_{2(t-1)} + \xi_{2t} \\
\gamma_{1t} &= \gamma_{1(t-1)} + \zeta_{1t} \\
\gamma_{2t} &= \gamma_{2(t-1)} + \zeta_{2t} \\
\gamma_{3t} &= \gamma_{3(t-1)} + \zeta_{3t}
\end{aligned}$$

All the disturbances $\epsilon_t, \eta_t, \xi_{1t}, \xi_{2t}, \zeta_{1t}, \zeta_{2t}$, and $\zeta_{3t}$ are independent, zero-mean, Gaussian variables, where $\xi_{1t}, \xi_{2t}$ share a common variance parameter $\sigma_\xi^2$ and $\zeta_{1t}, \zeta_{2t}, \zeta_{3t}$ share a common variance $\sigma_\zeta^2$. These dynamics can be captured in the state space form by taking state $\alpha_t = [\ \epsilon_t\ \mu_t\ \beta\ \kappa_{1t}\ \kappa_{2t}\ \gamma_{1t}\ \gamma_{2t}\ \gamma_{3t}\ ]'$, state disturbance $\zeta_t = [\ \epsilon_t\ \eta_t\ 0\ \xi_{1t}\ \xi_{2t}\ \zeta_{1t}\ \zeta_{2t}\ \zeta_{3t}\ ]'$, and the system matrices

$$\begin{aligned}
Z_t &= [\ 1\ 1\ x_t\ u_{1t}\ u_{2t}\ s_{1t}\ s_{2t}\ s_{3t}\ ] \\
T &= \text{Diag}\,[0,\ 1,\ 1,\ 1,\ 1,\ 1,\ 1,\ 1] \\
Q &= \text{Diag}\left[\sigma_\epsilon^2,\ \sigma_\eta^2,\ 0,\ \sigma_\xi^2,\ \sigma_\xi^2,\ \sigma_\zeta^2,\ \sigma_\zeta^2,\ \sigma_\zeta^2\right]
\end{aligned}$$

Note that the regression coefficients are elements of the state vector and that the system vector $Z_t$ is not time-invariant. The distribution of the initial state vector $\alpha_1$ is diffuse, with $P_* = \text{Diag}\left[\sigma_\epsilon^2, 0, 0, 0, 0, 0, 0, 0\right]$ and $P_\infty = \text{Diag}\,[0, 1, 1, 1, 1, 1, 1, 1]$. The parameters of this model are the disturbance variances, $\sigma_\epsilon^2$, $\sigma_\eta^2$, $\sigma_\xi^2$, and $\sigma_\zeta^2$, which are estimated by maximizing the likelihood. The regression coefficients, time-invariant $\beta$, and time-varying $\kappa_{1t}, \kappa_{2t}, \gamma_{1t}, \gamma_{2t}$ and $\gamma_{3t}$ are implicitly estimated during the state estimation (smoothing).

### State Space Form of a Transfer Function Relationship

This section illustrates the state space form of a simple transfer-function relationship. The state space form of more complicated transfer-function relationships can be deduced using the same logic. Suppose that a predictor $x$ enters the model for a response variable $y$ as

$$\begin{aligned} y_t &= f_t + \epsilon_t \\ f_t &= \frac{(\gamma_0 + \gamma_1 B)}{(1 - \delta_1 B - \delta_2 B^2)} x_t \end{aligned}$$

where $f_t$ is the transfer-function component and $\epsilon_t$ is a sequence of independent, zero-mean, Gaussian variables. In this description, the transfer-function component is described using the backward shift operator $B$. Alternatively, it can be described as follows:

$$f_t = \delta_1 f_{t-1} + \delta_2 f_{t-2} + \gamma_0 x_t + \gamma_1 x_{t-1}$$

This model can be easily put in a state space form by taking state $\boldsymbol{\alpha}_t = (\epsilon_t \;\; f_t \;\; f_{t-1} \;\; \gamma_0 \;\; \gamma_1)'$, state disturbance $\boldsymbol{\zeta}_t = (\epsilon_t \;\; 0 \;\; 0 \;\; 0 \;\; 0)'$, the system matrices $Z = [1 \;\; 1 \;\; 0 \;\; 0 \;\; 0]$, $Q = \text{Diag}[\sigma_\epsilon^2 \;\; 0 \;\; 0 \;\; 0 \;\; 0]$, and

$$T_t = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 \\ 0 & \delta_1 & \delta_2 & x_{t+1} & x_t \\ 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

The initial state $\boldsymbol{\alpha}_1$ is partially diffuse. The precise form of the initial state depends on the value of the TFSTART= option in the TF statement. If the TFSTART option is not specified, all elements of $\boldsymbol{\alpha}_1$ except for the first element ($\epsilon_1$) are treated as diffuse. On the other hand, if a value is specified in the TFSTART= option, the initial transfer function values ($f_1$ and $f_0$) in $\boldsymbol{\alpha}_1$ are fixed at that specified value. In this formulation of the model, the numerator coefficients of the transfer-function relationship ($\gamma_0$ and $\gamma_1$) are part of the state. They are implicitly estimated during the state estimation (smoothing). On the other hand, the denominator coefficients ($\delta_1$ and $\delta_2$) and the noise variance ($\sigma_\epsilon^2$) are estimated by maximizing the likelihood.

### Reporting Parameter Estimates for Random Regressors

If the random walk disturbance variance that is associated with a random regressor is held fixed at 0, then its coefficient is no longer time-varying. In the UCM procedure, the random regressor parameter estimates are reported differently if the random walk disturbance variance that is associated with a random regressor is held fixed at 0. The following points explain how the parameter estimates are reported in the parameter estimates table and in the OUTEST= data set:

- If the random walk disturbance variance that is associated with a random regressor is not held fixed, then its estimate is reported in the parameter estimates table and in the OUTEST= data set.

- If more that one random regressor is specified in a RANDOMREG statement, then the first regressor in the list is used as a representative of the list when the corresponding common variance parameter estimate is reported.
- If the random walk disturbance variance is held fixed at 0, then the parameter estimates table and the OUTEST= data set contain the corresponding regression parameter estimate rather than the variance parameter estimate.
- Similar considerations apply in the case of the derived random regressors that are associated with a spline regressor.

#### *Forecasting with Predictor Variables*

If regression effects are included in the model (in a MODEL statement or in one or more of the RANDOMREG, SPLINEREG, and TF statements) and the FORECAST statement is used to compute multistep forecasts, then future values of the predictor variables must be included in the DATA= data set for the forecast horizon that is defined by the BACK= and LEAD= options in the FORECAST statement. For more information about how the forecast horizon is defined, see the FORECAST statement.

### ARMA Irregular Component

The state space form for the irregular component that follows an ARMA$(p,q)\times(P,Q)_s$ model is described in this section. The notation for ARMA models is explained in the IRREGULAR statement. A number of alternate state space forms are possible in this case; the one given here is based on Jones (1980). With slight abuse of notation, let $p = p + sP$ denote the effective autoregressive order and $q = q + sQ$ denote the effective moving average order of the model. Similarly, let $\phi$ be the effective autoregressive polynomial and $\theta$ be the effective moving average polynomial in the backshift operator with coefficients $\phi_1, \ldots, \phi_p$ and $\theta_1, \ldots, \theta_q$, obtained by multiplying the respective nonseasonal and seasonal factors. Then, a random sequence $\epsilon_t$ that follows an ARMA$(p,q)\times(P,Q)_s$ model with a white noise sequence $a_t$ has a state space form with state vector of size $m = \max(p, q+1)$. The system matrices, which are time invariant, are as follows: $Z = [1\ 0\ \ldots\ 0]$. The state transition matrix $T$, in a blocked form, is given by

$$T = \begin{bmatrix} 0 & I_{m-1} \\ \phi_m \ \ldots & \phi_1 \end{bmatrix}$$

where $\phi_i = 0$ if $i > p$ and $I_{m-1}$ is an $(m-1)$ dimensional identity matrix. The covariance of the state disturbance matrix $Q = \sigma^2 \psi \psi'$ where $\sigma^2$ is the variance of the white noise sequence $a_t$ and the vector $\psi = [\psi_0 \ldots \psi_{m-1}]'$ contains the first $m$ values of the impulse response function—that is, the first $m$ coefficients in the expansion of the ratio $\theta/\phi$. Since $\epsilon_t$ is a stationary sequence, the initial state is nondiffuse and $P_\infty = 0$. The description of $P_*$, the covariance matrix of the initial state, is a little involved; the details are given in Jones (1980).

### Models with Dependent Lags

The state space form of a UCM consisting of the lags of the dependent variable is quite different from the state space forms considered so far. Let us consider an example to illustrate this situation. Consider a model that has random walk trend, two simple time-invariant regressors, and that also includes a few—for example,

$k$—lags of the dependent variable. That is,

$$\begin{aligned} y_t &= \sum_{i=1}^{k} \phi_i y_{t-i} + \mu_t + \beta_1 x_{1t} + \beta_2 x_{2t} + \epsilon_t \\ \mu_t &= \mu_{t-1} + \eta_t \end{aligned}$$

The state space form of this augmented model can be described in terms of the state space form of a model that has random walk trend with two simple time-invariant regressors. A superscript dagger (†) has been added to distinguish the augmented model state space entities from the corresponding entities of the state space form of the random walk with predictors model. With this notation, the state vector of the augmented model $\alpha_t^{\dagger} = \begin{bmatrix} \alpha_t' & y_t & y_{t-1} & \ldots & y_{t-k+1} \end{bmatrix}'$ and the new state noise vector $\zeta_t^{\dagger} = \begin{bmatrix} \zeta_t' & u_t & 0 \ldots & 0 \end{bmatrix}'$, where $u_t$ is the matrix product $Z_t \zeta_t$. Note that the length of the new state vector is $k + \text{length}(\alpha_t) = k + 4$. The new system matrices, in block form, are

$$Z_t^{\dagger} = [\, 0\, 0\, 0\, 0\, 1 \ \ldots\ 0\,], \quad T_t^{\dagger} = \begin{bmatrix} T_t & 0 & \ldots & 0 \\ Z_{t+1} T_t & \phi_1 & \ldots & \phi_k \\ 0 & I_{k-1,k-1} & & 0 \end{bmatrix}$$

where $I_{k-1,k-1}$ is the $k-1$ dimensional identity matrix and

$$Q_t^{\dagger} = \begin{bmatrix} Q_t & Q_t Z_t' & 0 \\ Z_t Q_t & Z_t Q_t Z_t' & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

Note that the $T$ and $Q$ matrices of the random walk with predictors model are time invariant, and in the expressions above their time indices are kept because they illustrate the pattern for more general models. The initial state vector is diffuse, with

$$P_*^{\dagger} = \begin{bmatrix} P_* & 0 \\ 0 & 0 \end{bmatrix}, \quad P_{\infty}^{\dagger} = \begin{bmatrix} P_{\infty} & 0 \\ 0 & I_{k,k} \end{bmatrix}$$

The parameters of this model are the disturbance variances $\sigma_{\epsilon}^2$ and $\sigma_{\eta}^2$, the lag coefficients $\phi_1, \phi_2, \ldots, \phi_k$, and the regression coefficients $\beta_1$ and $\beta_2$. As before, the regression coefficients get estimated during the state smoothing, and the other parameters are estimated by maximizing the likelihood.

## Outlier Detection

In time series analysis it is often useful to detect changes over time in the characteristics of the response series. In the UCM procedure you can search for two types of changes, additive outliers (AO) and level shifts (LS). An additive outlier is an unusual value in the series, the cause of which might be a data recording error or a temporary shock to the series generation process. A level shift represents a permanent shift, either up or down, in the level of the series. You can control different aspects of the outlier search, such as the significance level of the reported outliers, by choosing different options in the OUTLIER statement. The search for AOs is done by default, whereas the CHECKBREAK option in the LEVEL statement must be used to turn on the search for LSs.

The outlier detection process implemented in the UCM procedure is based on De Jong and Penzer (1998). In this approach the fitted model is taken to be the *null* model, and the series values and level shifts that are

not adequately accounted for by the null model are flagged as outliers. The unusualness of a response series value at a particular time point $t_0$, with respect to the fitted model, can be judged by estimating its value based on the rest of the data (that is, the series obtained by *deleting* the series value at $t_0$) and comparing the estimated value to the observed value. If the difference between the estimated and observed values is statistically significant, then such value can be regarded as an AO. Note that this difference between the estimated and observed values is also the regression coefficient of a *dummy* regressor that takes the value 1.0 at $t_0$ and is 0.0 elsewhere, assuming such a regressor is added to the null model. In this way the series value at $t_0$ is regarded as AO if the regression coefficient of this dummy regressor is significant. Similarly, you can say that a level shift has occurred at a time point $t_0$ if the regression coefficient of a regressor, which is 0.0 before $t_0$ and 1.0 at $t_0$ and thereafter, is statistically significant. De Jong and Penzer (1998) provide an efficient way to compute such AO and LS regression coefficients and their standard errors at all time points in the series. The outlier summary table, which is produced by default, simply lists the most statistically significant candidates among these.

## Missing Values

Embedded missing values in the dependent variable usually cause no problems in UCM modeling. However, no missing values are allowed in the predictor variables. Certain patterns of missing values in the dependent variable can lead to failure of the initialization step of the diffuse Kalman filtering for some models. For example, if in a monthly series all values are missing for a certain month—such as May—then a BSM with monthly seasonality leads to such a situation. However, in this case the initialization step can complete successfully for a nonseasonal model such as local linear model.

## Parameter Estimation

The parameter vector in a UCM consists of the variances of the disturbance terms of the unobserved components, the damping coefficients and frequencies in the cycles, the damping coefficient in the autoregression, the lag coefficients of the dependent lags, and the regression coefficients in the regression terms. The regression coefficients are always part of the state vector and are estimated by state smoothing. The remaining parameters are estimated by maximizing either the full diffuse likelihood or the nondiffuse likelihood. The decision to use the full diffuse likelihood or the nondiffuse likelihood depends on the presence or absence of the dependent lag coefficients in the parameter vector. If the parameter vector does not contain any dependent lag coefficients, then the full diffuse likelihood is used. If, on the other hand, the parameter vector does contain some dependent lag coefficients, then the parameters are estimated by maximizing the nondiffuse likelihood. The optimization of the full diffuse likelihood is often unstable when the parameter vector contains dependent lag coefficients. In this sense, when the parameter vector contains dependent lag coefficients, the parameter estimates are not true maximum likelihood estimates.

The optimization of the likelihood, either full or nondiffuse, is carried out using one of several nonlinear optimization algorithms. The user can control many aspects of the optimization process by using the NLOPTIONS statement and by providing the starting values of the parameters while specifying the corresponding components. However, in most cases the default settings work quite well. The optimization process is not guaranteed to converge to a maximum likelihood estimate. In most cases the difficulties in parameter estimation are associated with the specification of a model that is not appropriate for the series being modeled.

## Parameter Estimation by Profile Likelihood Optimization

If a disturbance variance, such as the disturbance variance of the irregular component, is a part of the UCM and is a free parameter, then it can be profiled out of the likelihood. This means solving analytically for its optimum and plugging this expression back into the likelihood formula, giving rise to the so-called *profile* likelihood. The expression of the profile likelihood and the MLE of the profiled variance are given earlier in the section "The UCMs as State Space Models" on page 2897, where the computation of the likelihood of the state space model is also discussed.

In some situations the optimization of the profile likelihood can be more efficient because the number of parameters to optimize is reduced by one; however, for a variety of reasons such gains might not always be observed. Moreover, in theory the estimates obtained by optimizing the profile likelihood and the usual likelihood should be the same, but in practice this might not hold because of numerical rounding and other conditions.

In the UCM procedure, by default the usual likelihood is optimized if any of the disturbance variance parameters is held fixed to a nonzero value by using the NOEST option in the corresponding component statement. In other cases the decision whether to optimize the profile likelihood or the usual likelihood is based on several factors that are difficult to document. You can choose which likelihood to optimize during parameter estimation by specifying the PROFILE option for the profile likelihood optimization or the NOPROFILE option for the usual likelihood optimization. In the presence of the PROFILE option, the disturbance variance to profile is checked in a specific order, so that if the irregular component disturbance variance is free then it is always chosen. The situation in other cases is more complicated.

### *Profiling in the Presence of Fixed Variance Parameters*

Note that when the parameter estimation is done by optimizing the profile likelihood, the interpretation of the variance parameters that are held fixed to nonzero values changes. In the presence of the PROFILE option, the disturbance variances that are held at a fixed value by using the NOEST option in their respective component statements are interpreted as being restricted to be that fixed multiple of the profiled variance rather than being fixed at that nominal value. That is, implicitly, the parameter estimation is done under the restriction of holding the disturbance variance *ratio* fixed at a given value rather than the disturbance variance itself. For an example of this type of restriction to obtain a UC model that is equivalent to the famous Hodrick-Prescott filter, see Example 42.5.

## *t* Values

The *t* values reported in the table of parameter estimates are approximations whose accuracy depends on the validity of the model, the nature of the model, and the length of the observed series. The distributional properties of the maximum likelihood estimates of general unobserved components models have not been explored fully; therefore the probability values that correspond to a *t* distribution should be interpreted carefully, as they can be misleading. This is particularly true if the parameters in question are close to the boundary of the parameter space. The two sources by Harvey (1989, 2001) are good references for information about this topic. For some parameters, such as the cycle period, the reported *t* values are uninformative because comparison of the estimated parameter with zero is never needed. In such cases the *t* values and the corresponding probability values should be ignored.

## Bootstrap Prediction Intervals (Experimental)

By default, the UCM procedure computes the standard errors of the series and component forecasts (both the filtered and smoothed estimates) by assuming that the estimated parameters are in fact the true parameters. Rodriguez and Ruiz (2010) describe a bootstrap-based procedure to compute the standard errors of the series and component forecasts that takes into account the uncertainty of parameter estimation. As an experimental feature in this release, you can request the computation of standard errors based on this bootstrap-based procedure by specifying the BOOTSTRAP option in the FORECAST statement. Subsequently, the confidence intervals for the series and component forecasts are based on these bootstrap standard errors. The algorithm that PROC UCM uses closely follows the first procedure described in Section 3 of Rodriguez and Ruiz (2010). Note that this bootstrap algorithm is computationally expensive. The computational burden increases with the number of bootstrap replications and is comparable to the computational burden of fitting the specified model as many times as the number of replications. Fortunately, these replications can be executed in parallel, and the UCM procedure can use multiple cores and multiple grid nodes (if they are available) to complete these calculations faster. For a single machine with multiple cores, the procedure automatically detects and uses all the cores. If a grid environment with multiple machines is available (with the appropriate SAS license), you must use the PERFORMANCE statement to supply the necessary information to the UCM procedure.

## Computational Issues

### Convergence Problems

As explained in the section "Parameter Estimation" on page 2908, the model parameters are estimated by nonlinear optimization of the likelihood. This process is not guaranteed to succeed. For some data sets, the optimization algorithm can fail to converge. Nonconvergence can result from a number of causes, including flat or ridged likelihood surfaces and ill-conditioned data. It is also possible for the algorithm to converge to a point that is not the global optimum of the likelihood.

If you experience convergence problems, the following points might be helpful:

- Data that are extremely large or extremely small can adversely affect results because of the internal tolerances used during the filtering steps of the likelihood calculation. Rescaling the data can improve stability.
- Examine your model for redundancies in the included components and regressors. If some of the included components or regressors are nearly collinear to each other, then the optimization process can become unstable.
- Experimenting with different options offered by the NLOPTIONS statement can help.
- Lack of convergence can indicate model misspecification or a violation of the normality assumption.

### Computer Resource Requirements

The computing resources required for the UCM procedure depend on several factors. The memory requirement for the procedure is largely dependent on the number of observations to be processed and the size of the state vector underlying the specified model. If $n$ denotes the sample size and $m$ denotes the size of the state vector, the memory requirement for the smoothing stage of the Kalman filter is of the order of $6 \times 8 \times n \times m^2$ bytes, ignoring the lower-order terms. If the smoothed component estimates are not needed then the memory requirement is of the order of $6 \times 8 \times (m^2 + n)$ bytes. Besides $m$ and $n$, the computing time for the parameter estimation depends on the type of components included in the model. For example, the parameter estimation is usually faster if the model parameter vector consists only of disturbance variances, because in this case there is an efficient way to compute the likelihood gradient.

## Displayed Output

The default printed output produced by the UCM procedure is described in the following list:

- brief information about the input data set, including the data set name and label, and the name of the ID variable specified in the ID statement
- summary statistics for the data in the estimation and forecast spans, including the names of the variables in the model, their categorization as dependent or predictor, the index of the beginning and ending observations in the spans, the total number of observations and the number of missing observations, the smallest and largest measurements, and the mean and standard deviation
- information about the model parameters at the start of the model-fitting stage, including the fixed parameters in the model and the initial estimates of the free parameters in the model
- convergence status of the likelihood optimization process if any parameter estimation is done
- estimates of the free parameters at the end of the model fitting-stage, including the parameter estimates, their approximate standard errors, $t$ statistics, and the approximate $p$-value
- the likelihood-based goodness-of-fit statistics, including the full likelihood, the portion of the likelihood corresponding to the diffuse initialization, the sum of squares of residuals normalized by their standard errors, and the information criteria: AIC, AICC, HQIC, BIC, and CAIC
- the fit statistics that are based on the raw residuals (observed minus predicted), including the mean squared error (MSE), the root mean squared error (RMSE), the mean absolute percentage error (MAPE), the maximum percentage error (MAXPE), the R-square, the adjusted R-square, the random walk R-square, and Amemiya's R-square
- the significance analysis of the components included in the model that is based on the estimation span
- brief information about the components included in the model
- additive outliers in the series, if any are detected
- the multistep series forecasts
- post-sample-prediction analysis table that compares the multistep forecasts with the observed series values, if the BACK= option is used in the FORECAST statement

## Statistical Graphics

Statistical procedures use ODS Graphics to create graphs as part of their output. ODS Graphics is described in detail in Chapter 24, "Statistical Graphics Using ODS" (*SAS/STAT User's Guide*).

Before you create graphs, ODS Graphics must be enabled (for example, with the ODS GRAPHICS ON statement). For more information about enabling and disabling ODS Graphics, see the section "Enabling and Disabling ODS Graphics" in that chapter.

The overall appearance of graphs is controlled by ODS styles. Styles and other aspects of using ODS Graphics are discussed in the section "A Primer on ODS Statistical Graphics" in that chapter.

This section provides information about the basic ODS statistical graphics produced by the UCM procedure.

You can obtain most plots relevant to the specified model by using the global PLOTS= option in the PROC UCM statement. The plot of series forecasts in the forecast horizon is produced by default. You can further control the production of individual plots by using the PLOT= options in the different statements.

The main types of plots available are as follows:

- Time series plots of the component estimates, either filtered or smoothed, can be requested by using the PLOT= option in the respective component statements. For example, the use of PLOT=SMOOTH option in a CYCLE statement produces a plot of smoothed estimate of that cycle.
- Residual plots for model diagnostics can be obtained by using the PLOT= option in the ESTIMATE statement.
- Plots of series forecasts and model decompositions can be obtained by using the PLOT= option in the FORECAST statement.

The following example is a simple illustration of the available plot options.

### Analysis of Sunspot Data: Illustration of ODS Graphics

In this example a well-known series, Wolfer's sunspot data (Anderson 1971), is considered. The data consist of yearly sunspot numbers recorded from 1749 to 1924. These sunspot numbers are known to have a cyclical pattern with a period of about eleven years. The following DATA step creates the input data set:

```
data sunspot;
   input year wolfer @@;
   year = mdy(1,1, year);
   format year year4.;
datalines;
1749  809 1750  834 1751  477 1752  478 1753  307 1754  122 1755   96
1756  102 1757  324 1758  476 1759  540 1760  629 1761  859 1762  612
1763  451 1764  364 1765  209 1766  114 1767  378 1768  698 1769 1061

   ... more lines ...
```

The following statements specify a UCM that includes a cycle component and a random walk trend component:

```
proc ucm data=sunspot;
   id year interval=year;
   model wolfer;
   irregular;
   level ;
   cycle plot=(filter smooth);
   estimate back=24 plot=(loess panel cusum wn);
   forecast back=24 lead=24 plot=(forecasts decomp);
run;
```

The following subsections explain the graphics produced by the preceding statements.

### Component Plots

The plots in Figure 42.8 and Figure 42.9, produced by specifying PLOT=(FILTER SMOOTH) in the CYCLE statement, show the filtered and smoothed estimates, respectively, of the cycle component in the model. Note that the smoothed estimate appears smoother than the filtered estimate. This is always true because the filtered estimate of a component at time $t$ is based on the observations prior to time $t$—that is, it uses measurements from the first observation up to the $(t-1)$th observation. On the other hand, the corresponding smoothed estimate uses all the available observations—that is, all the measurements from the first observation to the last. This makes the smoothed estimate of the component more precise than the filtered estimate for the time points within historical period. In the forecast horizon, both filtered and smoothed estimates are identical, being based on the same set of observations.

**Figure 42.8** Sunspots Series: Filtered Cycle

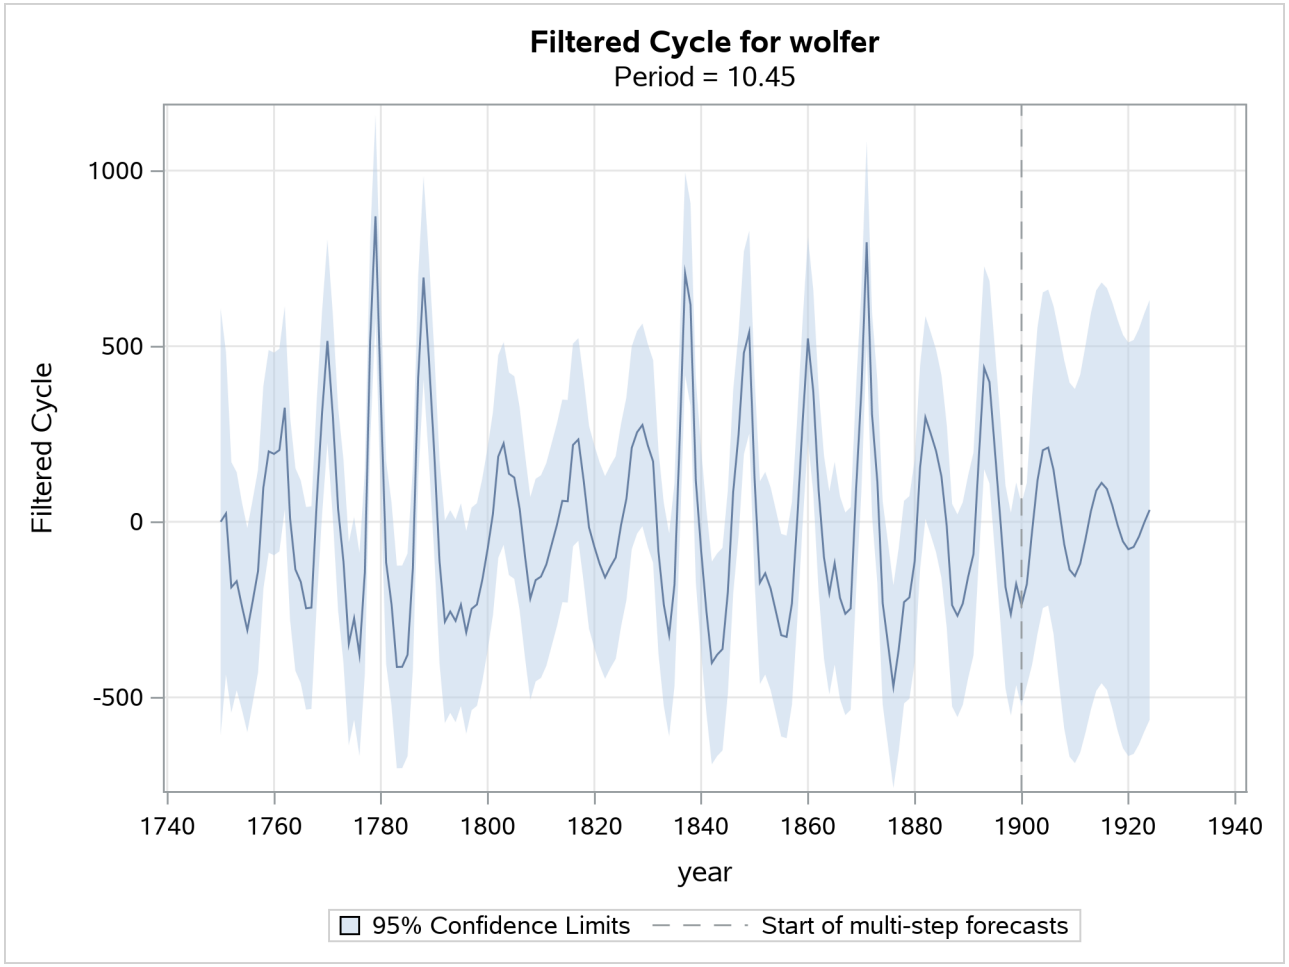

**Figure 42.9** Sunspots Series: Smoothed Cycle

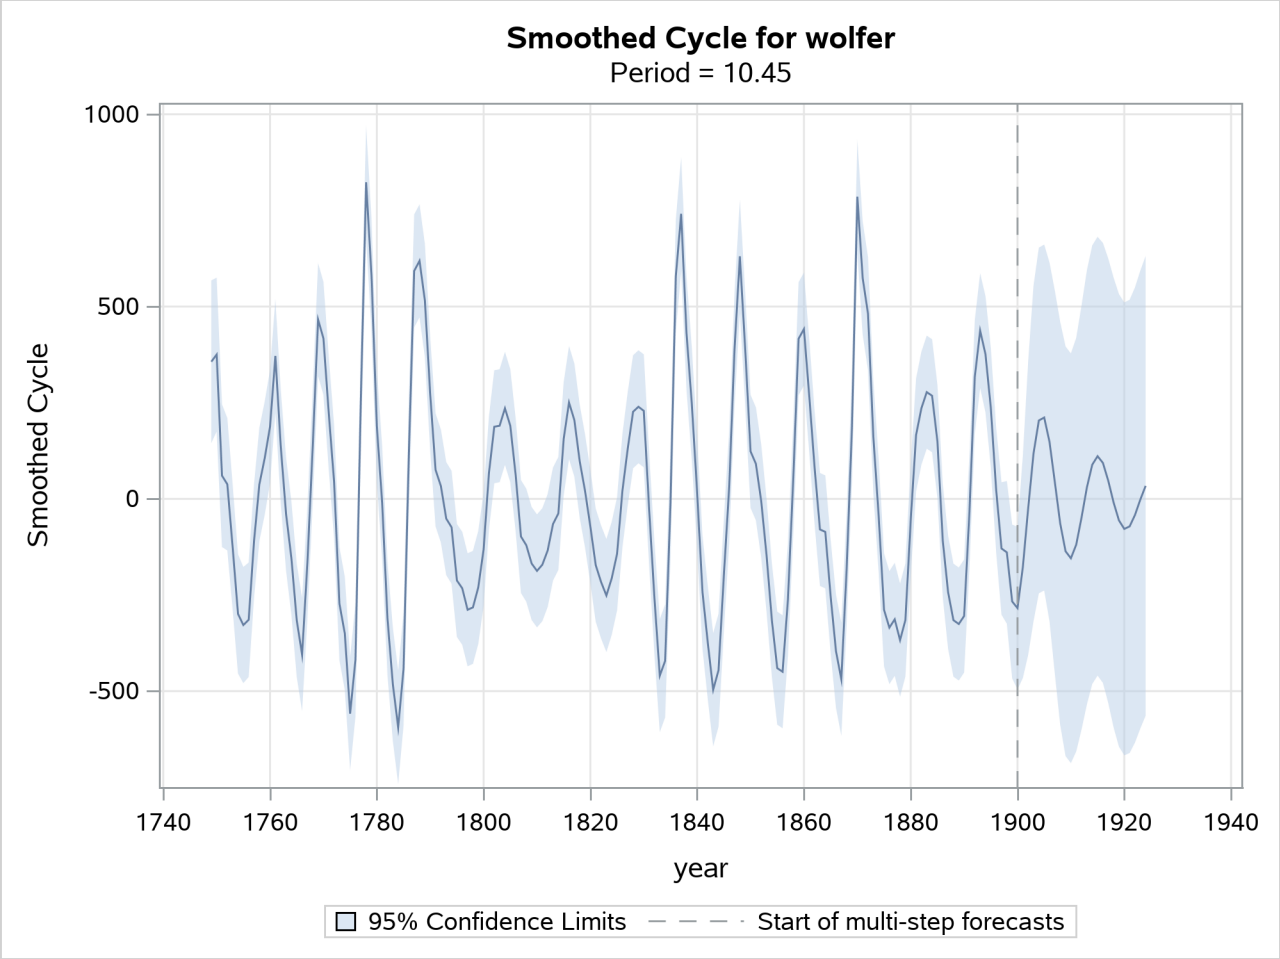
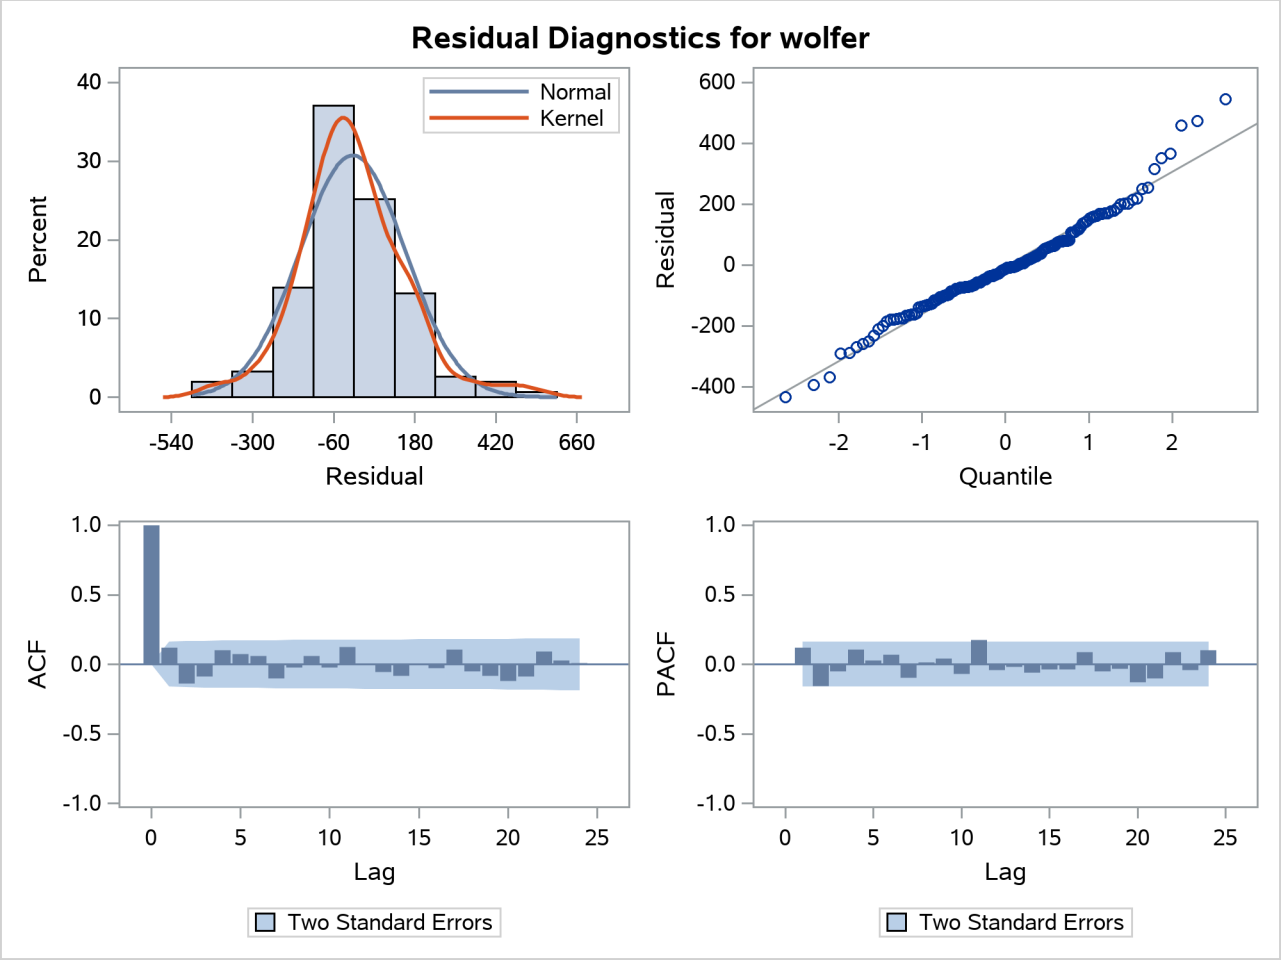


### *Residual Diagnostics*

If the fitted model is appropriate for the given data, then the corresponding one-step-ahead residuals should be approximately *white*—that is, uncorrelated—and approximately normal. Moreover, the residuals should not display any discernible pattern. You can detect departures from these conditions graphically. Different residual diagnostic plots can be requested by using the PLOT= option in the ESTIMATE statement.

The normality can be checked by examining the histogram and the normal quantile plot of residuals. The whiteness can be checked by examining the ACF and PACF plots that show the sample autocorrelation and sample partial-autocorrelation at different lags. The diagnostic panel shown in Figure 42.10, produced by specifying PLOT=PANEL, contains these four plots.

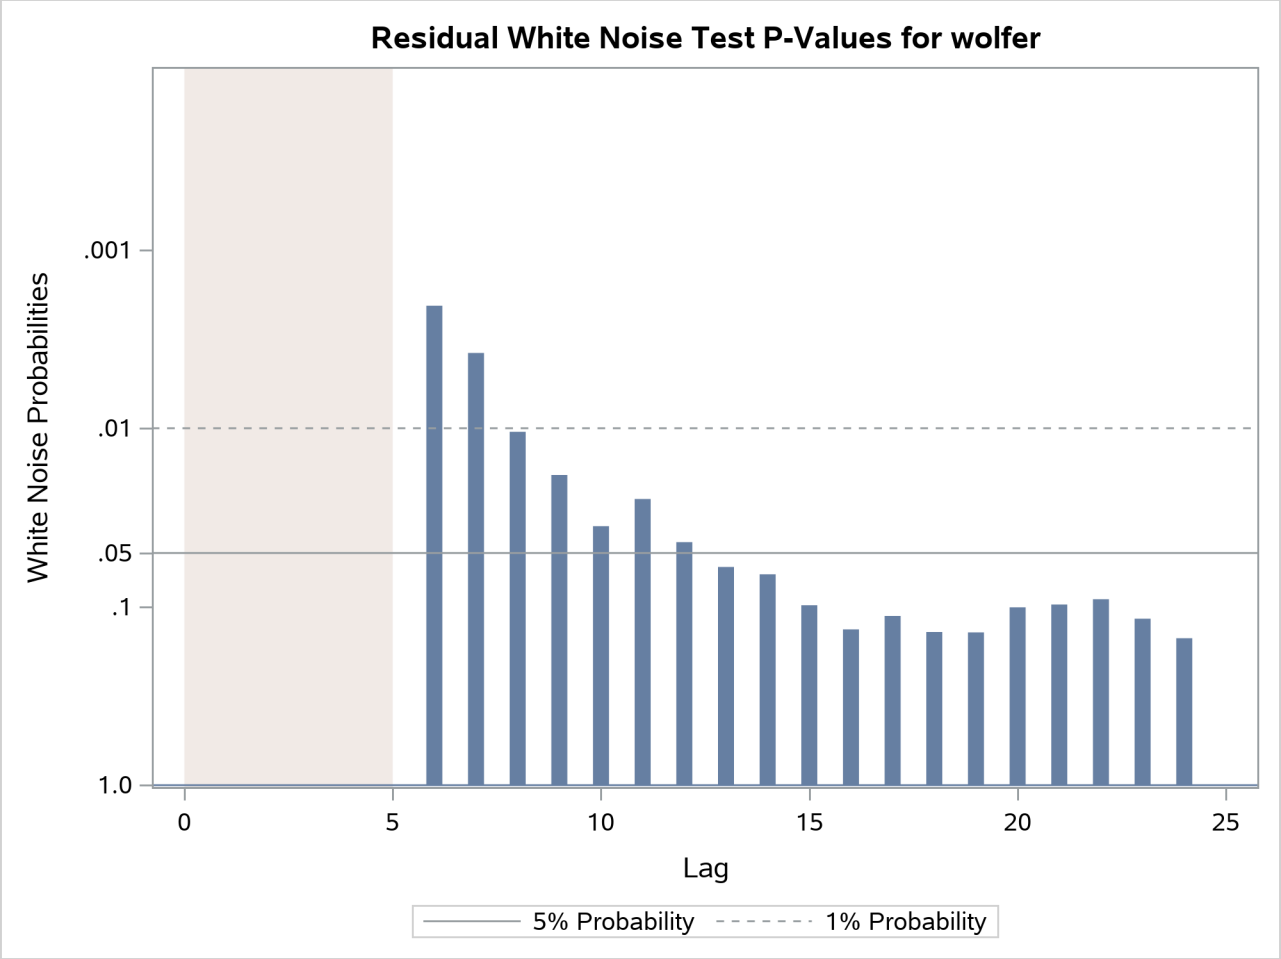
**Figure 42.10** Sunspots Series: Residual Diagnostics



The residual histogram and Q-Q plot show no serious violation of normality. The histogram appears reasonably symmetric and follows the overlaid normal density curve reasonably closely. Similarly, in the Q-Q plot the residuals follow the reference line fairly closely. The ACF and PACF plots also do not exhibit any violation of the whiteness assumption; the correlations at all nonzero lags seem to be insignificant.

The residual whiteness can also be formally tested by using the Ljung-Box portmanteau test. The plot in Figure 42.11, produced by specifying PLOT=WN, shows the $p$-values of the Ljung-Box test statistics at different lags. In these plots the $p$-values for the first few lags, equal to the number of estimated parameters in the model, are not shown because they are always missing. This portion of the plot is shaded blue to indicate this fact. In the case of this model, five parameters are estimated so the $p$-values for the first five lags are not shown. The $p$-values are displayed on a log scale in such a way that higher bars imply more extreme test statistics. In this plot some early $p$-values appear extreme. However, these $p$-values are based on large sample theory, which suggests that these statistics should be examined for lags larger than the square root of sample size. In this example it means that the $p$-values for the first $\sqrt{154} \approx 12$ lags can be ignored. With this consideration, the plot shows no violation of whiteness since the $p$-values after the 12th lag do not appear extreme.

**Figure 42.11** Sunspots Series: Ljung-Box Portmanteau Test

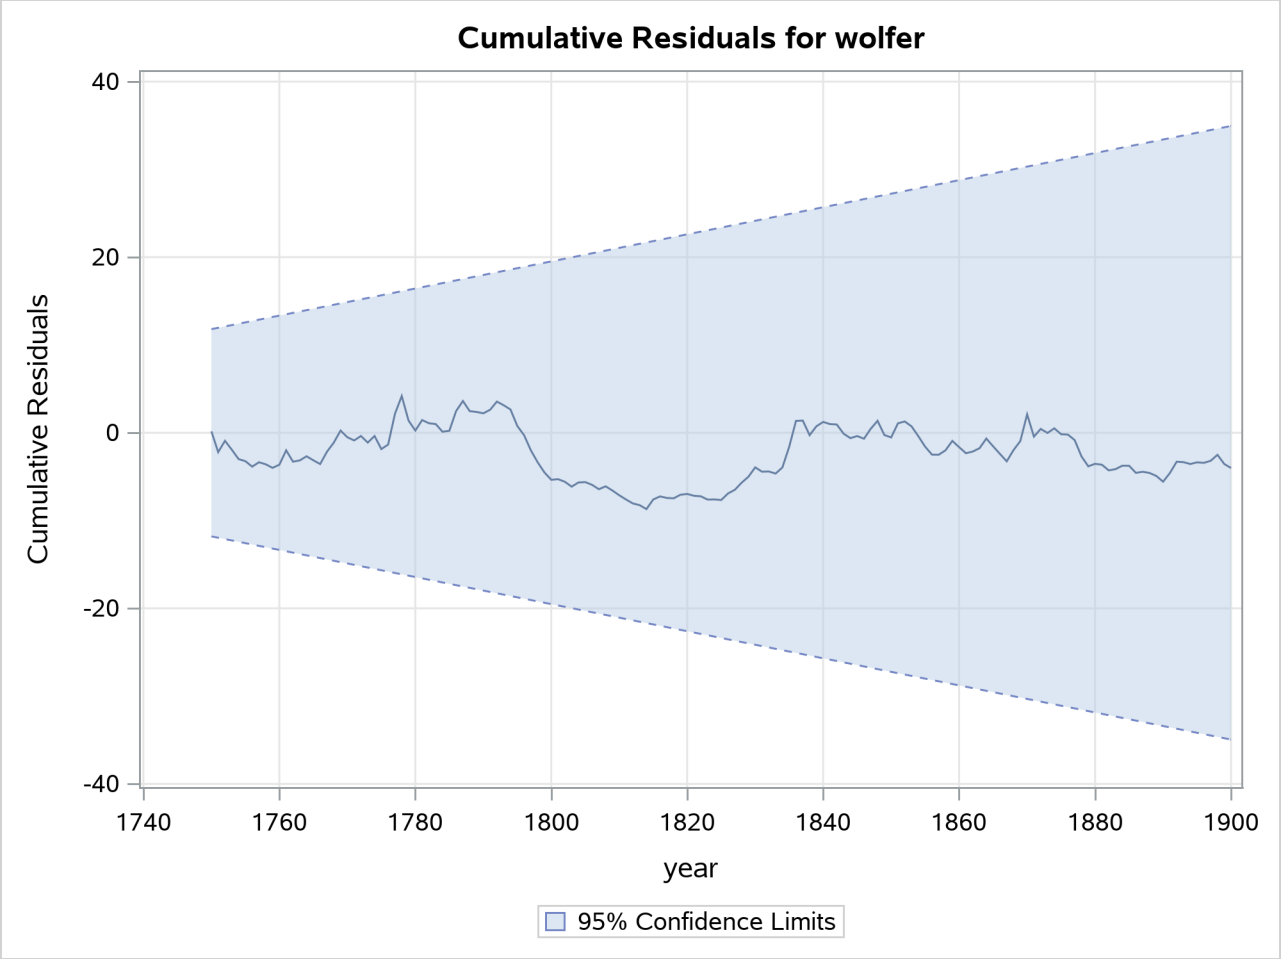


The plot in Figure 42.12, produced by specifying PLOT=LOESS, shows the residuals plotted against time with an overlaid loess curve. This plot is useful for checking whether any discernible pattern remains in the residuals. Here again, no significant pattern appears to be present.

**Figure 42.12** Sunspots Series: Residual Loess Plot

The plot in Figure 42.13, produced by specifying PLOT=CUSUM, shows the cumulative residuals plotted against time. This plot is useful for checking structural breaks. Here, there appears to be no evidence of structural break since the cumulative residuals remain within the confidence band throughout the sample period. Similarly, you can request a plot of the squared cumulative residuals by specifying PLOT=CUSUMSQ.

**Figure 42.13** Sunspots Series: CUSUM Plot



Brockwell and Davis (1991) can be consulted for additional information on diagnosing residuals. For more information about CUSUM and CUSUMSQ plots, you can consult Harvey (1989).

### *Forecast and Series Decomposition Plots*

You can use the PLOT= option in the FORECAST statement to obtain the series forecast plot and the series decomposition plots. The series decomposition plots show the result of successively adding different components in the model starting with the trend component. The IRREGULAR component is left out of this process. The following two plots, produced by specifying PLOT=DECOMP, show the results of successive component addition for this example. The first plot, shown in Figure 42.14, shows the smoothed trend component and the second plot, shown in Figure 42.15, shows the sum of smoothed trend and cycle.

**Figure 42.14** Sunspots Series: Smoothed Trend

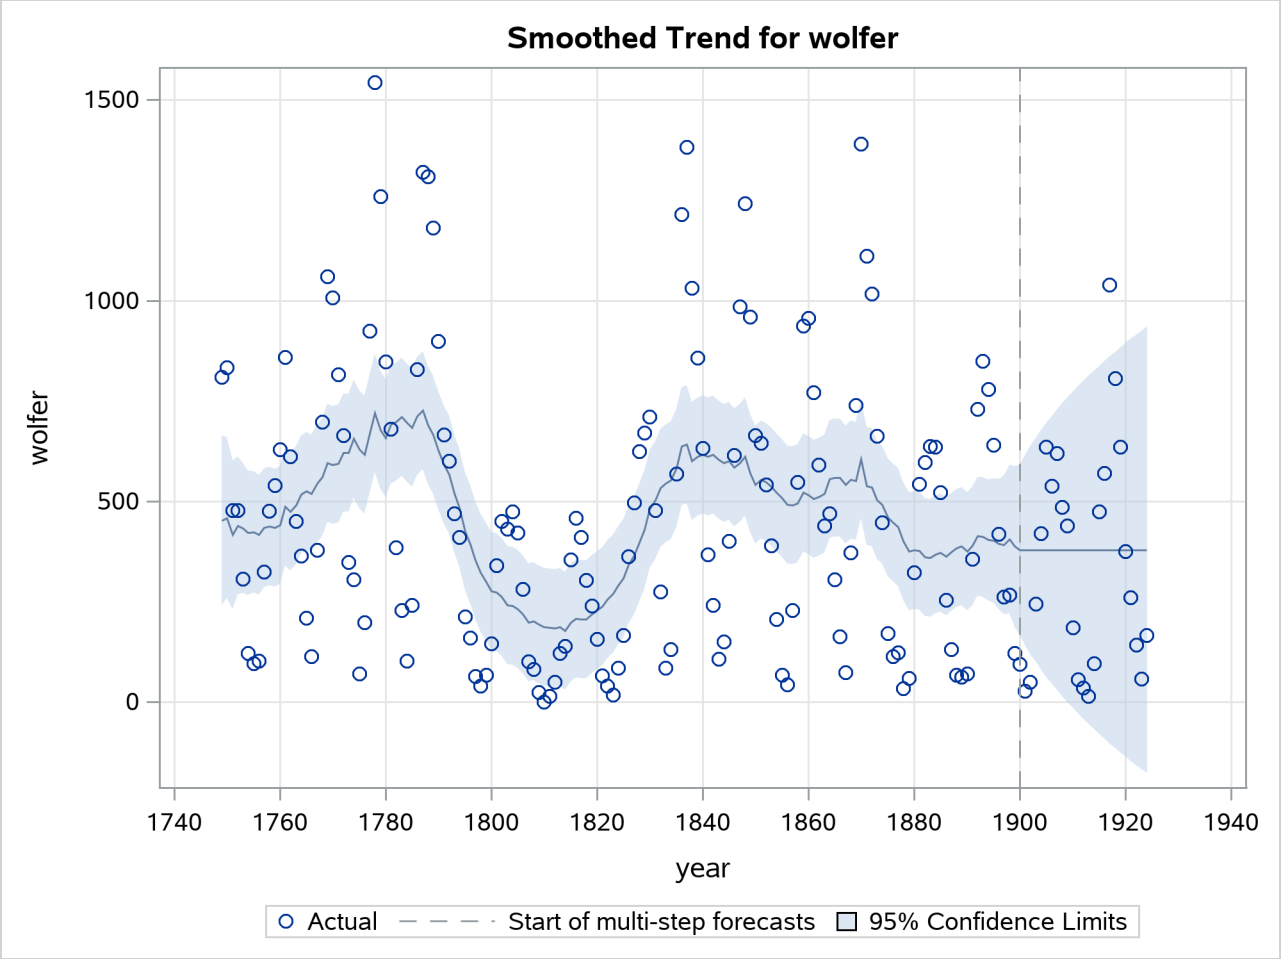


**Figure 42.15** Sunspots Series: Smoothed Trend plus Cycle

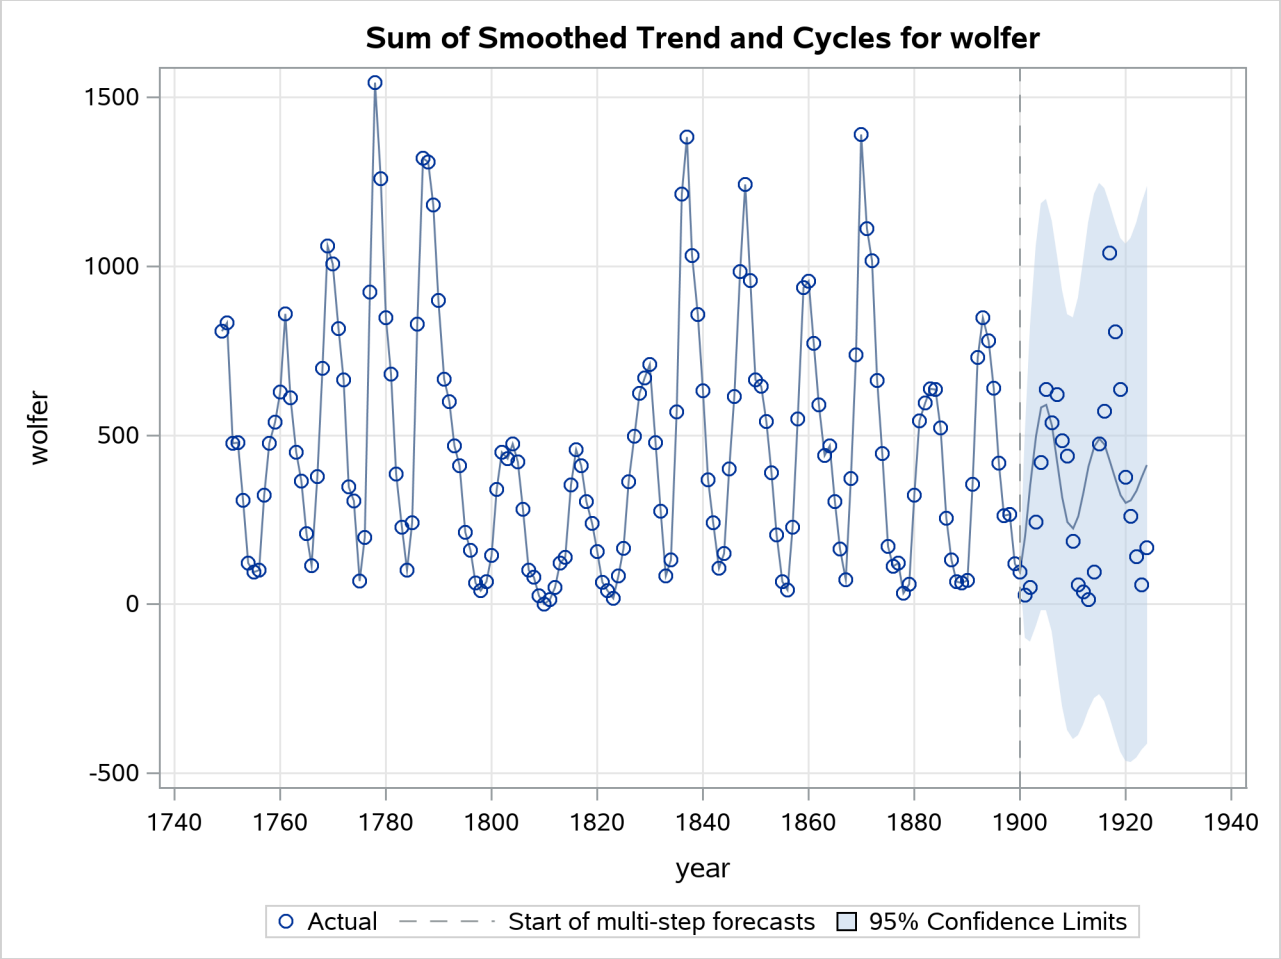
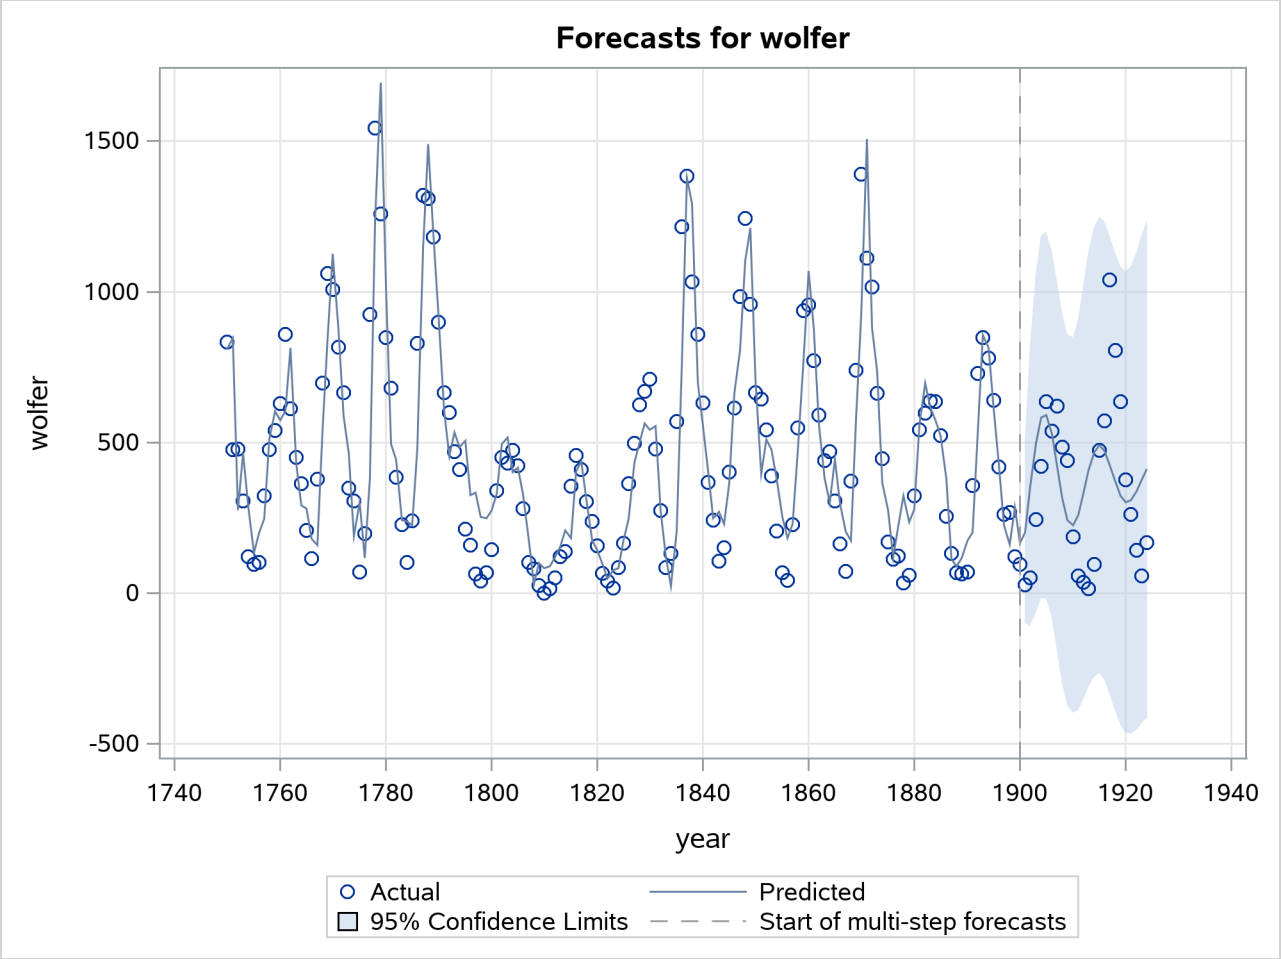


Finally, Figure 42.16 shows the forecast plot.

**Figure 42.16** Sunspots Series: Series Forecasts



## ODS Table Names

The UCM procedure assigns a name to each table it creates. You can use these names to reference the table when using the Output Delivery System (ODS) to select tables and create output data sets. These names are listed in Table 42.2.

**Table 42.2** ODS Tables Produced by PROC UCM

| ODS Table Name | Description | Statement | Option |
|---|---|---|---|
| **Tables Summarizing the Estimation and Forecast Spans** | | | |
| EstimationSpan | Estimation span summary information | | Default |
| ForecastSpan | Forecast span summary information | | Default |

**Table 42.2** *continued*

| ODS Table Name | Description | Statement | Option |
|---|---|---|---|
| **Tables Related to Model Parameters** | | | |
| ConvergenceStatus | Convergence status of the estimation process | | Default |
| FixedParameters | Fixed parameters in the model | | Default |
| InitialParameters | Initial estimates of the free parameters | | Default |
| ParameterEstimates | Final estimates of the free parameters | | Default |
| **Tables Related to Model Information and Diagnostics** | | | |
| BlockSeasonDescription | Information about the block seasonals in the model | | Default |
| ComponentSignificance | Significance analysis of the components in the model | | Default |
| CycleDescription | Information about the cycles in the model | | Default |
| FitStatistics | Fit statistics based on the one-step-ahead predictions | | Default |
| FitSummary | Likelihood-based fit statistics | | Default |
| OutlierSummary | Summary table of the detected outliers | | Default |
| AdditiveOutliers | AO statistics computed at each time point in the estimation span | OUTLIER | PRINT=DETAIL |
| LevelShifts | LS statistics computed at each time point in the estimation span | OUTLIER | PRINT=DETAIL |
| SeasonDescription | Information about the seasonals in the model | | Default |
| SeasonHarmonics | Summary of harmonics in a trigonometric seasonal component | SEASON | PRINT=HARMONICS |
| SplineSeasonDescription | Information about the spline-seasonals in the model | | Default |
| TrendInformation | Summary information of the level and slope components | | Default |
| **Tables Related to Filtered Component Estimates** | | | |
| FilteredAutoReg | Filtered estimate of an autoreg component | AUTOREG | PRINT=FILTER |
| FilteredBlockSeason | Filtered estimate of a block seasonal component | BLOCKSEASON | PRINT=FILTER |

**Table 42.2** *continued*

| ODS Table Name | Description | Statement | Option |
|---|---|---|---|
| FilteredCycle | Filtered estimate of a cycle component | CYCLE | PRINT=FILTER |
| FilteredIrregular | Filtered estimate of the irregular component | IRREGULAR | PRINT=FILTER |
| FilteredLevel | Filtered estimate of the level component | LEVEL | PRINT=FILTER |
| FilteredRandomReg | Filtered estimate of the time-varying random-regression coefficient | RANDOMREG | PRINT=FILTER |
| FilteredSeason | Filtered estimate of a seasonal component | SEASON | PRINT=FILTER |
| FilteredSlope | Filtered estimate of the slope component | SLOPE | PRINT=FILTER |
| FilteredSplineReg | Filtered estimate of the time-varying spline-regression coefficient | SPLINEREG | PRINT=FILTER |
| FilteredSplineSeason | Filtered estimate of a spline-seasonal component | SPLINESEASON | PRINT=FILTER |
| **Tables Related to Smoothed Component Estimates** | | | |
| SmoothedAutoReg | Smoothed estimate of an autoreg component | AUTOREG | PRINT=SMOOTH |
| SmoothedBlockSeason | Smoothed estimate of a block seasonal component | BLOCKSEASON | PRINT=SMOOTH |
| SmoothedCycle | Smoothed estimate of the cycle component | CYCLE | PRINT=SMOOTH |
| SmoothedIrregular | Smoothed estimate of the irregular component | IRREGULAR | PRINT=SMOOTH |
| SmoothedLevel | Smoothed estimate of the level component | LEVEL | PRINT=SMOOTH |
| SmoothedRandomReg | Smoothed estimate of the time-varying random-regression coefficient | RANDOMREG | PRINT=SMOOTH |
| SmoothedSeason | Smoothed estimate of a seasonal component | SEASON | PRINT=SMOOTH |
| SmoothedSlope | Smoothed estimate of the slope component | SLOPE | PRINT=SMOOTH |
| SmoothedSplineReg | Smoothed estimate of the time-varying spline-regression coefficient | SPLINEREG | PRINT=SMOOTH |
| SmoothedSplineSeason | Smoothed estimate of a spline-seasonal component | SPLINESEASON | PRINT=SMOOTH |

**Table 42.2** *continued*

| ODS Table Name | Description | Statement | Option |
|---|---|---|---|
| **Tables Related to Series Decomposition and Forecasting** | | | |
| FilteredAllExceptIrreg | Filtered estimate of sum of all components except the irregular component | FORECAST | PRINT=FDECOMP |
| FilteredTrend | Filtered estimate of trend | FORECAST | PRINT= FDECOMP |
| FilteredTrendReg | Filtered estimate of trend plus regression | FORECAST | PRINT=FDECOMP |
| FilteredTrendRegCyc | Filtered estimate of trend plus regression plus cycles and autoreg | FORECAST | PRINT=FDECOMP |
| Forecasts | Dependent series forecasts | | Default |
| PostSamplePrediction | Forecasting performance in the holdout period | FORECAST | BACK= |
| SmoothedAllExceptIrreg | Smoothed estimate of sum of all components except the irregular component | FORECAST | PRINT=DECOMP |
| SmoothedTrend | Smoothed estimate of trend | FORECAST | PRINT= DECOMP |
| SmoothedTrendReg | Smoothed estimate of trend plus regression | FORECAST | PRINT=DECOMP |
| SmoothedTrendRegCyc | Smoothed estimate of trend plus regression plus cycles and autoreg | FORECAST | PRINT=DECOMP |

**NOTE:** The tables are related to a single series within a BY group. In the case of models that contain multiple cycles, seasonal components, or block seasonal components, the corresponding component estimate tables are sequentially numbered. For example, if a model contains two cycles and a seasonal component and the PRINT=SMOOTH option is used for each of them, the ODS tables containing the smoothed estimates will be named SmoothedCycle1, SmoothedCycle2, and SmoothedSeason. Note that the seasonal table is not numbered because there is only one seasonal component. There are some exceptions to this numbering rule: the tables, FilteredRandomReg, SmoothedRandomReg, FilteredSplineReg, and SmoothedSplineReg, are always numbered starting with zero.

## ODS Graph Names

Statistical procedures use ODS Graphics to create graphs as part of their output. ODS Graphics is described in detail in Chapter 24, "Statistical Graphics Using ODS" (*SAS/STAT User's Guide*).

Before you create graphs, ODS Graphics must be enabled (for example, with the ODS GRAPHICS ON statement). For more information about enabling and disabling ODS Graphics, see the section "Enabling and Disabling ODS Graphics" in that chapter.

The overall appearance of graphs is controlled by ODS styles. Styles and other aspects of using ODS Graphics are discussed in the section "A Primer on ODS Statistical Graphics" in that chapter.

You can reference every graph produced through ODS Graphics with a name. The names of the graphs that PROC UCM generates are listed in Table 42.3, along with the required statements and options.

**Table 42.3** ODS Graphics Produced by PROC UCM

| ODS Graph Name | Description | Statement | Option |
|---|---|---|---|
| **Plots Related to Residual Analysis** | | | |
| ErrorACFPlot | Prediction error autocorrelation plot | ESTIMATE | PLOT=ACF |
| ErrorPACFPlot | Prediction error partial-autocorrelation plot | ESTIMATE | PLOT=PACF |
| ErrorHistogram | Prediction error histogram | ESTIMATE | PLOT=NORMAL |
| ErrorQQPlot | Prediction error normal quantile plot | ESTIMATE | PLOT=QQ |
| ErrorPlot | Plot of prediction errors | ESTIMATE | PLOT=RESIDUAL |
| ErrorWhiteNoiseLogProbPlot | Plot of *p*-values at different lags for the Ljung-Box portmanteau white noise test statistics | ESTIMATE | PLOT=WN |
| CUSUMPlot | Plot of cumulative residuals | ESTIMATE | PLOT=CUSUM |
| CUSUMSQPlot | Plot of cumulative squared residuals | ESTIMATE | PLOT=CUSUMSQ |
| ModelPlot | Plot of one-step-ahead forecasts in the estimation span | ESTIMATE | PLOT=MODEL |
| PanelResidualPlot | Panel of residual diagnostic plots | ESTIMATE | PLOT=PANEL |
| ResidualLoessPlot | Time series plot of residuals with superimposed loess smoother | ESTIMATE | PLOT=LOESS |
| **Plots Related to Filtered Component Estimates** | | | |
| FilteredAutoregPlot | Plot of filtered autoreg component | AUTOREG | PLOT=FILTER |
| FilteredBlockSeasonPlot | Plot of filtered block season component | BLOCKSEASON | PLOT=FILTER |

**Table 42.3** *continued*

| ODS Graph Name | Description | Statement | Option |
|---|---|---|---|
| FilteredCyclePlot | Plot of filtered cycle component | CYCLE | PLOT=FILTER |
| FilteredIrregularPlot | Plot of filtered irregular component | IRREGULAR | PLOT=FILTER |
| FilteredLevelPlot | Plot of filtered level component | LEVEL | PLOT=FILTER |
| FilteredRandomRegPlot | Plot of filtered time-varying regression coefficient | RANDOMREG | PLOT=FILTER |
| FilteredSeasonPlot | Plot of filtered season component | SEASON | PLOT=FILTER |
| FilteredSlopePlot | Plot of filtered slope component | SLOPE | PLOT=FILTER |
| FilteredSplineRegPlot | Plot of filtered time-varying regression coefficient | SPLINEREG | PLOT=FILTER |

## OUTFOR= Data Set

You can use the OUTFOR= option in the FORECAST statement to store the series and component forecasts produced by the procedure. This data set contains the following columns:

- the BY variables
- the ID variable. If an ID variable is not specified, then a numerical variable, _ID_, is created that contains the observation numbers from the input data set.
- the dependent series and the predictor series
- FORECAST, a numerical variable containing the one-step-ahead predicted values and the multistep forecasts
- RESIDUAL, a numerical variable containing the difference between the actual and forecast values
- STD, a numerical variable containing the standard error of prediction
- LCL and UCL, numerical variables containing the lower and upper forecast confidence limits
- S_SERIES and VS_SERIES, numerical variables containing the smoothed values of the dependent series and their variances
- S_IRREG and VS_IRREG, numerical variables containing the smoothed values of the irregular component and their variances. These variables are present only if the model has an irregular component.
- F_LEVEL, VF_LEVEL, S_LEVEL, and VS_LEVEL, numerical variables containing the filtered and smoothed values of the level component and the respective variances. These variables are present only if the model has a level component.
- F_SLOPE, VF_SLOPE, S_SLOPE, and VS_SLOPE, numerical variables containing the filtered and smoothed values of the slope component and the respective variances. These variables are present only if the model has a slope component.
- F_AUTOREG, VF_AUTOREG, S_AUTOREG, and VS_AUTOREG, numerical variables containing the filtered and smoothed values of the autoreg component and the respective variances. These variables are present only if the model has an autoreg component.

- F_CYCLE, VF_CYCLE, S_CYCLE, and VS_CYCLE, numerical variables containing the filtered and smoothed values of the cycle component and the respective variances. If there are multiple cycles in the model, these variables are sequentially numbered as F_CYCLE1, F_CYCLE2, and so on. These variables are present only if the model has at least one cycle component.

- F_SEASON, VF_SEASON, S_SEASON, and VS_SEASON, numerical variables containing the filtered and smoothed values of the season component and the respective variances. If there are multiple seasons in the model, these variables are sequentially numbered as F_SEASON1, F_SEASON2, and so on. These variables are present only if the model has at least one season component.

- F_BLKSEAS, VF_BLKSEAS, S_BLKSEAS, and VS_BLKSEAS, numerical variables containing the filtered and smoothed values of the blockseason component and the respective variances. If there are multiple block seasons in the model, these variables are sequentially numbered as F_BLKSEAS1, F_BLKSEAS2, and so on.

- F_SPLSEAS, VF_SPLSEAS, S_SPLSEAS, and VS_SPLSEAS, numerical variables containing the filtered and smoothed values of the splineseason component and the respective variances. If there are multiple spline seasons in the model, these variables are sequentially numbered as F_SPLSEAS1, F_SPLSEAS2, and so on. These variables are present only if the model has at least one splineseason component.

- Filtered and smoothed estimates, and their variances, of the time-varying regression coefficients of the variables that are specified in the RANDOMREG and SPLINEREG statements. A variable is not included if its coefficient is time-invariant, that is, if the associated disturbance variance is zero.

- F_TF, VF_TF, S_TF, and VS_TF, numerical variables that contain the filtered and smoothed values of the transfer-function component and their variances. If there are multiple transfer-function components in the model, these variables are sequentially numbered as F_TF1, F_TF2, and so on. These variables are present only if the model has at least one transfer-function component.

- S_TREG and VS_TREG, numerical variables containing the smoothed values of level plus regression component and their variances. These variables are present only if the model has at least one predictor variable or has dependent lags.

- S_TREGCYC and VS_TREGCYC, numerical variables containing the smoothed values of level plus regression plus cycle component and their variances. These variables are present only if the model has at least one cycle or an autoreg component.

- S_NOIRREG and VS_NOIRREG, numerical variables containing the smoothed values of the sum of all components except the irregular component and their variances. These variables are present only if the model has at least one seasonal or block seasonal component.

## OUTEST= Data Set

You can use the OUTEST= option in the ESTIMATE statement to store the model parameters and the related estimation details. This data set contains the following columns:

- the BY variables
- COMPONENT, a character variable containing the name of the component corresponding to the parameter being described
- PARAMETER, a character variable containing the parameter name
- TYPE, a character variable indicating whether the parameter value was fixed by the user or estimated
- _STATUS_, a character variable indicating whether the parameter estimation process converged or failed or there was an error of some other kind
- ESTIMATE, a numerical variable containing the parameter estimate
- STD, a numerical variable containing the standard error of the parameter estimate. This has a missing value if the parameter value is fixed.
- TVALUE, a numerical variable containing the *t*-statistic. This has a missing value if the parameter value is fixed.
- PVALUE, a numerical variable containing the *p*-value. This has a missing value if the parameter value is fixed.

## Statistics of Fit

This section explains the goodness-of-fit statistics reported to measure how well the specified model fits the data.

First the various statistics of fit that are computed using the prediction errors, $y_t - \hat{y}_t$, are considered. In these formulas, $n$ is the number of nonmissing prediction errors and $k$ is the number of fitted parameters in the model. Moreover, the sum of squared errors, $\mathrm{SSE} = \sum (y_t - \hat{y}_t)^2$, and the total sum of squares for the series corrected for the mean, $\mathrm{SST} = \sum (y_t - \overline{y})^2$, where $\overline{y}$ is the series mean, and the sums are over all the nonmissing prediction errors.

*Mean Squared Error*
The mean squared prediction error, $\mathrm{MSE} = \frac{1}{n}\mathrm{SSE}$

*Root Mean Squared Error*
The root mean square error, RMSE = $\sqrt{\mathrm{MSE}}$

*Mean Absolute Percent Error*
The mean absolute percent prediction error, MAPE = $\frac{100}{n} \sum_{t=1}^{n} |(y_t - \hat{y}_t)/y_t|$.
The summation ignores observations where $y_t = 0$.

*R-Square*
The R-square statistic, $R^2 = 1 - \mathrm{SSE}/\mathrm{SST}$.
If the model fits the series badly, the model error sum of squares, SSE, might be larger than SST and the R-square statistic will be negative.

*Adjusted R-Square*
The adjusted R-square statistic, $1 - (\frac{n-1}{n-k})(1 - R^2)$

*Amemiya's Adjusted R-Square*
Amemiya's adjusted R-square, $1 - (\frac{n+k}{n-k})(1 - R^2)$

*Random Walk R-Square*
The random walk R-square statistic (Harvey's R-square statistic that uses the random walk model for comparison), $1 - (\frac{n-1}{n})\mathrm{SSE}/\mathrm{RWSSE}$, where $\mathrm{RWSSE} = \sum_{t=2}^{n} (y_t - y_{t-1} - \mu)^2$, and $\mu = \frac{1}{n-1} \sum_{t=2}^{n} (y_t - y_{t-1})$

*Maximum Percent Error*
The largest percent prediction error, $100 \max((y_t - \hat{y}_t)/y_t)$. In this computation the observations where $y_t = 0$ are ignored.

The likelihood-based fit statistics are reported separately (see the section "The UCMs as State Space Models" on page 2897). They include the full log likelihood ($L_\infty$), the diffuse part of the log likelihood, the normalized residual sum of squares, and several information criteria: AIC, AICC, HQIC, BIC, and CAIC. Let $q$ denote the number of estimated parameters, $n$ be the number of nonmissing measurements in the estimation span, and $d$ be the number of diffuse elements in the initial state vector that are successfully initialized during the Kalman filtering process. Moreover, let $n^* = (n - d)$. The reported information criteria, all in smaller-is-better form, are described in Table 42.4:

**Table 42.4** Information Criteria

| Criterion | Formula | Reference |
|---|---|---|
| AIC | $-2L_\infty + 2q$ | Akaike (1974) |
| AICC | $-2L_\infty + 2qn^*/(n^* - q - 1)$ | Hurvich and Tsai (1989)<br>Burnham and Anderson (1998) |
| HQIC | $-2L_\infty + 2q \log\log(n^*)$ | Hannan and Quinn (1979) |
| BIC | $-2L_\infty + q \log(n^*)$ | Schwarz (1978) |
| CAIC | $-2L_\infty + q(\log(n^*) + 1)$ | Bozdogan (1987) |

# Examples: UCM Procedure

## Example 42.1: The Airline Series Revisited

The series in this example, the monthly airline passenger series, has already been discussed earlier; see the section "A Seasonal Series with Linear Trend" on page 2851. Recall that the series consists of monthly numbers of international airline travelers (from January 1949 to December 1960). Here additional output features of the UCM procedure are illustrated, such as how to use the ESTIMATE and FORECAST statements to limit the span of the data used in parameter estimation and forecasting. The following statements fit a BSM to the logarithm of the airline passenger numbers. The disturbance variance for the slope component is held fixed at value 0; that is, the trend is locally linear with constant slope. In order to evaluate the performance of the fitted model on observed data, some of the observed data are withheld during parameter estimation and forecast computations. The observations in the last two years, years 1959 and 1960, are not used in parameter estimation, while the observations in the last year, year 1960, are not used in the forecasting computations. This is done using the BACK= option in the ESTIMATE and FORECAST statements. In addition, a panel of residual diagnostic plots is obtained using the PLOT=PANEL option in the ESTIMATE statement.

```
data seriesG;
   set sashelp.air;
   logair = log(air);
run;

proc ucm data = seriesG;
   id date interval = month;
   model logair;
   irregular;
   level;
   slope var = 0 noest;
   season length = 12 type=trig;
   estimate back=24 plot=panel;
   forecast back=12 lead=24 print=forecasts;
run;
```

The following tables display the summary of data used in estimation and forecasting (Output 42.1.1 and Output 42.1.2). These tables provide simple summary statistics for the estimation and forecast spans; they include useful information such as the beginning and ending dates of the span, the number of nonmissing values, and so on.

**Output 42.1.1** Observation Span Used in Parameter Estimation (partial output)

| Variable | Type | First | Last | Nobs | Mean |
|---|---|---|---|---|---|
| logair | Dependent | JAN1949 | DEC1958 | 120 | 5.43035 |

**Output 42.1.2** Observation Span Used in Forecasting (partial output)

| Variable | Type | First | Last | Nobs | Mean |
|---|---|---|---|---|---|
| logair | Dependent | JAN1949 | DEC1959 | 132 | 5.48654 |

The following tables display the fixed parameters in the model, the preliminary estimates of the free parameters, and the final estimates of the free parameters (Output 42.1.3, Output 42.1.4, and Output 42.1.5).

**Output 42.1.3** Fixed Parameters in the Model

**The UCM Procedure**

| Fixed Parameters in the Model | | |
|---|---|---|
| **Component** | **Parameter** | **Value** |
| **Slope** | **Error Variance** | 0 |

**Output 42.1.4** Starting Values for the Parameters to Be Estimated

| Preliminary Estimates of the Free Parameters | | |
|---|---|---|
| **Component** | **Parameter** | **Estimate** |
| **Irregular** | **Error Variance** | 6.64120 |
| **Level** | **Error Variance** | 2.49045 |
| **Season** | **Error Variance** | 1.26676 |

**Output 42.1.5** Maximum Likelihood Estimates of the Free Parameters

| Final Estimates of the Free Parameters | | | | | |
|---|---|---|---|---|---|
| **Component** | **Parameter** | **Estimate** | **Approx Std Error** | **t Value** | **Approx Pr > \|t\|** |
| **Irregular** | **Error Variance** | 0.00018686 | 0.0001212 | 1.54 | 0.1233 |
| **Level** | **Error Variance** | 0.00040314 | 0.0001566 | 2.57 | 0.0100 |
| **Season** | **Error Variance** | 0.00000350 | 1.66319E-6 | 2.10 | 0.0354 |

Two types of goodness-of-fit statistics are reported after a model is fit to the series (see Output 42.1.6 and Output 42.1.7). The first type is the likelihood-based goodness-of-fit statistics, which include the full likelihood of the data, the diffuse portion of the likelihood (see the section "Details: UCM Procedure" on page 2891), and the information criteria. The second type of statistics is based on the raw residuals, residual = observed – predicted. If the model is nonstationary, then one-step-ahead predictions are not available for some initial observations, and the number of values used in computing these fit statistics will be different from those used in computing the likelihood-based test statistics.

**Output 42.1.6** Likelihood-Based Fit Statistics for the Airline Data

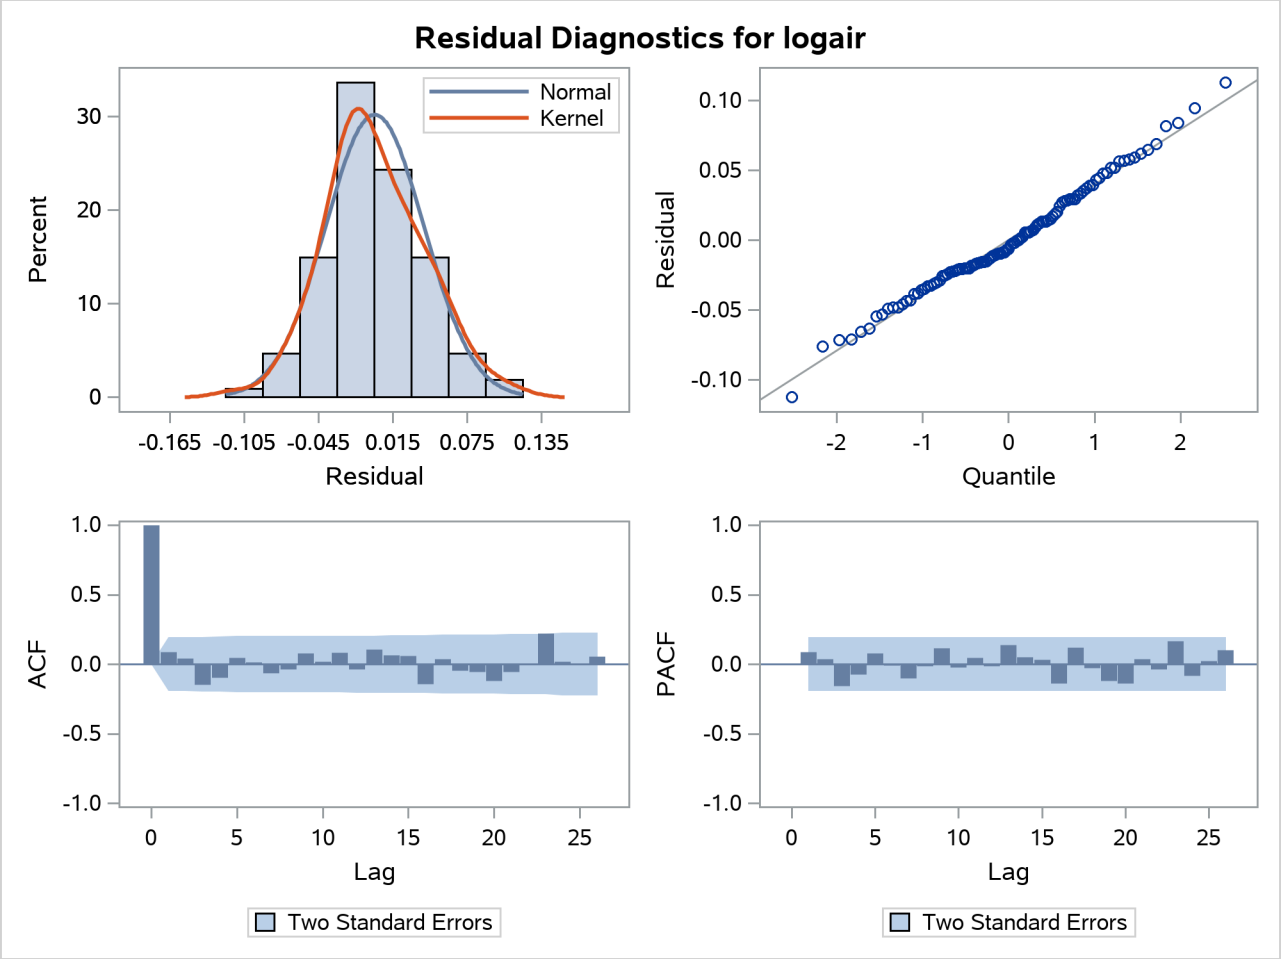
| Likelihood Based Fit Statistics | |
|---|---|
| **Statistic** | **Value** |
| **Diffuse Log Likelihood** | 180.63 |
| **Diffuse Part of Log Likelihood** | -13.93 |
| **Non-Missing Observations Used** | 120 |
| **Estimated Parameters** | 3 |
| **Initialized Diffuse State Elements** | 13 |
| **Normalized Residual Sum of Squares** | 107 |
| **AIC (smaller is better)** | -355.3 |
| **BIC (smaller is better)** | -347.2 |
| **AICC (smaller is better)** | -355 |
| **HQIC (smaller is better)** | -352 |
| **CAIC (smaller is better)** | -344.2 |

**Output 42.1.7** Residuals-Based Fit Statistics for the Airline Data

| Fit Statistics Based on Residuals | |
|---|---|
| **Mean Squared Error** | 0.00156 |
| **Root Mean Squared Error** | 0.03944 |
| **Mean Absolute Percentage Error** | 0.57677 |
| **Maximum Percent Error** | 2.19396 |
| **R-Square** | 0.98705 |
| **Adjusted R-Square** | 0.98680 |
| **Random Walk R-Square** | 0.86370 |
| **Amemiya's Adjusted R-Square** | 0.98630 |
| **Number of non-missing residuals used for computing the fit statistics = 107** | |

The diagnostic plots based on the one-step-ahead residuals are shown in Output 42.1.8. The residual histogram and the Q-Q plot show no reasons to question the approximate normality of the residual distribution. The remaining plots check for the *whiteness* of the residuals. The sample correlation plots, the autocorrelation function (ACF) and the partial autocorrelation function (PACF), also do not show any significant violations of the whiteness of the residuals. Therefore, on the whole, the model seems to fit the data well.

**Output 42.1.8** Residual Diagnostics for the Airline Series Using a BSM



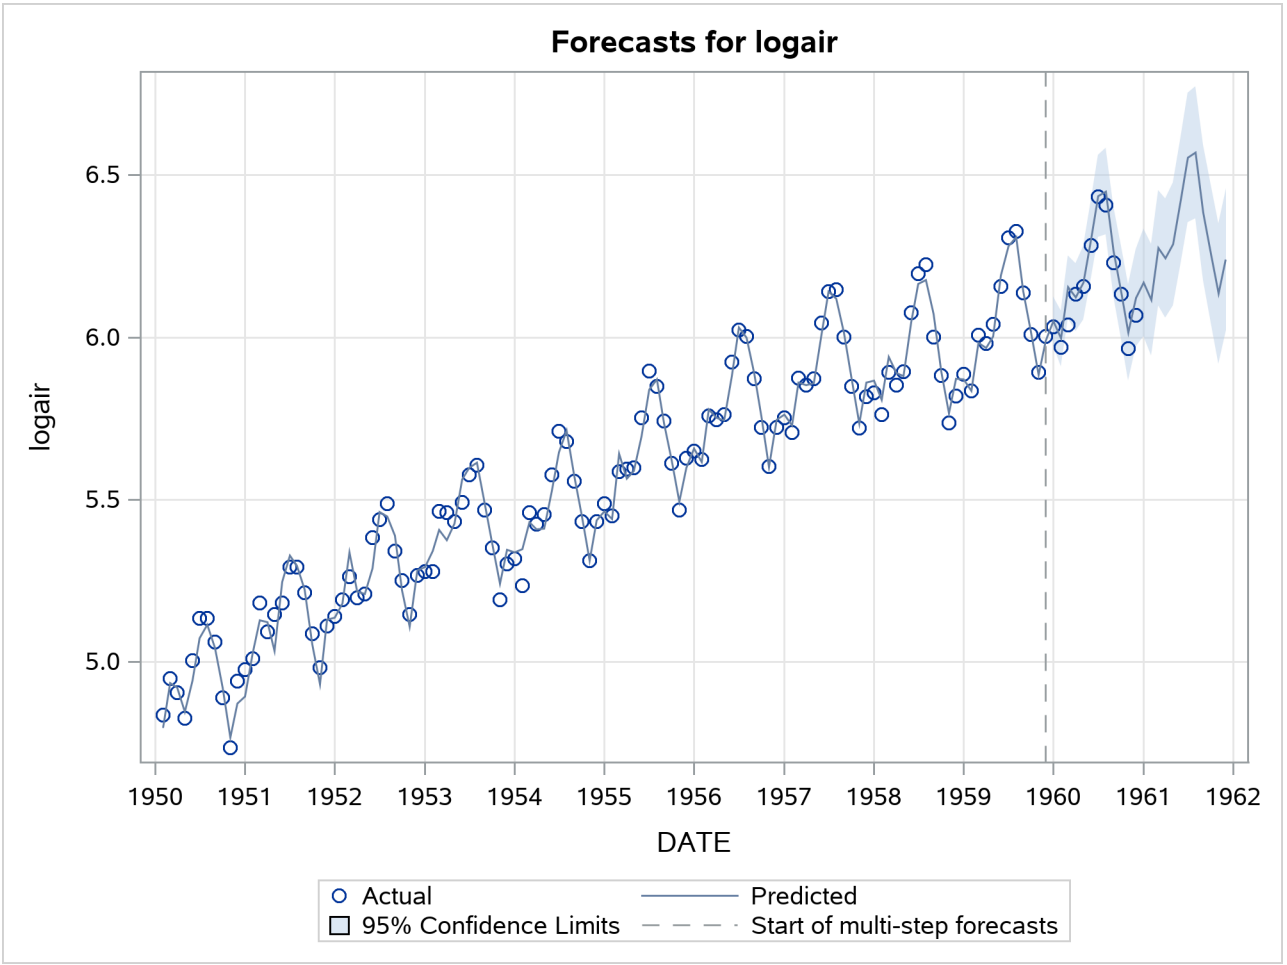
The forecasts are given in Output 42.1.9. In order to save the space, the upper and lower confidence limit columns are dropped from the output, and only the rows corresponding to the year 1960 are shown. Recall that the actual measurements in the years 1959 and 1960 were withheld during the parameter estimation, and the ones in 1960 were not used in the forecast computations.

**Output 42.1.9** Forecasts for the Airline Data

| Obs | date | Forecast | StdErr | logair | Residual |
|---|---|---|---|---|---|
| 133 | JAN60 | 6.050 | 0.038 | 6.033 | -0.017 |
| 134 | FEB60 | 5.996 | 0.044 | 5.969 | -0.027 |
| 135 | MAR60 | 6.156 | 0.049 | 6.038 | -0.118 |
| 136 | APR60 | 6.124 | 0.053 | 6.133 | 0.010 |
| 137 | MAY60 | 6.168 | 0.058 | 6.157 | -0.011 |
| 138 | JUN60 | 6.303 | 0.061 | 6.282 | -0.021 |
| 139 | JUL60 | 6.435 | 0.065 | 6.433 | -0.002 |
| 140 | AUG60 | 6.450 | 0.068 | 6.407 | -0.043 |
| 141 | SEP60 | 6.265 | 0.071 | 6.230 | -0.035 |
| 142 | OCT60 | 6.138 | 0.073 | 6.133 | -0.005 |
| 143 | NOV60 | 6.015 | 0.075 | 5.966 | -0.049 |
| 144 | DEC60 | 6.121 | 0.077 | 6.068 | -0.053 |

Output 42.1.10 shows the forecast plot. The forecasts in the year 1960 show that the model predictions were quite good.

**Output 42.1.10** Forecast Plot of the Airline Series Using a BSM



## Example 42.2: Variable Star Data

The series in this example is studied in detail in Bloomfield (2000). This series consists of brightness measurements (magnitude) of a variable star taken at midnight for 600 consecutive days. The data can be downloaded from a time series archive maintained by the University of York, England (http://www.york.ac.uk/depts/maths/data/ts/welcome.htm (series number 26)). The following DATA step statements read the data in a SAS data set:

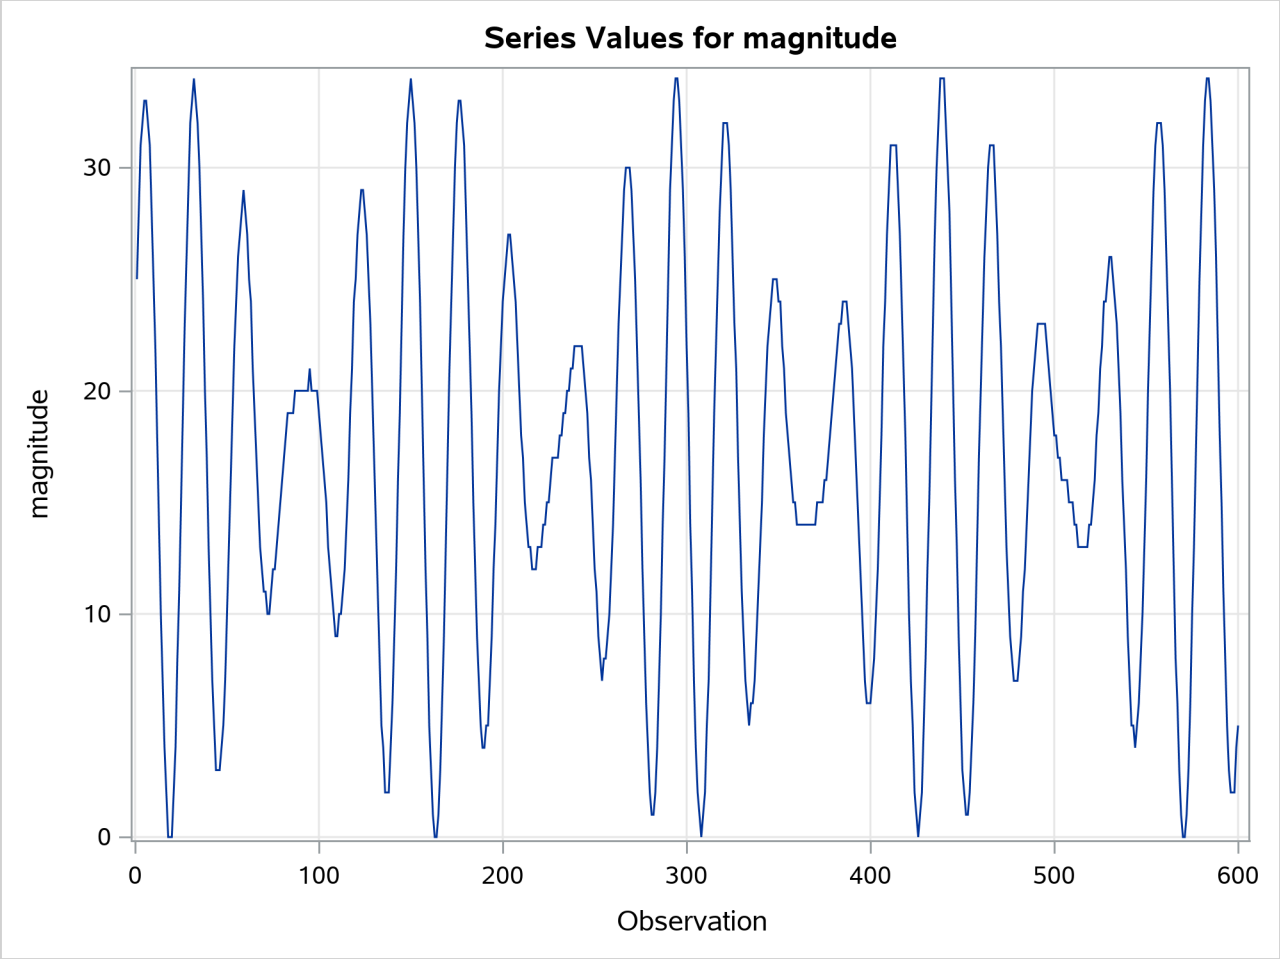
```
data star;
   input magnitude @@;
   day = _n_;
datalines;
  25  28  31  32  33  33  32  31  28   25   22   18
  14  10   7   4   2   0   0   0   2    4    8   11
  15  19  23  26  29  32  33  34  33   32   30   27
  24  20  17  13  10   7   5   3   3    3    4    5
   7  10  13  16  19  22  24  26  27   28   29   28
  27  25  24  21  19  17  15  13  12   11   11   10
  10  11  12  12  13  14  15  16  17   18   19   19

   ... more lines ...
```

The following statements use the TIMESERIES procedure to get a timeseries plot of the series (see Output 42.2.1):

```
proc timeseries data=star plot=series;
   var magnitude;
run;
```

**Output 42.2.1** Plot of Star Brightness on Successive Days



The plot clearly shows the cyclic nature of the series. Bloomfield shows that the series is very well explained by a model that includes two deterministic cycles that have periods 29.0003 and 24.0001 days, a constant term, and a simple error term. He also mentions the difficulty involved in estimating the periods from the data (Bloomfield 2000, Chapter 3). In his case the cycle periods are estimated by least squares, and the sum of squares surface has multiple local optima and ridges. The following statements show how to use the UCM procedure to fit this two-cycle model to the series. The constant term in the model is specified by holding the variance parameter of the level component to zero.

```
proc ucm data=star;
   model magnitude;
   irregular;
   level var=0 noest;
   cycle;
   cycle;
   estimate;
run;
```

The final parameter estimates and the goodness-of-fit statistics are shown in Output 42.2.2 and Output 42.2.3, respectively. The model fit appears to be good.

**Output 42.2.2** Two-Cycle Model: Parameter Estimates

**The UCM Procedure**

**Final Estimates of the Free Parameters**

| Component | Parameter | Estimate | Approx Std Error | t Value | Approx Pr > \|t\| |
|---|---|---|---|---|---|
| Irregular | Error Variance | 0.09257 | 0.0053845 | 17.19 | <.0001 |
| Cycle_1 | Damping Factor | 1.00000 | 1.81175E-7 | 5519514 | <.0001 |
| Cycle_1 | Period | 29.00036 | 0.0022709 | 12770.4 | <.0001 |
| Cycle_1 | Error Variance | 0.00000882 | 5.27213E-6 | 1.67 | 0.0944 |
| Cycle_2 | Damping Factor | 1.00000 | 2.11939E-7 | 4718334 | <.0001 |
| Cycle_2 | Period | 24.00011 | 0.0019128 | 12547.2 | <.0001 |
| Cycle_2 | Error Variance | 0.00000535 | 3.56374E-6 | 1.50 | 0.1330 |

**Output 42.2.3** Two-Cycle Model: Goodness of Fit

| Fit Statistics Based on Residuals | |
|---|---|
| Mean Squared Error | 0.12072 |
| Root Mean Squared Error | 0.34745 |
| Mean Absolute Percentage Error | 2.65141 |
| Maximum Percent Error | 36.38991 |
| R-Square | 0.99850 |
| Adjusted R-Square | 0.99849 |
| Random Walk R-Square | 0.97281 |
| Amemiya's Adjusted R-Square | 0.99847 |
| Number of non-missing residuals used for computing the fit statistics = 599 | |

A summary of the cycles in the model is given in Output 42.2.4.

**Output 42.2.4** Two-Cycle Model: Summary

| Name | Type | period | Rho | ErrorVar |
|---|---|---|---|---|
| Cycle_1 | Stationary | 29.00036 | 1.00000 | 0.00000882 |
| Cycle_2 | Stationary | 24.00011 | 1.00000 | 0.00000535 |

Note that the estimated periods are the same as in Bloomfield's model, the damping factors are nearly equal to 1.0, and the disturbance variances are very close to zero, implying persistent deterministic cycles. In fact, this model is identical to Bloomfield's model.

## Example 42.3: Modeling Long Seasonal Patterns

This example illustrates some of the techniques you can use to model long seasonal patterns in a series. If the seasonal pattern is of moderate length and the underlying dynamics are simple, then it is easily modeled by using the basic settings of the SEASON statement and these additional techniques are not needed. However, if the seasonal pattern has a long season length and/or has a complex stochastic dynamics, then the techniques discussed here can be useful. You can obtain parsimonious models for a long seasonal pattern by using an appropriate subset of trigonometric harmonics, or by using a suitable spline function, or by using a block-season pattern in combination with a seasonal component of much smaller length. You can also vary the disturbance variances of the subcomponents that combine to form the seasonal component.

The time series used in this example consists of number of calls received per shift at a call center. Each shift is six hours long, and the first shift of the day begins at midnight, resulting in four shifts per day. The observations are available from December 15, 1999, to April 30, 2000. This series is seasonal with season length 28, which is moderate, and in fact there is no particular need to use pattern approximation techniques in this case. However, it is adequate for demonstration purposes. The plan of this example is as follows. First an initial model with a full seasonal component is created. This model is used as a baseline for comparing alternate models created by the techniques that are being illustrated. In practice any candidate model is first checked for adequacy by using various diagnostic procedures. In this illustration the main focus is on the different ways a long seasonal pattern can be modeled and no model diagnostics are done for the models being entertained. The alternate models are compared by using the sum of absolute prediction errors in the holdout region.

The following DATA step statements create the input data set used in this example:

```
data callCenter;
   input calls @@;
   label calls= "Number of Calls Received in a 6 Hour Shift";
   start = '15dec99:00:00'dt;
   datetime = INTNX( 'dthour6', start, _n_-1 );
   format datetime datetime10.;
datalines;
  18    122    244    128     19    113    230    119     17    112
 219     93     14     73    139     53     11     32     74     56
  15    137    289    153     20    125    227    106     16    101
 201     92     14     94    187     69     11     59     94     21

   ... more lines ...
```

Initial exploration of the series clearly indicates that the series does not show any significant trend, and time of day and day of the week have a significant influence on the number of calls received. These considerations suggest a simple random walk trend model along with a seasonal component of season length 28, the total number of shifts in a week. The following statements specify this model. Note the PRINT=HARMONICS option in the SEASON statement, which produces a table that lists the full set of harmonics contributing to the seasonal along with the significance of their contribution. This table will be useful later in choosing a subset trigonometric model. The BACK=28 and LEAD=28 specifications in the FORECAST statement create a holdout region of 28 observations. The sum of absolute prediction errors (SAE) in this holdout region is used to compare the different models.

```
proc ucm data=callCenter;
   id datetime interval=dthour6;
   model calls;
   irregular;
   level;
   season length=28 type=trig
      print=(harmonics);
   estimate back=28;
   forecast back=28 lead=28;
run;
```

The forecasting performance of this model in the holdout region is shown in Output 42.3.1. The SAE is 516.22, which appears in the last row of the holdout analysis table.

**Output 42.3.1** Predictions in the Holdout Region: Baseline Model

| Obs | datetime | Actual | Forecast | Error | SAE |
|---|---|---|---|---|---|
| 525 | 24APR00:00 | 12 | -4.004 | 16.004 | 16.004 |
| 526 | 24APR00:06 | 136 | 110.825 | 25.175 | 41.179 |

| 549 | 30APR00:00 | 10 | -6.209 | 16.209 | 460.978 |
| 550 | 30APR00:06 | 30 | 12.167 | 17.833 | 478.811 |
| 551 | 30APR00:12 | 66 | 49.524 | 16.476 | 495.287 |
| 552 | 30APR00:18 | 61 | 40.071 | 20.929 | 516.216 |

Now that a baseline model is created, the exploration for alternate models can begin. The review of the harmonic table in Output 42.3.2 shows that all but the last three harmonics are significant, and deleting any of them to form a subset trigonometric seasonal component will lead to a poorer model. The last three harmonics, 12th, 13th, and 14th, with periods of 2.333, 2.15 and 2.0, respectively, do appear to be possible

choices for deletion. Note that the disturbance variance of the seasonal component is not very insignificant (see Output 42.3.3); therefore the seasonal component is stochastic and the preceding logic, which is based on the final state estimate, provides only a rough guideline.

**Output 42.3.2** Harmonic Analysis of the Season: Initial Model

**The UCM Procedure**

**Harmonic Analysis of Trigonometric Seasons (Based on the Final State)**

| Name | Season Length | Harmonic | Period | Chi-Square | DF | Pr > ChiSq |
|---|---|---|---|---|---|---|
| **Season** | 28 | 1 | 28.00000 | 234.19 | 2 | <.0001 |

| **Season** | 28 | 14 | 2.00000 | 2.33 | 1 | 0.1272 |

**Output 42.3.3** Parameter Estimates: Initial Model

**Final Estimates of the Free Parameters**

| Component | Parameter | Estimate | Approx Std Error | t Value | Approx Pr > \|t\| |
|---|---|---|---|---|---|
| **Irregular** | **Error Variance** | 92.14591 | 13.10986 | 7.03 | <.0001 |
| **Level** | **Error Variance** | 44.83595 | 10.65465 | 4.21 | <.0001 |
| **Season** | **Error Variance** | 0.01250 | 0.0065153 | 1.92 | 0.0551 |

The following statements fit a subset trigonometric model formed by dropping the last three harmonics by specifying the DROPH= option in the SEASON statement:

```
proc ucm data=callCenter;
   id datetime interval=dthour6;
   model calls;
   irregular;
   level;
   season length=28 type=trig droph=12 13 14;
   estimate back=28;
   forecast back=28 lead=28;
run;
```

The last row of the holdout region prediction analysis table for the preceding model is shown in Output 42.3.4. It shows that the subset trigonometric model has better prediction performance in the holdout region than the full trigonometric model; its SAE is 471.53, compared to an SAE of 516.22 for the full model.

**Output 42.3.4** SAE for the Subset Trigonometric Model

| Obs | datetime | Actual | Forecast | Error | SAE |
|---|---|---|---|---|---|
| 552 | 30APR00:18 | 61 | 40.836 | 20.164 | 471.534 |

The following statements illustrate a spline approximation to this seasonal component. In the spline specification the knot placement is quite important, and usually some experimentation is needed. In the following model the knots are placed at the beginning and the middle of each day. Note that the knots at the beginning and end of the season, 1 and 28 in this case, should not be listed in the knot list because knots are always placed there anyway.

```
proc ucm data=callCenter;
   id datetime interval=dthour6;
   model calls;
   irregular;
   level;
   splineseason length=28
      knots=3 5 7 9 11 13 15 17 19 21 23 25 27
      degree=3;
   estimate back=28;
   forecast back=28 lead=28;
run;
```

The spline season model takes about half the time to fit that the baseline model takes. The last row of the holdout region prediction analysis table for this model is shown in Output 42.3.5, which shows that the spline season model performs even better than the previous two models in the holdout region; its SAE is 313.79, compared to an SAE of 471.53 for the previous model.

**Output 42.3.5** SAE for the Spline Season Model

| Obs | datetime | Actual | Forecast | Error | SAE |
|---|---|---|---|---|---|
| 552 | 30APR00:18 | 61 | 23.350 | 37.650 | 313.792 |

The following statements illustrate yet another way to approximate a long seasonal component. Here a combination of BLOCKSEASON and SEASON statements results in a seasonal component that is a sum of two seasonal patterns: one seasonal pattern is simply a regular season with season length 4 that captures the *within-day* seasonal pattern, and the other seasonal pattern is a block seasonal pattern that remains constant during the day but varies from day to day within a week. Note the use of the NLOPTIONS statement to change the optimization technique during the parameter estimation to DBLDOG, which in this case performs better than the default technique, TRUREG.

```
proc ucm data=callCenter;
   id datetime interval=dthour6;
   model calls;
   irregular;
   level;
   season length=4 type=trig;
   blockseason nblocks=7 blocksize=4
      type=trig;
   estimate back=28;
   forecast back=28 lead=28;
```

```
   nloptions tech=dbldog;
run;
```

This model also takes about half the time to fit that the baseline model takes. The last row of the holdout region prediction analysis table for this model is shown in Output 42.3.6, which shows that the block season model does slightly better than the baseline model but not as well as the other two models; its SAE is 508.52, compared to an SAE of 516.22 for the baseline model.

**Output 42.3.6** SAE for the Block Season Model

| Obs | datetime | Actual | Forecast | Error | SAE |
|---|---|---|---|---|---|
| 552 | 30APR00:18 | 61 | 39.339 | 21.661 | 508.522 |

This example showed a few different ways to model a long seasonal pattern. It showed that parsimonious models for long seasonal patterns can be useful, and in some cases even more effective than the full model. Moreover, for very long seasonal patterns the high memory requirements and long computing times might make full models impractical.

## Example 42.4: Modeling Time-Varying Regression Effects

In April 1979, the Albuquerque Police Department began a special enforcement program aimed at reducing the number of DWI (driving while intoxicated) accidents. The program was administered by a squad of police officers, who used breath alcohol testing (BAT) devices and a van that houses a BAT device (Batmobile). These data were collected by the Division of Governmental Research of the University of New Mexico, under a contract with the National Highway Traffic Safety Administration of the U.S. Department of Transportation, to evaluate the Batmobile program. The first 29 observations are for a control period, and the next 23 observations are for the experimental (Batmobile) period. The data consist of two variables: ACC, which represents injuries and fatalities from Wednesday to Saturday nighttime accidents, and FUEL, which represents fuel consumption (millions of gallons) in Albuquerque. The variables are measured quarterly starting from the first quarter of 1972 up to the last quarter of 1984, covering the span of 13 years. The following DATA step statements create the input data set:

```
data bat;
   input ACC FUEL @@;
   batProgram = 0;
   if _n_ > 29 then batProgram = 1;
   date = INTNX( 'qtr', '1jan1972'd, _n_- 1 );
   format date qtr8.;
datalines;
192    32.592    238    37.250    232    40.032
246    35.852    185    38.226    274    38.711
266    43.139    196    40.434    170    35.898
234    37.111    272    38.944    234    37.717
210    37.861    280    42.524    246    43.965
248    41.976    269    42.918    326    49.789
342    48.454    257    45.056    280    49.385
290    42.524    356    51.224    295    48.562
279    48.167    330    51.362    354    54.646
331    53.398    291    50.584    377    51.320
327    50.810    301    46.272    269    48.664
```

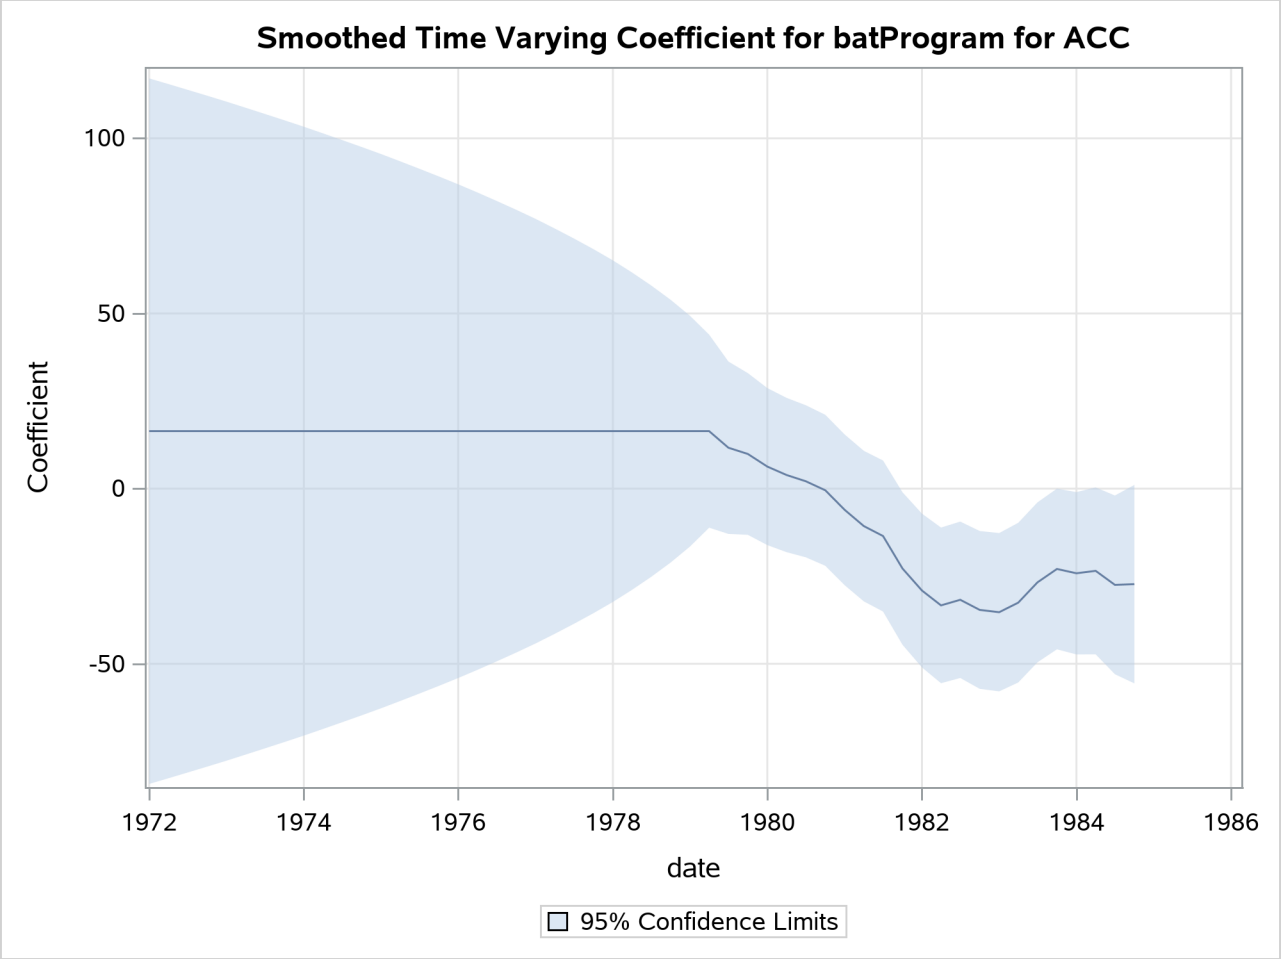
```
314    48.122    318    47.483    288    44.732
242    46.143    268    44.129    327    46.258
253    48.230    215    46.459    263    50.686
319    49.681    263    51.029    206    47.236
286    51.717    323    51.824    306    49.380
230    47.961    304    46.039    311    55.683
292    52.263
;
```

There are a number of ways to study these data and the question of the effectiveness of the BAT program. One possibility is to study the *before-after* difference in the injuries and fatalities per million gallons of fuel consumed, by regressing ACC on FUEL and the dummy variable BATPROGRAM, which is zero before the program began and one while the program is in place. However, it is possible that the effect of the Batmobiles might well be cumulative, because as awareness of the program becomes dispersed, its effectiveness as a deterrent to driving while intoxicated increases. This suggests that the regression coefficient of the BATPROGRAM variable might be *time-varying*. The following program fits a model that incorporates these considerations. A seasonal component is included in the model since it is easy to see that the data show strong quarterly seasonality.

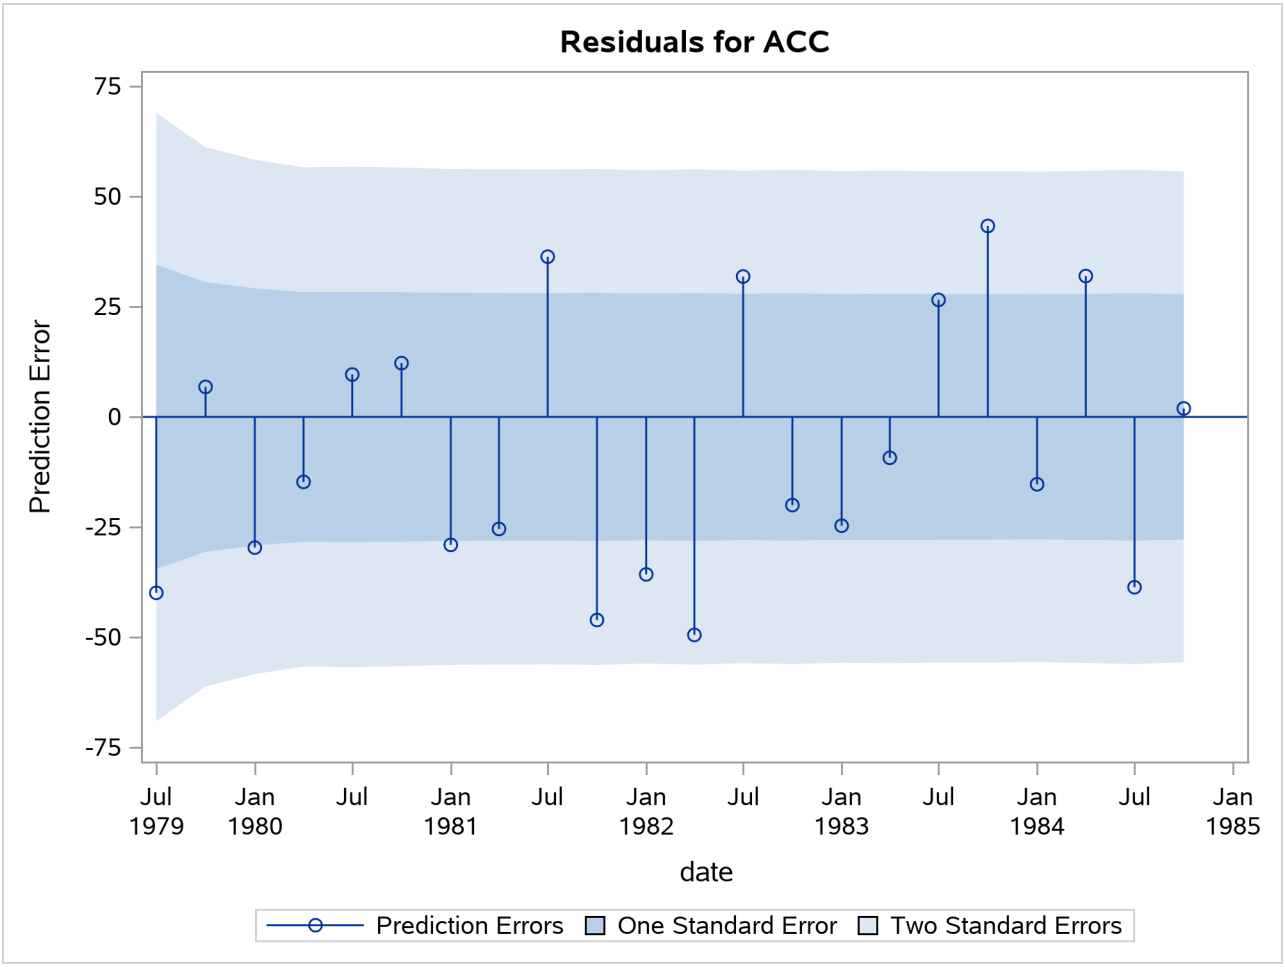
```
proc ucm data=bat;
   model acc = fuel;
   id date interval=qtr;
   irregular;
   level var=0 noest;
   randomreg batProgram / plot=smooth;
   season length=4 var=0 noest plot=smooth;
   estimate plot=(panel residual);
   forecast plot=forecasts lead=0;
run;
```

The model seems to fit the data adequately. No data are withheld for model validation because the series is relatively short. The plot of the time-varying coefficient of BATPROGRAM is shown in Output 42.4.1. As expected, it shows that the effectiveness of the program increases as awareness of the program becomes dispersed. The effectiveness eventually seems to level off. The residual diagnostic plots are shown in Output 42.4.2 and Output 42.4.3, the forecast plot is in Output 42.4.4, the goodness-of-fit statistics are in Output 42.4.5, and the parameter estimates are in Output 42.4.6.

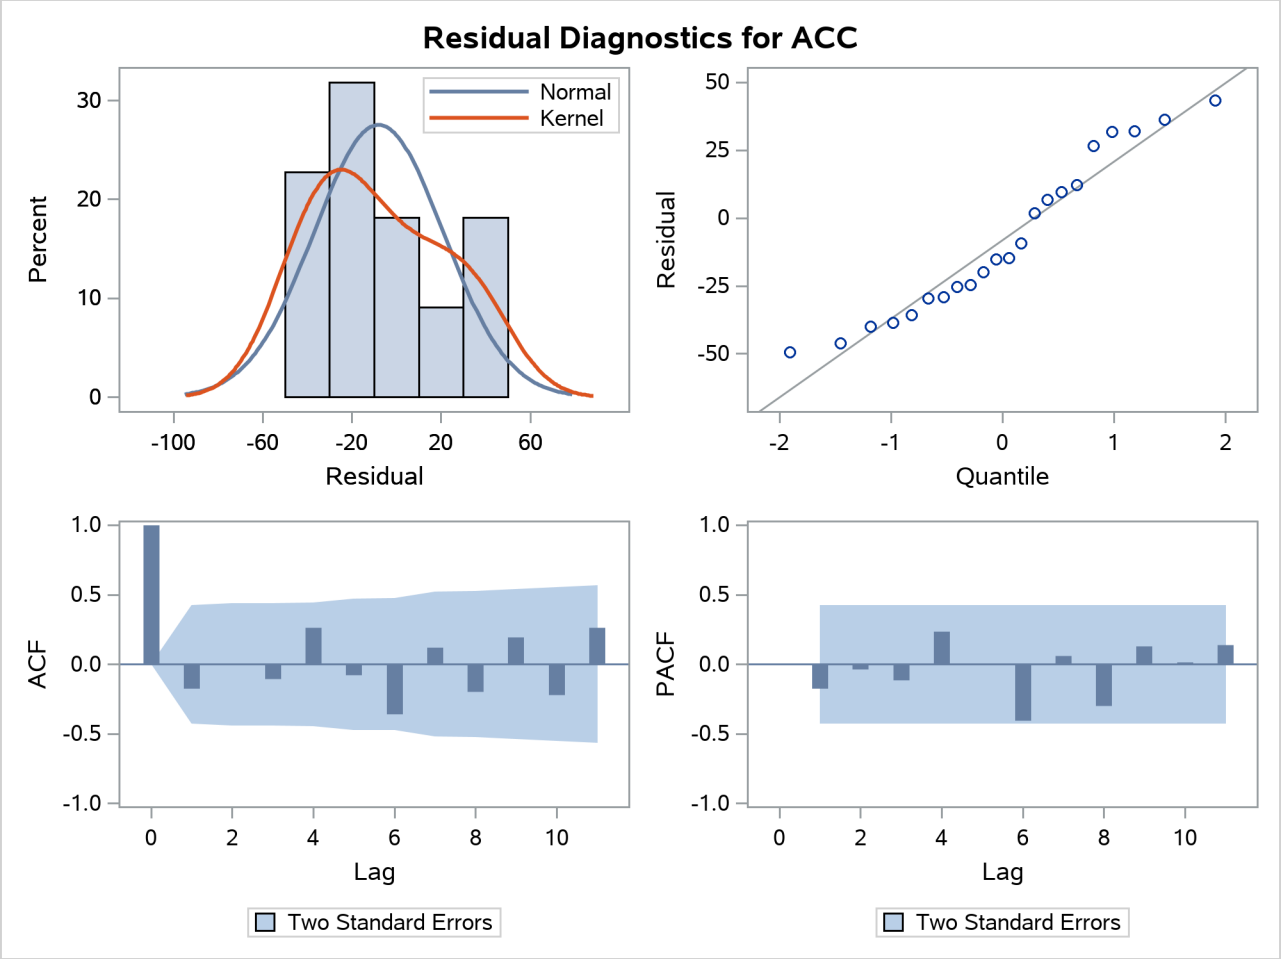
**Output 42.4.1** Time-Varying Regression Coefficient of BATPROGRAM



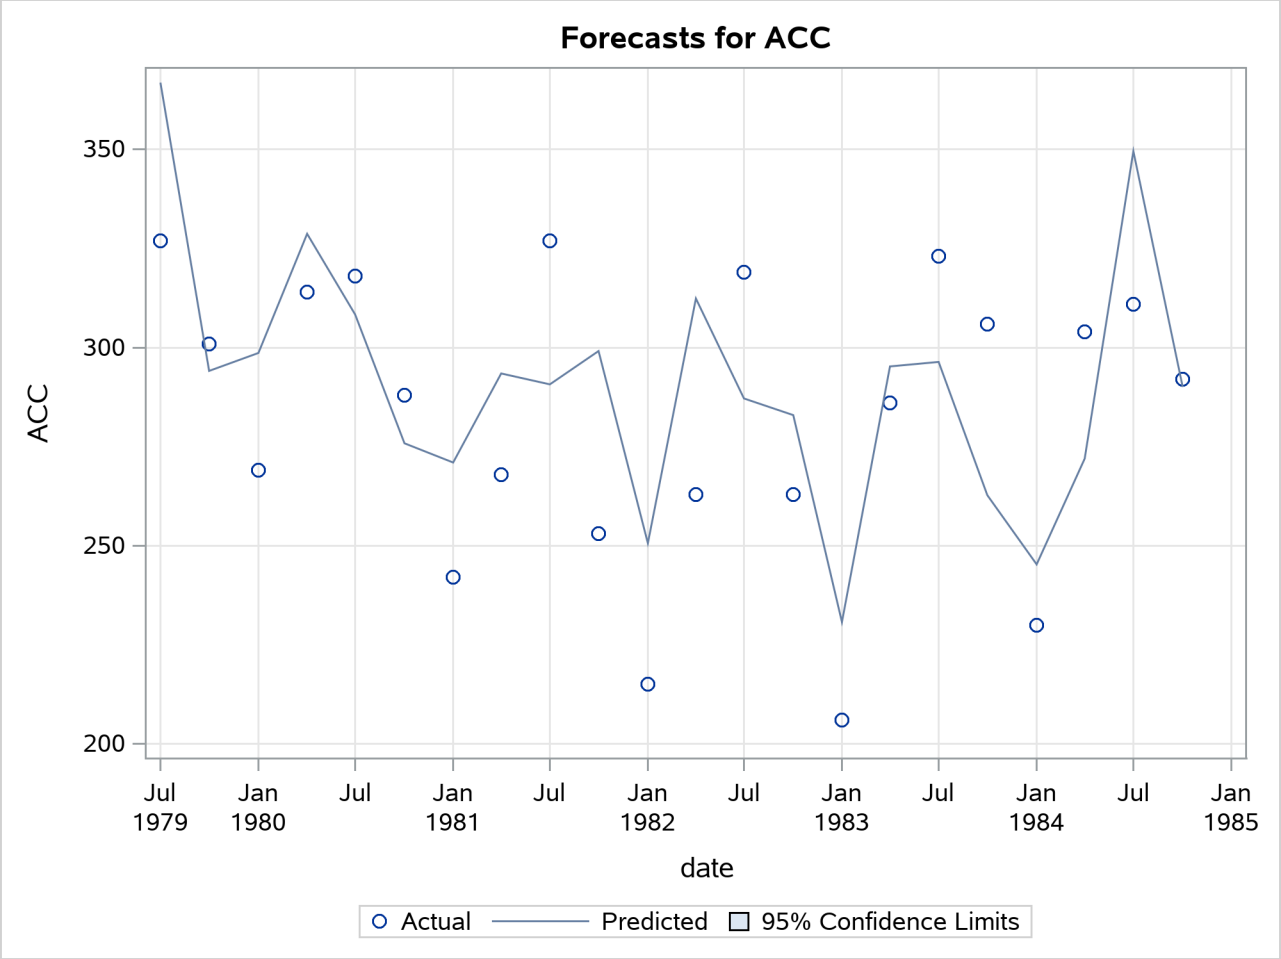
**Output 42.4.2** Residuals for the Time-Varying Regression Model



**Output 42.4.3** Residual Diagnostics for the Time-Varying Regression Model



**Output 42.4.4** One-Step-Ahead Forecasts for the Time-Varying Regression Model



**Output 42.4.5** Model Fit for the Time-Varying Regression Model

| Fit Statistics Based on Residuals | |
|---|---|
| **Mean Squared Error** | 866.75562 |
| **Root Mean Squared Error** | 29.44071 |
| **Mean Absolute Percentage Error** | 9.50326 |

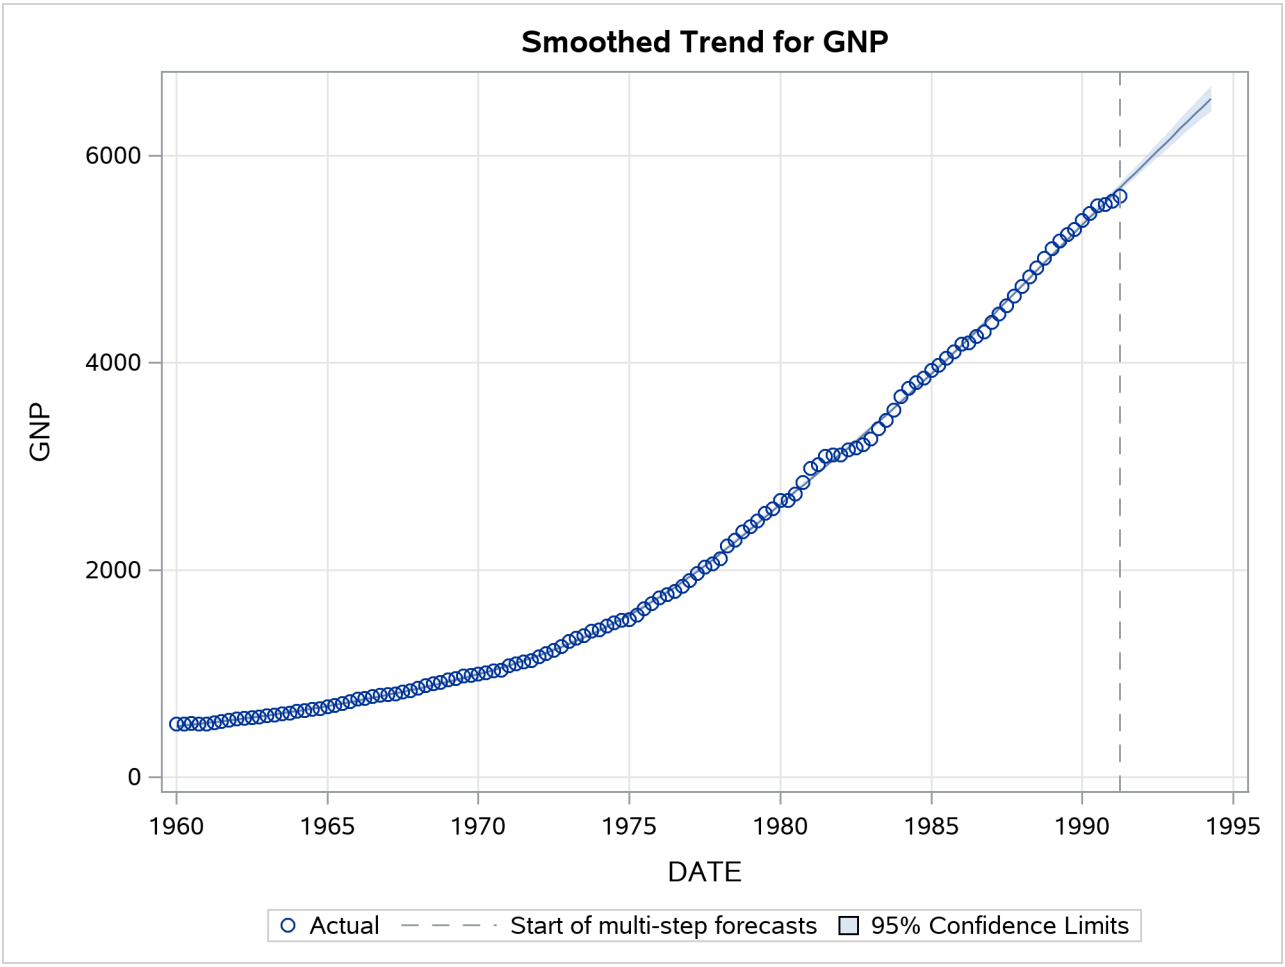
| batProgram | Error Variance | 84.22334 | 79.88166 | 1.05 | 0.2917 |

## Example 42.5: Trend Removal Using the Hodrick-Prescott Filter

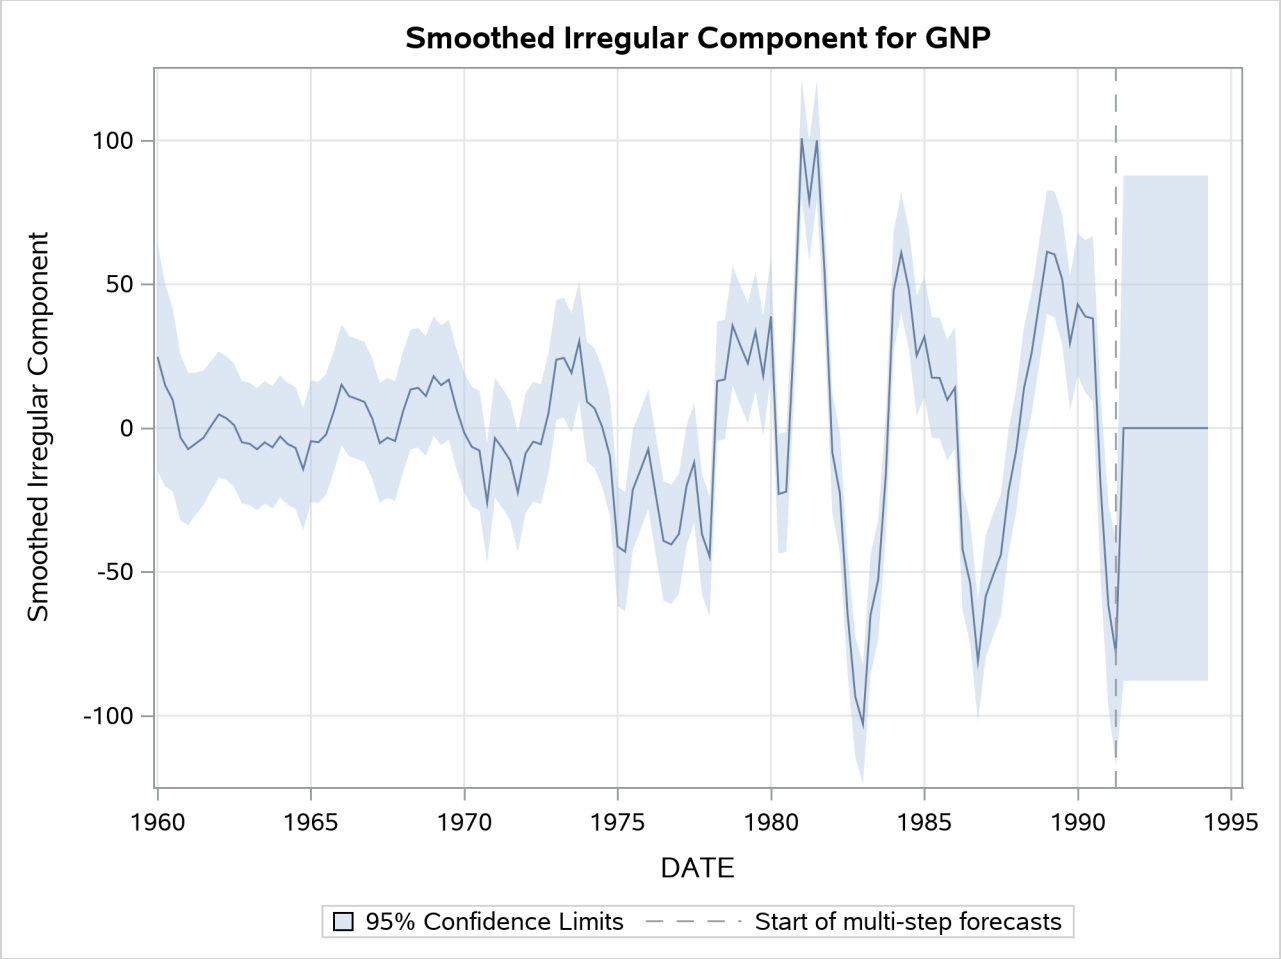
The Hodrick-Prescott filter (Hodrick and Prescott 1997) is a popular tool in macroeconomics for fitting a smooth trend to time series. It is well known that the trend computation according to this filter is equivalent to fitting the local linear trend plus irregular model with the level disturbance variance restricted to zero and the slope disturbance variance restricted to be a suitable multiple of the irregular component variance. The multiple used depends on the frequency of the series; for example, for quarterly series the commonly recommended multiple is $1/1600 = 0.000625$. For other intervals there is no consensus, but a frequently suggested value for monthly series is $1/14400$ and the value for an annual series can range from $1/400 = 0.0025$ to $1/7 = 0.15$. The data set considered in this example consists of quarterly GNP values for the United States from 1960 to 1991. In the UCM procedure statements that follow, the presence of the PROFILE option in the ESTIMATE statement implies that the restriction that the disturbance variance of the slope component be fixed at 0.000625 is interpreted differently: it implies that the disturbance variance of the slope component be restricted to be 0.000625 *times* the estimated irregular component variance, as needed for the Hodrick-Prescott filter. The plot of the fitted trend is shown in Output 42.5.1, and the plot of the smoothed irregular component, which corresponds to the detrended series, is given in Output 42.5.2. The detrended series can be further analyzed for business cycles.

```
proc ucm data=sashelp.gnp;
   id date interval=qtr;
   model gnp;
   irregular plot=smooth;
   level var=0 noest plot=smooth;
   slope var=0.000625 noest;
   estimate PROFILE;
   forecast plot=(decomp);
run;
```

**Output 42.5.1** Smoothed Trend for the GNP Series as per the Hodrick-Prescott Filter



**Output 42.5.2** Detrended GNP Series



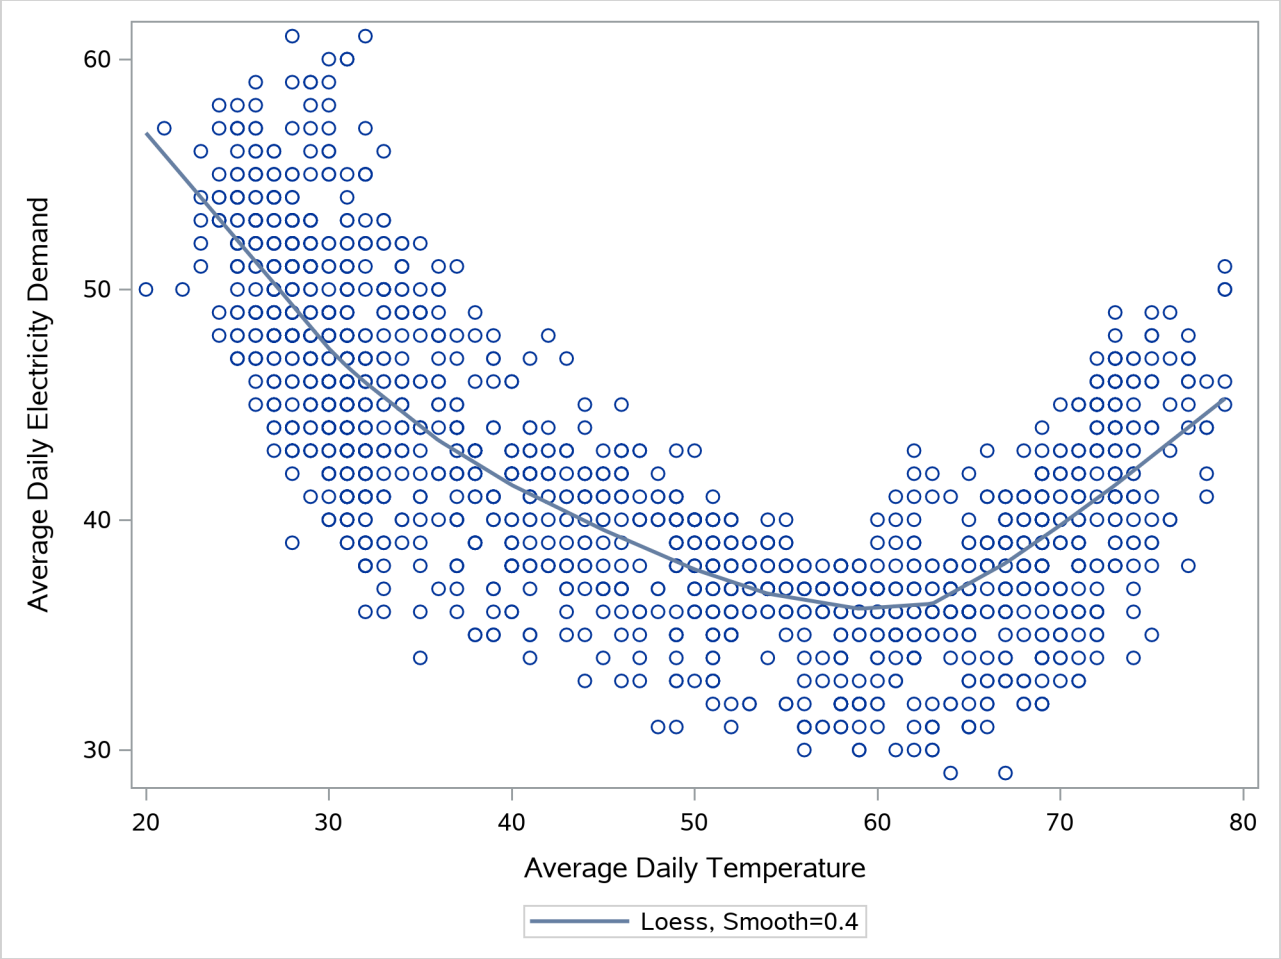
## Example 42.6: Using Splines to Incorporate Nonlinear Effects

The data in this example are created to mirror the electricity demand and temperature data recorded at a utility company in the midwest region of the United States. The data set (not shown), utility, has three variables: load, temp, and date. The load column contains the daily electricity demand, the temp column has the average daily temperature readings, and the date column records the observation date.

The following statements produce a plot, shown in Output 42.6.1, of electricity load versus temperature. Clearly the relationship is smooth but nonlinear: the load generally increases when the temperatures are away from the comfortable sixties.

```
proc sgplot data=utility;
    loess x=temp y=load / smooth=0.4;
run;
```

**Output 42.6.1** Load versus Temperature Plot



The time series plot of the load (not shown) also shows that, apart from a day-of-the-week seasonal effect, there are no additional easily identifiable patterns in the series. The series has no apparent upward or downward trend. The following statements fit a UCM to the series that takes into account these observations. The particular choice of the model is a result of a little modeling exercise that compared a small number of competing models. The chosen model is adequate but by no means the best possible. The temperature effect is modeled by a deterministic three-degree spline with knots at 30, 40, 50, 60, and 75. The knot locations and the degree were chosen by visual inspection of the plot (Output 42.6.1). An autoreg component is used in place of the simple irregular component, which improved the residual analysis. The last 60 days of data are withheld for out-of-sample forecast evaluation (note the BACK= option in both the ESTIMATE and FORECAST statements). The OUTLIER statement is used to increase the number of outliers reported to 10. Since no CHECKBREAK option is used in the LEVEL statement, only the additive outliers are searched. In this example the use of the EXTRADIFFUSE= option in the ESTIMATE and FORECAST statements is useful for discarding some early one-step-ahead forecasts and residuals with large variance.

```
proc ucm data=utility;
   id date interval=day;
   model load;
   autoreg;
   level plot=smooth;
```

```
   splinereg temp knots=30 40 50 65 75 degree=3
      variance=0 noest;
   season length=7 var=0 noest;
   estimate plot=panel back=60
      extradiffuse=50;
   outlier maxnum=10;
   forecast back=60 lead=60
      extradiffuse=50;
run;
```

The parameter estimates are given in Output 42.6.2, and the residual goodness-of-fit statistics are shown in Output 42.6.3. The residual diagnostic plots are shown in Output 42.6.4. The ACF and PACF plots appear satisfactory, but the normality plots, particularly the Q-Q plot, show possible violations. It appears that, at least in part, this nonnormal behavior of the residuals might be attributable to the outliers in the series. The outlier summary table, Output 42.6.5, shows the most likely outlying observations. Notice that most of these outliers are holidays, like July 4th, when the electricity load is lower than usual for that day of the week.

**Output 42.6.2** Electricity Load: Parameter Estimates

**The UCM Procedure**

**Final Estimates of the Free Parameters**

| Component | Parameter | Estimate | Approx Std Error | t Value | Approx Pr > \|t\| |
|---|---|---|---|---|---|

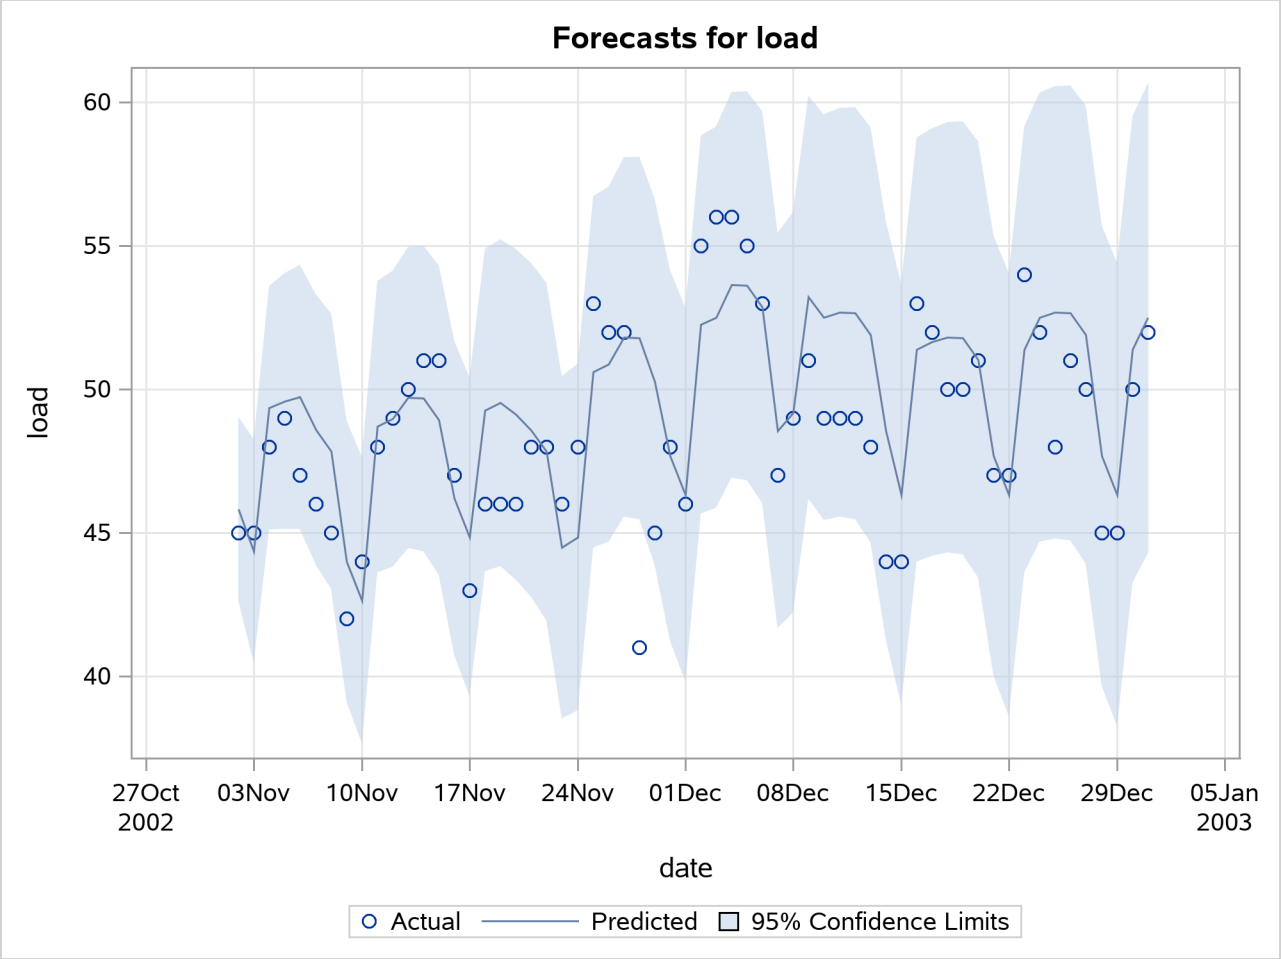
The plot of the load forecasts for the withheld data is shown in Output 42.6.6.

**Output 42.6.6** Electricity Load: Forecast Evaluation of the Withheld Data



## Example 42.7: Detection of Level Shift

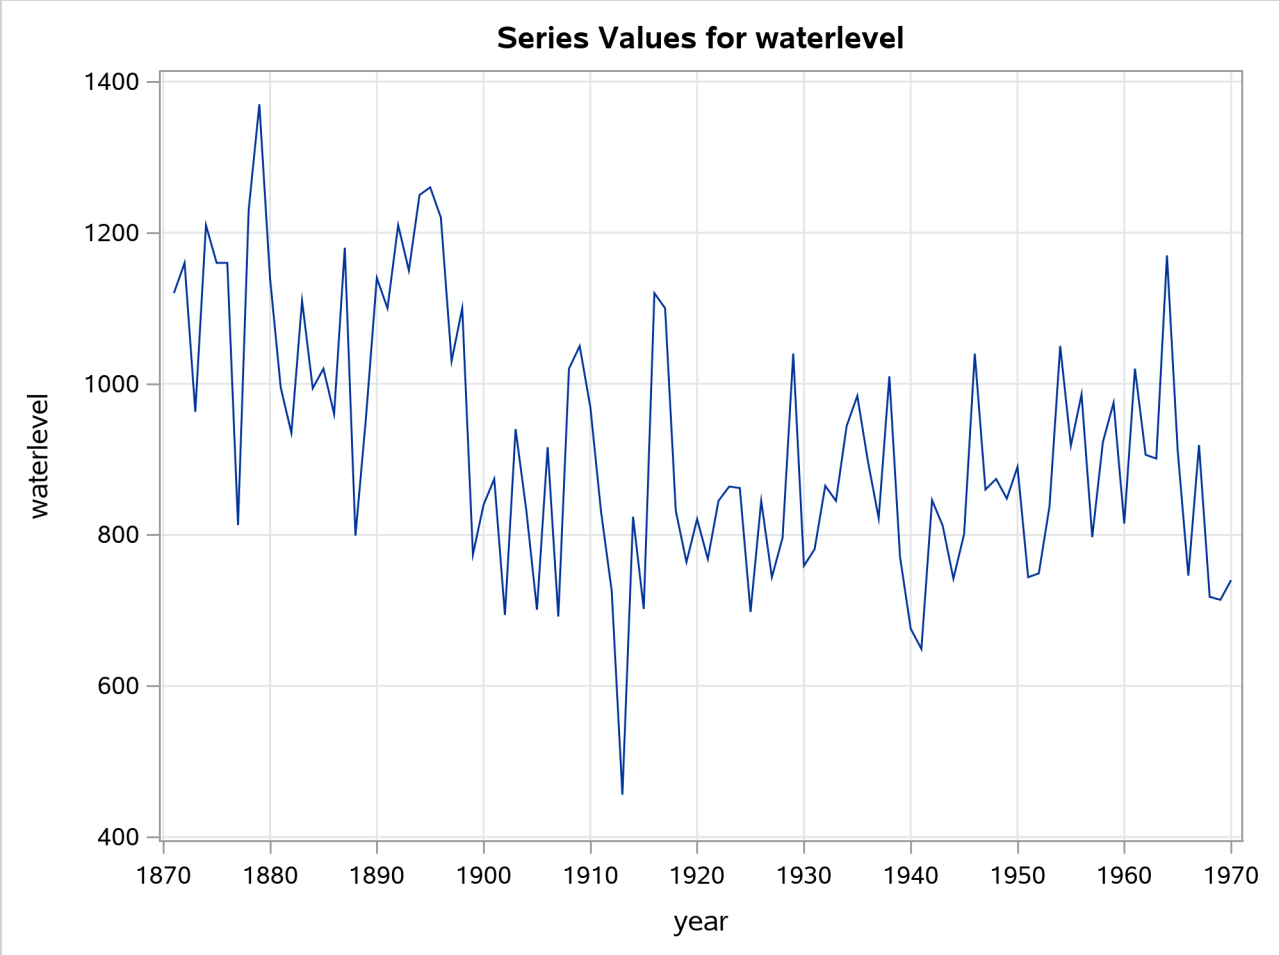
The series in this example consists of the yearly water level readings of the Nile River recorded at Aswan, Egypt (Cobb 1978; De Jong and Penzer 1998). The readings are from the years 1871 to 1970. The series does not show any apparent trend or any other distinctive patterns; however, there is a shift in the water level starting at the year 1899. This shift could be attributed to the start of construction of a dam near Aswan in that year. A time series plot of this series is given in Output 42.7.1. The following DATA step statements create the input data set:

```
data nile;
   input waterlevel @@;
   year = intnx( 'year', '1jan1871'd, _n_-1 );
   format year year4.;
datalines;
   1120  1160  963  1210  1160  1160  813  1230   1370  1140
   995   935   1110 994   1020  960   1180 799    958   1140
   1100  1210  1150 1250  1260  1220  1030 1100   774   840
   874   694   940  833   701   916   692  1020   1050  969
```

```
   831   726   456  824   702   1120  1100 832    764   821
   768   845   864  862   698   845   744  796    1040  759
   781   865   845  944   984   897   822  1010   771   676
   649   846   812  742   801   1040  860  874    848   890
   744   749   838  1050  918   986   797  923    975   815
   1020  906   901  1170  912   746   919  718    714   740
;

proc timeseries data=nile plot=series;
   id year interval=year;
   var waterlevel;
run;
```

**Output 42.7.1** Nile Water Level

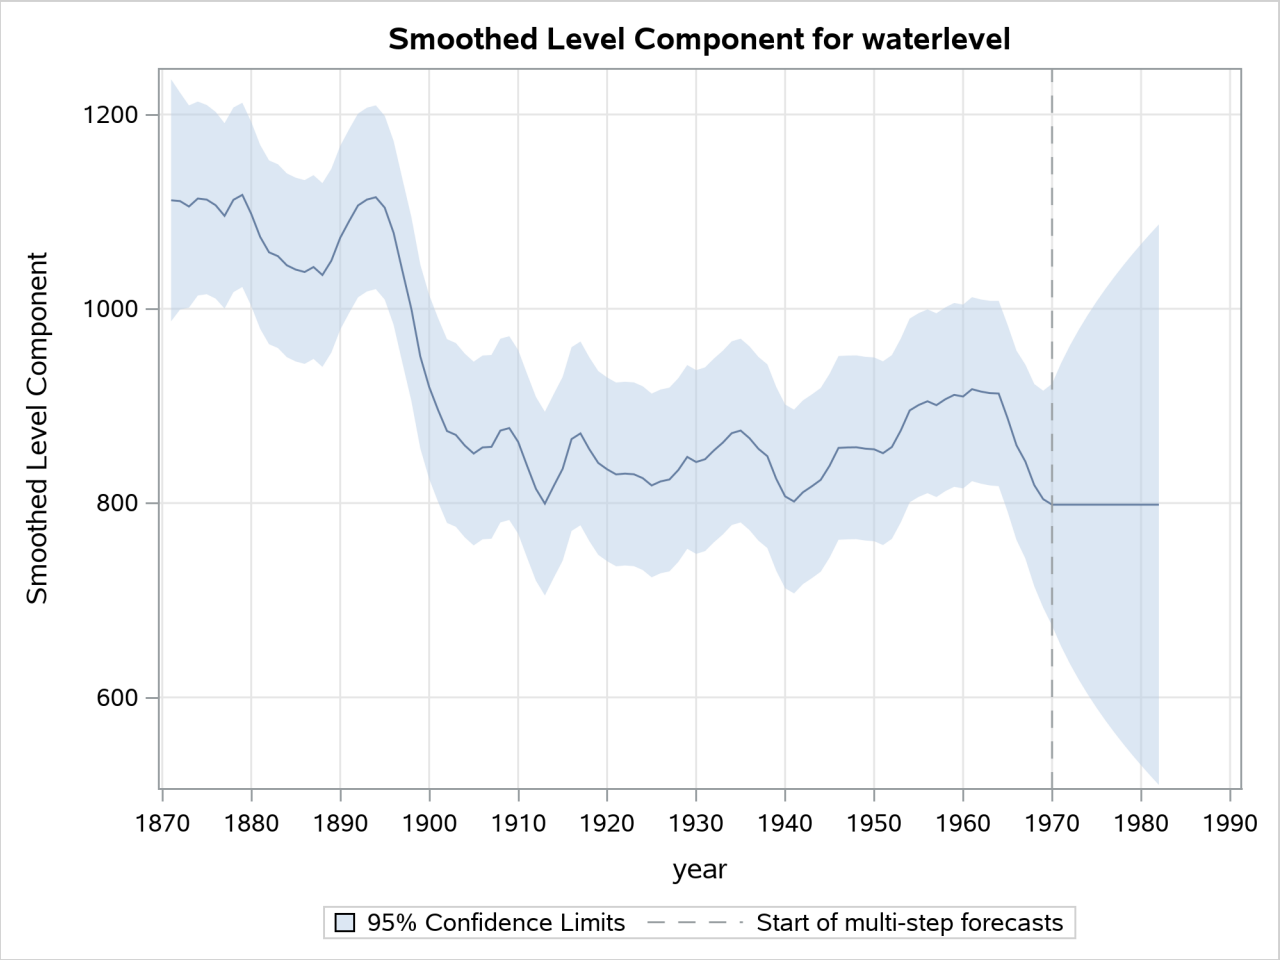


In this situation it is known that a shift in the water level occurred within the span of the series, and its effect can be easily taken into account by including an appropriate indicator variable as a regressor. However, in many situation such prior information is not available, and it is useful to detect such a shift in a data analytic fashion. You can check for breaks in the level by using the CHECKBREAK option in the LEVEL statement. The following statements fit a simple locally constant level plus error model to the series:

```
proc ucm data=nile;
   id year interval=year;
   model waterlevel;
   irregular;
   level plot=smooth checkbreak;
   estimate;
   forecast plot=decomp;
run;
```

The plot in Output 42.7.2 shows a noticeable drop in the smoothed water level around 1899.

**Output 42.7.2** Smoothed Trend without the Shift of 1899



The "Outlier Summary" table in Output 42.7.3 shows the most likely types of breaks and their locations within the series span. The shift of 1899 is easily detected.

**Output 42.7.3** Detection of Structural Breaks in the Nile River Level

**Outlier Summary**

| Obs | year | Break Type | Estimate | Standard Error | Chi-Square | DF | Pr > ChiSq |
|---|---|---|---|---|---|---|---|
| **29** | **1899** | **Level** | -315.73791 | 97.639753 | 10.46 | 1 | 0.0012 |

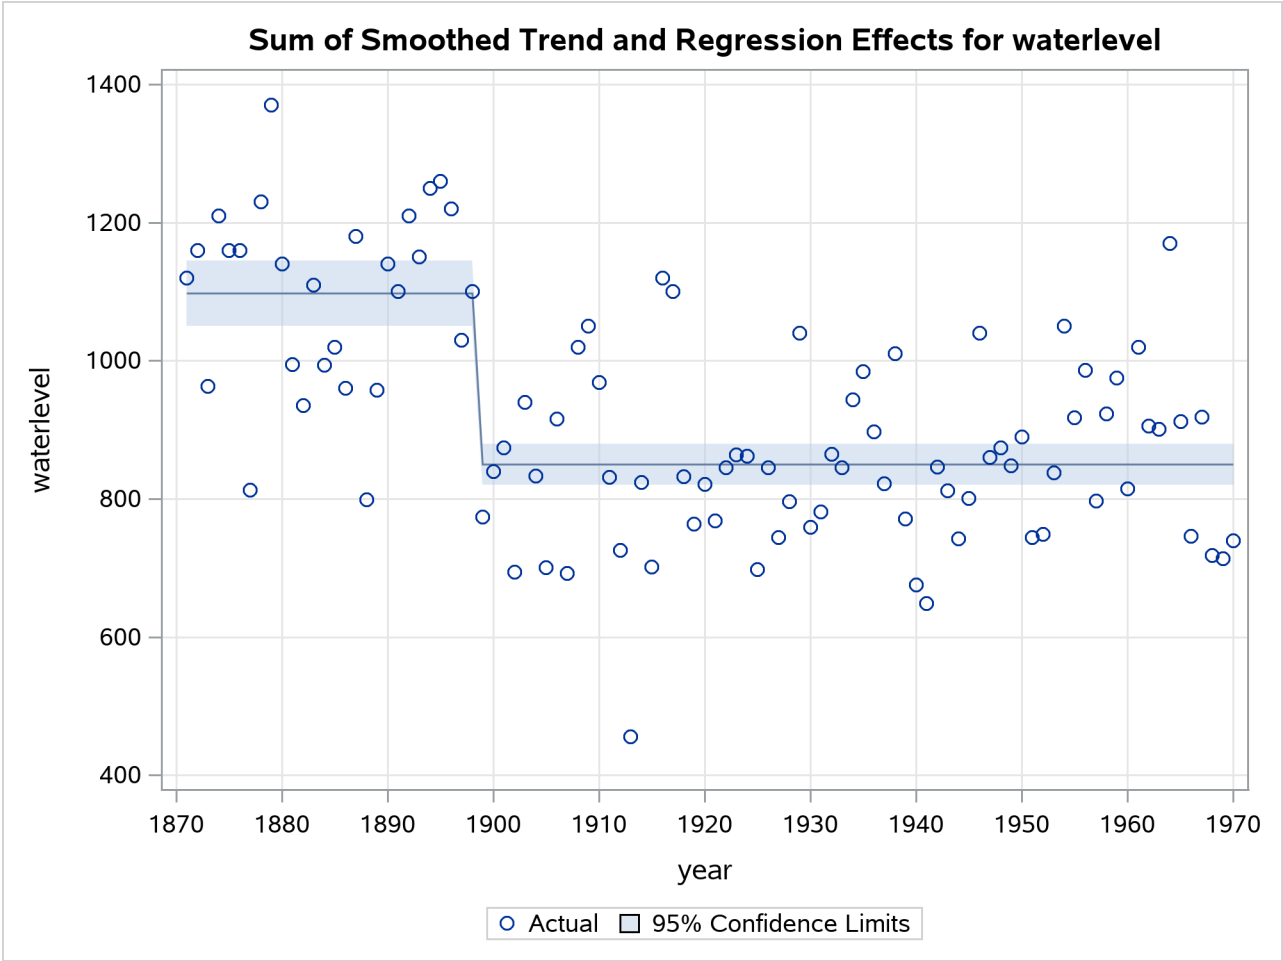
The following statements specify a UCM that models the level of the river as a locally constant series with a shift in the year 1899, represented by a dummy regressor (SHIFT1899):

```
data nile;
   set nile;
   shift1899 = ( year >= '1jan1899'd );
run;

proc ucm data=nile;
   id year interval=year;
   model waterlevel = shift1899;
   irregular;
   level;
   estimate;
   forecast plot=decomp;
run;
```

The plot in Output 42.7.4 shows the smoothed trend, including the correction due to the shift in the year 1899. Notice the simplicity in the shape of the smoothed curve after the incorporation of the shift information.

**Output 42.7.4** Smoothed Trend plus Shift of 1899



## Example 42.8: ARIMA Modeling

This example shows how you can use the UCM procedure for ARIMA modeling. The parameter estimates and predictions for ARIMA models obtained by using PROC UCM will be close to those obtained by using PROC ARIMA (in the presence of the ML option in its ESTIMATE statement) if the model is stationary or if the model is nonstationary and there are no missing values in the data. For more information about the ARIMA procedure, see Chapter 8, "The ARIMA Procedure." However, if there are missing values in the data and the model is nonstationary, then the UCM and ARIMA procedures can produce significantly different parameter estimates and predictions. An article by Kohn and Ansley (1986) suggests a statistically sound method of estimation, prediction, and interpolation for nonstationary ARIMA models with missing data. This method is based on an algorithm that is equivalent to the Kalman filtering and smoothing algorithm used in the UCM procedure. The results of an illustrative example in their article are reproduced here using the UCM procedure. In this example an ARIMA$(0,1,1)\times(0,1,1)_{12}$ model is applied to the logarithm of the air series in the sashelp.air data set. Four different missing value patterns are considered to highlight different aspects of the problem:

- *Data1.* The full data set of 144 observations.
- *Data2.* The set of 78 observations that omit January through November in each of the last 6 years.
- *Data3.* The data set with the 5 observations July 1949, June, July, and August 1957, and July 1960 missing.
- *Data4.* The data set with all July observations missing and June and August 1957 also missing.

The following DATA steps create these data sets:

```
data Data1;
   set sashelp.air;
   logair = log(air);
run;

data Data2;
   set data1;
   if year(date) >= 1955 and month(date) < 12 then logair = .;
run;

data Data3;
   set data1;
   if (year(date) = 1949 and month(date) = 7) then logair = .;
   if ( year(date) = 1957 and
        (month(date) = 6 or month(date) = 7 or month(date) = 8))
        then logair = .;
   if (year(date) = 1960 and month(date) = 7) then logair = .;
run;

data Data4;
   set data1;
   if month(date) = 7 then logair = .;
   if year(date) = 1957 and (month(date) = 6 or month(date) = 8)
```

```
      then logair = .;
run;
```

The following statements specify the ARIMA$(0,1,1) \times (0,1,1)_{12}$ model for the logair series in the first data set (Data1):

```
proc ucm data=Data1;
   id date interval=month;
   model logair;
   irregular q=1 sq=1 s=12;
   deplag lags=(1)(12) phi=1 1 noest;
   estimate outest=est1;
   forecast outfor=for1;
run;
```

Note that the moving average part of the model is specified by using the Q=, SQ=, and S= options in the IRREGULAR statement and the differencing operator, $(1-B)(1-B^{12})$, is specified by using the DEPLAG statement. The model does not contain an intercept term; therefore no LEVEL statement is needed. The parameter estimates are saved in a data set EST1 by using the OUTEST= option in the ESTIMATE statement and the forecasts and the component estimates are saved in a data set FOR1 by using the OUTFOR= option in the FORECAST statement. The same analysis is performed on the other three data sets, but is not shown here.

Output 42.8.1 resembles Table 1 in Kohn and Ansley (1986). This table is generated by merging the parameter estimates from the four analyses. Only the moving average parameter estimates and their standard errors are reported. The columns EST1 and STD1 correspond to the estimates for Data1. The parameter estimates and their standard errors for other three data sets are similarly named. Note that the parameter estimates closely match the parameter estimates in the article. However, their standard errors differ slightly. This difference could be the result of different ways of computing the Hessian at the optimum. The white noise error variance estimates are not reported here, but they agree quite closely with those in the article.

**Output 42.8.1** Data Sets 1–4: Parameter Estimates and Standard Errors

| PARAMETER | est1 | std1 | est2 | std2 | est3 | std3 | est4 | std4 |
|---|---|---|---|---|---|---|---|---|
| MA_1 | 0.402 | 0.090 | 0.457 | 0.121 | 0.408 | 0.092 | 0.431 | 0.091 |
| SMA_1 | 0.557 | 0.073 | 0.758 | 0.236 | 0.566 | 0.075 | 0.573 | 0.074 |

Output 42.8.2 resembles Table 2 in Kohn and Ansley (1986). It contains forecasts and their standard errors for the four data sets. The numbers are very close to those in the article.

**Output 42.8.2** Data Sets 1–4: Forecasts and Standard Errors

| DATE | for1 | std1 | for2 | std2 | for3 | std3 | for4 | std4 |
|---|---|---|---|---|---|---|---|---|
| JAN61 | 6.110 | 0.037 | 6.084 | 0.052 | 6.110 | 0.037 | 6.111 | 0.037 |

| DEC61 | 6.168 | 0.082 | 6.174 | 0.086 | 6.168 | 0.082 | 6.169 | 0.080 |

Output 42.8.3 is based on Data2. It resembles Table 3 in Kohn and Ansley (1986). The columns S_SERIES and VS_SERIES in the OUTFOR= data set contain the interpolated values of logair and their variances. The estimate column in Output 42.8.3 reports interpolated values (which are the same as S_SERIES), and the std column reports their standard errors (which are computed as square root of VS_SERIES) for January–November 1957. The actual logair values for these months, which are missing in Data2, are also provided for comparison. The numbers are very close to those in the article.

**Output 42.8.3** Data Set 2: Interpolated Values and Standard Errors

| DATE | logair | estimate | std |
|---|---|---|---|
| JAN57 | 5.753 | 5.733 | 0.045 |
| FEB57 | 5.707 | 5.738 | 0.049 |
| MAR57 | 5.875 | 5.893 | 0.052 |
| APR57 | 5.852 | 5.850 | 0.054 |
| MAY57 | 5.872 | 5.843 | 0.055 |
| JUN57 | 6.045 | 5.951 | 0.055 |
| JUL57 | 6.142 | 6.051 | 0.055 |
| AUG57 | 6.146 | 6.055 | 0.054 |
| SEP57 | 6.001 | 5.938 | 0.052 |
| OCT57 | 5.849 | 5.812 | 0.049 |
| NOV57 | 5.720 | 5.680 | 0.045 |

Output 42.8.4 resembles Table 4 in Kohn and Ansley (1986). These numbers are based on Data3, and they also are very close to those in the article.

**Output 42.8.4** Data Set 3: Interpolated Values and Standard Errors

| DATE | logair | estimate | std |
|---|---|---|---|
| JUL49 | 4.997 | 5.013 | 0.031 |
| JUN57 | 6.045 | 6.024 | 0.030 |
| JUL57 | 6.142 | 6.147 | 0.031 |
| AUG57 | 6.146 | 6.148 | 0.030 |
| JUL60 | 6.433 | 6.409 | 0.031 |

Output 42.8.5 resembles Table 5 in Kohn and Ansley (1986). As before, the numbers are very close to those in the article.

**Output 42.8.5** Data Set 4: Interpolated Values and Standard Errors

| DATE | logair | estimate | std |
|---|---|---|---|
| JUN57 | 6.045 | 6.023 | 0.030 |
| AUG57 | 6.146 | 6.147 | 0.030 |

The similarity between the outputs in this example and the results shown in Kohn and Ansley (1986) demonstrate that PROC UCM can be effectively used for nonstationary ARIMA models with missing data.

## Example 42.9: Extracting A Business Cycle (Experimental)

The data set (not shown) gdp in this example has two variables: date dates the observations, and lgdp contains the quarterly readings of the US real GDP (in log scale). Pelagatti (2015, Example 3.3, Example 8.2) uses this quarterly time series (lgdp) to illustrate how you can adjust the smoothness of the estimated cycle by changing the order of the cycle in a trend-cycle decomposition,

$$lgdp_t = \mu_t + \psi_t + \epsilon_t$$

where $\mu_t$ is an integrated random walk trend, $\psi_t$ is a cycle component, and $\epsilon_t$ is an irregular component.

The following statements fit the model $lgdp_t = \mu_t + \psi_t + \epsilon_t$, where the cycle component has an order of 1 (default):

```
proc ucm data=gdp;
    where year(date) >= 1970;
    id date interval=quarter;
    model lgdp;
    irregular;
    level variance=0 noest plot=smooth;
    slope;
    cycle plot=smooth;
    estimate plot=panel;
    forecast plot=decomp outfor=for1;
run;
```

The following statements fit the same model, except that the cycle order is 2. Similarly, a model with a cycle order of 4 is also fit (not shown).

```
proc ucm data=gdp;
    where year(date) >= 1970;
    id date interval=quarter;
    model lgdp;
    irregular;
    level variance=0 noest plot=smooth;
    slope;
    cycle order=2 plot=smooth;
    estimate plot=panel;
    forecast plot=decomp outfor=for2;
```

```
run;
```

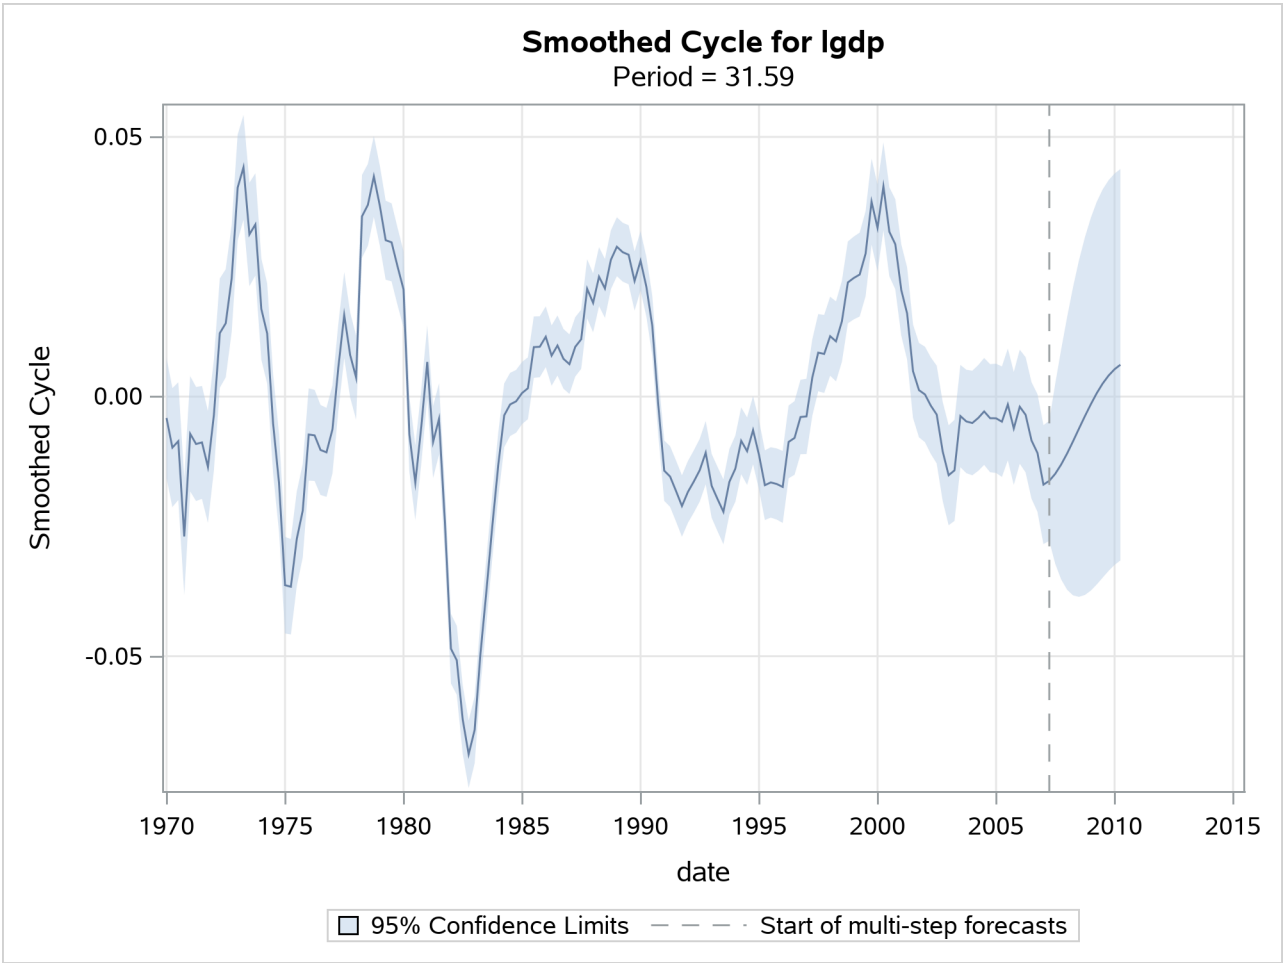
Output 42.9.1 summarizes the features of the estimated cycles of different orders. The estimated periods of the first-order and second-order cycles, 31.59 and 45.18, are reasonable. However, the period of the fourth-order cycle seems quite unreasonable. Fortunately, Pelagatti (2015, Example 8.2) mentions that cycles of order 3 or higher are rarely needed when you are working with real economic series. Although they are not the same, the parameter estimates that the UCM procedure produces are reasonably close to those reported in Pelagatti (2015, Example 8.2).

**Output 42.9.1** Cycles of Orders 1, 2, and 4: Summary

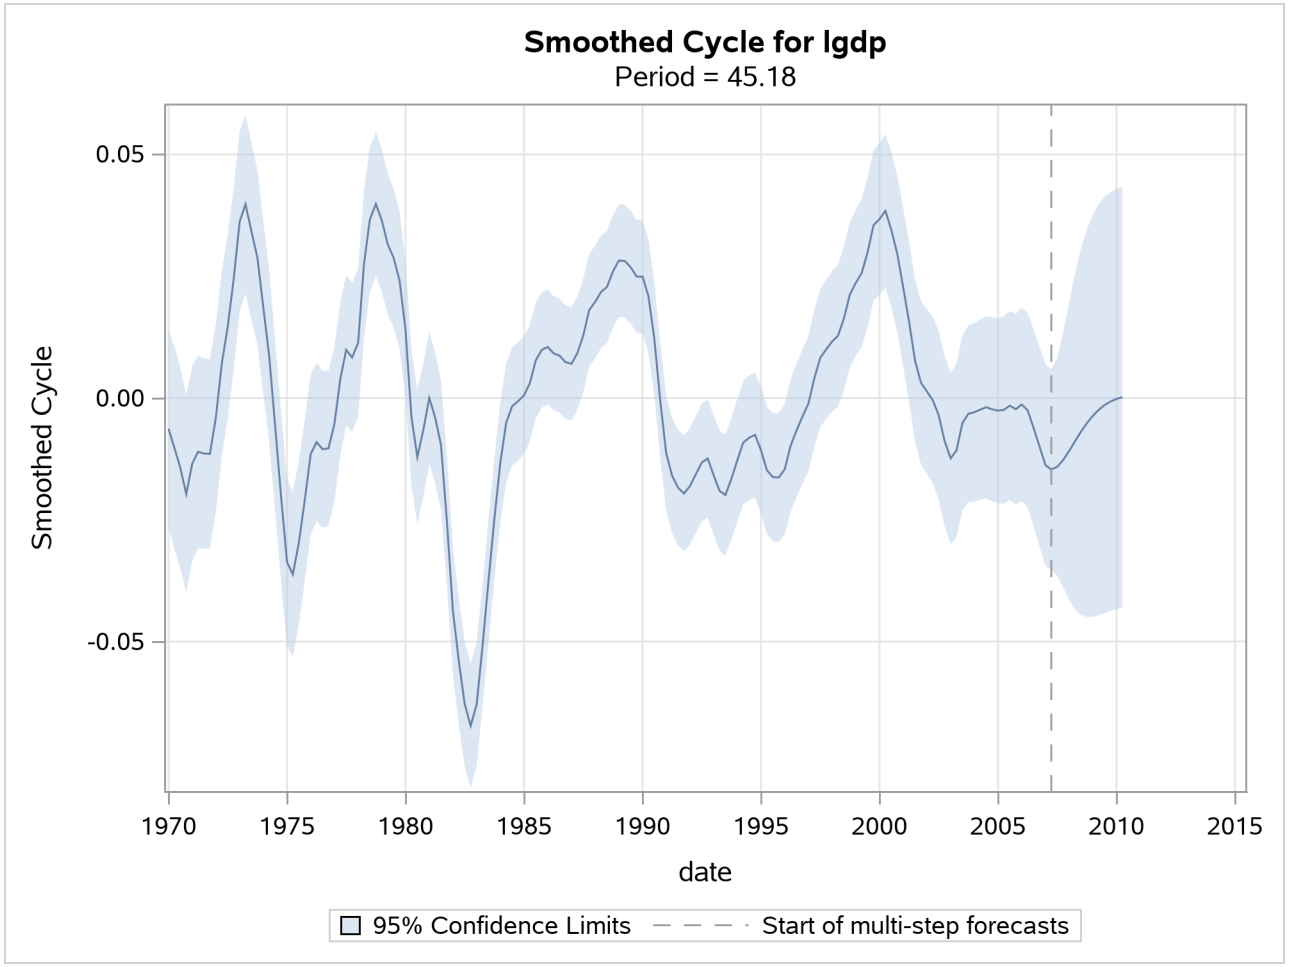
| order | period | Frequency | Rho | ErrorVar |
|---|---|---|---|---|
| 1 | 31.59295 | 0.19888 | 0.94371 | 0.00004873 |
| 2 | 45.18256 | 0.13906 | 0.76177 | 0.00000956 |
| 4 | 23580 | 0.00026647 | 0.52055 | 0.00000856 |

Output 42.9.2 shows the plot of the first-order cycle, Output 42.9.3 shows the plot of the second-order cycle, and Output 42.9.4 shows the plot of the fourth-order cycle. You can see that although the overall form of the estimated cycle remains the same, the smoothness of the plot of the estimated cycle increases with the order.

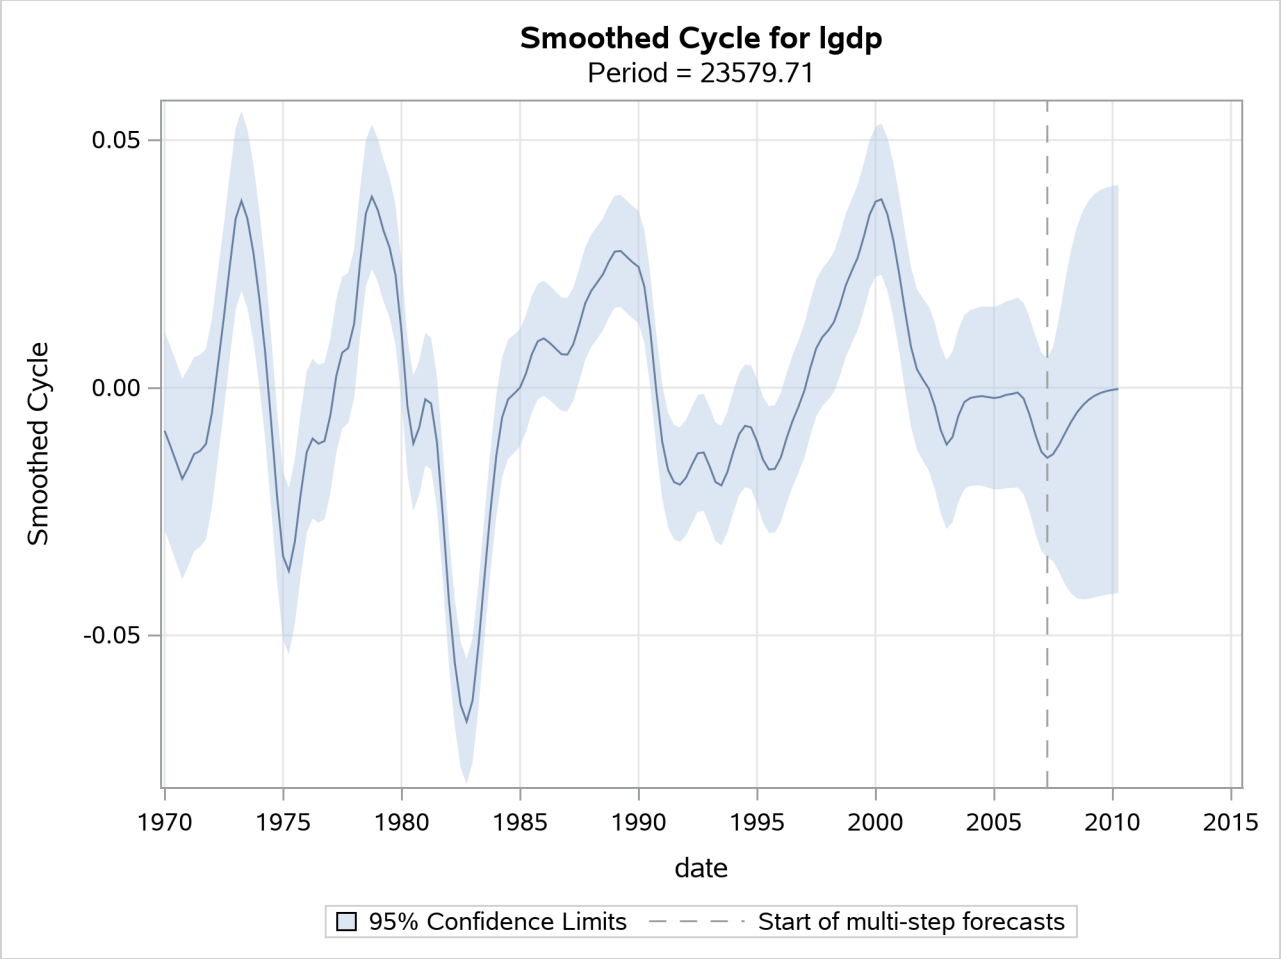
**Output 42.9.2** Estimated Cycle: Order = 1



**Output 42.9.3** Estimated Cycle: Order = 2

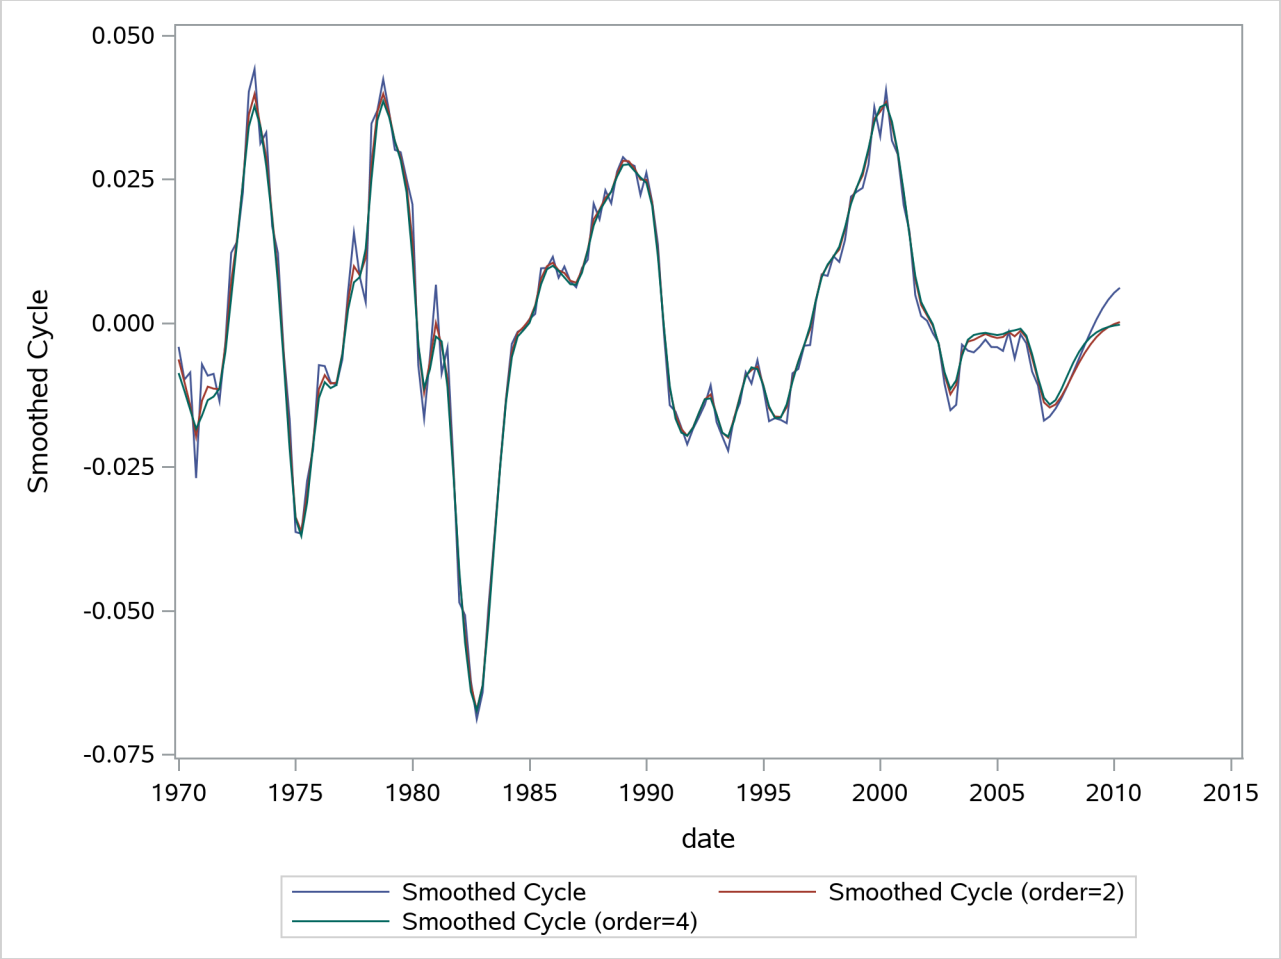


**Output 42.9.4** Estimated Cycle: Order = 4



Output 42.9.5 shows the three cycle estimates in the same plot. It shows that the estimates don't differ very much.

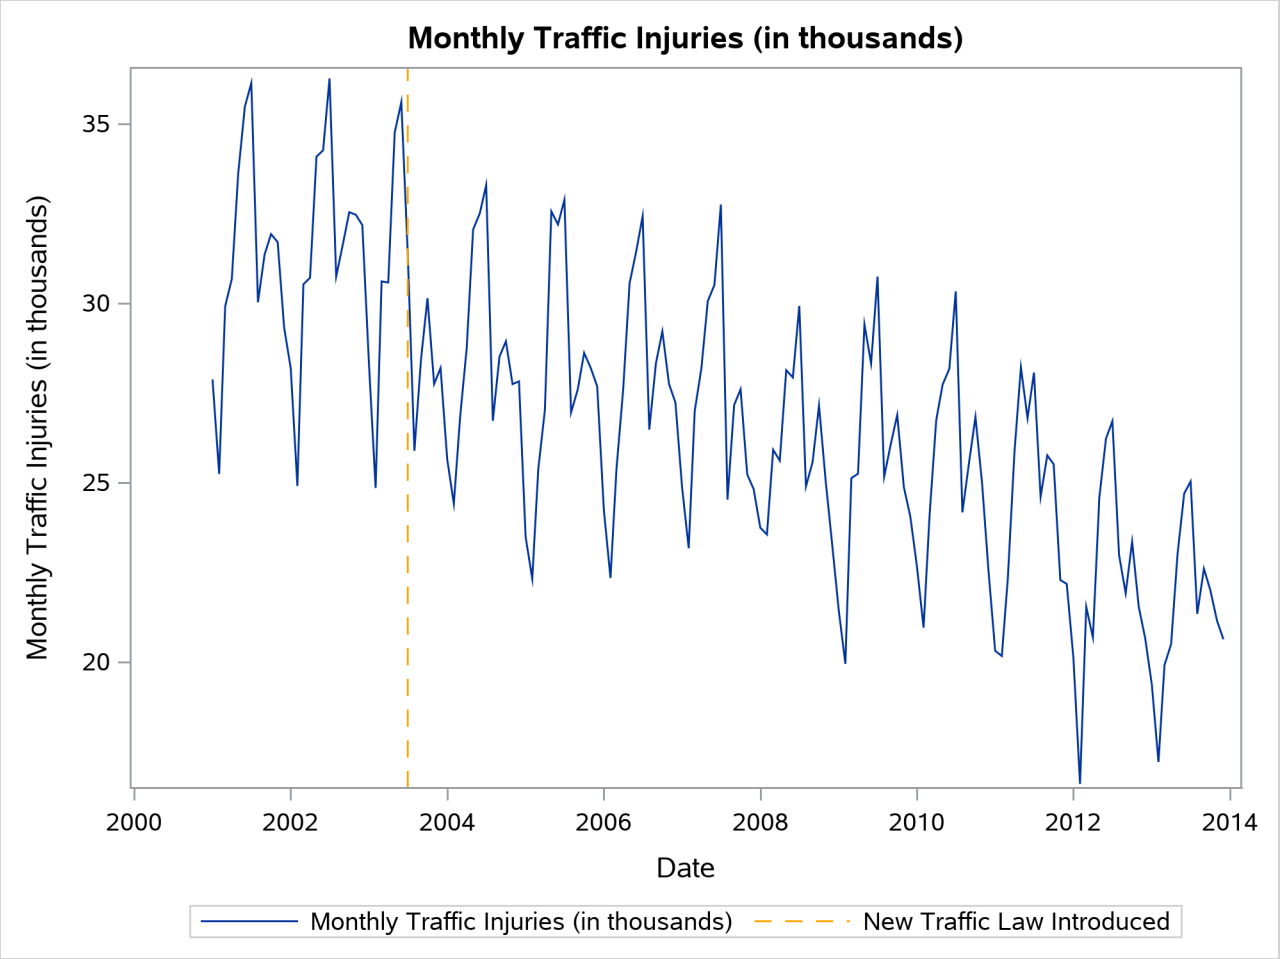
**Output 42.9.5** Estimated Cycles of Orders 1, 2, and 4



## Example 42.10: A Transfer-Function Model for the Italian Traffic Accident Data (Experimental)

This example is based on a case study described in Pelagatti (2015, chap. 9, sec. 1). In July 2003, Italy introduced a new traffic monitoring system with the aim of improving traffic safety. The case study tried to answer the question, "Was the monitoring system effective in reducing the number of traffic injuries?" The time series plot in Output 42.10.1 shows monthly traffic injuries for the span of January 2001 to December 2013. Visual inspection of the plot clearly shows that the series is seasonal and has an overall downward trend, which appears to be more pronounced after the intervention.

**Output 42.10.1** Monthly Traffic Injuries in Italy



Pelagatti (2015, chap. 9, sec. 1) suggests the following model for this series:

$$y_t = \mu_t + \psi_t + \text{shift03}\ \beta + \xi_t + \epsilon_t$$

Various terms in the right-hand side of this model are explained as follows:

- $\mu_t$ is the trend component, which is modeled as an integrated random walk.
- $\psi_t$ is the trigonometric seasonal component, which accounts for the monthly seasonality.
- The effect of the introduction of the monitoring system is modeled using two terms:
  - One term captures a permanent shift, which is a regression effect that is associated with the dummy regressor shift03. This regressor is 0 before July 2003 and 1 thereafter.
  - The other term captures a transient effect that rapidly decays to 0. The transient effect $\xi_t$ is a transfer-function effect

    $$\xi_t = \frac{\gamma_0\ \text{pulse03}_t}{(1 - \delta B)}$$

    where pulse03 is a dummy regressor that is 1 at July 2003 and 0 otherwise. In this example, the transfer function $\xi_t$ is clearly 0 before July 2003.

- $\epsilon_t$ is the simple irregular component.

The following statements show how to fit this model to the data. The LIKE=MARGINAL option in the ESTIMATE statement causes the parameter estimation to be based on marginal likelihood rather than on diffuse likelihood, which is the default. Since the parameter vector of this model contains $\delta$ (the denominator coefficient of the transfer function), the parameter estimations that are based on marginal likelihood and diffuse likelihood can lead to different results. In this example, the results turn out to be similar; however, this is not necessarily the case in general. Generally, parameter estimation that is based on marginal likelihood is the preferred choice in such cases.

```
proc ucm data=italy;
   id date interval=month;
   model Injured = shift03;
   irregular;
   level variance=0 noest;
   slope;
   season length=12 type=trig;
   tf pulse03 den=1 tfstart=0 plot=smooth;
   estimate plot=(panel residual) like=marginal;
   forecast plot=decomp;
run;
```

Output 42.10.3 shows the parameter estimates. It shows that soon after the introduction of the monitoring system in July 2003, the accident level decreased by about 5.22 thousand ($\hat{\beta} + \hat{\gamma}_0 = -(2.48 + 2.74)$). However, the permanent decrease was only about 2.48 thousand ($\hat{\beta} = -2.48$). The estimate of the decay parameter of the transfer function, $\delta$, is 0.587.

**Output 42.10.2** Estimates of the Model Parameters

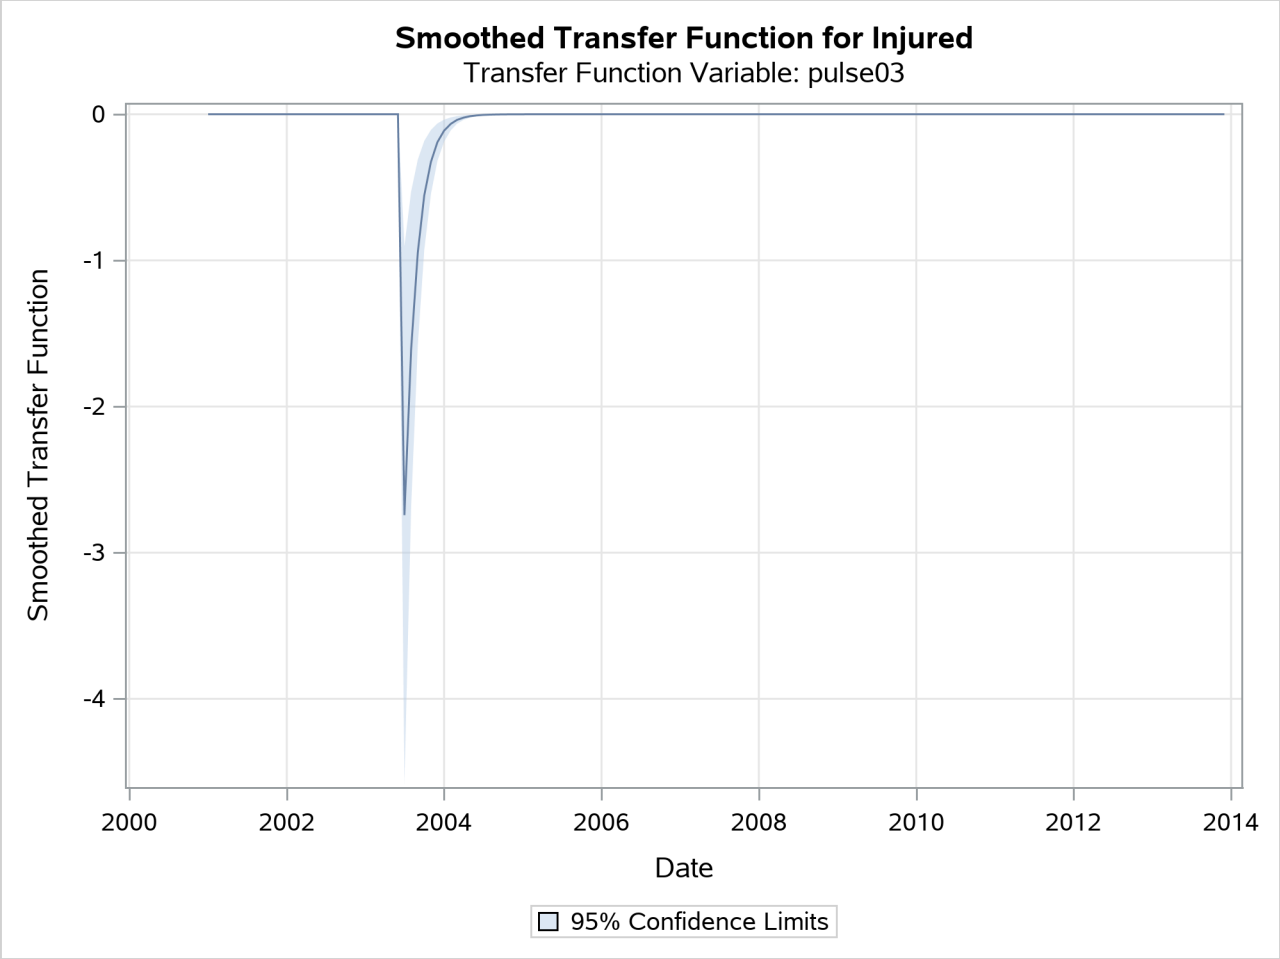
**The UCM Procedure**

**Final Estimates of the Free Parameters**

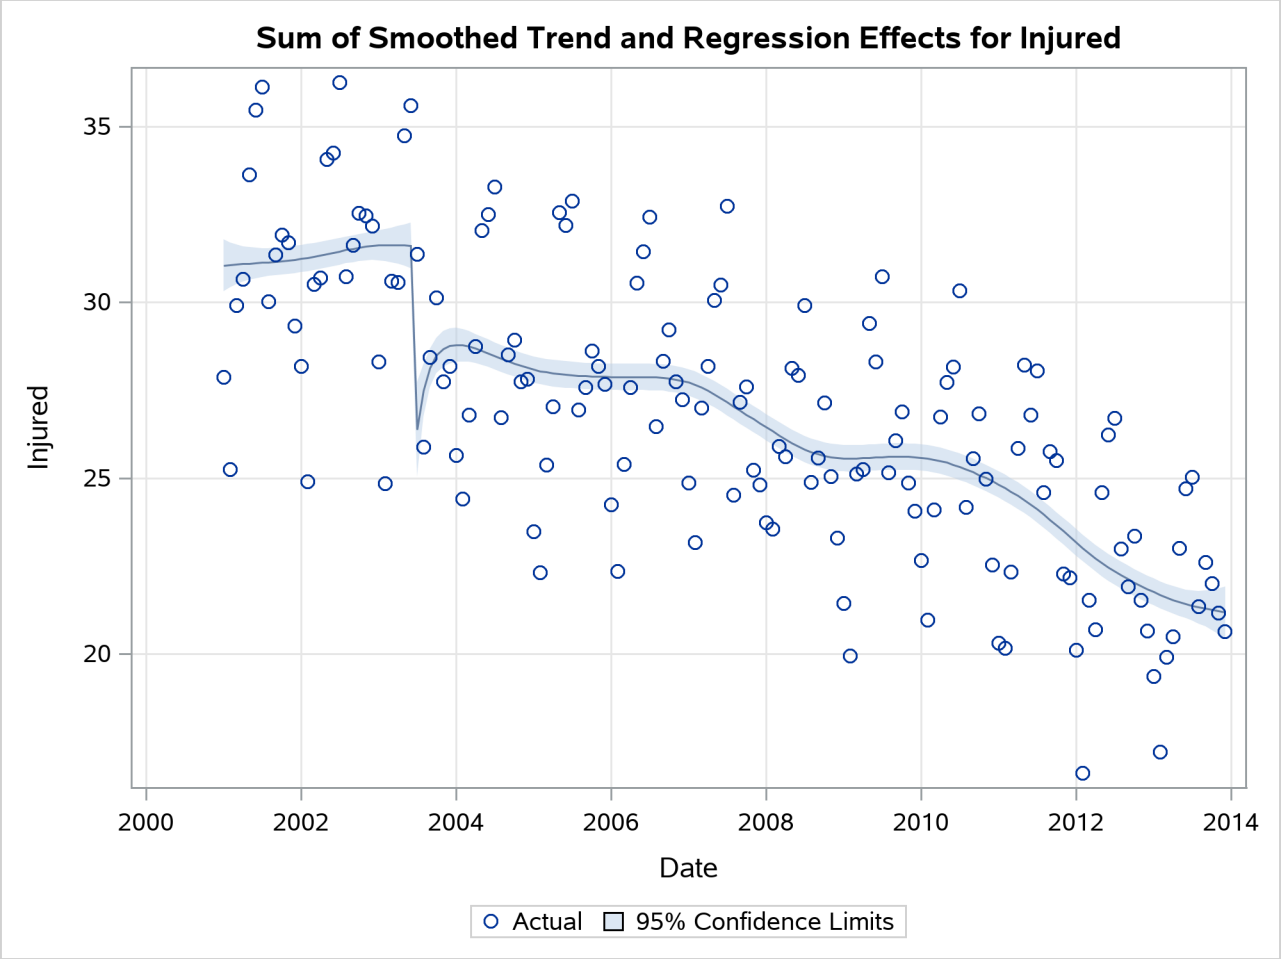
| Component | Parameter | Estimate | Approx Std Error | t Value | Approx Pr > \|t\| |
|---|---|---|---|---|---|
| Irregular | Error Variance | 0.55447 | 0.09227 | 6.01 | <.0001 |
| Slope | Error Variance | 0.00064586 | 0.0004515 | 1.43 | 0.1526 |
| Season | Error Variance | 0.00068803 | 0.0005190 | 1.33 | 0.1849 |
| shift03 | Coefficient | -2.47939 | 0.70928 | -3.50 | 0.0005 |
| pulse03 | Coefficient | -2.74316 | 0.93850 | -2.92 | 0.0035 |
| pulse03 | DEN_1 | 0.58714 | 0.17805 | 3.30 | 0.0010 |

Output 42.10.3 shows the plot of smoothed estimate of the transfer function $\xi_t$, and Output 42.10.4 shows the plot of the estimate of the trend plus the total effect of the July 2003 intervention.

**Output 42.10.3** Decaying Part of the July 2003 Intervention Effect (Smoothed Estimate of $\xi_t$)



**Output 42.10.4** Smoothed Estimate of $\mu_t$ + shift03 $\beta + \xi_t$



Finally, the Output 42.10.5 shows the plot of the overall model fit.

**Output 42.10.5** Sum of All Model Terms Except the Irregular

# Overview: VARMAX Procedure

Given a multivariate time series, the VARMAX procedure estimates the model parameters and generates forecasts that are associated with vector autoregressive moving average processes with exogenous regressors (VARMAX) models. Often, economic or financial variables are not only contemporaneously correlated with each other, but also correlated with each other's past values. You can use the VARMAX procedure to model these types of time relationships. In many economic and financial applications, the variables of interest (dependent, response, or endogenous variables) are influenced by variables external to the system under consideration (independent, input, predictor, regressor, or exogenous variables). The VARMAX procedure enables you to model the dynamic relationships both among the dependent variables and between the dependent and independent variables.

A VARMAX model is defined in terms of the orders of the autoregressive or moving average processes (or both). When you use the VARMAX procedure, these orders can be specified by options or they can be automatically determined according to the information criteria. The VARMAX procedure supports the following information criteria: Akaike's information criterion (AIC), the corrected AIC (AICC), the Hannan-Quinn criterion (HQC), the final prediction error (FPE), and the Schwarz Bayesian criterion (SBC), which is

also known as the Bayesian information criterion (BIC). For the definitions and usages of the information criteria, see the section "The Minimum Information Criterion (MINIC) Method" on page 3093.

If you do not want to use automatic order selection, the VARMAX procedure provides the following autoregressive order identification aids: partial cross-correlations, partial autoregressive coefficients, partial canonical correlations, and Yule-Walker estimates.

For situations where the stationarity of the time series is in question, the VARMAX procedure provides the following tests to aid in determining the presence of unit roots and cointegration: Dickey-Fuller tests, the Stock-Watson common trends test for the possibility of cointegration among nonstationary vector processes of integrated order one, and Johansen cointegration tests for nonstationary vector processes of integrated order one and order two.

For stationary vector times series or nonstationary series that are made stationary by appropriate differencing or cointegration, the VARMAX procedure provides the vector autoregressive and moving average (VARMA) model and the vector error correction model (VECM). The vector error correction model can be in both autoregressive (AR) and autoregressive and moving average (ARMA) forms.

To cope with the problem of high dimensionality in the parameters of the VAR model and the VECM, the VARMAX procedure provides both the Bayesian vector autoregressive (BVAR) model and the Bayesian vector error correction model (BVECM). Bayesian models are used when prior information about the model parameters is available.

The VARMAX procedure also allows independent (exogenous) variables and their distributed lags to influence dependent (endogenous) variables in various models. These models are identified by an X suffix added to the original model name; for example, VARMAX, VECMX, BVARX, and BVECMX.

Correlations in the second moments of the vector time series might exist; this is called conditional heteroscedasticity. The VARMAX procedure supports three forms of multivariate generalized autoregressive conditional heteroscedasticity (GARCH) models to model the conditional heteroscedasticity: the Baba-Engle-Kroner-Kraft (BEKK) GARCH model, the constant conditional correlation (CCC) GARCH model, and the dynamic conditional correlation (DCC) GARCH model. For CCC and DCC GARCH models, five subforms of univariate GARCH models are supported: the GARCH model, the exponential GARCH (EGARCH) model, the quadratic GARCH (QGARCH) model, the threshold GARCH (TGARCH) model, and the power GARCH (PGARCH) model.

You can use the VARMAX-GARCH model or the VEC-ARMAX-GARCH model to simultaneously model both the first and second moments of the time series.

Finally, for stationary time series exhibiting long-range dependence (also known as long memory or persistence), that is series with a slowly decaying sample autocorrelation function, the VARMAX procedure supports the VARFIMA (vector autoregressive fractionally integrated moving average) and VARFIMAX models.

Forecasting is one of the main objectives of multivariate time series analysis. After successfully fitting the VARMAX, BVARX, VECMX, BVECMX, VARFIMAX and multivariate GARCH models, the VARMAX procedure computes predicted values and conditional heteroscedasticity based on the parameter estimates and the past values of the vector time series. Out-of-sample multistep-ahead forecasts are also supported. Simulation-based conditional forecasts and scenario analysis are supported for the VAR, BVAR, VECM, and BVECM models with or without the exogenous variables.

The following model parameter estimation methods are supported:

- the least squares (LS) method, which can be applied to VARX models

- the maximum likelihood (ML) method, which can be applied to all types of models and is used by default for VARFIMAX models,
- the conditional maximum likelihood (CML) method, which can be applied to VARMAX models

When you use the ML or CML method, you can start your optimization with the default or with different initial parameter values.

The VARMAX procedure supports the estimation of the restricted model when you impose linear constraints on the parameters of interest. The VARMAX procedure also supports various hypothesis tests of long-run effects and adjustment coefficients by using the likelihood ratio test that is based on Johansen cointegration analysis. It also supports the likelihood ratio test of weak exogeneity for each variable. In fact, because the VARMAX procedure outputs log-likelihood values for all models, you can always use the likelihood ratio test to check any linear hypothesis on parameters that are estimated in the models by estimating the restricted and unrestricted models separately. The VARMAX procedure also supports another alternative test, the Wald test.

After fitting the model parameters, the VARMAX procedure uses the following tests to provide model checks and residual analysis: Durbin-Watson (DW) statistics, the $F$ test for autoregressive conditional heteroscedastic (ARCH) disturbance, the $F$ test for AR disturbance, the Jarque-Bera normality test, and the portmanteau test.

The VARMAX procedure supports several modeling features, including seasonal deterministic terms, linear and quadratic time trends, subset models, multiple regression with distributed lags, the dead-start model (which does not have present values of the exogenous variables), and so on.

The VARMAX procedure provides a Granger causality test to determine the Granger-causal relationships between two distinct groups of variables. It also provides the following: the infinite order AR representation, the impulse response function (also called infinite order MA representation), the decomposition of the predicted error covariances, roots of the characteristic functions for both the AR and MA parts to evaluate the proximity of the roots to the unit circle, and contemporaneous relationships among the components of the vector time series.

# Getting Started: VARMAX Procedure

This section provides several examples of the types of models that the VARMAX procedure supports.

## Vector Autoregressive Model

Let $\mathbf{y}_t = (y_{1t}, \ldots, y_{kt})'$, $t = 1, 2, \ldots$, denote a $k$-dimensional time series vector of random variables of interest. The $p$th-order VAR process is written as

$$\mathbf{y}_t = \boldsymbol{\delta} + \Phi_1 \mathbf{y}_{t-1} + \cdots + \Phi_p \mathbf{y}_{t-p} + \boldsymbol{\epsilon}_t$$

where $\boldsymbol{\epsilon}_t = (\epsilon_{1t}, \ldots, \epsilon_{kt})'$ is a vector white noise process such that $\mathrm{E}(\boldsymbol{\epsilon}_t) = 0$, $\mathrm{E}(\boldsymbol{\epsilon}_t \boldsymbol{\epsilon}_t') = \Sigma$, and $\mathrm{E}(\boldsymbol{\epsilon}_t \boldsymbol{\epsilon}_s') = 0$ for $t \neq s$; $\boldsymbol{\delta} = (\delta_1, \ldots, \delta_k)'$ is a constant vector; and $\Phi_i$ is a $k \times k$ matrix.

Analyzing and modeling the series jointly enables you to understand the dynamic relationships over time among the series and to improve the accuracy of forecasts for individual series by using the additional information available from the related series and their forecasts.

Consider the first-order stationary bivariate vector autoregressive model:

$$\mathbf{y}_t = \begin{pmatrix} 1.2 & -0.5 \\ 0.6 & 0.3 \end{pmatrix} \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t, \quad \text{with } \Sigma = \begin{pmatrix} 1.0 & 0.5 \\ 0.5 & 1.25 \end{pmatrix}$$

The following IML procedure statements simulate a bivariate vector time series from this model to provide test data for the VARMAX procedure:

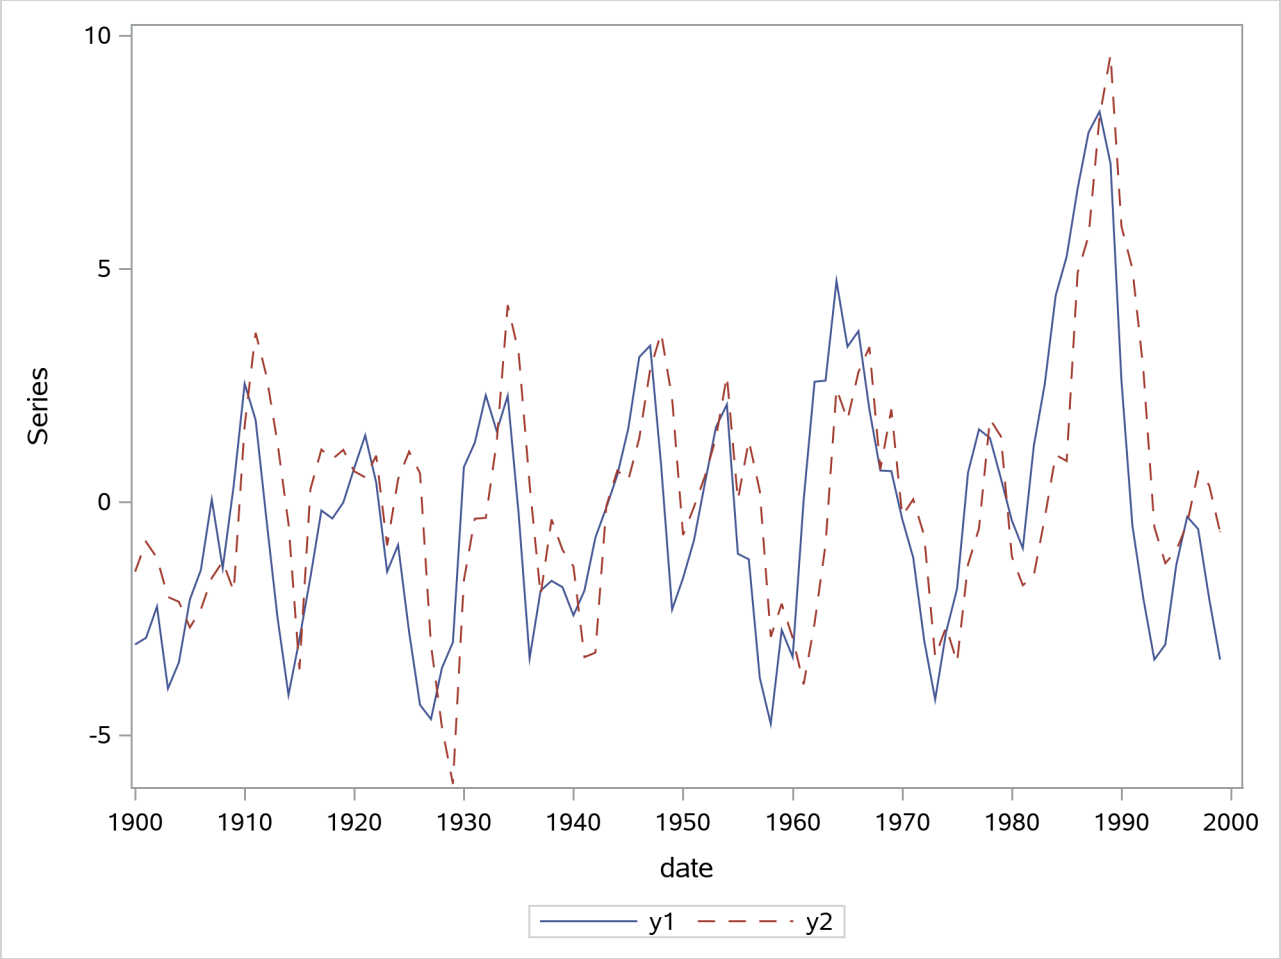
```
proc iml;
   sig = {1.0  0.5, 0.5 1.25};
   phi = {1.2 -0.5, 0.6 0.3};
   /* simulate the vector time series */
   call varmasim(y,phi) sigma = sig n = 100 seed = 34657;
   cn = {'y1' 'y2'};
   create simul1 from y[colname=cn];
   append from y;
quit;
```

The following statements plot the simulated vector time series $\mathbf{y}_t$, which is shown in Figure 43.1:

```
data simul1;
   set simul1;
   date = intnx( 'year', '01jan1900'd, _n_-1 );
   format date year4.;
run;

proc sgplot data=simul1;
   series x=date y=y1 / lineattrs=(pattern=solid);
   series x=date y=y2 / lineattrs=(pattern=dash);
   yaxis label="Series";
run;
```

**Figure 43.1** Plot of the Generated Data Process



The following statements fit a VAR(1) model to the simulated data:

```
/*--- Vector Autoregressive Model ---*/

proc varmax data=simul1;
   id date interval=year;
   model y1 y2 / p=1 noint lagmax=3
                 print=(estimates diagnose);
   output out=for lead=5;
run;
```

First, you specify the input data set in the PROC VARMAX statement. Then, you use the MODEL statement to designate the dependent variables, $y_1$ and $y_2$. To estimate a zero-mean VAR model, you specify the order of the autoregressive model in the P= option and the NOINT option. The MODEL statement fits the model to the data and prints parameter estimates and their significance. The PRINT=ESTIMATES option prints the matrix form of parameter estimates, and the PRINT=DIAGNOSE option prints various diagnostic tests. The LAGMAX=3 option prints the output for the residual diagnostic checks.

To output the forecasts to a data set, you specify the OUT= option in the OUTPUT statement. If you want to forecast five steps ahead, you use the LEAD=5 option. The ID statement specifies the yearly interval between observations and provides the Time column in the forecast output.

The VARMAX procedure output is shown in Figure 43.2 through Figure 43.10. The VARMAX procedure first displays descriptive statistics, as shown in Figure 43.2. The Type column indicates that the variables are dependent variables. The N column indicates the number of nonmissing observations.

**Figure 43.2** Descriptive Statistics

**The VARMAX Procedure**

| | |
|---|---|
| **Number of Observations** | 100 |
| **Number of Pairwise Missing** | 0 |

**Simple Summary Statistics**

| Variable | Type | N | Mean | Standard Deviation | Min | Max |
|---|---|---|---|---|---|---|
| **y1** | **Dependent** | 100 | -0.21653 | 2.78210 | -4.75826 | 8.37032 |
| **y2** | **Dependent** | 100 | 0.16905 | 2.58184 | -6.04718 | 9.58487 |

Figure 43.3 shows the model type and the estimation method that is used to fit the model to the simulated data. It also shows the AR coefficient matrix in terms of lag 1, the schematic representation, and the parameter estimates and their significance that can indicate how well the model fits the data.

The "AR" table shows the AR coefficient matrix. The "Schematic Representation" table schematically represents the parameter estimates and enables you to easily verify their significance in matrix form.

In the "Model Parameter Estimates" table, the first column shows the variable on the left side of the equation; the second column is the parameter name AR$l_i_j$, which indicates the $(i, j)$ element of the lag $l$ autoregressive coefficient; the next four columns provide the estimate, standard error, $t$ value, and $p$-value for the parameter; and the last column is the regressor that corresponds to the displayed parameter.

**Figure 43.3** Model Type and Parameter Estimates

**The VARMAX Procedure**

| | |
|---|---|
| **Type of Model** | VAR(1) |
| **Estimation Method** | Least Squares Estimation |

| | | AR | |
|---|---|---|---|
| **Lag** | **Variable** | **y1** | **y2** |
| **1** | **y1** | 1.15977 | -0.51058 |
| | **y2** | 0.54634 | 0.38499 |

| **Schematic Representation** | |
|---|---|
| **Variable/Lag** | **AR1** |
| **y1** | +- |
| **y2** | ++ |
| **+ is > 2*std error, - is < -2*std error, . is between, * is N/A** | |

**Model Parameter Estimates**

| **Equation** | **Parameter** | **Estimate** | **Standard Error** | **t Value** | **Pr > \|t\|** | **Variable** |
|---|---|---|---|---|---|---|
| **y1** | **AR1_1_1** | 1.15977 | 0.05508 | 21.06 | 0.0001 | y1(t-1) |
| | **AR1_1_2** | -0.51058 | 0.05898 | -8.66 | 0.0001 | y2(t-1) |
| **y2** | **AR1_2_1** | 0.54634 | 0.05779 | 9.45 | 0.0001 | y1(t-1) |
| | **AR1_2_2** | 0.38499 | 0.06188 | 6.22 | 0.0001 | y2(t-1) |

The fitted VAR(1) model with estimated standard errors in parentheses is given as

$$\mathbf{y}_t = \begin{pmatrix} 1.160 & -0.511 \\ (0.055) & (0.059) \\ 0.546 & 0.385 \\ (0.058) & (0.062) \end{pmatrix} \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t$$

Clearly, all parameter estimates in the coefficient matrix $\Phi_1$ are significant.

The model can also be written as two univariate regression equations:

$$\begin{aligned} y_{1t} &= 1.160\, y_{1,t-1} - 0.511\, y_{2,t-1} + \epsilon_{1t} \\ y_{2t} &= 0.546\, y_{1,t-1} + 0.385\, y_{2,t-1} + \epsilon_{2t} \end{aligned}$$

The table in Figure 43.4 shows the innovation covariance matrix estimates, the log likelihood, and the various information criteria results. The variable names in the table for the innovation covariance matrix estimates $\hat{\Sigma}$ are printed for convenience: $y1$ means the innovation for $y1$, and $y2$ means the innovation

for $y2$. The log likelihood for a VAR model that is estimated through least squares method is defined as $-T(\log(|\hat{\Sigma}_{\mathrm{ML}}|) + k)/2$, where $T(= 100 - 1 = 99)$ is the sample size except the presample being skipped because of the AR lag order, $k(= 2)$ is the number of dependent variables, and $\hat{\Sigma}_{\mathrm{ML}}$ is the maximum likelihood estimate (MLE) of innovation covariance matrix. The matrix $\hat{\Sigma}_{\mathrm{ML}}$ is computed from the reported least squares estimate of the innovation covariance matrix, $\hat{\Sigma}$, by adjusting the degrees of freedom. $\hat{\Sigma}_{\mathrm{ML}} = \frac{T-r_b}{T}\hat{\Sigma}$, where $r_b(= 2)$ is the number of parameters in each equation. You can use the information criteria to compare the fit of competing models to a set of data. The model that has a smaller value of the information criterion is preferred when it is compared to other models. For more information about how to calculate the information criteria, see the section "Multivariate Model Diagnostic Checks" on page 3114.

**Figure 43.4** Innovation Covariance Estimates, Log Likelihood, and Information Criteria

**Covariances of Innovations**

| 3 | 8 | 2.78 | 0.9473 |

The VARMAX procedure provides diagnostic checks for the univariate form of the equations. The table in Figure 43.8 describes how well each univariate equation fits the data. From the two univariate regression equations shown in Figure 43.3, the values of $R^2$ in the second column of Figure 43.8 are 0.84 and 0.79. The standard deviations in the third column are the square roots of the diagonal elements of the covariance matrix from Figure 43.4. The $F$ statistics in the fourth column test the null hypotheses $\phi_{11} = \phi_{12} = 0$ and $\phi_{21} = \phi_{22} = 0$, where $\phi_{ij}$ is the $(i, j)$ element of the matrix $\Phi_1$. The last column shows the $p$-values of the $F$ statistics. The results show that each univariate model is significant.

**Figure 43.8** Univariate Diagnostic Checks

| Univariate Model ANOVA Diagnostics | | | | |
|---|---|---|---|---|
| Variable | R-Square | Standard Deviation | F Value | Pr > F |
| y1 | 0.8351 | 1.13523 | 491.25 | <.0001 |
| y2 | 0.7906 | 1.19096 | 366.29 | <.0001 |

The check for white noise residuals in terms of the univariate equation is shown in Figure 43.9. This output contains information that indicates whether the residuals are correlated and heteroscedastic. In the first table, the second column contains the Durbin-Watson test statistics to test the null hypothesis that the residuals are

uncorrelated. The third and fourth columns show the Jarque-Bera normality test statistics and their $p$-values to test the null hypothesis that the residuals have normality. The last two columns show $F$ statistics and their $p$-values for ARCH(1) disturbances to test the null hypothesis that the residuals have equal covariances. The second table includes $F$ statistics and their $p$-values for AR(1), AR(1,2), AR(1,2,3) and AR(1,2,3,4) models of residuals to test the null hypothesis that the residuals are uncorrelated.

**Figure 43.9** Univariate Diagnostic Checks, Continued

## Bayesian Vector Autoregressive Model

The Bayesian vector autoregressive (BVAR) model avoids problems of collinearity and overparameterization that often occur with the use of VAR models. BVAR models avoid these problems by imposing priors on the AR parameters.

The following statements fit a BVAR(1) model to the simulated data:

```
/*--- Bayesian Vector Autoregressive Process ---*/

proc varmax data=simul1;
   model y1 y2 / p=1 noint
                 prior=(lambda=0.9 theta=0.1);
run;
```

The hyperparameters, LAMBDA=0.9 and THETA=0.1, in the PRIOR= option control the prior covariance. Part of the VARMAX procedure output is shown in Figure 43.11, whose parameter estimates are slightly different from those in Figure 43.3. By choosing the appropriate priors, you might be able to obtain more accurate forecasts by using a BVAR model instead of an unconstrained VAR model. For more information, see the section "Bayesian VAR and VARX Modeling" on page 3102.

**Figure 43.11** Parameter Estimates for the BVAR(1) Model

| **y2** | 0.50192 | 1.51456 |

## Vector Error Correction Model

A vector error correction model (VECM) can lead to a better understanding of the nature of any nonstationarity among the different component series and can also improve longer-term forecasting compared to an unconstrained model.

The VECM($p$) form with the cointegration rank, $r(\leq k)$, is written as

$$\Delta \mathbf{y}_t = \boldsymbol{\delta} + \Pi \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t$$

where $\Delta$ is the differencing operator, such that $\Delta \mathbf{y}_t = \mathbf{y}_t - \mathbf{y}_{t-1}$; $\Pi = \alpha\beta'$, where $\alpha$ and $\beta$ are $k \times r$ matrices; and $\Phi_i^*$ is a $k \times k$ matrix.

The VECM($p$) form has an equivalent VAR($p$) representation as described in the section "Vector Autoregressive Model" on page 2978.

$$\mathbf{y}_t = \boldsymbol{\delta} + (I_k + \Pi + \Phi_1^*)\mathbf{y}_{t-1} + \sum_{i=2}^{p-1}(\Phi_i^* - \Phi_{i-1}^*)\mathbf{y}_{t-i} - \Phi_{p-1}^* \mathbf{y}_{t-p} + \boldsymbol{\epsilon}_t$$

where $I_k$ is a $k \times k$ identity matrix.

An example of the second-order nonstationary vector autoregressive model is

$$\mathbf{y}_t = \begin{pmatrix} -0.2 & 0.1 \\ 0.5 & 0.2 \end{pmatrix} \mathbf{y}_{t-1} + \begin{pmatrix} 0.8 & 0.7 \\ -0.4 & 0.6 \end{pmatrix} \mathbf{y}_{t-2} + \boldsymbol{\epsilon}_t$$

with

$$\Sigma = \begin{pmatrix} 100 & 0 \\ 0 & 100 \end{pmatrix} \text{ and } \mathbf{y}_{-1} = \mathbf{y}_0 = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

This process can be given the following VECM(2) representation with the cointegration rank one:

$$\Delta \mathbf{y}_t = \begin{pmatrix} -0.4 \\ 0.1 \end{pmatrix} (1, -2)\mathbf{y}_{t-1} - \begin{pmatrix} 0.8 & 0.7 \\ -0.4 & 0.6 \end{pmatrix} \Delta \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t$$

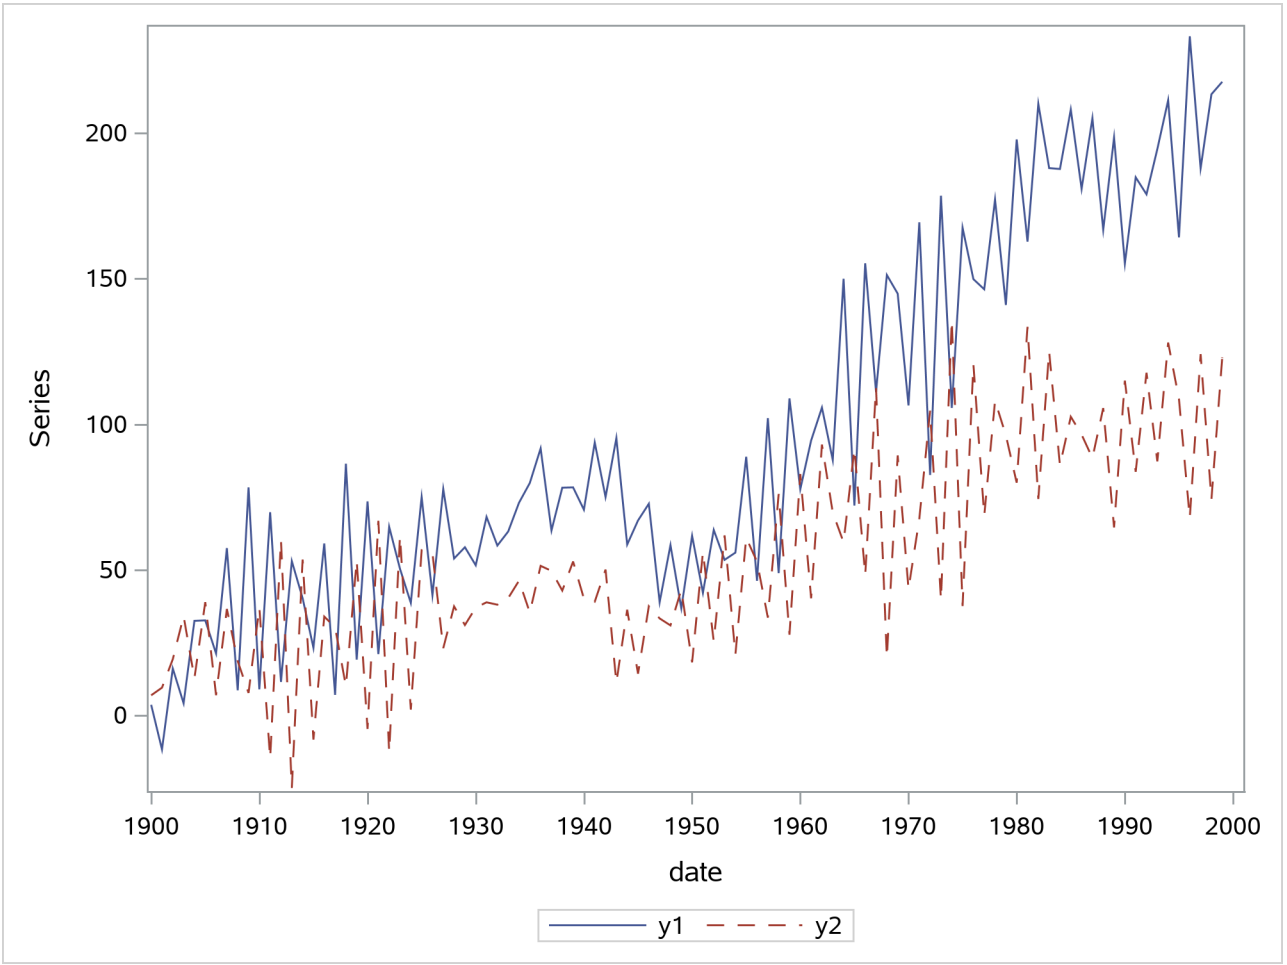
The following PROC IML statements generate simulated data for this VECM(2) form and the PROC SGPLOT statements plot the data, as shown in Figure 43.12:

```
proc iml;
   sig = 100*i(2);
   phi = {-0.2 0.1, 0.5 0.2, 0.8 0.7, -0.4 0.6};
   call varmasim(y,phi) sigma=sig n=100 initial=0
                        seed=45876;
   cn = {'y1' 'y2'};
   create simul2 from y[colname=cn];
   append from y;
quit;

data simul2;
   set simul2;
   date = intnx( 'year', '01jan1900'd, _n_-1 );
   format date year4. ;
run;

proc sgplot data=simul2;
   series x=date y=y1 / lineattrs=(pattern=solid);
   series x=date y=y2 / lineattrs=(pattern=dash);
   yaxis label="Series";
run;
```

**Figure 43.12** Plot of Generated Data Process



## Cointegration Testing

The following statements use the Johansen cointegration rank test. The COINTTEST=(JOHANSEN) option performs the Johansen trace test and is equivalent to specifying the COINTTEST option with no additional suboptions or specifying the COINTTEST=(JOHANSEN=(TYPE=TRACE)) option.

```
/*--- Cointegration Test ---*/

proc varmax data=simul2;
   model y1 y2 / p=2 noint dftest cointtest=(johansen);
run;
```

Figure 43.13 shows the output for Dickey-Fuller tests for the nonstationarity of each series and the Johansen cointegration rank test between series.

**Figure 43.13** Dickey-Fuller Tests and Cointegration Rank Test

**Cointegration Rank Test Using Trace**

| H0: Rank=r | H1: Rank>r | Eigenvalue | Trace | Pr > Trace | Drift in ECM | Drift in Process |
|---|---|---|---|---|---|---|
| 0 | 0 | 0.5086 | 70.7279 | <.0001 | NOINT | Constant |
| 1 | 1 | 0.0111 | 1.0921 | 0.3441 | | |

In Dickey-Fuller tests, the second column specifies three types of models, which are zero mean, single mean, or trend. The third column (Rho) and the fifth column (Tau) are the test statistics that are used to test the null hypothesis that the series has a unit root. Other columns are their $p$-values. You can see that both series have unit roots. For a description of Dickey-Fuller tests, see the section "PROBDF Function for Dickey-Fuller Tests" on page 160 in Chapter 6, "SAS Macros and Functions."

In the "Cointegration Rank Test Using Trace" table, the last two columns explain the drift in the model or process. Because the NOINT option is specified, the model is

$$\Delta \mathbf{y}_t = \Pi \mathbf{y}_{t-1} + \Phi_1^* \Delta \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t$$

The column Drift in ECM indicates that there is no separate drift in the error correction model, and the column Drift in Process indicates that the process has a constant drift before differencing.

H0 is the null hypothesis, and H1 is the alternative hypothesis. The first row tests the cointegration rank $r = 0$ against $r > 0$, and the second row tests $r = 1$ against $r > 1$. The trace test statistics in the fourth column are computed by $-T \sum_{i=r+1}^{k} \log(1 - \lambda_i)$, where $T$ is the available number of observations and $\lambda_i$

is the eigenvalue in the third column. The $p$-values for these statistics are output in the fifth column. If you compare the $p$-value in each row to the significance level of interest (such as 5%), the null hypothesis that there is no cointegrated process (H0: $r = 0$) is rejected, whereas the null hypothesis that there is at most one cointegrated process (H0: $r = 1$) cannot be rejected.

The following statements fit a VECM(2) form to the simulated data:

```
/*--- Vector Error Correction Model ---*/

proc varmax data=simul2;
   model y1 y2 / p=2 noint lagmax=3
                 print=(iarr estimates);
   cointeg rank=1 normalize=y1;
run;
```

The results in Figure 43.13 indicate that the time series are cointegrated with rank = 1. So you might want to specify the RANK=1 option in the COINTEG statement. For normalizing the value of the cointegrated vector, you specify the normalized variable by using the NORMALIZE= option in the COINTEG statement. The COINTEG statement produces the estimates of the long-run parameter, $\boldsymbol{\beta}$, and the adjustment coefficient, $\boldsymbol{\alpha}$. The PRINT=(IARR) option provides the VAR(2) representation.

The VARMAX procedure output is shown in Figure 43.14 through Figure 43.17. In Figure 43.14, "1" indicates the first column of the $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ matrices. Because the cointegration rank is 1 in the bivariate system, $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ are two-dimensional vectors. The estimated cointegrating vector is $\hat{\boldsymbol{\beta}} = (1, -1.96)'$. Therefore, the long-run relationship between $y_{1t}$ and $y_{2t}$ is $y_{1t} = 1.96 y_{2t}$. The first element of $\hat{\boldsymbol{\beta}}$ is 1 because $y_1$ is specified as the normalized variable. Asymptotically, $\boldsymbol{\alpha}$ follows a normal distribution, and the $t$ values and $p$-values of its elements are shown in the "Alpha and Beta Parameter Estimates" table; however, because $\boldsymbol{\beta}$ follows a nonnormal distribution, the corresponding standard errors, $t$ values, and $p$-values are missing. The Variable column shows the variables that correspond to the coefficients. For example, for the coefficient $\boldsymbol{\alpha}_{ij}$ (the $i$th element in the $j$th column of $\boldsymbol{\alpha}$), ALPHA$i_j$, the variable is the inner product of the transpose of the $j$th column of $\boldsymbol{\beta}$ (Beta[,$j$]$'$) and the vector of lag 1 dependent variables $\mathbf{y}_{t-1}$ (_DEP_(t–1)).

Figure 43.15 shows the parameter estimates in terms of lag 1 coefficients, $\mathbf{y}_{t-1}$, and lag 1 first-differenced coefficients, $\Delta\mathbf{y}_{t-1}$, and their significance. "Alpha * Beta′" indicates the coefficients of $\mathbf{y}_{t-1}$ and is obtained by multiplying the Alpha and Beta estimates in Figure 43.14. The parameter AR1_$i$_$j$ (which is shown in the "Model Parameter Estimates" table) corresponds to the elements in the "Alpha * Beta′" matrix. The parameter AR2_$i$_$j$ corresponds to the elements in the differenced lagged AR coefficient matrix. The "D_" prefixed to a variable name in Figure 43.15 implies differencing.

| **COV2_2** | 109.57038 | 15.65291 | 7.00 | <.0001 |

The fitted model is represented as

$$\Delta \mathbf{y}_t = \begin{pmatrix} -0.467 & 0.913 \\ (0.048) & (0.094) \\ 0.107 & -0.209 \\ (0.051) & (0.100) \end{pmatrix} \mathbf{y}_{t-1} + \begin{pmatrix} -0.743 & -0.746 \\ (0.045) & (0.048) \\ 0.405 & -0.572 \\ (0.049) & (0.051) \end{pmatrix} \Delta \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t$$

**Figure 43.17** Change the VECM(2) Form to the VAR(2) Model

| Infinite Order AR Representation | | | |
|---|---|---|---|
| **Lag** | **Variable** | **y1** | **y2** |
| **1** | **y1** | -0.21013 | 0.16674 |
| | **y2** | 0.51160 | 0.21980 |
| **2** | **y1** | 0.74332 | 0.74621 |
| | **y2** | -0.40493 | 0.57157 |
| **3** | **y1** | 0.00000 | 0.00000 |
| | **y2** | 0.00000 | 0.00000 |

The PRINT=(IARR) option in the previous SAS statements prints the reparameterized coefficient estimates. Because LAGMAX=3 in those statements, the coefficient matrix of lag 3 is zero.

The VECM(2) form in Figure 43.17 can be rewritten as the following second-order vector autoregressive model:

$$\mathbf{y}_t = \begin{pmatrix} -0.210 & 0.167 \\ 0.512 & 0.220 \end{pmatrix} \mathbf{y}_{t-1} + \begin{pmatrix} 0.743 & 0.746 \\ -0.405 & 0.572 \end{pmatrix} \mathbf{y}_{t-2} + \boldsymbol{\epsilon}_t$$

## Bayesian Vector Error Correction Model

Bayesian inference on a cointegrated system begins by using the priors of $\boldsymbol{\beta}$, which are obtained from the VECM($p$) form. Bayesian vector error correction models can improve forecast accuracy for cointegrated processes.

To use a Bayesian vector error correction model, you specify both the PRIOR= option in the MODEL statement and the COINTEG statement. The following statements fit a BVECM(2) form to the simulated data:

```
/*--- Bayesian Vector Error Correction Model ---*/

proc varmax data=simul2;
   model y1 y2 / p=2 noint
                 prior=( lambda=0.5 theta=0.2 )
                 print=(estimates);
   cointeg rank=1 normalize=y1;
run;
```

The VARMAX procedure output in Figure 43.18 shows the model type fitted to the data, the estimates of the adjustment coefficient ($\boldsymbol{\alpha}$), the parameter estimates in terms of lag 1 coefficients ($\mathbf{y}_{t-1}$), and lag 1 first-differenced coefficients ($\Delta\mathbf{y}_{t-1}$).

## Vector Autoregressive Fractionally Integrated Moving Average Model

Fractionally integrated models can be used to model stationary time series whose sample autocorrelation function decays slowly at large positive and negative lags. This behavior is often referred to as long-range dependence (LRD), long memory, or persistence; series that exhibit such behavior are called long-range dependent (LRD).

A typical parametric model for a $k$-dimensional series $\mathbf{y}_t = (y_{1t}, \ldots, y_{kt})'$, $t = 1, \ldots, T$, whose individual components are LRD is the VARFIMA (vector autoregressive fractionally integrated moving average) model. It is obtained as a natural extension of the well-known class of ARFIMA models by fractionally integrating the individual components of a $k$-dimensional white noise series. For example, a bivariate VARFIMA$(0, D, 0)$ series with no intercept term is given by

$$\mathbf{y}_t = \begin{pmatrix} y_{1t} \\ y_{2t} \end{pmatrix} = \begin{pmatrix} (I-B)^{-d_1} & 0 \\ 0 & (I-B)^{-d_2} \end{pmatrix} \begin{pmatrix} \epsilon_{1t} \\ \epsilon_{2t} \end{pmatrix} = (I-B)^{-D} \boldsymbol{\epsilon}_t$$

where $B$ is the backshift operator; $I = B^0$ is the identity operator; $d_1, d_2 \in (-1/2, 1/2)$ are the LRD parameters of the component series $\{y_{1t}\}_{t \in \mathrm{Z}}$ and $\{y_{2t}\}_{t \in \mathrm{Z}}$, respectively; $D = \mathrm{diag}(d_1, d_2)$; and $\{\boldsymbol{\epsilon}_t\}_{t \in \mathrm{Z}} = \{(\epsilon_{1t}, \epsilon_{2t})'\}_{t \in \mathrm{Z}}$ is a bivariate white noise series indexed by the set of integers Z with zero mean $\mathrm{E}\boldsymbol{\epsilon}_t = 0$ and covariance $\mathrm{E}\boldsymbol{\epsilon}_t \boldsymbol{\epsilon}_t' = \Sigma$.

The multivariate VARFIMA model is defined analogously. The matrix $\Sigma$ is in general nondiagonal, which enables the VARFIMA model to capture dependence between the individual series.

The following statements plot a simulated bivariate VARFIMA(0, $D$, 0) series with $d_1 = 0.2$, $d_2 = 0.4$, and Gaussian errors with $\Sigma_{11} = \Sigma_{22} = 3$ and $\Sigma_{12} = 0.5$:

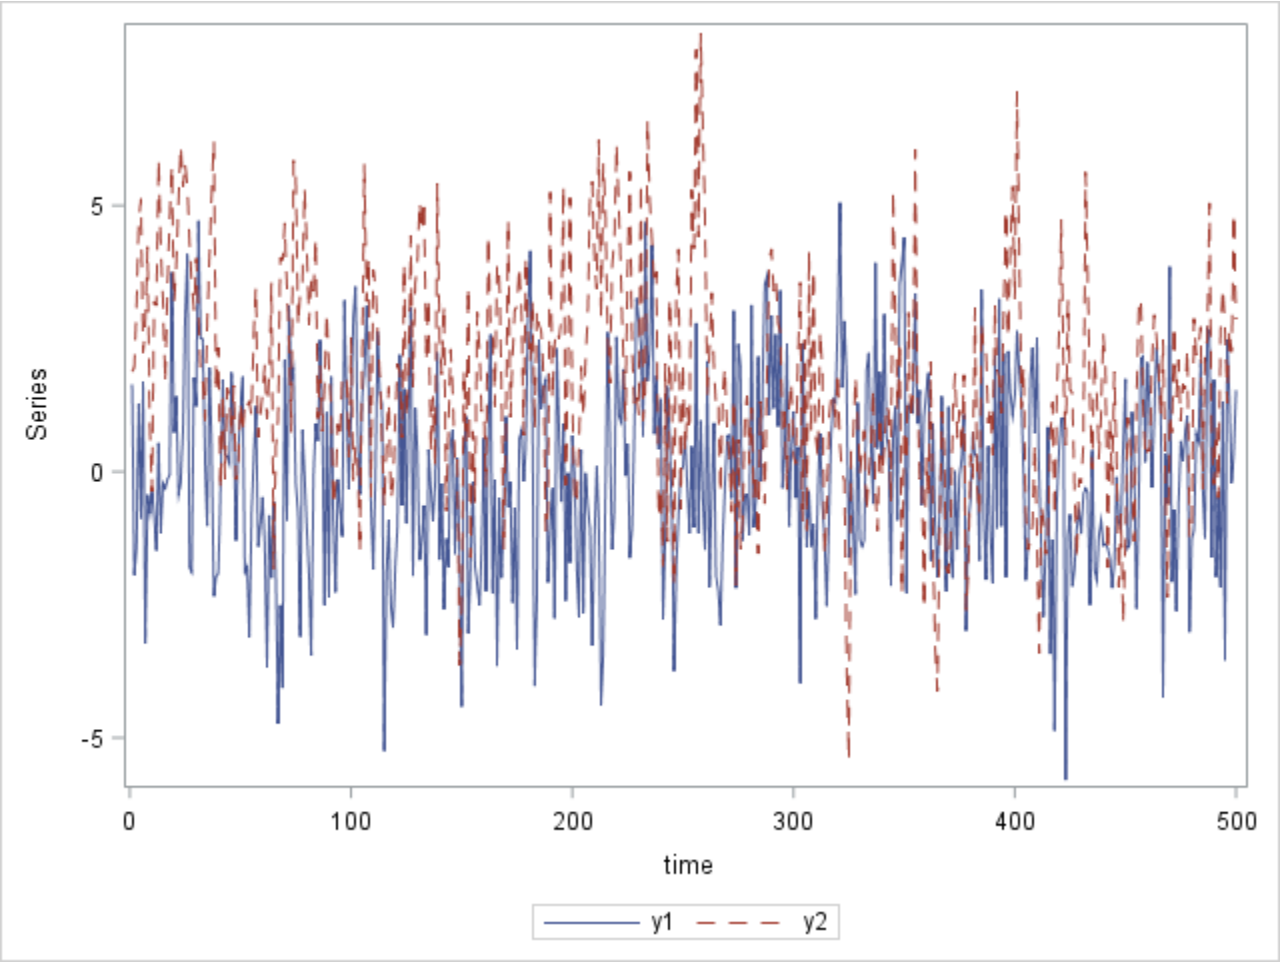
```
data VARFIMA0D0;
   time = _N_;
   input y1 y2;
datalines;
1.6380971 1.877144

   ... more lines ...

0.3482938 4.8601886
1.5320803 2.8687495
;

proc sgplot data = VARFIMA0D0;
   series x = time y=y1 / lineattrs=(pattern=solid);
   series x = time y=y2 / lineattrs=(pattern=dash);
   yaxis label="Series";
run;
```

**Figure 43.19** Plot of the Data



Before fitting a VARFIMA model to a data set, you should plot the series' sample autocorrelation function to confirm its slow decay. It is also instructive to plot the periodogram of the series. In the presence of long memory, the periodogram explodes at frequencies near 0.

The following statements produce the periodogram and the sample autocorrelation function for the specified data:

```
ods graphics on;
proc timeseries data= VARFIMA0D0 plots = (periodogram acf);
   var y1 y2;
   spectra freq  / adjmean;
   corr / NLAG = 30;
run;
```

**Figure 43.20** Sample Autocorrelation Functions of the Two Series

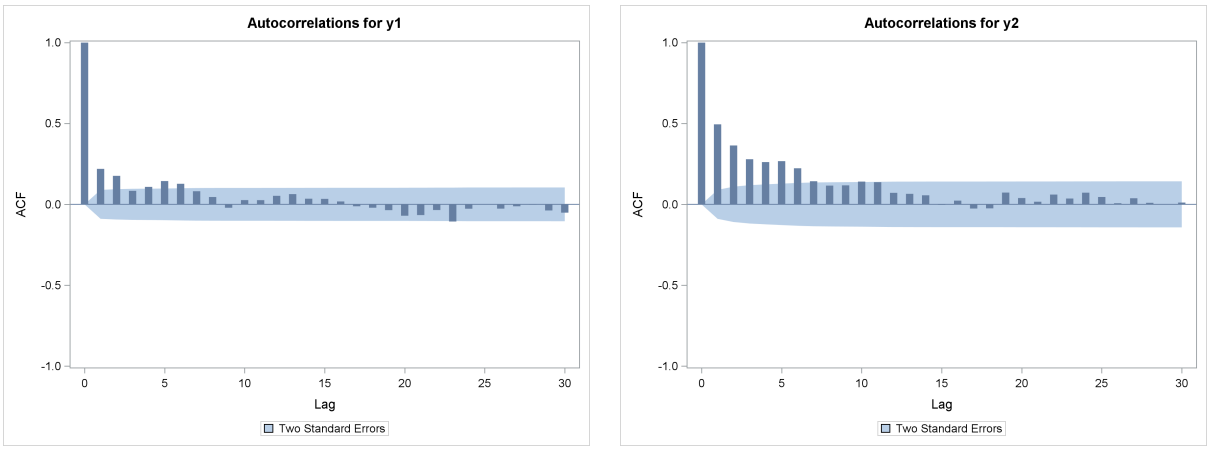


**Figure 43.21** Periodograms of the Two Series

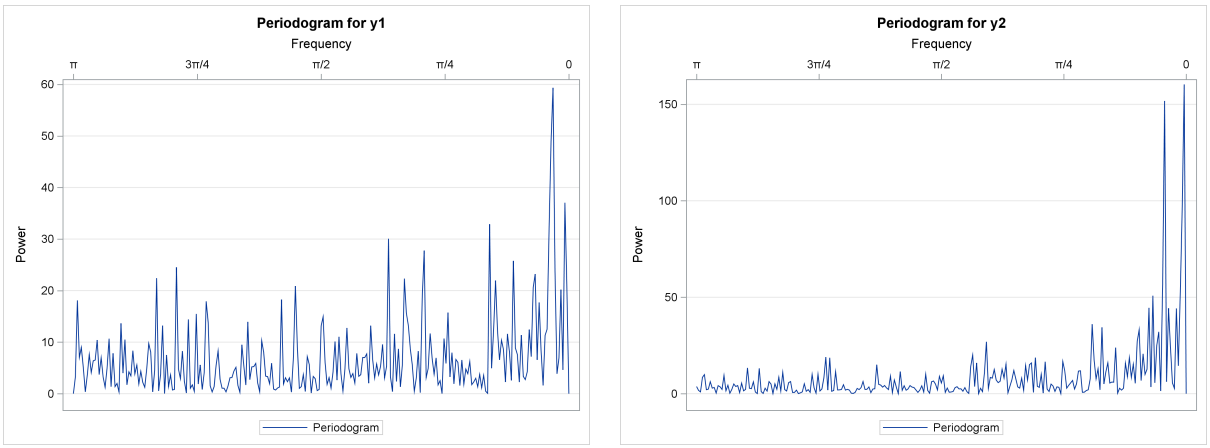

The magnitude of the LRD parameters $d_1$ and $d_2$ controls the memory of the two series. Series $y2$ has a larger LRD parameter than series $y1$ and hence is expected to exhibit longer memory. In the time domain, this effect is illustrated in Figure 43.20, where the autocorrelation function of series $y2$ (right plot in Figure 43.20) decays more slowly than the autocorrelation function of series $y1$ (left plot in Figure 43.20) with the increasing lag.

Figure 43.21 is the frequency domain analogue of Figure 43.20. In this case, the longer memory of series $y2$ is reflected by its periodogram (right plot in Figure 43.21), which blows up higher than the periodogram of series $y1$ (left plot in Figure 43.21) at frequencies near 0. Note the different scales used in the two plots.

The following statements fit the VARFIMA$(0, D, 0)$ model with no intercept term to the data. The FI option in the MODEL statement specifies fractional integration.

```
proc varmax data = VARFIMA0D0;
   model y1 y2 / fi noint method = ML;
run;
```

**Figure 43.22** Parameter Estimates for the VARFIMA$(0, D, 0)$ Model

**The VARMAX Procedure**

| | |
|---|---|
| **Type of Model** | VARFIMA(0,D,0) |
| **Estimation Method** | Maximum Likelihood Estimation |

**Model Parameter Estimates**

| Equation | Parameter | Estimate | Standard Error | t Value | Pr > \|t\| | Variable |
|---|---|---|---|---|---|---|
| **y1** | **D1** | 0.20250 | 0.03555 | 5.70 | 0.0001 | |
| **y2** | **D2** | 0.38839 | 0.03053 | 12.72 | 0.0001 | |

**Covariances of Innovations**

| Variable | y1 | y2 |
|---|---|---|
| **y1** | 3.20607 | 0.48068 |
| **y2** | 0.48068 | 3.15651 |

The estimation method that PROC VARMAX uses by default for the VARFIMA series is maximum likelihood (for more information, see the section "VARFIMA and VARFIMAX Modeling" on page 3150). All five parameter are estimated close to their true value and are significant.

## Vector Autoregressive Model with Exogenous Variables

A VAR process can be affected by other observable variables that are determined outside the system of interest. Such variables are called exogenous (independent) variables. Exogenous variables can be stochastic or nonstochastic. The process can also be affected by the lags of exogenous variables. A model used to describe this process is called a VARX($p$,$s$) model.

The VARX($p$,$s$) model is written as

$$\mathbf{y}_t = \boldsymbol{\delta} + \sum_{i=1}^{p} \Phi_i \mathbf{y}_{t-i} + \sum_{i=0}^{s} \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

where $\mathbf{x}_t = (x_{1t}, \ldots, x_{rt})'$ is an $r$-dimensional time series vector and $\Theta_i^*$ is a $k \times r$ matrix.

For example, a VARX(1,0) model is

$$\mathbf{y}_t = \boldsymbol{\delta} + \Phi_1 \mathbf{y}_{t-1} + \Theta_0^* \mathbf{x}_t + \boldsymbol{\epsilon}_t$$

where $\mathbf{y}_t = (y_{1t}, y_{2t}, y_{3t})'$ and $\mathbf{x}_t = (x_{1t}, x_{2t})'$.

The following statements fit the VARX(1,0) model to the given data:

```
data grunfeld;
   input year y1 y2 y3 x1 x2 x3;
   label y1='Gross Investment GE'
         y2='Capital Stock Lagged GE'
         y3='Value of Outstanding Shares GE Lagged'
         x1='Gross Investment W'
         x2='Capital Stock Lagged W'
         x3='Value of Outstanding Shares Lagged W';
datalines;
1935  33.1 1170.6  97.8 12.93  191.5   1.8
1936  45.0 2015.8 104.4 25.90  516.0    .8
1937  77.2 2803.3 118.0 35.05  729.0   7.4
1938  44.6 2039.7 156.2 22.89  560.4  18.1

   ... more lines ...

/*--- Vector Autoregressive Process with Exogenous Variables ---*/

proc varmax data=grunfeld;
   model y1-y3 = x1 x2 / p=1 lagmax=5
                         printform=univariate
                         print=(impulsx=(all) estimates);
run;
```

The VARMAX procedure output is shown in Figure 43.23 through Figure 43.25.

Figure 43.23 shows the descriptive statistics for the dependent (endogenous) and independent (exogenous) variables with labels.

The fitted model is given as

$$\begin{pmatrix} y_{1t} \\ y_{2t} \\ y_{3t} \end{pmatrix} = \begin{pmatrix} -12.013 \\ (27.471) \\ 702.086 \\ (256.480) \\ -22.421 \\ (10.312) \end{pmatrix} + \begin{pmatrix} 1.693 & -0.009 \\ (0.544) & (0.054) \\ -6.099 & 2.580 \\ (5.078) & (0.501) \\ -0.023 & -0.013 \\ (0.204) & (0.020) \end{pmatrix} \begin{pmatrix} x_{1t} \\ x_{2t} \end{pmatrix}$$
$$+ \begin{pmatrix} 0.237 & 0.008 & 0.029 \\ (0.207) & (0.016) & (0.049) \\ -2.467 & 0.164 & -0.841 \\ (1.930) & (0.152) & (0.453) \\ 0.951 & 0.002 & 0.938 \\ (0.078) & (0.006) & (0.018) \end{pmatrix} \begin{pmatrix} y_{1,t-1} \\ y_{2,t-1} \\ y_{3,t-1} \end{pmatrix} + \begin{pmatrix} \epsilon_{1t} \\ \epsilon_{2t} \\ \epsilon_{3t} \end{pmatrix}$$

## Parameter Estimation and Testing on Restrictions

In the previous example, the VARX(1,0) model is written as

$$\mathbf{y}_t = \boldsymbol{\delta} + \Theta_0^* \mathbf{x}_t + \Phi_1 \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t$$

with

$$\Theta_0^* = \begin{pmatrix} \theta_{11}^* & \theta_{12}^* \\ \theta_{21}^* & \theta_{22}^* \\ \theta_{31}^* & \theta_{32}^* \end{pmatrix} \quad \Phi_1 = \begin{pmatrix} \phi_{11} & \phi_{12} & \phi_{13} \\ \phi_{21} & \phi_{22} & \phi_{23} \\ \phi_{31} & \phi_{32} & \phi_{33} \end{pmatrix}$$

In Figure 43.25 of the preceding section, you can see several insignificant parameters. For example, the coefficients XL0_1_2, AR1_1_2, and AR1_3_2 are insignificant.

The following statements restrict the coefficients of $\theta_{12}^* = \phi_{12} = \phi_{32} = 0$ for the VARX(1,0) model:

```
/*--- Models with Restrictions and Tests ---*/

proc varmax data=grunfeld;
   model y1-y3 = x1 x2 / p=1 print=(estimates);
   restrict XL(0,1,2)=0, AR(1,1,2)=0, AR(1,3,2)=0;
run;
```

The output in Figure 43.26 shows that three parameters $\theta_{12}^*$, $\phi_{12}$, and $\phi_{32}$ are replaced by the restricted values, zeros, and their standard errors are also zeros to indicate that the parameters are fixed to these values.

**Figure 43.26** Parameter Estimation with Restrictions

**The VARMAX Procedure**

**Model Parameter Estimates**

| Equation | Parameter | Estimate | Standard Error | t Value | Pr > \|t\| | Variable |
|---|---|---|---|---|---|---|
| y1 | CONST1 | -2.16781 | 13.13755 | -0.17 | 0.8715 | 1 |
| | XL0_1_1 | 1.67592 | 0.40792 | 4.11 | 0.0012 | x1(t) |
| | XL0_1_2 | 0.00000 | 0.00000 | | | x2(t) |
| | AR1_1_1 | 0.27671 | 0.17606 | 1.57 | 0.1401 | y1(t-1) |
| | AR1_1_2 | 0.00000 | 0.00000 | | | y2(t-1) |
| | AR1_1_3 | 0.01747 | 0.03519 | 0.50 | 0.6279 | y3(t-1) |
| y2 | CONST2 | 768.14598 | 224.12735 | 3.43 | 0.0045 | 1 |
| | XL0_2_1 | -6.30880 | 4.85729 | -1.30 | 0.2166 | x1(t) |
| | XL0_2_2 | 2.65308 | 0.43840 | 6.05 | 0.0001 | x2(t) |
| | AR1_2_1 | -2.16968 | 1.83550 | -1.18 | 0.2584 | y1(t-1) |
| | AR1_2_2 | 0.10945 | 0.11751 | 0.93 | 0.3686 | y2(t-1) |
| | AR1_2_3 | -0.93053 | 0.41478 | -2.24 | 0.0429 | y3(t-1) |
| y3 | CONST3 | -19.88165 | 7.69575 | -2.58 | 0.0227 | 1 |
| | XL0_3_1 | -0.03576 | 0.20079 | -0.18 | 0.8614 | x1(t) |
| | XL0_3_2 | -0.00919 | 0.01747 | -0.53 | 0.6076 | x2(t) |
| | AR1_3_1 | 0.96398 | 0.06907 | 13.96 | 0.0001 | y1(t-1) |
| | AR1_3_2 | 0.00000 | 0.00000 | | | y2(t-1) |
| | AR1_3_3 | 0.93412 | 0.01473 | 63.41 | 0.0001 | y3(t-1) |

The output in Figure 43.27 shows the estimates of the Lagrangian parameters and their significance. Based on the $p$-values associated with the Lagrangian parameters, you cannot reject the null hypotheses $\theta_{12}^{*} = 0$, $\phi_{12} = 0$, and $\phi_{32} = 0$ with the 0.05 significance level.

**Figure 43.27** RESTRICT Statement Results

**Testing of the Restricted Parameters**

| Parameter | Estimate | Standard Error | t Value | Pr > \|t\| | Equation |
|---|---|---|---|---|---|
| Restrict0 | 1.74969 | 21.44026 | 0.08 | 0.9353 | XL0_1_2 = 0 |
| Restrict1 | 30.36254 | 70.74347 | 0.43 | 0.6700 | AR1_1_2 = 0 |
| Restrict2 | 55.42191 | 164.03075 | 0.34 | 0.7371 | AR1_3_2 = 0 |

The TEST statement in the following example tests $\phi_{31} = 0$ and $\theta_{12}^{*} = \phi_{12} = \phi_{32} = 0$ for the VARX(1,0) model:

```
proc varmax data=grunfeld;
   model y1-y3 = x1 x2 / p=1;
   test AR(1,3,1)=0;
   test XL(0,1,2)=0, AR(1,1,2)=0, AR(1,3,2)=0;
run;
```

The output in Figure 43.28 shows that the first column in the output is the index corresponding to each TEST statement. You can reject the hypothesis test $\phi_{31} = 0$ at the 0.05 significance level, but you cannot reject the joint hypothesis test $\theta_{12}^{*} = \phi_{12} = \phi_{32} = 0$ at the 0.05 significance level.

**Figure 43.28** TEST Statement Results

**The VARMAX Procedure**

| Testing of the Parameters | | | |
|---|---|---|---|
| **Test** | **DF** | **Chi-Square** | **Pr > ChiSq** |
| **1** | 1 | 150.31 | <.0001 |
| **2** | 3 | 0.34 | 0.9522 |

## Causality Testing

The following statements use the CAUSAL statement to compute the Granger causality test for a VAR(1) model. For the Granger causality tests, the autoregressive order should be defined by the P= option in the MODEL statement. The variable groups are defined in the CAUSAL statement as well. Regardless of whether the variables specified in the GROUP1= and GROUP2= options are designated as dependent or exogenous (independent) variables in the MODEL statement, the CAUSAL statement fits the VAR($p$) model by considering the variables in the two groups as dependent variables.

```
/*--- Causality Testing ---*/

proc varmax data=grunfeld;
   model y1-y3 = x1 x2 / p=1 noprint;
   causal group1=(x1) group2=(y1-y3);
   causal group1=(y3) group2=(y1 y2);
run;
```

The output in Figure 43.29 is associated with the CAUSAL statement. The first CAUSAL statement fits the VAR(1) model by using the variables $y1$, $y2$, $y3$, and $x1$. The second CAUSAL statement fits the VAR(1) model by using the variables $y1$, $y3$, and $y2$.

**Figure 43.29** CAUSAL Statement Results

**The VARMAX Procedure**

| Granger-Causality Wald Test | | | |
|---|---|---|---|
| **Test** | **DF** | **Chi-Square** | **Pr > ChiSq** |
| **1** | 3 | 2.40 | 0.4946 |
| **2** | 2 | 262.88 | <.0001 |

| | | |
|---|---|---|
| **Test 1:** | **Group 1 Variables:** | x1 |
| | **Group 2 Variables:** | y1 y2 y3 |
| **Test 2:** | **Group 1 Variables:** | y3 |
| | **Group 2 Variables:** | y1 y2 |

The null hypothesis of the Granger causality test is that GROUP1 is influenced only by itself, and not by GROUP2.

The first column in the output is the index corresponding to each CAUSAL statement. The output shows that you cannot reject that $x1$ is influenced by itself and not by $(y1, y2, y3)$ at the 0.05 significance level for Test 1. You can reject that $y3$ is influenced by itself and not by $(y1, y2)$ for Test 2. For more information, see the section "VAR and VARX Modeling" on page 3095.

## Multivariate GARCH Models

Modeling and forecasting the volatility of time series has been the focus of many researchers and practitioners, especially in the fields of risk management, portfolio optimization, and asset pricing. One of the most powerful tools for volatility modeling is the autoregressive conditional heteroscedasticity (ARCH) model proposed by Engle (1982) and extended by Bollerslev (1986) to the generalized autoregressive conditional heteroscedasticity (GARCH) model. The VARMAX procedure supports three forms of multivariate GARCH models: BEKK, CCC, and DCC. This section shows some examples of how to specify, estimate, and compare various forms of multivariate GARCH models.

Data about two indices, the Dow Jones Industrial Average index and the Standard & Poor's 500 index, are obtained from Yahoo Finance and used in this section. The sample contains daily data from February 16, 2005, to February 13, 2015. The following statements input the daily prices and then generate the daily returns:

```
data indices;
   input date : MMDDYY10. DJIA SP500;
   logDJIA = log(DJIA); logSP500 = log(SP500);
   rDJIA = (logDJIA-lag(logDJIA))*100;
   rSP500 = (logSP500-lag(logSP500))*100;
datalines;
2/16/2005    10834.88    1210.34
2/17/2005    10754.26    1200.75
2/18/2005    10785.22    1201.59

   ... more lines ...

2/12/2015    17972.38    2088.48
2/13/2015    18019.35    2096.99
;
```

To model the volatility of bivariate returns, rDJIA and rSP500, you can start with the BEKK GARCH(1,1) model. The following equations describe the bivariate BEKK GARCH(1,1) model:

$$
\begin{aligned}
r_t &= H_t^{\frac{1}{2}} \epsilon_t \\
H_t &= C + A_1' r_{t-1} r_{t-1}' A_1 + G_1' H_{t-1} G_1 \\
&= \begin{bmatrix} c_{11} & c_{12} \\ c_{12} & c_{22} \end{bmatrix} + \begin{bmatrix} a_{11,1} & a_{12,1} \\ a_{21,1} & a_{22,1} \end{bmatrix}' \begin{bmatrix} r_{1,t-1} \\ r_{2,t-1} \end{bmatrix} \begin{bmatrix} r_{1,t-1} \\ r_{2,t-1} \end{bmatrix}' \begin{bmatrix} a_{11,1} & a_{12,1} \\ a_{21,1} & a_{22,1} \end{bmatrix} \\
&+ \begin{bmatrix} g_{11,1} & g_{12,1} \\ g_{21,1} & g_{22,1} \end{bmatrix}' \begin{bmatrix} h_{11,t-1} & h_{12,t-1} \\ h_{12,t-1} & h_{22,t-1} \end{bmatrix} \begin{bmatrix} g_{11,1} & g_{12,1} \\ g_{21,1} & g_{22,1} \end{bmatrix}
\end{aligned}
$$

In these equations, $r_t$ is the vector of returns at time $t$, $H_t$ is the conditional covariance matrix of $r_t$, $H_t^{\frac{1}{2}}$ denotes the square root of $H_t$ such that the square of matrix $H_t^{\frac{1}{2}}$ is $H_t$, $\epsilon_t$ is the innovation at time $t$ and follows an iid bivariate standard normal distribution, $C$ is a $2 \times 2$ symmetric parameter matrix, $A_1$ is a $2 \times 2$ full parameter matrix for the first lag of the ARCH term, and $G_1$ is a $2 \times 2$ full parameter matrix for the first

lag of the GARCH term. Hence, there are 11 parameters in total for a bivariate BEKK GARCH(1,1) model; that is, a vector $\left(c_{11}, c_{12}, c_{22}, a_{11,1}, a_{21,1}, a_{12,1}, a_{22,1}, g_{11,1}, g_{21,1}, g_{12,1}, g_{22,1}\right)'$.

You can use the FORM=BEKK option in the GARCH statement to specify the BEKK GARCH form, or you can omit this option because BEKK is the default value for the FORM= option. The Q= option in the GARCH statement specifies the lags of the ARCH terms, and the P= option in the GARCH statement specifies the lags of the GARCH terms. The forecasts of conditional covariance matrices are output to a SAS data set when you specify the OUTHT= option in the GARCH statement. The parameter estimates and their covariance matrix are output to a SAS data set when you specify the OUTEST= option together with the OUTCOV option in the PROC VARMAX statement.

The following statement specifies the BEKK GARCH(1,1) model:

```
/*--- BEKK ---*/

proc varmax data=indices outest=oebekk outcov;
   model rDJIA rSP500 / noint;
   garch p=1 q=1 form=bekk outht=ohbekk;
run;
```

Figure 43.30 shows the log likelihood and the information criteria. They are used later in the model comparison.

**Figure 43.30** BEKK GARCH Log Likelihood and Information Criteria

**The VARMAX Procedure**

| | |
|---|---|
| **Log-likelihood** | 1360.976 |

| Information Criteria | |
|---|---|
| **AICC** | -2699.85 |
| **HQC** | -2676.68 |
| **AIC** | -2699.95 |
| **SBC** | -2635.82 |
| **FPEC** | 0.080617 |

Figure 43.31 shows the parameters estimates for the BEKK GARCH(1,1) model. For the constant term $C$, **GCHC***i_j*, $i, j = 1, 2$, correspond to parameters $c_{ij}$, respectively. Because $C$ is symmetric, **GCHC2_1** is omitted. For the ARCH and GARCH terms, **ACH***l_i_j*, $l = 1, i, j = 1, 2$, correspond to $a_{ij,l}$, respectively, and **GCH***l_i_j*, $l = 1, i, j = 1, 2$, correspond to $g_{ij,l}$, respectively.

**Figure 43.31** BEKK GARCH Parameter Estimates

**GARCH Model Parameter Estimates**

| Parameter | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|
| GCHC1_1 | 0.19101 | 0.00000 | | |
| GCHC1_2 | 0.09343 | 0.00000 | | |
| GCHC2_2 | 0.00000 | 0.01807 | 0.00 | 1.0000 |
| ACH1_1_1 | 0.27518 | 0.13503 | 2.04 | 0.0417 |
| ACH1_2_1 | 0.20619 | 0.11122 | 1.85 | 0.0639 |
| ACH1_1_2 | 0.24907 | 0.11982 | 2.08 | 0.0377 |
| ACH1_2_2 | 0.23448 | 0.09739 | 2.41 | 0.0161 |
| GCH1_1_1 | 0.11391 | 0.10984 | 1.04 | 0.2998 |
| GCH1_2_1 | 0.64841 | 0.11363 | 5.71 | 0.0001 |
| GCH1_1_2 | 0.75455 | 0.11263 | 6.70 | 0.0001 |
| GCH1_2_2 | 0.20598 | 0.11520 | 1.79 | 0.0739 |

As shown in Figure 43.31, the standard errors of **GCHC1_1** and **GCHC1_2** are both zeros. It might be a sign that the numerical optimization for the BEKK GARCH model converges to a local minimum instead of the global minimum, which often happens for nonlinear optimization of complex models that have many parameters. A possible way to solve this problem is to try different initial values. To obtain reasonable initial values, the following statements fit a diagonal BEKK GARCH model (that is, a restricted BEKK GARCH model in which the ARCH and GARCH parameter matrices are diagonal):

```
/*--- Diagonal BEKK ---*/

proc varmax data=indices outest=oebekk outcov;
   model rDJIA rSP500 / noint;
   garch p=1 q=1 form=bekk;
   restrict ach(1,1,2), ach(1,2,1), gch(1,1,2), gch(1,2,1);
run;
```

The parameter estimates of the diagonal BEKK GARCH model are shown in Figure 43.32. As expected, the standard errors of the off-diagonal elements of the ARCH and GARCH parameter matrices (namely **ACH1_1_2**, **ACH1_2_1**, **GCH1_1_2**, and **GCH1_2_1**) are all zeros because they are restricted in the RESTRICT statement. All other parameters have valid standard errors.

**Figure 43.32** Diagonal BEKK GARCH Parameter Estimates

**The VARMAX Procedure**

**GARCH Model Parameter Estimates**

| Parameter | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|
| GCHC1_1 | 0.01407 | 0.00254 | 5.53 | 0.0001 |
| GCHC1_2 | 0.01446 | 0.00262 | 5.51 | 0.0001 |
| GCHC2_2 | 0.01598 | 0.00299 | 5.34 | 0.0001 |
| ACH1_1_1 | 0.25702 | 0.01251 | 20.54 | 0.0001 |
| ACH1_2_1 | 0.00000 | 0.00000 | | |
| ACH1_1_2 | 0.00000 | 0.00000 | | |
| ACH1_2_2 | 0.26061 | 0.01302 | 20.02 | 0.0001 |
| GCH1_1_1 | -0.95794 | 0.00413 | -231.85 | 0.0001 |
| GCH1_2_1 | 0.00000 | 0.00000 | | |
| GCH1_1_2 | 0.00000 | 0.00000 | | |
| GCH1_2_2 | -0.95694 | 0.00443 | -216.10 | 0.0001 |

Figure 43.33 shows the log likelihood and the information criteria. The log likelihood for the diagonal BEKK GARCH model is larger than that of the previous estimated BEKK GARCH model (which is shown in Figure 43.30). The larger value confirms that the previous BEKK GARCH model does not converge to the global minimum.

**Figure 43.33** Diagonal BEKK GARCH Log Likelihood and Information Criteria

| | |
|---|---|
| **Log-likelihood** | 1520.235 |

| Information Criteria | |
|---|---|
| **AICC** | -3026.43 |
| **HQC** | -3011.66 |
| **AIC** | -3026.47 |
| **SBC** | -2985.66 |
| **FPEC** | 0.080617 |

The following statements reestimate the BEKK GARCH model whose initial values are parameter estimates of the diagonal BEKK GARCH model (which are shown in Figure 43.32):

```
/*--- BEKK with Initial Values ---*/

proc varmax data=indices outest=oebekk outcov;
   model rDJIA rSP500 / noint;
   garch p=1 q=1 form=bekk;
   initial gchc(1,1)=0.01407, gchc(1,2)=0.01446, gchc(2,2)=0.01598,
           ach(1,1,1)=0.25702, ach(1,2,2)=0.26061,
           gch(1,1,1)=-0.95794, gch(1,2,2)=-0.95694,
           ach(1,1,2), ach(1,2,1), gch(1,1,2), gch(1,2,1);
run;
```

The parameter estimates of the reestimated BEKK GARCH models are shown in Figure 43.34. The standard errors of all parameters are valid.

**Figure 43.34** Reestimated BEKK GARCH Parameter Estimates

**The VARMAX Procedure**

**GARCH Model Parameter Estimates**

| Parameter | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|
| GCHC1_1 | 0.01999 | 0.00394 | 5.07 | 0.0001 |
| GCHC1_2 | 0.02043 | 0.00391 | 5.22 | 0.0001 |
| GCHC2_2 | 0.02112 | 0.00408 | 5.18 | 0.0001 |
| ACH1_1_1 | 0.07178 | 0.10153 | 0.71 | 0.4796 |
| ACH1_2_1 | 0.22679 | 0.09285 | 2.44 | 0.0147 |
| ACH1_1_2 | -0.09556 | 0.11262 | -0.85 | 0.3962 |
| ACH1_2_2 | 0.41214 | 0.10167 | 4.05 | 0.0001 |
| GCH1_1_1 | -0.95018 | 0.03580 | -26.55 | 0.0001 |
| GCH1_2_1 | 0.01069 | 0.03266 | 0.33 | 0.7434 |
| GCH1_1_2 | 0.03746 | 0.04018 | 0.93 | 0.3513 |
| GCH1_2_2 | -0.97038 | 0.03589 | -27.04 | 0.0001 |

Figure 43.35 shows the log likelihood and information criteria of the reestimated BEKK GARCH model. As expected, the log likelihood of the reestimated BEKK GARCH model is larger than that of the diagonal BEKK GARCH model. Moreover, the reestimated BEKK GARCH model has a smaller SBC, compared to the SBC of the diagonal BEKK GARCH model (which is shown in Figure 43.33). The smaller SBC means that the BEKK GARCH model should be chosen instead of the diagonal BEKK GARCH model.

**Figure 43.35** Reestimated BEKK GARCH Log Likelihood and Information Criteria

| | |

| **Log-likelihood** | 1542.362 |

| Information Criteria | |
|---|---|
| **AICC** | -3062.62 |
| **HQC** | -3039.45 |
| **AIC** | -3062.72 |
| **SBC** | -2998.59 |
| **FPEC** | 0.080617 |

The number of parameters for a BEKK GARCH model increases very quickly as the number of dependent variables increases. There are $(p+q)k^2 + k(k+1)/2$ parameters for a $k$-variate BEKK GARCH($p$, $q$) model. For example, a 16-variate BEKK GARCH(1,1) model has 648 parameters to be estimated.

Compared with BEKK GARCH models, CCC GARCH models are much more parsimonious. In a CCC GARCH model, each series follows a GARCH process and their composition through the constant conditional correlation matrix constructs the conditional covariance matrices. A bivariate CCC GARCH(1,1) has the form

$$
\begin{aligned}
r_t &= H_t^{\frac{1}{2}} \epsilon_t \\
H_t &= D_t S D_t \\
D_t &= \begin{bmatrix} \sqrt{h_{11,t}} & 0 \\ 0 & \sqrt{h_{22,t}} \end{bmatrix} \\
S &= \begin{bmatrix} 1 & s_{12} \\ s_{12} & 1 \end{bmatrix} \\
h_{11,t} &= c_{11} + a_{11,1} r_{1,t-1}^2 + g_{11,1} h_{11,t-1} \\
h_{22,t} &= c_{22} + a_{22,1} r_{2,t-1}^2 + g_{22,1} h_{22,t-1}
\end{aligned}
$$

where $D_t$ is the diagonal matrix with conditional standard deviations and $S$ is the time-invariant conditional correlation matrix. Hence, there are seven parameters to be estimated; that is, a vector $\left(s_{12}, c_{11}, c_{22}, a_{11,1}, a_{22,1}, g_{11,1}, g_{22,1}\right)'$. A $k$-variate CCC GARCH($p$, $q$) model has $(p + q + 1)k + k(k-1)/2$ parameters. For example, a 16-variate CCC GARCH(1,1) model has 168 parameters to be estimated, about $1/4$ of the number that a BEKK GARCH(1,1) model has.

The following statements estimate a CCC GARCH(1,1) model:

```
/*--- CCC ---*/

proc varmax data=indices outest=oeccc outcov;
   model rDJIA rSP500 / noint;
   garch p=1 q=1 form=ccc outht=ohccc;
run;
```

Figure 43.36 shows the parameter estimates for the CCC GARCH(1,1) model. For the constant conditional correlation matrix $S$, `CCC1_2` corresponds to the parameter $s_{12}$.

**Figure 43.36** CCC GARCH Parameter Estimates

**The VARMAX Procedure**

**GARCH Model Parameter Estimates**

| Parameter | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|
| CCC1_2 | 0.97294 | 0.00109 | 890.75 | 0.0001 |
| GCHC1_1 | 0.03713 | 0.00504 | 7.37 | 0.0001 |
| GCHC2_2 | 0.04004 | 0.00536 | 7.47 | 0.0001 |
| ACH1_1_1 | 0.06862 | 0.00737 | 9.31 | 0.0001 |
| ACH1_2_2 | 0.06684 | 0.00690 | 9.68 | 0.0001 |
| GCH1_1_1 | 0.88472 | 0.01183 | 74.81 | 0.0001 |
| GCH1_2_2 | 0.88916 | 0.01099 | 80.92 | 0.0001 |

Figure 43.37 shows the log likelihood and the information criteria. Compared to the SBC for the BEKK GARCH model (shown in Figure 43.35), the SBC for the CCC GARCH model is much larger, which means the CCC GARCH model should not be preferred.

**Figure 43.37** CCC GARCH Log Likelihood and Information Criteria

| **Log-likelihood** | 1474.578 |
|---|---|

| **Information Criteria** | |
|---|---|
| **AICC** | -2935.11 |
| **HQC** | -2920.34 |
| **AIC** | -2935.16 |
| **SBC** | -2894.34 |
| **FPEC** | 0.080617 |

The CCC GARCH model is not preferred over the BEKK GARCH model in this case because the basic assumption in the CCC GARCH model—that the conditional correlation matrix is time-invariant—might not hold. A DCC GARCH model relaxes this assumption and models the time-varying conditional correlation matrix in an ARMA form. A bivariate DCC GARCH(1,1) has the form

$$
\begin{aligned}
r_t &= H_t^{\frac{1}{2}} \boldsymbol{\epsilon}_t \\
H_t &= D_t S_t D_t \\
D_t &= \begin{bmatrix} \sqrt{h_{11,t}} & 0 \\ 0 & \sqrt{h_{22,t}} \end{bmatrix} \\
h_{11,t} &= c_{11} + a_{11,1} r_{1,t-1}^2 + g_{11,1} h_{11,t-1} \\
h_{22,t} &= c_{11} + a_{22,1} r_{2,t-1}^2 + g_{22,1} h_{22,t-1} \\
S_t &= \begin{bmatrix} 1 & s_{12,t} \\ s_{12,t} & 1 \end{bmatrix} \\
s_{12,t} &= \frac{q_{12,t}}{\sqrt{q_{11,t} q_{22,t}}} \\
q_{12,t} &= (1-\alpha-\beta) s_{12} + \alpha \frac{r_{1,t-1}}{\sqrt{h_{11,t-1}}} \frac{r_{2,t-1}}{\sqrt{h_{22,t-1}}} + \beta q_{12,t-1} \\
q_{11,t} &= (1-\alpha-\beta) + \alpha \frac{r_{1,t-1}^2}{h_{11,t-1}} + \beta q_{11,t-1} \\
q_{22,t} &= (1-\alpha-\beta) + \alpha \frac{r_{2,t-1}^2}{h_{22,t-1}} + \beta q_{22,t-1}
\end{aligned}
$$

where $S_t$ is the time-varying conditional correlation matrix at time $t$. Compared to the CCC GARCH model, two more parameters, $\alpha$ and $\beta$, are added into the DCC GARCH model. There are nine parameters in total; that is, a vector $\left(\alpha, \beta, s_{12}, c_{11}, c_{22}, a_{11,1}, a_{22,1}, g_{11,1}, g_{22,1}\right)'$.

The following statements estimate a DCC GARCH model:

```
/*--- DCC ---*/

proc varmax data=indices outest=oedcc outcov;
   model rDJIA rSP500 / noint;
```

```
   garch p=1 q=1 form=dcc outht=ohdcc;
run;
```

Figure 43.38 shows the parameter estimates for the DCC GARCH(1,1) model. **DCCA** corresponds to the parameter $\alpha$, **DCCB** corresponds to the parameter $\beta$, and **DCCS1_2** corresponds to the parameter $s_{12}$, the off-diagonal element in the unconditional correlation matrix. The standard errors of many parameter estimates are zeros, which might be a sign that the model does not converge to the global minimum.

**Figure 43.38** DCC GARCH Parameter Estimates

**The VARMAX Procedure**

**GARCH Model Parameter Estimates**

| Parameter | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|
| DCCA | 0.01540 | 0.00000 | | |
| DCCB | 0.00000 | 0.00000 | | |
| DCCS1_2 | 0.98743 | 0.00040 | 999.00 | 0.0001 |
| GCHC1_1 | 1.28530 | 0.00000 | | |
| GCHC2_2 | 1.50117 | 0.00000 | | |
| ACH1_1_1 | 0.03378 | 0.00216 | 15.62 | 0.0001 |
| ACH1_2_2 | 0.02694 | 0.00084 | 32.07 | 0.0001 |
| GCH1_1_1 | 0.07596 | 0.00000 | | |
| GCH1_2_2 | 0.09939 | 0.00000 | | |

Figure 43.39 shows the log likelihood and the information criteria.

**Figure 43.39** DCC GARCH Log Likelihood and Information Criteria

| | |
|---|---|
| **Log-likelihood** | 700.3131 |

| Information Criteria | |
|---|---|
| **AICC** | -1382.55 |
| **HQC** | -1363.58 |
| **AIC** | -1382.63 |
| **SBC** | -1330.16 |
| **FPEC** | 0.080617 |

Because a CCC GARCH model can be regarded as a restricted DCC GARCH model in which $\alpha$ and $\beta$ in the conditional correlation equations are restricted to zeros, it is expected that the log likelihood of the "unrestricted" DCC GARCH model should always be larger than (or at least equal to) the log likelihood of the corresponding CCC GARCH model, even though DCC might have a larger information criterion and not be chosen. Hence, it is unexpected that the log likelihood of the DCC GARCH model (shown in Figure 43.39) is smaller than that of the CCC GARCH model (shown in Figure 43.37). This unexpected phenomenon confirms that the numerical optimization for the DCC GARCH model converges to a local minimum instead of the global minimum. Different initial values should be tried. In addition to some reasonable values for parameters DCCA and DCCB, the INITIAL statement specifies the initial values for the DCC GARCH model parameters in the following statements; these values are based on the corresponding parameter estimates of the CCC GARCH model (shown in Figure 43.36):

```
/*--- DCC with Initial Values ---*/

proc varmax data=indices outest=oedcc outcov;
   model rDJIA rSP500 / noint;
   garch p=1 q=1 form=dcc outht=ohdcc;
   initial DCCA=0.01, DCCB=0.98, DCCS(1,2)  = 0.97294,
           GCHC(1,1)  = 0.03713, GCHC(2,2)  = 0.04004,
           ACH(1,1,1) = 0.06862, ACH(1,2,2) = 0.06684,
           GCH(1,1,1) = 0.88472, GCH(1,2,2) = 0.88916;
run;
```

Figure 43.40 shows the parameter estimates for the reestimated DCC GARCH(1,1) model. All standard errors of parameter estimates are valid.

**Figure 43.40** Reestimated DCC GARCH Parameter Estimates

**The VARMAX Procedure**

**GARCH Model Parameter Estimates**

| Parameter | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|
| DCCA | 0.03802 | 0.00634 | 6.00 | 0.0001 |
| DCCB | 0.93782 | 0.01084 | 86.49 | 0.0001 |
| DCCS1_2 | 0.97401 | 0.00247 | 394.22 | 0.0001 |
| GCHC1_1 | 0.02193 | 0.00370 | 5.93 | 0.0001 |
| GCHC2_2 | 0.02395 | 0.00401 | 5.97 | 0.0001 |
| ACH1_1_1 | 0.07842 | 0.00787 | 9.97 | 0.0001 |
| ACH1_2_2 | 0.07758 | 0.00770 | 10.07 | 0.0001 |
| GCH1_1_1 | 0.89540 | 0.01046 | 85.58 | 0.0001 |
| GCH1_2_2 | 0.89738 | 0.01012 | 88.64 | 0.0001 |

As shown in Figure 43.41, the log likelihood of the DCC GARCH model increases dramatically. Compared to the SBC of the CCC GARCH model (shown in Figure 43.37), the SBC for the DCC GARCH model is much smaller, and the DCC GARCH model is chosen. However, compared to the SBC for the BEKK GARCH model (shown in Figure 43.35), the SBC for the DCC GARCH model is a little larger, The BEKK GARCH model should be chosen although it has two more parameters than the DCC GARCH model.

**Figure 43.41** Reestimated DCC GARCH Log Likelihood and Information Criteria

| Log-likelihood | 1531.454 |
|---|---|

| Information Criteria | |
|---|---|
| AICC | -3044.84 |
| HQC | -3025.86 |
| AIC | -3044.91 |
| SBC | -2992.44 |
| FPEC | 0.080617 |

Compared to the BEKK GARCH model, in addition to parsimony, another advantage of the DCC (and

also the CCC) GARCH model is that you can use subforms other than GARCH to model the conditional covariance of each series. For example, you can use the threshold GARCH (TGARCH) model for modeling the conditional covariances of rDJIA and rSP500. A bivariate DCC TGARCH(1,1) has the same form as the bivariate DCC GARCH(1,1) except that the conditional covariance equations are replaced by

$$
\begin{aligned}
h_{11,t} &= c_{11} + a_{11,1} r_{1,t-1}^2 + \mathbf{1}_{r_{1,t-1}<0} b_{11,1} r_{1,t-1}^2 + g_{11,1} h_{11,t-1} \\
h_{22,t} &= c_{11} + a_{22,1} r_{2,t-1}^2 + \mathbf{1}_{r_{2,t-1}<0} b_{22,1} r_{2,t-1}^2 + g_{22,1} h_{22,t-1}
\end{aligned}
$$

where the indicator function $\mathbf{1}_A$ is 1 if $A$ is true and 0 otherwise. Compared to the DCC GARCH model, two more parameters, $b_{11,1}$ and $b_{22,1}$, are added to the DCC TGARCH model to catch the so-called leverage effect (that is, the positive and negative returns have different impacts on future volatility).

The following statements include the SUBFORM=TARCH option to fit a bivariate DCC TGACH(1,1) model with the same initial values that are used for the previous DCC GARCH(1,1) model. Because the LEAD=10 option is specified in the OUTPUT statement, the 1- to 10-step-ahead forecasts of rDJIA and rSP500 are output to the OUT= data set odcct and the 1- to 10-step-ahead forecasts of conditional covariance matrices of rDJIA and rSP500 are output to the OUTHT= data set ohdcct.

```
proc varmax data=indices outest=oedcct outcov;
   model rDJIA rSP500 / noint;
   garch p=1 q=1 form=dcc outht=ohdcct subform=tgarch;
   initial DCCA=0.01, DCCB=0.98, DCCS(1,2)  = 0.97294,
           GCHC(1,1)  = 0.03713, GCHC(2,2)  = 0.04004,
           ACH(1,1,1) = 0.06862, ACH(1,2,2) = 0.06684,
           GCH(1,1,1) = 0.88472, GCH(1,2,2) = 0.88916;
   output out=odcct lead=10;
run;
```

Figure 43.42 shows the parameter estimates for the DCC TGARCH(1,1) model. **TACH1_1_1** and **TACH1_2_2** correspond to the parameters $b_{11,1}$ and $b_{22,1}$, respectively. They are significant, which means that the leverage effect exists.

**Figure 43.42** DCC TGARCH Parameter Estimates

**The VARMAX Procedure**

**GARCH Model Parameter Estimates**

| Parameter | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|
| DCCA | 0.04302 | 0.00669 | 6.43 | 0.0001 |
| DCCB | 0.92807 | 0.01142 | 81.26 | 0.0001 |
| DCCS1_2 | 0.97309 | 0.00248 | 392.01 | 0.0001 |
| GCHC1_1 | 0.02068 | 0.00305 | 6.78 | 0.0001 |
| GCHC2_2 | 0.02329 | 0.00346 | 6.73 | 0.0001 |
| ACH1_1_1 | 0.00104 | 0.00684 | 0.15 | 0.8787 |
| ACH1_2_2 | 0.00314 | 0.00698 | 0.45 | 0.6525 |
| TACH1_1_1 | 0.11443 | 0.01207 | 9.48 | 0.0001 |
| TACH1_2_2 | 0.10805 | 0.01166 | 9.27 | 0.0001 |
| GCH1_1_1 | 0.91490 | 0.00956 | 95.68 | 0.0001 |
| GCH1_2_2 | 0.91574 | 0.00964 | 95.03 | 0.0001 |

Figure 43.43 shows the log likelihood and the information criteria. The SBC for the DCC TGARCH model is smaller than the SBC for the BEKK GARCH model (which is shown in Figure 43.35). The smaller SBC means that the DCC TGARCH model is the final winner.

**Figure 43.43** DCC TGARCH Log Likelihood and Information Criteria

| | |
|---|---|
| **Log-likelihood** | 1587.793 |

| Information Criteria | |
|---|---|
| **AICC** | -3153.48 |

| **AIC** | -3153.59 |
| **SBC** | -3089.46 |
| **FPEC** | 0.080617 |

Other subforms of GARCH models—the exponential GARCH (EGARCH) model, the quadratic GARCH (QGARCH) model, and the power GARCH (PGARCH) model—are also supported for the CCC and DCC GARCH models. Furthermore, the multivariate GARCH models can be used together with VARMAX or vector error correction models. For more information and examples, see the sections "Multivariate GARCH Modeling" on page 3139 and "Example 43.4: Analysis of Euro Foreign Exchange Reference Rates" on page 3205.

## Functional Summary

The statements and options available in the VARMAX procedure are summarized in Table 43.1.

**Table 43.1** Functional Summary

| Description | Statement | Option |
|---|---|---|
| **Data Set Options** | | |
| Specifies the input data set | VARMAX | DATA= |
| Writes parameter estimates to an output data set | VARMAX | OUTEST= |
| Includes covariances in the OUTEST= data set | VARMAX | OUTCOV |
| Writes the diagnostic checking tests for a model and the cointegration test results to an output data set | VARMAX | OUTSTAT= |
| Specifies the input data set for scenarios | CONDFORE | SDATA= |
| Writes the statistics of simulated forecasts to an output data set | CONDFORE | OUT= |
| Writes the simulated forecasts to an output data set | CONDFORE | OUTSIM= |
| Writes the conditional covariance matrix to an output data set | GARCH | OUTHT= |
| Writes actuals, predictions, residuals, and confidence limits to an output data set | OUTPUT | OUT= |
| **BY Groups** | | |
| Specifies BY-group processing | BY | |
| **ID Variable** | | |
| Specifies the identifying variable | ID | |
| Specifies the time interval between observations | ID | INTERVAL= |

**Table 43.1** *continued*

| Description | Statement | Option |
|---|---|---|
| Controls the alignment of SAS date values | ID | ALIGN= |
| **Options to Control the Optimization Process** | | |
| Specifies the optimization options | NLOPTIONS | |
| **Printing Control Options** | | |
| Specifies how many lags to print results | MODEL | LAGMAX= |
| Suppresses the printed output | MODEL | NOPRINT |
| Requests all printing options | MODEL | PRINTALL |
| Requests the printing format | MODEL | PRINTFORM= |
| Controls plots produced through ODS GRAPHICS | VARMAX | PLOTS= |
| **PRINT= Option** | | |
| Prints the correlation matrix of parameter estimates | MODEL | CORRB |
| Prints the cross-correlation matrices of independent variables | MODEL | CORRX |
| Prints the cross-correlation matrices of dependent variables | MODEL | CORRY |
| Prints the covariance matrices of prediction errors | MODEL | COVPE |
| Prints the cross-covariance matrices of the independent variables | MODEL | COVX |
| Prints the cross-covariance matrices of the dependent variables | MODEL | COVY |
| Prints the covariance matrix of parameter estimates | MODEL | COVB |
| Prints the decomposition of the prediction error covariance matrix | MODEL | DECOMPOSE |
| Prints the residual diagnostics | MODEL | DIAGNOSE |
| Prints the contemporaneous relationships among the components of the vector time series | MODEL | DYNAMIC |
| Prints the parameter estimates | MODEL | ESTIMATES |
| Prints the infinite order AR representation | MODEL | IARR |
| Prints the impulse response function | MODEL | IMPULSE= |
| Prints the impulse response function in the transfer function | MODEL | IMPULSX= |
| Prints the partial autoregressive coefficient matrices | MODEL | PARCOEF |
| Prints the partial canonical correlation matrices | MODEL | PCANCORR |
| Prints the partial correlation matrices | MODEL | PCORR |
| Prints the eigenvalues of the companion matrix | MODEL | ROOTS |
| Prints the Yule-Walker estimates | MODEL | YW |
| **Model Estimation and Order Selection Options** | | |
| Specifies the initial parameter values for non-linear optimization when the model is estimated through the maximum likelihood method | INITIAL | |

**Table 43.1** *continued*

| Description | Statement | Option |
|---|---|---|
| Centers the dependent variables | MODEL | CENTER |
| Specifies the degrees of differencing for the specified model variables | MODEL | DIF= |
| Specifies the degrees of differencing for all independent variables | MODEL | DIFX= |
| Specifies the degrees of differencing for all dependent variables | MODEL | DIFY= |
| Specifies the estimation method | MODEL | METHOD= |
| Selects the tentative order | MODEL | MINIC= |
| Suppresses the current values of independent variables | MODEL | NOCURRENTX |
| Suppresses the intercept parameters | MODEL | NOINT |
| Specifies the number of seasonal periods | MODEL | NSEASON= |
| Specifies the order of autoregressive polynomial | MODEL | P= |
| Specifies the Bayesian prior model | MODEL | PRIOR= |
| Specifies the order of moving-average polynomial | MODEL | Q= |
| Centers the seasonal dummies | MODEL | SCENTER |
| Specifies the degree of time trend polynomial | MODEL | TREND= |
| Specifies the denominator for error covariance matrix estimates | MODEL | VARDEF= |
| Specifies the lag order of independent variables | MODEL | XLAG= |
| **GARCH-Related Options** | | |
| Specifies how to calculate the constant (unconditional) correlation matrix in the CCC (DCC) GARCH model | GARCH | CORRCONSTANT= |
| Specifies the type of the multivariate GARCH model | GARCH | FORM= |
| Specifies the order of the GARCH polynomial | GARCH | P= |
| Specifies the order of the ARCH polynomial | GARCH | Q= |
| Specifies the type of the univariate GARCH model for each innovation in the CCC or DCC GARCH model | GARCH | SUBFORM= |
| **Cointegration-Related Options** | | |
| Specifies the restriction on the drift in the VECM | COINTEG | ECTREND |
| Prints the results from the weak exogeneity test of the long-run parameters | COINTEG | EXOGENEITY |
| Specifies the restriction on the cointegrated coefficient matrix | COINTEG | H= |
| Specifies the restriction on the adjustment coefficient matrix | COINTEG | J= |

**Table 43.1** *continued*

| Description | Statement | Option |
|---|---|---|
| Specifies the nonlinear constraints that the adjustment coefficient matrix and the cointegrated coefficient matrix are both full rank | COINTEG | NLC |
| Specifies the variable name whose cointegrating vectors are normalized | COINTEG | NORMALIZE= |
| Specifies a cointegration rank | COINTEG | RANK= |
| Prints the Johansen cointegration rank test | MODEL | COINTTEST= (JOHANSEN= ) |
| Prints the Stock-Watson common trends test | MODEL | COINTTEST=(SW= ) |
| Prints the Dickey-Fuller unit root test | MODEL | DFTEST= |
| Specifies the vector error correction model (obsolete)[1] | MODEL | ECM= |
| **Long Memory Options** | | |
| Specifies the Vector autoregressive fractionally integrated moving average model | MODEL | FI |
| **Tests and Restrictions on Parameters** | | |
| Tests the Granger causality | CAUSAL | GROUP1= GROUP2= |
| Places and tests restrictions on parameter estimates | BOUND | |
| Places and tests restrictions on parameter estimates | RESTRICT | |
| Tests hypotheses on parameter estimates | TEST | |
| **Forecasting Control Options** | | |
| Specifies the size of confidence limits for forecasting | OUTPUT | ALPHA= |
| Starts forecasting before end of the input data | OUTPUT | BACK= |
| Specifies how many periods to forecast | OUTPUT | LEAD= |
| Suppresses the printed forecasts | OUTPUT | NOPRINT |
| **Conditional Forecasts and Scenario Analysis Options** | | |
| Specifies the size of the credible interval | CONDFORE | ALPHA= |
| Specifies the number of multistep forecast values to compute | CONDFORE | LEAD= |
| Specifies the number of burn-in iterations | CONDFORE | NBI= |
| Specifies the number of Monte Carlo iterations | CONDFORE | NMC= |
| Specifies whether and how to consider the uncertainty of parameters | CONDFORE | PARM= |
| Specifies a nonnegative integer to use as the seed for generating random number sequences | CONDFORE | SEED= |
| Specifies the numeric variable that identifies each scenario | CONDFORE | SID= |

[1] Starting with SAS/ETS 14.1, it is recommended that you use the COINTEG statement instead.

## PROC VARMAX Statement

**PROC VARMAX** *options* **;**

The following options can be used in the PROC VARMAX statement:

**DATA=***SAS-data-set*
specifies the input SAS data set. If the DATA= option is not specified, the PROC VARMAX statement uses the most recently created SAS data set.

**OUTEST=***SAS-data-set*
writes the parameter estimates to the output data set.

**COVOUT**
**OUTCOV**
writes the covariance matrix for the parameter estimates to the OUTEST= data set. This option is valid only if the OUTEST= option is specified.

**OUTSTAT=***SAS-data-set*
writes residual diagnostic results to an output data set. If the COINTTEST=(JOHANSEN) option is specified, the results of this option are also written to the output data set.

The following statements are the examples of these options in the PROC VARMAX statement:

```
proc varmax data=one outest=est outcov outstat=stat;
   model y1-y3 / p=1;
run;
```

```
proc varmax data=one outest=est outstat=stat;
   model y1-y3 / p=1 cointtest=(johansen);
run;
```

**PLOTS<(***global-plot-option***)> = ***plot-request-option* **<(***options***)>**
**PLOTS<(***global-plot-option***)> = (** *plot-request-option* **<(***options***)> ... ***plot-request-option* **<(***options***)>)**
controls the plots produced through ODS Graphics. When you specify only one plot, you can omit the parentheses around the plot request. Some examples follow:

```
plots=none
plots=all
plots=condcorr
plots(unpack)=residual(residual normal)
plots=(forecasts model)
```

For general information about ODS Graphics, see Chapter 24, "Statistical Graphics Using ODS" (*SAS/STAT User's Guide*).

```
proc varmax data=one plots=impulse(simple);
   model y1-y3 / p=1;
run;

proc varmax data=one plots=(model residual);
   model y1-y3 / p=1;
run;

proc varmax data=one plots=forecasts;
   model y1-y3 / p=1;
   output lead=12;
run;
```

The first VARMAX program produces the simple response impulse plots. The second VARMAX program produces the plots associated with the model and prediction errors. The plots associated with prediction errors are the ACF, PACF, IACF, distribution, white-noise, and Normal quantile plots and the prediction error plot. The third VARMAX program produces the FORECASTS and FORECASTSONLY plots.

The *global-plot-option* applies to the impulse and prediction error analysis plots generated by the VARMAX procedure. The following *global-plot-option* is available:

**UNPACK** displays each graph separately. (By default, some graphs can appear together in a single panel.)

The following *plot-request-options* are available:

**ALL** produces all plots appropriate for the particular analysis.

**CONDCORR** produces dynamic conditional covariance plots. This option is available only when the DCC GARCH model is specified. This option is experimental in this release.

**FORECASTS** <(*forecasts-plot-options*)> produces plots of the forecasts. The forecasts-only plot that shows the multistep forecasts in the forecast region is produced by default. The following *forecasts-plot-options* are available:

- **ALL** produces the FORECASTSONLY and the FORECASTS plots. This is the default.
- **FORECASTS** produces a plot that shows the one-step-ahead as well as the multistep forecasts.
- **FORECASTSONLY** produces a plot that shows only the multistep forecasts.

**IMPULSE** <(*impulse-plot-options*)> produces the plots of impulse response function and the impulse response of the transfer function.

- **ALL** produces all impulse plots. This is the default.
- **ACCUM** produces the accumulated impulse plot.
- **ORTH** produces the orthogonalized impulse plot.

**SIMPLE** produces the simple impulse plot.

**MODEL** produces plots of dependent variables listed in the MODEL statement and plots of the one-step-ahead predicted values for each dependent variables.

**NONE** suppresses all plots.

**RESIDUAL** < (*residual-plot-options* ) > produces plots associated with the prediction errors obtained after modeling the data. The following *residual-plot-options* are available:

**ALL** produces all plots associated with the analysis of the prediction errors. This is the default.

**RESIDUAL** produces prediction error plot.

**DIAGNOSTICS** produces a panel of plots useful in assessing the autocorrelations and white-noise of the prediction errors. The panel consists of the following:

- the autocorrelation plot of the prediction errors
- the partial autocorrelation plot of the prediction errors
- the inverse autocorrelation plot of the prediction errors
- the log scaled white noise plot of the prediction errors

**NORMAL** produces a panel of plots useful in assessing normality of the prediction errors. The panel consists of the following:

- distribution of the prediction errors with overlaid the normal curve
- normal quantile plot of the prediction errors

## Other Options

In addition, any of the following MODEL statement options can be specified in the PROC VARMAX statement, which is equivalent to specifying the option for every MODEL statement: CENTER, DFTEST=, DIF=, DIFX=, DIFY=, LAGMAX=, METHOD=, MINIC=, NOCURRENTX, NOINT, NOPRINT, NSEASON=, P=, PRINT=, PRINTALL, PRINTFORM=, Q=, SCENTER, TREND=, VARDEF=, and XLAG= options.

The following is an example of the options in the PROC VARMAX statement:

```
proc varmax data=one lagmax=3 method=ml;
   model y1-y3 / p=1;
run;
```

## BOUND Statement

**BOUND** *restriction, . . . , restriction* **;**

The BOUND statement sets up linear bounds for parameters when the maximum likelihood method is applied to the estimation of VARMAX, VECM, VARMAX-GARCH, and VEC-ARMAX-GARCH models. Only one BOUND statement is allowed. If you specify more than one *restriction*, separate them with commas. The *restrictions* are specified in the same manner as the *restrictions* in the RESTRICT statement. For information about how to define restrictions by using matrix expressions, operators, and functions, see the section "RESTRICT Statement" on page 3052. Both equality and inequality constraints are allowed in the BOUND statement, although usually equality constraints are specified in the RESTRICT statement and inequality constraints are specified in the BOUND statement.

To use the BOUND statement, you need to know the form of the model. If you do not specify the GARCH statement, the COINTEG statement, or the ECM=, P=, Q=, or XLAG= option in the MODEL statement, then the BOUND statement is not applicable. If you specify the ECM=(NORMALIZE=), METHOD=LS, or PRIOR= option in the MODEL statement, or if you specify the EXOGENEITY, H=, J=, or NORMALIZE= option in the COINTEG statement, the BOUND statement is ignored. Nonlinear restrictions on parameters are not supported.

The following is an example of the BOUND statement for a bivariate ($k$=2) zero-mean VARMA(1,1) model, which is by default estimated by maximum likelihood method because the MA term is present:

```
proc varmax data=one;
   model y1 y2 / noint p=1 q=1;
   bound -1<=AR<=1, 0<MA;
run;
```

This BOUND statement specifies that all AR parameters must be between $-1$ and 1 and that all MA parameters must be positive.

You can use the BOUND statement together with the RESTRICT statement, as in the following bivariate ($k$=2) zero-mean VARMA(1,1) model:

```
proc varmax data=one;
   model y1 y2 / noint p=1 q=1;
   bound AR+MA>=0.001;
   restrict AR(1,1,2) = 0.5;
run;
```

## BY Statement

**BY** *variables* **;**

A BY statement can be used with PROC VARMAX to obtain separate analyses on observations in groups defined by the BY variables.

When a BY statement appears, the procedure expects the input data set to be sorted in order of the BY variables.

If your input data set is not sorted in ascending order, use one of the following alternatives:

- Sort the data using the SORT procedure with a similar BY statement.
- Specify the BY statement option NOTSORTED or DESCENDING in the BY statement for the VARMAX procedure. The NOTSORTED option does not mean that the data are unsorted but rather that the data are arranged in groups (according to values of the BY variables) and that these groups are not necessarily in alphabetical or increasing numeric order.
- Create an index on the BY variables using the DATASETS procedure.

For more information about the BY statement, see in *SAS Language Reference: Concepts*. For more information about the DATASETS procedure, see the discussion in the *Base SAS Procedures Guide*.

The following is an example of the BY statement:

```
proc varmax data=one;
   by region;
   model y1-y3 / p=1;
run;
```

## CAUSAL Statement

**CAUSAL GROUP1=(***variables***)GROUP2=(***variables***) ;**

A CAUSAL statement prints the Granger causality test by fitting the VAR($p$) model by using all variables defined in GROUP1 and GROUP2. Any number of CAUSAL statements can be specified. The CAUSAL statement proceeds with the MODEL statement and uses the variables and the autoregressive order, $p$, specified in the MODEL statement. Variables in the GROUP1= and GROUP2= options should be defined in the MODEL statement. If the P=0 option is specified in the MODEL statement, the CAUSAL statement is not applicable.

The null hypothesis of the Granger causality test is that GROUP1 is influenced only by itself, and not by GROUP2. If the hypothesis test fails to reject the null, then the variables listed in GROUP1 might be considered as independent variables.

For more information, see the section "VAR and VARX Modeling" on page 3095.

The following is an example of the CAUSAL statement. You specify the CAUSAL statement with the GROUP1= and GROUP2= options.

```
proc varmax data=one;
   model y1-y3 = x1 / p=1;
   causal group1=(x1) group2=(y1-y3);
   causal group1=(y2) group2=(y1 y3);
run;
```

The first CAUSAL statement fits the VAR(1) model by using the variables $y1$, $y2$, $y3$, and $x1$ and tests the null hypothesis that $x1$ causes the other variables, $y1$, $y2$, and $y3$, but the other variables do not cause $x1$. The second CAUSAL statement fits the VAR(1) model by using the variables $y1$, $y3$, and $y2$ and tests the null hypothesis that $y2$ causes the other variables, $y1$ and $y3$, but the other variables do not cause $y2$.

## COINTEG Statement

**COINTEG RANK=***number* < *options* > **;**

The COINTEG statement fits the vector error correction model to the data, tests the restrictions of the long-run parameters and the adjustment parameters, and tests for weak exogeneity in the long-run parameters. The P= option in the MODEL statement specifies the autoregressive order of the VECM. Only one COINTEG statement is allowed.

The cointegrated system uses maximum likelihood estimation. If there are no moving average (MA) terms specified by the Q= option in the MODEL statement, no GARCH terms specified in the GARCH statement, and no general restrictions specified in the BOUND and RESTRICT statements, then PROC VARMAX applies the maximum likelihood analysis proposed by Johansen and Juselius (1990); Johansen (1995a, b). Otherwise, the likelihood is maximized using an optimizer whose options can be specified in the NLOPTIONS statement.

The following statements fit a VECM(2):

```
proc varmax data=one;
   model y1-y3 / p=2;
   cointeg rank=1;
run;
```

To test restrictions on $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$, you specify the J= option and the H= option, respectively. You specify the EXOGENEITY option in the COINTEG statement for tests of weak exogeneity in the long-run parameters.

The following example of the COINTEG statement specifies tests of restrictions on $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$, along with tests of weak exogeneity:

```
proc varmax data=one;
   model y1-y3 / p=2;
   cointeg rank=1 h=(1 0, -1 0, 0 1)
           j=(1 0, 0 0, 0 1) exogeneity;
run;
```

You must specify the following option:

**RANK=***number*

specifies the cointegration rank of the cointegrated system. The rank of cointegration should be greater than 0 and less than the number of dependent (endogenous) variables. If *number* is different from the value of the RANK= option specified in the ECM= option in the MODEL statement, the *number* specified here is used for the rank.

You can also specify the following *options* in the COINTEG statement:

**ECTREND**

specifies the restriction on the drift in the VECM. This option is used in the following cases:

- There is no separate drift in the VECM, but a constant enters only through the error correction term. For example, for VECM($p$),

$$\Delta \mathbf{y}_t = \boldsymbol{\alpha}(\boldsymbol{\beta}', \boldsymbol{\beta}_0)(\mathbf{y}'_{t-1}, 1)' + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t$$

  An example of the ECTREND option follows:

```
model y1 y2 / p=2;
cointeg rank=1 ectrend;
```

- There is a separate drift and no separate linear trend in the VECM, but a linear trend enters only through the error correction term. For example, for VECM($p$),

$$\Delta \mathbf{y}_t = \boldsymbol{\alpha}(\boldsymbol{\beta}', \boldsymbol{\beta}_1)(\mathbf{y}'_{t-1}, t)' + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \boldsymbol{\delta}_0 + \boldsymbol{\epsilon}_t$$

  An example of the ECTREND option with the TREND= option follows:

```
model y1 y2 / p=2 trend=linear;
cointeg rank=1 ectrend;
```

If you specify both this option and the NSEASON option in the MODEL statement, then the NSEASON option is ignored. If you specify the NOINT option in the MODEL statement, then this option is ignored.

**EXOGENEITY**

formulates the likelihood ratio tests for testing weak exogeneity in the long-run parameters. The null hypothesis is that one variable is weakly exogenous for the others.

**H=(***matrix***)**

specifies the restrictions $\mathbf{H}$ on the $k \times r$ or $(k+1) \times r$ cointegrated coefficient matrix $\tilde{\boldsymbol{\beta}}$ such that $\tilde{\boldsymbol{\beta}} = \mathbf{H}\boldsymbol{\phi}$, where $\mathbf{H}$ is known and $\boldsymbol{\phi}$ is unknown. If you do not specify the ECTREND option, then the cointegrated coefficient matrix $\tilde{\boldsymbol{\beta}}$ is the cointegrating matrix $\boldsymbol{\beta}$ and the $\mathbf{H}$ matrix has dimension $k \times m$. If you specify the ECTREND option, then the cointegrated coefficient matrix $\tilde{\boldsymbol{\beta}}$ is the cointegrating matrix $\boldsymbol{\beta}$ stacked with the coefficient row vector $\boldsymbol{\beta}_0$ or $\boldsymbol{\beta}_1$ for the constant or linear trend in the error correction term, and the $\mathbf{H}$ matrix has dimension $(k+1) \times m$. Here $k$ is the number of dependent variables and $m$ is $r \leq m < k$, where $r$ is defined in the RANK=$r$ option.

For example, consider a VECM(2) with rank equal to 1 on four dependent variables. Then, $\boldsymbol{\beta} = (\beta_{11}, \beta_{21}, \beta_{31}, \beta_{41})'$. To test the null hypothesis $\beta_{11} + \beta_{21} = 0$ (that is, $\mathbf{H}'_\perp \boldsymbol{\beta} = 0$, where $\mathbf{H}_\perp = (1 \ -1 \ 0 \ 0)'$), you can use the following statements to specify the restriction matrix $\mathbf{H}$:

```
model y1-y4 / p=2;
cointeg rank=1 h=(1 0 0, -1 0 0, 0 1 0, 0 0 1);
```

Here the dimension of matrix $\mathbf{H}$ is $4 \times 3$ because $k = 4$ and $m = 3$, and each row of the matrix $\mathbf{H}$ is separated by commas. Note that $\mathbf{H}'_{\perp}\mathbf{H} = 0$; that is, the $\mathbf{H}$ and $\mathbf{H}_{\perp}$ matrices are orthogonal.

When the series has no separate deterministic trend, and therefore you specify the ECTREND option, the constant term should be restricted by $\boldsymbol{\alpha}'_{\perp}\boldsymbol{\delta} = 0$. The matrix $\boldsymbol{\alpha}_{\perp}$ is a $k \times (k - r)$ full-rank matrix orthogonal to $\boldsymbol{\alpha}$, such that $rank(\boldsymbol{\alpha}_{\perp}) = k - r$ and $\boldsymbol{\alpha}'_{\perp}\boldsymbol{\alpha} = 0$. The $\tilde{\boldsymbol{\beta}}$ becomes $(\boldsymbol{\beta}', \boldsymbol{\beta}_0)'$ or $\tilde{\boldsymbol{\beta}} = (\beta_{11}, \beta_{21}, \beta_{31}, \beta_{41}, \beta_{11}^{(0)})'$. As for the previous test of $\beta_{11} + \beta_{21} = 0$ (that is, $\mathbf{H}'_{\perp}\tilde{\boldsymbol{\beta}} = 0$, where $\mathbf{H}_{\perp} = (1 \ -1 \ 0 \ 0 \ 0)'$), you can specify the restriction matrix $\mathbf{H}$ as follows:

```
model y1-y4 / p=2;
cointeg rank=1 ectrend
   h=(1 0 0 0, -1 0 0 0, 0 1 0 0, 0 0 1 0, 0 0 0 1);
```

Because the dimension is changed in the $\mathbf{H}_{\perp}$ matrix, the dimension of $\mathbf{H}$ matrix has to be adjusted accordingly.

When the cointegrated system contains three dependent variables and the RANK=2 option is specified, the test of $\beta_{1j} = -\beta_{2j}$ for $j = 1, 2$ can be run with the following restriction matrix $\mathbf{H}$, where $\mathbf{H}_{\perp} = (1 \ 1 \ 0)'$ and $\mathbf{H}'_{\perp}\boldsymbol{\beta} = 0$:

```
cointeg rank=2 h=(1 0, -1 0, 0 1);
```

There are many ways to achieve a matrix that is orthogonal to a particular matrix. The following statements illustrate how to obtain the orthogonal matrix through QR decomposition:

```
proc iml;
   /* For a given matrix H_dot, */
   H_dot = {1 1 0}`;
   /* get its QR decomposition, i.e., H_dot = QR. */
   call qr(Q, R, piv, lindep, H_dot);
   /* Then, the matrix orthogonal to H_dot
      can be extracted from Q. */
   H = Q[,ncol(H_dot)+1:nrow(H_dot)];
   /* Finally, normalize each column of H if necessary. */
   do i = 1 to ncol(H);
      k = 0;
      do j = nrow(H) to 1 by -1;
         if (H[j,i]^=0) then k=j;
      end;
      if (k=0) then
         print "Error: H is not full rank!";
      else
         do j = nrow(H) to 1 by -1;
            H[j,i] = H[j,i] / H[k,i];
         end;
   end;
```

```
   print "The given matrix is:";
   print H_dot;
   print "The matrix orthogonal to it is:";
   print H;
quit;
```

**J=(*matrix*)**

specifies the restrictions $\mathbf{J}$ on the $k \times r$ adjustment matrix $\boldsymbol{\alpha}$ such that $\boldsymbol{\alpha} = \mathbf{J}\boldsymbol{\psi}$, where $\mathbf{J}$ is known and $\boldsymbol{\psi}$ is unknown. The $k \times m$ matrix $\mathbf{J}$ is specified by using this option, where $k$ is the number of dependent variables, $m$ is $r \leq m < k$, and $r$ is defined in the RANK=*r* option.

For example, suppose the system contains four variables, the RANK=1 option is specified, and you want to test $\alpha_j = 0$ for $j = 2, 3, 4$ —that is, $\mathbf{J}'_\perp \boldsymbol{\alpha} = 0$, where

$$J_\perp = \begin{pmatrix} 0 & 0 & 0 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

Then you can specify the restriction matrix $\mathbf{J}$ as follows:

```
cointeg rank=1 j=(1, 0, 0, 0);
```

Suppose the system contains three variables, the RANK=2 option is specified, and you want to test $\alpha_{2j} = 0$ for $j = 1, 2$—that is, $\mathbf{J}'_\perp \boldsymbol{\alpha} = 0$, where $\mathbf{J}_\perp = (0\ 1\ 0)'$. Then you can specify the restriction matrix $\mathbf{J}$ as follows:

```
cointeg rank=2 j=(1 0, 0 0, 0 1);
```

**NLC**

specifies the nonlinear constraints that $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ are full column rank. Although the constraints are required for a well-defined VECM, only the TECH=QUANEW and TECH=NMSIMP optimization methods in the NLOPTIONS statement support nonlinear constraints. The full-rank constraints are not imposed by default so that other optimization methods, such as TECH=CONGRA or TECH=TRUREG, can be tried. The NLC option works only when numerical optimization is used for estimating VECM (for example, when the BOUND, INITIAL, or RESTRICT statement is specified, or the VEC-ARMA or VEC-ARMA-GARCH model is estimated). That is, the NLC option is ignored if the closed-form solution of parameter estimates and maximum likelihood analysis, which is provided in Johansen and Juselius (1990) and Johansen (1995a, b), can be applied.

**NORMALIZE=*variable***

specifies a single dependent (endogenous) *variable* whose cointegrating vectors are normalized. If the *variable* is different from the variable specified in the COINTTEST=(JOHANSEN=) or ECM= option in the MODEL statement, the *variable* in this option is used. If this option is not specified, cointegrating vectors are not normalized.

If the EXOGENEITY, H=, J=, or NORMALIZE= option is specified, the BOUND, GARCH, INITIAL, and RESTRICT statements are all ignored, and the Q= option in the MODEL statement is also ignored.

## CONDFORE Statement

**CONDFORE** < *options* > **;**

The CONDFORE statement defines the options for conditional forecasts and scenario analysis.

You can apply conditional forecasts and scenario analysis for both Bayesian and non-Bayesian vector autoregressive models and vector error correction models, with or without independent variables. The future values of dependent and independent variables (which define the scenario) are saved in a table, which can then be input by specifying the SDATA= option in the CONDFORE statement. If you do not specify the SDATA= option, unconditional forecasts are performed. If you specify several scenarios (which are distinguished by the variable that is specified in the SID= option), conditional forecasts are performed for each scenario. The statistics of forecasts (including the mean, standard error, median, and lower and upper bounds of credible interval of each forecast) are output to the table that is specified in the OUT= option in the CONDFORE statement, and the simulated forecasts in each iteration are output to the table that is specified in the OUTSIM= option in the CONDFORE statement.

If you specify the BY statement, the scenarios in the SDATA= table are applied to each BY group, and the BY variables are included in the tables that are specified in the OUT= and OUTSIM= options in the CONDFORE statement. If you specify the ID statement, the ID variable is included in the table that is specified in the OUT= option in the CONDFORE statement. If you specify the SID= option in the CONDFORE statement, the SID= variable is included in the tables that are specified in the OUT= and OUTSIM= options in the CONDFORE statement.

When the GARCH statement is specified or the Q= or FI option is specified in the MODEL statement, the CONDFORE statement is ignored.

You can specify the following *options*:

**ALPHA=**$\alpha$

sets the size, $\alpha$ (the probability of falsely rejecting the null hypothesis), of the credible interval $(100(1-\alpha)\%)$, where $\alpha$ is inclusively between 0 and 1. The credible interval is an equal-tailed interval. By default, ALPHA=0.05, which produces a 95% credible interval.

**LEAD=***number*

specifies the number of multistep forecast values to compute. By default, LEAD=12.

**NBI=***number*

specifies the number of burn-in iterations. By default, NBI=0.

**NMC=***number*

specifies the number of Monte Carlo iterations. By default, NMC=1000.

**OUT=***SAS-data-set*

specifies the output table for forecasts. The columns of the table are the mean, standard error, median, and lower and upper bounds of credible interval of the forecasts for each dependent variable in each scenario.

**OUTSIM=***SAS-data-set*
specifies the output table for the simulated forecasts in each scenario.

**PARM=FIXED | SAMPLING <(SCENARIO)>**
specifies whether and how to consider the uncertainty of parameters. You can specify the following values:

**FIXED** fixes the parameters that are used in conditional forecasts to the parameter estimates for non-Bayesian models or to the expectation of the posterior distribution of parameters for Bayesian models.

**SAMPLING <SCENARIO>** samples the parameters from the posterior distribution of parameters. If you specify PARM=SAMPLING(SCENARIO), the parameters are sampled through the Gibbs sampling algorithm to consider the effect of the information in each scenario. In theory, it is suggested that the parameter uncertainty should be considered in the conditional forecasts for Bayesian models; however, in practice, the sampling (especially Gibbs sampling) might lead to floating point overflow because of some outlier-like realized parameters. You can specify this value only for Bayesian models.

By default, PARM=FIXED.

**SDATA=***SAS-data-set*
specifies the input data table that contains observations for one or multiple scenarios.

**SEED=***number*
specifies a nonnegative integer to use as the seed for generating random number sequences. You can use this option to replicate results from different runs if you specify the same positive random seed. If you specify SEED=0, the random seed is determined according to the system clock. By default, SEED=1.

**SID=***variable*
**SCENARIOID=(***variable***)**
specifies a numeric variable that identifies each scenario. This option is ignored if the SDATA= option is not specified.

Some examples of the CONDFORE statements follow:

```
proc varmax data=one;
   model y1 y2 / p=2;
   condfore out=oucf;
run;

proc varmax data=one;
   model y1 y2 / p=2;
   condfore alpha=0.2 lead=6 sdata=scenarios sid=scenarioIndex
      nbi=1000 nmc=10000 seed=12345 parm=sampling(scenario)
      out=ocf outsim=ocfsim;
run;
```

## GARCH Statement

**GARCH** *options* **;**

The GARCH statement specifies a GARCH-type multivariate conditional heteroscedasticity model.

You can specify the following options:

**CORRCONSTANT=ESTIMATE** | **EXPECT**
specifies how to calculate the constant or unconditional correlation matrix in the CCC or DCC GARCH model, respectively. If you specify CORRCONSTANT=EXPECT, the constant conditional correlation matrix in the CCC GARCH model or the unconditional correlation matrix in the DCC GARCH model is calculated through the standardized residuals, given the other parameters. After parameter estimates are output, the constant or unconditional correlation matrix for the CCC or DCC GARCH model is output in the CCCCorrConstant or DCCCorrConstant ODS table, respectively. If you specify CORRCONSTANT=ESTIMATE, the correlation matrix is estimated like all other parameters in the model. By default, CORRCONSTANT=ESTIMATE.

**FORM=***value*
specifies the representation for a GARCH model. Valid values are as follows:

**BEKK** specifies a BEKK representation. This is the default.

**CCC** specifies a constant conditional correlation representation.

**DCC** specifies a dynamic conditional correlation representation.

**OUTHT=***SAS-data-set*
writes the conditional covariance matrix to an output data set. When you use the LEAD= option in the OUTPUT statement together with this option in the GARCH statement, you can obtain the multistep forecast of conditional covariance matrices at any horizons ahead that are of interest.

**P=***number*

**P=(***number-list***)**
specifies the order of the process or the subset of GARCH terms to be fitted. For example, you can specify the P=(1,3) option. The P=3 option is equivalent to the P=(1,2,3) option. By default, P=0.

**Q=***number*

**Q=(***number-list***)**
specifies the order of the process or the subset of ARCH terms to be fitted. This option is required in the GARCH statement. For example, you can specify the Q=(2) option. The Q=2 option is equivalent to the Q=(1,2) option.

**SUBFORM=***value*
specifies the type of the univariate GARCH model for each innovation in the CCC or DCC GARCH model. If you specify the FORM=BEKK option, the SUBFORM= option is ignored. The values of the SUBFORM= option are as follows:

**EGARCH** specifies the exponential GARCH, or EGARCH, model.

**GARCH** specifies the GARCH model with no constraints.

**GJR | TGARCH** specifies the GJR GARCH (also called threshold GARCH, or TGARCH) model.

**PGARCH** specifies the power GARCH, or PGARCH, model.

**QGARCH** specifies the quadratic GARCH, or QGARCH, model.

By default, SUBFORM=GARCH.

If you specify the ECM=(NORMALIZE=) or PRIOR= option in the MODEL statement, or if you specify the EXOGENEITY, H=, J=, or NORMALIZE= option in the COINTEG statement, the GARCH statement is ignored.

For the VAR(1)–ARCH(1) model,

```
model y1 y2 / p=1;
garch q=1 form=bekk;
```

For the multivariate GARCH(1,1) model,

```
model y1 y2;
garch q=1 p=1 form=ccc;
```

Other multivariate GARCH-type models are

```
model y1 y2 = x1 / xlag=1;
garch q=1;

model y1 y2 / q=1;
garch q=1 p=1;
```

For more information, see the section "Multivariate GARCH Modeling" on page 3139.

## ID Statement

**ID** *variable* **INTERVAL=***value* < **ALIGN=***value* > **;**

The ID statement specifies a variable that identifies observations in the input data set. The datetime variable specified in the ID statement is included in the OUT= data set if the OUTPUT statement is specified. The ID *variable* is usually a SAS datetime variable. The values of the ID variable are extrapolated for the forecast observations based on the value of the INTERVAL= option.

**ALIGN=** *value*

controls the alignment of SAS dates used to identify output observations. The ALIGN= option allows the following values: BEGINNING | BEG | B, MIDDLE | MID | M, and ENDING | END | E. The default is BEGINNING. The ALIGN= option is used to align the ID variable to the beginning, middle, or end of the time ID interval specified by the INTERVAL= option.

**INTERVAL=***value*

specifies the time interval between observations. This option is required in the ID statement. The INTERVAL= option is used in conjunction with the ID variable to check that the input data are in order and have no missing periods. The INTERVAL= option is also used to extrapolate the ID values past the end of the input data when the OUTPUT statement is specified.

The following is an example of the ID statement:

```
proc varmax data=one;
   id date interval=qtr align=mid;
   model y1-y3 / p=1;
run;
```

## INITIAL Statement

**INITIAL** *equation, . . . , equation* **;**

The INITIAL statement sets up the initial parameter values for nonlinear optimization when the maximum likelihood method is applied to the estimation of VARMAX, VECM, VARMAX-GARCH, or VEC-ARMAX-GARCH models. Only one INITIAL statement is allowed. If you specify more than one *equation*, separate them with commas. The *equations* are specified in the same manner as the *restrictions* in the RESTRICT statement. For information about how to define equations by using matrix expressions, operators, and functions, see the section "RESTRICT Statement" on page 3052.

To use the INITIAL statement, you need to know the form of the model. If you do not specify the GARCH statement, the COINTEG statement, or the ECM=, P=, Q=, or XLAG= option in the MODEL statement, then the INITIAL statement is not applicable. If you specify the ECM=(NORMALIZE=), METHOD=LS, or PRIOR= option in the MODEL statement, or if you specify the EXOGENEITY, H=, J=, or NORMALIZE= option in the COINTEG statement, the INITIAL statement is ignored. Nonlinear restrictions on parameters are not supported.

The initial parameter values are the solution of the specified linear equations. If you do not specify initial values for all parameters, the default initial value for any parameter that is not specified in the INITIAL statement is 0, except for the following:

- The diagonal elements of the **COV** parameter matrix are set to ones if the **COV** parameter matrix is to be estimated.
- The diagonal elements of the **GCHC** parameter matrix are set to ones if the **GCHC** parameter matrix is to be estimated and the SUBFORM=EGARCH option is not specified.
- The diagonal elements of the **PACH** parameter matrix are set to ones if the SUBFORM=PGARCH option is specified.

The following is an example of the INITIAL statement for a bivariate ($k$=2) zero-mean VARMA(1,1) model, which is estimated by the maximum likelihood method by default because a moving average (MA) term is present:

```
proc varmax data=one;
   model y1 y2 / noint p=1 q=1;
   initial AR = 0, MA = 0,
           COV={1 0.5, 0.5 4};
run;
```

Like the RESTRICT statement, the preceding INITIAL statement can be abbreviated as follows:

```
initial AR = MA = 0,
        COV={1 0.5, 0.5 4};
```

or

```
initial AR, MA, COV={1 0.5, 0.5 4};
```

Furthermore, you can omit **AR** and **MA** in the INITIAL statement as follows, because by default the **AR** and **MA** matrices are set to zeros if they are not specified in the INITIAL statement:

```
initial COV={1 0.5, 0.5 4};
```

If you use the INITIAL statement for a vector error correction model (VECM), you must specify initial values for both the **ALPHA** and **BETA** matrices and make sure they are both full rank; otherwise, the INITIAL statement is ignored.

In the following example, the INITIAL statement is ignored because initial values for **ALPHA** and **BETA** are not specified:

```
proc varmax data=one;
   model y1 y2 / noint p=1;
   cointeg rank=1;
   initial cov=I(2)*4;
run;
```

In the following example, the INITIAL statement is ignored because initial values for **ALPHA** are not specified:

```
proc varmax data=one;
   model y1 y2 / noint p=1;
   cointeg rank=1;
   initial beta=1;
run;
```

In the following example, the INITIAL statement is ignored because the initial **BETA** matrix is not full rank:

```
proc varmax data=one;
   model y1 y2 y3 / noint p=1;
   cointeg rank=2;
   initial alpha={1 0, 0 1, 0 0},
           beta ={1 2, 2 4, 3 6};
run;
```

In the following example, the INITIAL statement works fine because the specified initial **ALPHA** and **BETA** matrices are both full rank:

```
proc varmax data=one;
   model y1 y2 y3 / noint p=1;
   cointeg rank=2;
   initial alpha={1 0, 0 1, 0 0},
           beta ={1 2, 2 4, 3 5};
run;
```

## MODEL Statement

**MODEL** *dependents* < **=** *regressors* >
< , *dependents* < **=** *regressors* > . . . >
< / *options* > **;**

The MODEL statement specifies dependent (endogenous) variables and independent (exogenous) variables for the VARMAX model. The multivariate model can have the same or different independent variables corresponding to the dependent variables. As a special case, the VARMAX procedure allows you to analyze one dependent variable. Only one MODEL statement is allowed.

For example, the following statements are equivalent ways of specifying the multivariate model for the vector $(y1, y2, y3)$:

```
model y1 y2 y3 </options>;
model y1-y3 </options>;
```

The following statements are equivalent ways of specifying the multivariate model with independent variables, where $y1, y2, y3$, and $y4$ are the dependent variables and $x1, x2, x3, x4$, and $x5$ are the independent variables:

```
model y1 y2 y3 y4 = x1 x2 x3 x4 x5 </options>;
model y1 y2 y3 y4 = x1-x5 </options>;
model y1 = x1-x5, y2 = x1-x5, y3 y4 = x1-x5 </options>;
model y1-y4 = x1-x5 </options>;
```

When the multivariate model has different independent variables that correspond to each of the dependent variables, equations are separated by commas (,) and the model can be specified as illustrated by the following MODEL statement:

```
model y1 = x1-x3, y2 = x3-x5, y3 y4 = x1-x5 </options>;
```

The FI, PRIOR, and Q= options, the GARCH statement, and vector error correction models require that the same independent variables be used for all dependent variables. If you specify different independent variables that correspond to each of the dependent variables together with these options, statement, or models, all independent variables are dropped from the model. You can use the RESTRICT statement to achieve the goal when these options, statement, or models are specified. For example, if you need to specify x1 as the regressor of y1, x2 as the regressor of y2, and x3 as the regressor of y3 in a VMA(1) model, the following statement does not work:

```
model y1 = x1, y2 = x2, y3 = x3 / q=1;
```

But you can use the following statement to achieve your goal:

```
model y1 y2 y3 = x1 x2 x3 / q=1;
restrict xl(,y1,{x2 x3}) = 0,
         xl(,y2,{x1 x3}) = 0,
         xl(,y3,{x1 x2}) = 0;
```

You can specify the following *options* in the MODEL statement after a forward slash (/):

**CENTER**

centers the dependent (endogenous) variables by subtracting their means. Note that centering is done after differencing when the DIF= or DIFY= option is specified. If there are exogenous (independent) variables, this option is not applicable.

```
model y1 y2 / p=1 center;
```

**DIF(***variable* **(***number-list***) <... ***variable* **(***number-list***) >)**

**DIF=(***variable* **(***number-list***) <... ***variable* **(***number-list***) >)**

specifies the degrees of differencing to be applied to the specified dependent or independent variables. The *number-list* must contain one or more numbers, each of which should be greater than zero. The differencing can be the same for all variables, or it can vary among variables. For example, the DIF=($y_1$(1,4) $y_3$(1) $x_2$(2)) option specifies that the series $y_1$ is differenced at lag 1 and at lag 4, which is

$$(1 - B^4)(1 - B)y_{1t} = (y_{1t} - y_{1,t-1}) - (y_{1,t-4} - y_{1,t-5})$$

the series $y_3$ is differenced at lag 1, which is $(y_{3t} - y_{3,t-1})$; and the series $x_2$ is differenced at lag 2, which is $(x_{2t} - x_{2,t-2})$.

The following uses the data $dy1$, $y2$, $x1$, and $dx2$, where $dy1 = (1 - B)y_{1t}$ and $dx2 = (1 - B)^2 x_{2t}$:

```
model y1 y2 = x1 x2 / p=1 dif=(y1(1) x2(2));
```

**DIFX(***number-list***)**

**DIFX=(***number-list***)**

specifies the degrees of differencing to be applied to all independent variables. The *number-list* must contain one or more numbers, each of which should be greater than zero. For example, the DIFX=(1) option specifies that all of the independent series are differenced once at lag 1. The DIFX=(1,4) option specifies that all of the independent series are differenced at lag 1 and at lag 4. If independent variables are specified in the DIF= option, then the DIFX= option is ignored.

The following statement uses the data $y1$, $y2$, $dx1$, and $dx2$, where $dx1 = (1 - B)x_{1t}$ and $dx2 = (1 - B)x_{2t}$:

```
model y1 y2 = x1 x2 / p=1 difx(1);
```

**DIFY(***number-list***)**

**DIFY=(***number-list***)**

specifies the degrees of differencing to be applied to all dependent (endogenous) variables. The *number-list* must contain one or more numbers, each of which should be greater than zero. For more information, see the DIFX= option. If dependent variables are specified in the DIF= option, then the DIFY= option is ignored.

```
model y1 y2 / p=1 dify(1);
```

**FI**

uses the vector autoregressive fractionally integrated moving average model with exogenous variables.

```
model y1 y2 / fi method = ML;
```

**METHOD=***value*

specifies the type of estimates to compute. You can specify the following *values*:

**LS** specifies least squares estimates.

**ML** specifies maximum likelihood estimates.

**CML** specifies conditional maximum likelihood estimates.

For VARX models, you can apply the least squares method, maximum likelihood method, or conditional maximum likelihood method; for VARMAX models, you can apply either the maximum the likelihood method or the conditional maximum likelihood method; for other type of models, namely, vector error correction models, GARCH models, and Bayesian models, the default maximum likelihood method is applied. The (conditional) log-likelihood equations are solved by iterative numerical methods such as quasi-Newton optimization. The starting values for the AR and MA parameters are obtained from the least squares estimates. Although the small-sample properties of CML estimates might not be as good as the ML estimates, the CML method is much faster than the ML method.

```
model y1 y2 / p=1 method=ml;
```

**NOCURRENTX**

suppresses the current values $x_t$ of the independent variables. In general, the VARX($p, s$) model is

$$\mathbf{y}_t = \delta + \sum_{i=1}^{p} \Phi_i \mathbf{y}_{t-i} + \sum_{i=0}^{s} \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

where $p$ is the number of lags of the dependent variables included in the model, and $s$ is the number of lags of the independent variables included in the model, including the contemporaneous values of $x_t$.

A VARX(1,2) model can be specified as:

```
model y1 y2 = x1 x2 / p=1 xlag=2;
```

If the NOCURRENTX option is specified, it suppresses the current values $\mathbf{x}_t$ and starts with $\mathbf{x}_{t-1}$. The VARX($p, s$) model is redefined as:

$$\mathbf{y}_t = \delta + \sum_{i=1}^{p} \Phi_i \mathbf{y}_{t-i} + \sum_{i=1}^{s} \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

This model with $p = 1$ and $s = 2$ can be specified as:

```
model y1 y2 = x1 x2 / p=1 xlag=2 nocurrentx;
```

**NOINT**

suppresses the intercept parameter $\delta$.

```
model y1 y2 / p=1 noint;
```

**NSEASON=***number*

specifies the number of seasonal periods. When the NSEASON=*number* option is specified, (*number* –1) seasonal dummies are added to the regressors. If the NOINT option is specified, the NSEASON= option is not applicable. For more information, see the section "Seasonal Dummies and Time Trends" on page 3100.

```
model y1 y2 / p=1 nseason=4;
```

**SCENTER**

centers seasonal dummies specified by the NSEASON= option. The centered seasonal dummies are generated by $c - (1/s)$, where $c$ is a seasonal dummy generated by the NSEASON=$s$ option.

```
model y1 y2 / p=1 nseason=4 scenter;
```

**TREND=***value*

specifies the degree of deterministic time trend included in the model. Valid values are as follows:

**LINEAR** includes a linear time trend as a regressor.

**QUAD** includes linear and quadratic time trends as regressors.

The TREND=QUAD option is not applicable for a cointegration analysis. For more information, see the section "Seasonal Dummies and Time Trends" on page 3100.

```
model y1 y2 / p=1 trend=linear;
```

**VARDEF=***value*

corrects for the degrees of freedom of the denominator for computing an error covariance matrix for the METHOD=LS option. If the METHOD=ML option is specified, the VARDEF=N option is always used. Valid values are as follows:

**DF** specifies that the number of nonmissing observation minus the number of regressors be used.

**N** specifies that the number of nonmissing observation be used.

```
model y1 y2 / p=1 vardef=n;
```

## Printing Control Options

**LAGMAX=***number*

specifies the maximum number of lags for which results are computed and displayed by the PRINT=(CORRX CORRY COVX COVY IARR IMPULSE= IMPULSX= PARCOEF PCANCORR PCORR) options. This option is also used to limit the printed results for the cross covariances and cross-correlations of residuals. The default is LAGMAX=min(12, $T$-2), where $T$ is the number of nonmissing observations.

```
model y1 y2 / p=1 lagmax=6;
```

**NOPRINT**

suppresses all printed output.

```
model y1 y2 / p=1 noprint;
```

**PRINTALL**

requests all printing control options. The options set by the option PRINTALL are DFTEST=, MINIC=, PRINTFORM=BOTH, and PRINT=(CORRB CORRX CORRY COVB COVPE COVX COVY DECOMPOSE DYNAMIC IARR IMPULSE=(ALL) IMPULSX=(ALL) PARCOEF PCANCORR PCORR ROOTS YW).

You can also specify this option as the option ALL.

```
model y1 y2 / p=1 printall;
```

**PRINTFORM=***value*

requests the printing format of the output generated by the PRINT= option and cross covariances and cross-correlations of residuals. Valid values are as follows:

**BOTH** prints output in both MATRIX and UNIVARIATE forms.

**MATRIX** prints output in matrix form. This is the default.

**UNIVARIATE** prints output by variables.

```
model y1 y2 / p=1 print=(impulse) printform=univariate;
```

## Printing Options

**PRINT=(*options*)**

The following options can be used in the PRINT=( ) option. The options are listed within parentheses. If a number in parentheses follows an option listed below, then the option prints the number of lags specified by *number* in parentheses. The default is the number of lags specified by the LAGMAX=*number* option.

**CORRB**

prints the estimated correlations of the parameter estimates.

**CORRX**

**CORRX(*number*)**

prints the cross-correlation matrices of exogenous (independent) variables. The *number* should be greater than zero.

**CORRY**

**CORRY(*number*)**

prints the cross-correlation matrices of dependent (endogenous) variables. The *number* should be greater than zero.

**COVB**

prints the estimated covariances of the parameter estimates.

**COVPE**

**COVPE(*number*)**

prints the covariance matrices of *number*-ahead prediction errors for the VARMAX($p$,$q$,$s$) model. The *number* should be greater than zero. If the DIF= or DIFY= option is specified, the covariance matrices of multistep prediction errors are computed based on the differenced data. This option is not applicable when the PRIOR= option is specified. For more information, see the section "Forecasting" on page 3084.

**COVX**

**COVX(*number*)**

prints the cross-covariance matrices of exogenous (independent) variables. The *number* should be greater than zero.

**COVY**

**COVY(*number*)**

prints the cross-covariance matrices of dependent (endogenous) variables. The *number* should be greater than zero.

**DECOMPOSE**

**DECOMPOSE(*number*)**

prints the decomposition of the prediction error covariances using up to the number of lags specified by *number* in parentheses for the VARMA($p$,$q$) model. The *number* should be greater than zero. It can be interpreted as the contribution of innovations in one variable to the mean squared error of the multistep forecast of another variable. The DECOMPOSE option also prints proportions of the forecast error variance.

If the DIF= or DIFY= option is specified, the covariance matrices of multistep prediction errors are computed based on the differenced data. This option is not applicable when the PRIOR= option is specified. For more information, see the section "Forecasting" on page 3084.

**DIAGNOSE**
prints the residual diagnostics and model diagnostics.

**DYNAMIC**
prints the contemporaneous relationships among the components of the vector time series.

**ESTIMATES**
prints the coefficient estimates and a schematic representation of the significance and sign of the parameter estimates.

**IARR**

**IARR(***number***)**
prints the infinite order AR representation of a VARMA process. The *number* should be greater than zero. If the ECM= option or the COINTEG statement is specified, then the reparameterized AR coefficient matrices are printed.

**IMPULSE**

**IMPULSE(***number***)**

**IMPULSE=(SIMPLE ACCUM ORTH STDERR ALL)**

**IMPULSE(***number***)=(SIMPLE ACCUM ORTH STDERR ALL)**
prints the impulse response function. The *number* should be greater than zero. It investigates the response of one variable to an impulse in another variable in a system that involves a number of other variables as well. It is an infinite order MA representation of a VARMA process. For more information, see the section "Impulse Response Function" on page 3073.

You can specify the following options within parentheses:

| | |
|---|---|
| **ACCUM** | prints the accumulated impulse response function. |
| **ALL** | is equivalent to specifying SIMPLE, ACCUM, ORTH, and STDERR. |
| **ORTH** | prints the orthogonalized impulse response function. |
| **SIMPLE** | prints the impulse response function. This is the default. |
| **STDERR** | prints the standard errors of the impulse response function, the accumulated impulse response function, or the orthogonalized impulse response function. |

**IMPULSX**

**IMPULSX(***number***)**

**IMPULSX=(SIMPLE ACCUM STDERR ALL)**

**IMPULSX(***number***)=(SIMPLE ACCUM STDERR ALL)**
prints the impulse response function related to exogenous (independent) variables. The *number* should be greater than zero. For more information, see the section "Impulse Response Function" on page 3073.

You can specify the following options within parentheses:

| | |
|---|---|
| **ACCUM** | prints the accumulated impulse response matrices for the transfer function. |
| **ALL** | is equivalent to specifying SIMPLE, ACCUM, and STDERR. |
| **SIMPLE** | prints the impulse response matrices for the transfer function. |
| **STDERR** | prints the standard errors of the simple impulse response function or the accumulated impulse response function. |

By default, IMPULSX(*number*)=(SIMPLE).

**PARCOEF**

**PARCOEF(***number***)**

prints the partial autoregression coefficient matrices, $\Phi_{mm}$ up to the lag *number*. The *number* should be greater than zero. With a VAR process, this option is useful for the identification of the order since the $\Phi_{mm}$ have the property that they equal zero for $m > p$ under the hypothetical assumption of a VAR($p$) model. For more information, see the section "Tentative Order Selection" on page 3089.

**PCANCORR**

**PCANCORR(***number***)**

prints the partial canonical correlations of the process at lag $m$ and the test for testing $\Phi_m$=0 for $m > p$ up to the lag *number*. The *number* should be greater than zero. The lag $m$ partial canonical correlations are the canonical correlations between $\mathbf{y}_t$ and $\mathbf{y}_{t-m}$, after adjustment for the dependence of these variables on the intervening values $\mathbf{y}_{t-1}, \ldots, \mathbf{y}_{t-m+1}$. For more information, see the section "Tentative Order Selection" on page 3089.

**PCORR**

**PCORR(***number***)**

prints the partial correlation matrices. The *number* should be greater than zero. With a VAR process, this option is useful for a tentative order selection by the same property as the partial autoregression coefficient matrices, as described in the PRINT=(PARCOEF) option. For more information, see the section "Tentative Order Selection" on page 3089.

**ROOTS**

prints the eigenvalues of the $kp \times kp$ companion matrix associated with the AR characteristic function $\Phi(B)$, where $k$ is the number of dependent (endogenous) variables, and $\Phi(B)$ is the finite order matrix polynomial in the backshift operator $B$, such that $B^i\mathbf{y}_t = \mathbf{y}_{t-i}$. These eigenvalues indicate the stationary condition of the process since the stationary condition on the roots of $|\Phi(B)| = 0$ in the VAR($p$) model is equivalent to the condition in the corresponding VAR(1) representation that all eigenvalues of the companion matrix be less than one in absolute value. Similarly, you can use this option to check the invertibility of the MA process. In addition, when the GARCH statement is specified, this option prints the roots of the GARCH characteristic polynomials to check covariance stationarity for the GARCH process.

**YW**

prints Yule-Walker estimates of the preliminary autoregressive model for the dependent (endogenous) variables. The coefficient matrices are printed using the maximum order of the autoregressive process.

Some examples of the PRINT= option are as follows:

```
model y1 y2 / p=1 print=(covy(10) corry(10));
model y1 y2 / p=1 print=(parcoef pcancorr pcorr);
model y1 y2 / p=1 print=(impulse(8) decompose(6) covpe(6));
model y1 y2 / p=1 print=(dynamic roots yw);
```

## Lag Specification Options

**P=***number*

**P=(***number-list***)**

specifies the order of the vector autoregressive process. Subset models of vector autoregressive orders can be specified by listing the desired set of lags. For example, you can specify the P=(1,3,4) option. The P=3 option is equivalent to the P=(1,2,3) option. The default is P=0.

If P=0 and there are no exogenous (independent) variables, then the AR polynomial order is automatically determined by minimizing an information criterion. If P=0 and the PRIOR= or ECM= option or COINTEG statement are specified, then the AR polynomial order is determined automatically.

If the ECM= option or the COINTEG statement is specified, then subset models of vector autoregressive orders are not allowed and the AR maximum order specified is used.

Examples illustrating the P= option follow:

```
model y1 y2 / p=3;
model y1 y2 / p=(1,3);
model y1 y2 / p=(1,3) prior;
```

**Q=***number*

**Q=(***number-list***)**

specifies the order of the moving-average error process. Subset models of moving-average orders can be specified by listing the desired set of lags. For example, you can specify the Q=(1,5) option. The default is Q=0.

```
model y1 y2 / p=1 q=1;
model y1 y2 / q=(2);
```

**XLAG=***number*

**XLAG=(***number-list***)**

specifies the lags of exogenous (independent) variables. Subset models of distributed lags can be specified by listing the desired set of lags. For example, XLAG=(2) selects only a lag 2 of the exogenous variables. The default is XLAG=0. To exclude the present values of exogenous variables from the model, the NOCURRENTX option must be used.

```
model y1 y2 = x1-x3 / xlag=2 nocurrentx;
model y1 y2 = x1-x3 / p=1 xlag=(2);
```

## Tentative Order Selection Options

**MINIC**

**MINIC=( P=***number* **PERROR=***number* **Q=***number* **TYPE=***value* **)**
prints the information criterion for the appropriate AR and MA tentative order selection.

You can specify the following options within parentheses in the MINIC= option:

**P=***number*

**P=(**$p_{min}$ **:** $p_{max}$**)**
specifies the range of AR orders to be considered in the tentative order selection. The default is P=(0:5). P=3 is equivalent to P=(0:3).

**PERROR=***number*

**PERROR=(**$p_{\epsilon,min}$ **:** $p_{\epsilon,max}$**)**
specifies the range of AR orders for obtaining the error series. The default is PERROR=($p_{max}$ : $p_{max} + q_{max}$).

**Q=***number*

**Q=(**$q_{min}$ **:** $q_{max}$**)**
specifies the range of MA orders to be considered in the tentative order selection. The default is Q=(0:5).

**TYPE= AIC** | **AICC** | **FPE** | **HQC** | **SBC**
specifies the criterion for the model order selection. Valid criteria are as follows:

| | |
|---|---|
| **AIC** | specifies Akaike's information criterion. |
| **AICC** | specifies the corrected Akaike's information criterion. |
| **FPE** | specifies the final prediction error criterion. |
| **HQC** | specifies the Hanna-Quinn criterion. |
| **SBC** | specifies the Schwarz Bayesian criterion. You can also specify this value as TYPE=BIC. |

By default, TYPE=AICC.

The following examples show how to use the MINIC or MINIC= option:

```
model y1 y2 / minic;
```

```
model y1 y2 / minic=(type=aic p=13);
```

In the selection of AR and MA orders, the model that has the smallest criterion value is chosen. For the definitions of the information criteria used in the MINIC option, see the section "The Minimum Information Criterion (MINIC) Method" on page 3093.

## Cointegration Related Options

Two options are related to integrated time series; one is the DFTEST option to test for a unit root and the other is the COINTTEST option to test for cointegration.

**DFTEST**

**DFTEST=(DLAG=***number***)**

**DFTEST=(DLAG=(***number***) . . . (***number***) )**

prints the Dickey-Fuller unit root tests. The DLAG=(*number*) . . . (*number*) option specifies the regular or seasonal unit root test. Supported values of *number* are in 1, 2, 4, 12. If the *number* is greater than one, a seasonal Dickey-Fuller test is performed. If the TREND= option is specified, the seasonal unit root test is not available. The default is DLAG=1.

For example, the DFTEST=(DLAG=(1)(12)) option produces two tables: the Dickey-Fuller regular unit root test and the seasonal unit root test.

Some examples of the DFTEST= option follow:

```
model y1 y2 / p=2 dftest;
model y1 y2 / p=2 dftest=(dlag=4);
model y1 y2 / p=2 dftest=(dlag=(1)(12));
model y1 y2 / p=2 dftest cointtest;
```

**COINTTEST**

**COINTTEST=(JOHANSEN <(=***options***)> SW <(=***options***)> SIGLEVEL=***number* **)**

specifies the cointegration tests.

You can specify the following options within parentheses in the COINTTEST= option:

**JOHANSEN**

**JOHANSEN=(TYPE=***value* **IORDER=***number* **NORMALIZE=***variable***)**

prints the cointegration rank test for multivariate time series based on Johansen's method. This test is provided when the number of dependent (endogenous) variables is less than or equal to 64. For more information, see the section "Vector Error Correction Modeling" on page 3119.

The VARX($p$,$s$) model can be written as the error correction model

$$\Delta \mathbf{y}_t = \Pi \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + AD_t + \sum_{i=0}^{s} \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

where $\Pi$, $\Phi_i^*$, $A$, and $\Theta_i^*$ are coefficient parameters and $D_t$ is a deterministic term such as a constant, a linear trend, or seasonal dummies.

The $I(1)$ model is defined by one reduced-rank condition. If the cointegration rank is $r < k$, then there exist $k \times r$ matrices $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ of rank $r$ such that $\Pi = \boldsymbol{\alpha}\boldsymbol{\beta}'$.

The $I(1)$ model is rewritten as the $I(2)$ model

$$\Delta^2 \mathbf{y}_t = \Pi \mathbf{y}_{t-1} - \Psi \Delta \mathbf{y}_{t-1} + \sum_{i=1}^{p-2} \Psi_i \Delta^2 \mathbf{y}_{t-i} + AD_t + \sum_{i=0}^{s} \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

where $\Psi = I_k - \sum_{i=1}^{p-1} \Phi_i^*$ and $\Psi_i = -\sum_{j=i+1}^{p-1} \Phi_i^*$.

The $I(2)$ model is defined by two reduced-rank conditions. One is that $\Pi = \boldsymbol{\alpha}\boldsymbol{\beta}'$, where $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ are $k \times r$ matrices of full-rank $r$. The other is that $\boldsymbol{\alpha}_\perp' \Psi \boldsymbol{\beta}_\perp = \boldsymbol{\xi}\boldsymbol{\eta}'$, where $\boldsymbol{\xi}$ and $\boldsymbol{\eta}$ are $(k-r) \times s$ matrices with $s \leq k - r$, and $\boldsymbol{\alpha}_\perp$ and $\boldsymbol{\beta}_\perp$ are $k \times (k-r)$ matrices of full-rank $k - r$ such that $\boldsymbol{\alpha}'\boldsymbol{\alpha}_\perp = 0$ and $\boldsymbol{\beta}'\boldsymbol{\beta}_\perp = 0$.

You can specify the following options within parentheses in the JOHANSEN= option:

**IORDER=1 | 2**
specifies the integrated order. You can specify the following values:

**1** prints the cointegration rank test for an integrated order 1 and prints the long-run parameter, $\boldsymbol{\beta}$, and the adjustment coefficient, $\boldsymbol{\alpha}$. If you specify IORDER=1, then the AR order should be greater than or equal to 1. If you specify P=0 in the MODEL statement, the value of P is set to 1 for the Johansen test.

**2** prints the cointegration rank test for integrated orders 1 and 2. If you specify IORDER=2, then the AR order should be greater than or equal to 2. If you specify P=1 and IORDER=2, then the value of IORDER is set to 1; if you specify P=0 and IORDER=2, then the value of P is set to 2.

By default, IORDER=1.

**NORMALIZE=*variable***
specifies the dependent (endogenous) *variable* whose cointegration vectors are to be normalized. If the *variable* is different from the variable specified in the COINTEG statement or in the ECM= option in the MODEL statement, then the value specified in the COINTEG statement is used. If you specify this option and you want to estimate an error correction model, then the BOUND, GARCH, INITIAL, and RESTRICT statements are all ignored and the Q= option in the MODEL statement is also ignored.

**TYPE=MAX | TRACE**
specifies the type of cointegration rank test to be printed. You can specify the following values:

**MAX** prints the cointegration maximum eigenvalue test.

**TRACE** prints the cointegration trace test.

By default, TYPE=TRACE. If the NOINT option is not specified, PROC VARMAX prints two different cointegration rank tests in the presence of the unrestricted and restricted deterministic terms (constant or linear trend) models. If you specify IORDER=2, the procedure automatically sets the TYPE=TRACE option.

The following examples illustrate the JOHANSEN= option:

```
model y1 y2 / p=2 cointtest=(johansen=(type=max normalize=y1));
```

```
model y1 y2 / p=2 cointtest=(johansen=(iorder=2 normalize=y1));
```

**SIGLEVEL=***value*

sets the size (the significance level) of the common trends tests.

The SIGLEVEL=*value* can be set to 0.1, 0.05, or 0.01. By default, SIGLEVEL=0.05.

```
model y1 y2 / p=2 cointtest=(sw siglevel=0.1);

model y1 y2 / p=2 cointtest=(sw siglevel=0.01);
```

**SW**

**SW=(TYPE=***value* **LAG=***number***)**

prints common trends tests for a multivariate time series based on the Stock-Watson method. This test is provided when the number of dependent (endogenous) variables is less than or equal to 6. For more information, see the section "Common Trends" on page 3116.

You can specify the following options within parentheses in the SW= option:

**LAG=***number*

specifies the number of lags. The default is LAG=max(1,$p$) for the TYPE=FILTDIF or TYPE=FILTRES option, where $p$ is the AR maximum order specified by the P= option. The default is LAG=$T^{1/4}$ for the TYPE=KERNEL option, where $T$ is the number of nonmissing observations. If the specified LAG=*number* exceeds the default, then it is replaced by the default.

**TYPE=FILTDIF** | **FILTRES** | **KERNEL**

specifies the type of common trends test to be printed. You can specify the following values:

| | |
|---|---|
| **FILTDIF** | prints the common trends test based on the filtering method applied to the differenced series. |
| **FILTRES** | prints the common trends test based on the filtering method applied to the residual series. |
| **KERNEL** | prints the common trends test based on the kernel method. |

By default, TYPE=FILTDIF.

The following examples illustrate the SW option:

```
model y1 y2 / p=2 cointtest=(sw);

model y1 y2 / p=2 cointtest=(sw=(type=kernel));

model y1 y2 / p=2 cointtest=(sw=(type=kernel lag=3));
```

## Bayesian VARX Estimation Options

### PRIOR

**PRIOR=(*prior-options*)**

specifies the prior value of parameters for the BVARX($p$, $s$) model. The BVARX model allows for a subset model specification. If the ECM= option or the COINTEG statement is specified with the PRIOR option, the BVECMX($p$, $s$) form is fitted. When the PRIOR option is specified, the Q= option in the MODEL statement is ignored, and the BOUND, GARCH, INITIAL, RESTRICT, and TEST statements are all ignored. For more information, see the section "Bayesian VAR and VARX Modeling" on page 3102.

The following options can be used with the PRIOR=(*prior-options*) option. The *prior-options* are listed within parentheses.

### IVAR

**IVAR=(*variables*)**

specifies an integrated BVAR($p$) model. The *variables* should be specified in the MODEL statement as dependent variables. If you use the IVAR option without *variables*, then it sets the overall prior mean of the first lag of each variable equal to one in its own equation and sets all other coefficients to zero. If *variables* are specified, it sets the prior mean of the first lag of the specified variables equal to one in its own equation and sets all other coefficients to zero. When the series $\mathbf{y}_t = (y_1, y_2)'$ follows a bivariate BVAR(2) process, the IVAR or IVAR=($y_1$ $y_2$) option is equivalent to specifying MEAN=(1 0 0 0 0 1 0 0).

If the PRIOR=(MEAN=) or ECM= option or the COINTEG statement is specified, the IVAR= option is ignored.

**LAMBDA=*value***

specifies the prior standard deviation of the AR coefficient parameter matrices. It should be a positive number. The default is LAMBDA=1. As the value of the LAMBDA= option is increased, the BVAR($p$) model becomes closer to a VAR($p$) model.

**MEAN=(*vector*)**

specifies the mean vector in the prior distribution for the AR coefficients. If the vector is not specified, the prior value is assumed to be a zero vector. For more information, see the section "Bayesian VAR and VARX Modeling" on page 3102.

You can specify the mean vector by order of the equation. Let $(\delta, \Phi_1, \ldots, \Phi_p)$ be the parameter sets to be estimated and $\Phi = (\Phi_1, \ldots, \Phi_p)$ be the AR parameter sets. The mean vector is specified by row-wise from $\Phi$; that is, the MEAN=($\mathrm{vec}(\Phi')$) option.

For the PRIOR=(mean) option in the BVAR(2),

$$\Phi = \begin{pmatrix} \phi_{1,11} & \phi_{1,12} & \phi_{2,11} & \phi_{2,12} \\ \phi_{1,21} & \phi_{1,22} & \phi_{2,21} & \phi_{2,22} \end{pmatrix} = \begin{pmatrix} 2 & 0.1 & 1 & 0 \\ 0.5 & 3 & 0 & -1 \end{pmatrix}$$

where $\phi_{l,ij}$ is an element of $\Phi$, $l$ is a lag, $i$ is associated with the first dependent variable, and $j$ is associated with the second dependent variable.

```
model y1 y2 / p=2 prior=(mean=(2 0.1 1 0 0.5 3 0 -1));
```

The deterministic terms and exogenous variables are considered to shrink toward zero; you must omit prior means of exogenous variables and deterministic terms such as a constant, seasonal dummies, or trends.

For a Bayesian error correction model estimated when both the ECM= option (or the COINTEG statement) and the PRIOR= option are used, a mean vector for only lagged AR coefficients, $\Phi_i^*$, in terms of regressors $\Delta \mathbf{y}_{t-i}$, for $i = 1, \ldots, (p-1)$ is used in the VECM($p$) representation. The diffused prior variance of $\boldsymbol{\alpha}$ is used, since $\boldsymbol{\beta}$ is replaced by $\hat{\boldsymbol{\beta}}$ estimated in a nonconstrained VECM($p$) form.

$$\Delta \mathbf{y}_t = \boldsymbol{\alpha} \mathbf{z}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + AD_t + \sum_{i=0}^{s} \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

where $\mathbf{z}_t = \boldsymbol{\beta}' \mathbf{y}_t$.

For example, in the case of a bivariate ($k = 2$) BVECM(2) form, the option

$$\text{MEAN} = (\phi_{1,11}^* \; \phi_{1,12}^* \; \phi_{1,21}^* \; \phi_{1,22}^*)$$

where $\phi_{1,ij}^*$ is the $(i, j)$ element of the matrix $\Phi_1^*$.

**NREP=***number*

determines the number of repetitions that are used to compute the measure of forecast accuracy. For more information, see the equation in the section "Forecasting of BVAR Modeling" on page 3103. The default is NREP=$0.5T$, where $T$ is the number of observations. If NREP is above $0.5T$, it is decreased to $0.5T$; if NREP is below the value of the LEAD= option, it is increased to the value of the LEAD= option.

**THETA=***value*

specifies the prior standard deviation of the AR coefficient parameter matrices. The *value* is in the interval (0,1). The default is THETA=0.1. As the value of the THETA= option approaches 1, the specified BVAR($p$) model approaches a VAR($p$) model.

Some examples of the PRIOR= option follow:

```
model y1 y2 / p=2 prior;
model y1 y2 / p=2 prior=(theta=0.2 lambda=5);
model y1 y2 = x1 / p=2 prior=(theta=0.2 lambda=5);
model y1 y2 = x1 / p=2
   prior=(theta=0.2 lambda=5 mean=(2 0.1 1 0 0.5 3 0 -1));
```

For more information, see the section "Bayesian VAR and VARX Modeling" on page 3102.

## Vector Error Correction Model Options

**ECM=(RANK=***number* **< ECTREND > < NORMALIZE=***variable* **> )**

specifies a vector error correction model.

The ECM= option is obsolete. Use the COINTEG statement instead.

You must specify the following option within parentheses in the ECM= option:

**RANK=***number*

specifies the cointegration rank of the cointegrated system. The rank of cointegration should be greater than 0 and less than the number of dependent (endogenous) variables. If *number* is different from the RANK= option specified in the COINTEG statement, the value specified in the COINTEG statement is used for the rank.

You can also specify the following options within parentheses in the ECM= option:

**ECTREND**

specifies the restriction on the drift in the VECM. This option is used in the following cases:

- There is no separate drift in the VECM, but a constant enters only through the error correction term. For example, for VECM($p$),

$$\Delta \mathbf{y}_t = \boldsymbol{\alpha}(\boldsymbol{\beta}', \boldsymbol{\beta}_0)(\mathbf{y}'_{t-1}, 1)' + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t$$

  An example of the ECTREND option follows:

```
model y1 y2 / p=2 ecm=(rank=1 ectrend);
```

- There is a separate drift and no separate linear trend in the VECM, but a linear trend enters only through the error correction term. For example, for VECM($p$),

$$\Delta \mathbf{y}_t = \boldsymbol{\alpha}(\boldsymbol{\beta}', \boldsymbol{\beta}_1)(\mathbf{y}'_{t-1}, t)' + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \boldsymbol{\delta}_0 + \boldsymbol{\epsilon}_t$$

  An example of the ECTREND option with the TREND= option follows:

```
model y1 y2 / p=2 ecm=(rank=1 ectrend) trend=linear;
```

If you specify both this option and the NSEASON option in the MODEL statement, then the NSEASON option is ignored. If you specify the NOINT option in the MODEL statement, then this option is ignored.

**NORMALIZE=***variable*

specifies a single dependent (endogenous) *variable* whose cointegrating vectors are normalized. If the *variable* is different from the variable specified in the NORMALIZE= option in the COINTEG statement, the variable specified in the NORMALIZE= option in the COINTEG statement is used. If this option is not specified, cointegrating vectors are not normalized. If you specify this option, then the BOUND, GARCH, INITIAL, and RESTRICT statements are all ignored and the Q= option in the MODEL statement is also ignored.

The following examples illustrate the ECM= option:

```
model y1 y2 / p=2 ecm=(rank=1 normalize=y1);

model y1 y2 / p=2 ecm=(rank=1 ectrend) trend=linear;
```

For more information, see the section "Vector Error Correction Modeling" on page 3119.

## NLOPTIONS Statement

**NLOPTIONS** *options* **;**

The VARMAX procedure uses the nonlinear optimization (NLO) subsystem to perform nonlinear optimization tasks. For a list of all the options in the NLOPTIONS statement, see Chapter 7, "Nonlinear Optimization Methods."

An example of the NLOPTIONS statement is as follows:

```
proc varmax data=one;
   nloptions tech=qn maxit=1000 pall;
   model y1 y2 / p=2;
run;
```

By default, the VARMAX procedure uses the dual quasi-Newton optimization method.

## OUTPUT Statement

**OUTPUT** < *options* > **;**

The OUTPUT statement generates and prints forecasts based on the model estimated in the previous MODEL statement and, optionally, creates an output SAS data set that contains these forecasts.

When the GARCH model is estimated, the upper and lower confidence limits of forecasts are calculated according to the conditional covariance of errors.

**ALPHA=***number*

sets the forecast confidence limit size, where *number* is between 0 and 1. When you specify the ALPHA=*number* option, the upper and lower confidence limits define the $100(1-\alpha)\%$ confidence interval. The default is ALPHA=0.05, which produces 95% confidence intervals.

**BACK=***number*

specifies the number of observations before the end of the data at which the multistep forecasts begin. The BACK= option value must be less than or equal to the number of observations minus the number of lagged regressors in the model. The default is BACK=0, which means that the forecasts start at the end of the available data.

**LEAD=***number*
specifies the number of multistep forecast values to compute. The default is LEAD=12.

**NOPRINT**
suppresses the printed forecast values of each dependent (endogenous) variable.

**OUT=***SAS-data-set*
writes the forecast values to an output data set. If the OUT= option is not included in the OUTPUT statement, then the output data set is named using the DATA*n* naming convention.

Some examples of the OUTPUT statements follow:

```
proc varmax data=one;
   model y1 y2 / p=2;
   output lead=6 back=2;
run;
```

```
proc varmax data=one;
   model y1 y2 / p=2;
   output out=for noprint;
run;
```

## RESTRICT Statement

**RESTRICT** *restriction, . . . , restriction* **;**

The RESTRICT statement places linear restrictions on the parameters and provides constrained estimation. Only one RESTRICT statement is allowed. If you specify more than one *restriction* in a RESTRICT statement, separate them with commas. Both equality and inequality constraints are allowed in the RESTRICT statement, although usually equality constraints are specified in the RESTRICT statement and inequality constraints are specified in the BOUND statement. If the least squares method is used, the inequality constraints are not applicable.

To use the RESTRICT statement, you need to know the form of the model. If you do not specify the GARCH statement, the COINTEG statement, or the ECM=, P=, Q=, or XLAG= option in the MODEL statement then the RESTRICT statement is not applicable. If you specify the ECM=(NORMALIZE=) option or PRIOR= option in the MODEL statement or if you specify the EXOGENEITY, H=, J=, or NORMALIZE= option in the COINTEG statement, then the RESTRICT statement is ignored. Nonlinear restrictions on parameters are not supported.

Restricted parameter estimates are computed by introducing a Lagrangian parameter for each restriction (Pringle and Rayner 1971). The Lagrangian parameter measures the sensitivity of the sum of squared errors to the restriction. The estimates of these Lagrangian parameters and their significance are printed in the Restrict ODS table.

## Matrix Expression

The RESTRICT statement operates on matrices. That is, you can specify the parameter matrices or constant matrices through the RESTRICT statement's built-in operators and functions. You can add elements of the matrices **A** and **B** with the expression **A+B**, and you can perform matrix multiplication with the expression **A*B** and elementwise multiplication with the expression **A#B**. You can get the diagonal elements of the matrix **A** through the function **DIAG(A)**, and you can get the $n \times n$ identity matrix through the function **I(n)**.

Each restriction is written as a matrix expression composed of constants, operators, and functions.

### Constants

Constants are either scalar constants (such as –1.2, 0.3, and so on) or matrix constants enclosed in braces (such as the $2 \times 2$ matrix, **{1 2, 3 4}**, or the $1 \times 3$ row vector, **{-0.2 5.3 12}**). Constants also include the dependent variable names and exogenous variable names that represent their index values and are mostly used in the subscripts or function arguments. For example, in the following PROC VARMAX statements, the dependent and exogenous variables have the following index values (based on their orders in the MODEL statement): GDP is equal to 1, CPI to 2, M2 to 3, FFR to 1, and CP to 2. Hence, the function call **AR(2, GDP, {CPI M2})** is equivalent to **AR(2,1,{2 3})**, and **XL(0, CPI, {FFR CP})** is equivalent to **XL(0,2,{1 2})**. For more information about the use of **AR** and **XL** functions to access parameters, see the section "Functions" on page 3054.

```
proc varmax data=macrodata;
   model GDP CPI M2 = FFR CP / p=12 xlag=12;
   restrict AR(2, GDP, {CPI M2}) = 0,
            XL(0, CPI, {FFR CP}) = 0;
run;
```

The matrix constant cannot be the first item in the RESTRICT statement. For example, you cannot specify the following statement:

```
restrict {-0.1 -0.2, -0.3 -0.4} <= AR <= {0.1 0.2, 0.3 0.4};
```

However, you can put the first matrix constant in parentheses and specify the preceding example in the following way:

```
restrict ({-0.1 -0.2, -0.3 -0.4}) <= AR <= {0.1 0.2, 0.3 0.4};
```

### Operators

Operators define the operations on operands. Table 43.2 lists all built-in operators supported by the RESTRICT statement.

**Table 43.2** Operators

| Operator | Name | Description |
|---|---|---|
| + | Addition | Adds corresponding matrix elements |
| = | Comparison, equal | Compares matrix elements |
| < | Comparison, less than | Compares matrix elements |
| <= | Comparison, not greater than | Compares matrix elements |
| > | Comparison, greater than | Compares matrix elements |
| >= | Comparison, not less than | Compares matrix elements |
| \|\| | Concatenation, horizontal | Concatenates matrices horizontally |

**Table 43.2** *continued*

| Operator | Name | Description |
|---|---|---|
| // | Concatenation, vertical | Concatenates matrices vertically |
| @ | Direct product | Takes the direct product of two matrices |
| : | Index creation | Creates an index vector |
| # | Multiplication, elementwise | Performs elementwise multiplication |
| * | Multiplication, matrix | Performs matrix multiplication |
| – | Sign reverse | Reverses the signs of elements |
| [ ] | Subscripts | Selects submatrices |
| – | Subtraction | Subtracts corresponding matrix elements |
| ` | Transpose | Transposes a matrix |

For more information about each operator, see the section "Details of Operators" on page 3059.

Table 43.3 shows the precedence of matrix operators in the RESTRICT statement.

**Table 43.3** Operator Precedence

| Priority Group | Operators | | |
|---|---|---|---|
| I (highest) | [ ] (subscripts) | ` (transpose) | |
| II | – (sign reverse) | | |
| III | * | # | @ |
| IV | – (subtraction) | + | |
| V | \|\| | // | : |
| VI (lowest) | = | < | <= > >= |

Each restriction can be a compound expression that involves several matrix operators and operands. The rules for evaluating compound expressions are as follows:

- Evaluation follows the order of operator precedence, as described in Table 43.3. Group I has the highest priority; that is, Group I operators are evaluated first. Group II operators are evaluated after Group I operators, and so on. For example, $1 + 2 * 3$ returns 7.
- If neighboring operators in an expression have equal precedence, the expression is evaluated from left to right, except for the Group I operators. For example, $1 - 2 - 3$ returns $-4$.
- All expressions in parentheses are evaluated first, following the two preceding rules. For example, $3 * (2 + 1)$ returns 9.

### Functions

Functions are mainly divided into two categories: one type of function refers to parameters to be estimated, such as `AR(L,I,J)` and `CCC(I,J)`; the other type does not, such as `I(n)` and `DIAG(A)`.

Functions that refer to the parameters are listed in Table 43.4. The arguments for functions can be matrices. The simplest case, scalar arguments, is discussed first. For convenience, the scalar indices `i` and `j` refer to the position of the element in the coefficient matrix, and scalar `l` refers to the lag value.

**Table 43.4** Functions That Refer to Parameters

| Function | Description |
|---|---|
| **ACH(l,i,j)** | ARCH parameter of the lag $l$ value of $\boldsymbol{\epsilon}_t \boldsymbol{\epsilon}_t'$ in a GARCH model |
| **ALPHA(i,j)** | The $(i, j)$ element in the adjustment coefficient matrix $\boldsymbol{\alpha}$ for the vector error correction model |
| **AR(l,i,j)** | Autoregressive parameter of the lag $l$ value of the $j$th dependent (endogenous) variable, $y_{j,t-l}$, to the $i$th dependent variable at time $t$, $y_{it}$ for models other than error-correction models. For error correction models, **AR(1,i,j)** is the $(i, j)$ element in $\Pi(= \boldsymbol{\alpha}\boldsymbol{\beta}')$ for $\mathbf{y}_{t-1}$, and **AR(l,i,j)**, $l > 1$, is the autoregressive parameter of the lag $(l-1)$ value of the $j$th differenced dependent (endogenous) variable, $\Delta y_{j,t-(l-1)}$, to the $i$th differenced dependent variable at time $t$, $\Delta y_{it}$. |
| **BETA(i,j)** | The $(i, j)$ element in the cointegrating matrix $\boldsymbol{\beta}$ for the vector error correction model |
| **CCC(i,j)** | Constant conditional correlation parameter between the $i$th and $j$th standardized error processes for the CCC GARCH model |
| **CONST(i)** | Intercept parameter of the $i$th time series, $y_{it}$ |
| **COV(i,j)** | Covariance of innovations parameter between the $i$th and $j$th error processes when the maximum likelihood method is used for the fitted non-GARCH model |
| **D(i)** | Long-range dependent parameter of the $i$th time series, $y_i$, when the FI option is specified. By default, the LRD parameters are restricted between –1/2 and 1/2. |
| **DCCA()** | Parameter $\alpha$ in the correlation equation for the DCC GARCH model |
| **DCCB()** | Parameter $\beta$ in the correlation equation for the DCC GARCH model |
| **DCCS(i,j)** | Unconditional correlation parameter between the $i$th and $j$th standardized error processes for the DCC GARCH model |
| **EACH(l,i,j)** | Exponential ARCH parameter of the lag $l$ value of $\boldsymbol{\epsilon}_{it}/\sigma_{it}$ in the CCC or DCC GARCH model when SUBFORM=EGARCH is specified and $i = j$. If $i \neq j$, the value is set to 0. |
| **ECCONST(i)** | The $i$th element for the constant in the error correction term for the vector error correction model when the ECTREND option in the COINTEG statement is specified |
| **ECLTREND(i)** | The $i$th element for the linear trend in the error correction term for vector error correction model when the ECTREND option in the COINTEG statement is specified |
| **GCH(l,i,j)** | GARCH parameter of the lag $l$ value of the covariance matrix, $H_t$, in a GARCH model |
| **GCHC(i,j)** | Constant parameter of the covariance matrix, $H_t$, in a GARCH model |
| **LAMBDA(i)** | Power parameter for the $i$th error process in the CCC or DCC GARCH model when SUBFORM=PGARCH is specified |
| **LTREND(i)** | Linear trend parameter of the $i$th time series, $y_{it}$, when the TREND= option is specified |
| **MA(l,i,j)** | Moving average parameter of the lag $l$ value of the $j$th error process, $\boldsymbol{\epsilon}_{j,t-l}$, to the $i$th dependent variable at time $t$, $y_{it}$ |

**Table 43.4** *continued*

| Function | Description |
|---|---|
| **PACH(l,i,j)** | Power ARCH parameter of the lag $l$ value of $\epsilon_{it}$ in the CCC or DCC GARCH model when SUBFORM=PGARCH is specified and $i = j$. If $i \neq j$, the value is set to 0. |
| **QACH(l,i,j)** | Quadratic ARCH center parameter of the lag $l$ value of $\epsilon_{it}$ in the CCC or DCC GARCH model when SUBFORM=QGARCH is specified and $i = j$. If $i \neq j$, the value is set to 0. |
| **QTREND(i)** | Quadratic trend parameter of the $i$th time series, $y_{it}$, when TREND=QUAD is specified |
| **SD(i,j)** | Same as **SDUMMY(i, j)** |
| **SDUMMY(i,j)** | The $j$th seasonal dummy of the $i$th time series at time $t$, $y_{it}$, where $j = 1, \ldots, (nseason-1)$, where *nseason* is the value of the NSEASON= option in the MODEL statement |
| **TACH(l,i,j)** | Threshold ARCH parameter of the lag $l$ value of $1_{\epsilon_{it}<0}\epsilon_{it}^2$ in the CCC or DCC GARCH model when SUBFORM=GJR is specified and $i = j$. If $i \neq j$, the value is set to 0. |
| **XL(l,i,j)** | Exogenous parameter of the lag $l$ value of the $j$th exogenous (independent) variable, $x_{j,t-l}$, to the $i$th dependent variable at time $t$, $y_{it}$ |

The functions that refer to parameters, as shown in Table 43.4, accept vector arguments and return the matrix that is constructed by the corresponding parameters. According to the number of arguments, the following list shows what matrix a function returns when the arguments are vectors:

- A function, **FUNC0**, that has zero arguments, always returns the corresponding scalar parameter. **DCCA** and **DCCB** are types of **FUNC0**.
- A function, **FUNC1**, that has one vector argument $I$, where $I = (i_1\ i_2\ \ldots\ i_{n_I})'$, returns a vector $R = (r_1\ r_2\ \ldots\ r_{n_I})'$, where $r_k =$ **FUNC1(**$i_k$**)**, $k = 1, \ldots, n_I$. **CONST**, **ECCONST**, **ECLTREND**, **LAMBDA**, **LTREND**, and **QTREND** are types of **FUNC1**.
- A function, **FUNC2**, that has two vector arguments $I$ and $J$, where $I = (i_1\ i_2\ \ldots\ i_{n_I})'$ and $J = (j_1\ j_2\ \ldots\ j_{n_J})'$, returns a matrix

$$R = \begin{pmatrix} r_{1,1} & r_{1,2} & \cdots & r_{1,n_J} \\ r_{2,1} & r_{2,2} & \cdots & r_{2,n_J} \\ \cdots & & & \\ r_{n_I,1} & r_{n_I,2} & \cdots & r_{n_I,n_J} \end{pmatrix}$$

  where $r_{k,m} =$ **FUNC2(**$i_k, j_m$**)**, $k = 1, \ldots, n_I, m = 1, \ldots, n_J$. **ALPHA**, **BETA**, **CCC**, **COV**, **DCCS**, **GCHC**, **SD**, and **SDUMMY** and types of **FUNC2**.
- A function, **FUNC3**, that has three vector arguments $L$, $I$, and $J$, where $L = (l_1\ l_2\ \ldots\ l_{n_L})'$, $I = (i_1\ i_2\ \ldots\ i_{n_I})'$, and $J = (j_1\ j_2\ \ldots\ j_{n_J})'$, returns a matrix

$$R = \begin{pmatrix} r_{1,1} & r_{1,2} & \cdots & r_{1,n_L n_J} \\ r_{2,1} & r_{2,2} & \cdots & r_{2,n_L n_J} \\ \cdots & & & \\ r_{n_I,1} & r_{n_I,2} & \cdots & r_{n_I,n_L n_J} \end{pmatrix}$$

where $r_{k,m} =$ **FUNC3(**$l_m, i_k, j_m$**)**, $k = 1, \ldots, n_I, m = 1, \ldots, n_L n_J$, and $l_m$ and $j_m$ are the quotient and remainder of $m$ divided by $n_J$, respectively. **ACH**, **AR**, **EACH**, **GCH**, **MA**, **PACH**, **QACH**, **TACH**, and **XL** are types of **FUNC3**.

The functions that refer to parameters can accept empty arguments or omit any number of last arguments. The empty or omitted arguments are replaced with all possible values for those arguments. For example, PROC VARMAX is used to fit a bivariate ($k$=2) VARX(1,1) model with three exogenous variables as follows:

```
model y1 y2 = x1 x2 x3 / p=1 xlag=3;
```

In order to restrict the third exogenous variable from having an effect on the first dependent variable, and to restrict the first exogenous variable from having an effect on the second dependent variable, you can use the following statement:

```
restrict XL({0 1 2 3}, 1, 3) = 0,
         XL({0 1 2 3}, 2, 1) = 0;
```

Taking advantage of empty arguments, you can specify the preceding example as follows:

```
restrict XL( , 1, 3) = 0,
         XL( , 2, 1) = 0;
```

To get all coefficients of the first lag exogenous variables on dependent variables, you can use **XL(1, {1 2}, {1 2 3})** or **XL(1, , )** or **XL(1)**. To get all coefficients of exogenous variables on dependent variables, you can use **XL({0 1 2 3}, {1 2}, {1 2 3})**, or **XL( , , )** or **XL()** or even just **XL**.

Another type of function does not refer to parameters but generates useful matrices. Table 43.5 lists all built-in functions supported by the RESTRICT statement.

**Table 43.5** Functions Not Referring to Parameters

| Function | Description |
|---|---|
| **DIAG(A)** | Creates a diagonal matrix from a vector or extracts the diagonal elements of a matrix |
| **I(n)** | Creates an $n \times n$ identity matrix |
| **J(m,n,elem)** | Creates an $m \times n$ matrix with all elements equal to **elem** |
| **SHAPE(A,m,n)** | Creates a $m \times n$ matrix with elements of matrix **A** |

For more information about each function in Table 43.5, see the section "Details of Functions" on page 3063.

## Examples

The following examples show how to use the RESTRICT statement.

This example shows a bivariate ($k$=2) VAR(2) model:

```
proc varmax data=one;
   model y1 y2 / p=2;
   restrict AR(1,1,2)=0, AR(2,1,2)=0.3;
run;
```

The `AR(1,1,2)` and `AR(2,1,2)` parameters are fixed as `AR(1,1,2)=0` and `AR(2,1,2)=0.3`, respectively, and other parameters are to be estimated.

The following example shows a bivariate ($k$=2) VAR(1) model, estimated using the ML method:

```
proc varmax data=two;
   model y1 y2 = / p=1 method=ml;
   restrict cov(1,1)=cov(2,2), cov(1,2)=0;
run;
```

The `COV(1,1)` and `COV(2,2)` parameters are equal, and the correlation between the two series is fixed at 0. You can also express the preceding restrictions in matrix expressions as follows. This approach is very convenient when the number of dependent variables is large:

```
proc varmax data=two;
   model y1 y2 = / p=1 method=ml;
   restrict cov = cov(1,1)*I(2);
run;
```

When restricting a linear combination of parameters to be 0, you can omit the equal sign. For example, the following two RESTRICT statements are equivalent:

```
restrict AR(1)[1,1]-AR(1)[2,2], 2*MA(1)[1,2]-MA(1)[2,1];

restrict AR(1)[1,1]-AR(1)[2,2] = 0, 2*MA(1)[1,2]-MA(1)[2,1] = 0;
```

The following RESTRICT statement constrains four parameter estimates to be equal:

```
restrict AR(1)[1,1] = AR(1)[1,2],
         AR(1)[1,2] = AR(1)[2,1],
         AR(1)[2,1] = AR(1)[2,2];
```

This restriction can be abbreviated as follows:

```
restrict AR(1)[1,1] = AR(1)[1,2] = AR(1)[2,1] = AR(1)[2,2];
```

Or, in matrix expressions,

```
restrict AR(1,1:2,1:2) = J(2,2,AR(1,1,1));
```

The VARMA representation $A(L)y_t = \Theta(L)\varepsilon_t$, where $A(L) = I_k - A_1L - \cdots - A_pL^p$ and $\Theta(L) = I_k - \Theta_1L - \cdots - \Theta_qL^q$, is said to be in final equation form if $A(L) = a(L)I_k$, where $a(L) = 1 - a_1L - \cdots - a_pL^p$ is a scalar operator with $a_p \neq 0$. If $p$ and $k$ are large, it would be difficult and inconvenient to restrict AR parameters element by element in standard form to estimate the VARMA model in final equation form. However, when you use matrix expressions, the restrictions become very simple, as shown in the following statement for a trivariate ($k = 3$) VARMA($p$, $q$) model, where $p$ might be any positive integer:

```
restrict AR = AR(,1,1) @ I(3);
```

For the vector error correction models, the **AR(1,.,.)** parameters (that is, $\Pi$) are not supported in the RESTRICT statement, because **AR(1)** is in fact the product of the estimated parameters $\boldsymbol{\alpha}$ and the transpose of $\boldsymbol{\beta}$. Any linear constraints on **AR(1)** should be regarded as nonlinear constraints on the estimated parameters. For the same reason, the **CONST(.)** or **LTREND(.)** functions are not supported in the RESTRICT statement if the ECTREND option in the COINTEG statement is specified. For example, the following statements are supported:

```
model y1-y4 / p=2;
cointeg rank=1 ectrend;
restrict ALPHA + BETA = 1.0,
         ECCONST;
```

However, neither of the following sets of statements is supported:

```
model y1-y4 / p=2;
cointeg rank=1 ectrend;
restrict AR(1,1,1) = 0;
```

```
model y1-y4 / p=2;
cointeg rank=1 ectrend;
restrict CONST(2) = 0.2;
```

## Details of Operators

This section describes all operators that are available in the RESTRICT statement. Each subsection shows how the operator is used, followed by a description of the operator.

### *Addition Operator: +*

```
matrix1 + matrix2

matrix + scalar

matrix + vector
```

The addition operator (+) computes a new matrix whose elements are the sums of the corresponding elements of **matrix1** and **matrix2**. If **matrix1** and **matrix2** are both $n \times p$ matrices, then the addition operator adds the element in the $i$th row and $j$th column of the first matrix to the element in the $i$th row and $j$th column of the second matrix, for $i = 1, \ldots, n$, $j = 1, \ldots, p$. For example, **{1 2 3, 4 5 6} + {7 8 9, 10 11 12}** results in **{8 10 12, 14 16 18}**.

You can also use the addition operator as follows to conveniently add a value to each element of a matrix, to each column of a matrix, or to each row of a matrix:

- When you use the **matrix + scalar** form, the scalar value is added to each element of the matrix.
- When you use the **matrix + vector** form, the vector is added to each row or column of the $n \times p$ matrix.
  - If you add an $n \times 1$ column vector, each row of the vector is added to each row of the matrix.
  - If you add a $1 \times p$ row vector, each column of the vector is added to each column of the matrix.

For example, you can obtain `{2 3 4, 5 6 7}` from `{1 2 3, 4 5 6} + 1` or `{1 2 3, 4 5 6} + {1 1 1}` or `{1 2 3, 4 5 6} + {1, 1}`.

### Comparison Operators: =, <, <=, >, >=

```
matrix1 = matrix2

matrix1 < matrix2

matrix1 <= matrix2

matrix1 > matrix2

matrix1 >= matrix2
```

The comparison operators (=, <, <=, >, >=) compare two matrices element by element and return a list of equivalent restrictions on only scalar constants and parameters.

For example, the RESTRICT statement with matrix expressions

```
restrict AR(1,{1,2},{1,2}) = MA(2,{3,4},{3,4});
```

is transformed into the following equivalent RESTRICT statement with scalar parameters:

```
restrict AR(1,1,1) = MA(2,3,3),
         AR(1,1,2) = MA(2,3,4),
         AR(1,2,1) = MA(2,4,3),
         AR(1,2,2) = MA(2,4,4);
```

You can also use the comparison operators to conveniently compare all elements of a matrix with a scalar:

- If either argument is a scalar, then the VARMAX procedure performs an elementwise comparison between each element of the matrix and the scalar.

You can also compare an $n \times p$ matrix with a row or column vector:

- If the comparison is with an $n \times 1$ column vector, the VARMAX procedure compares each row of the vector to each row of the matrix.
- If the comparison is with a $1 \times p$ row vector, the VARMAX procedure compares each column of the vector to each column of the matrix.

For example, the following statements are equivalent:

```
restrict AR(1,1:2,1:3) >= 0.2;

restrict AR(1,1:2,1:3) >= {0.2, 0.2};

restrict AR(1,1:2,1:3) >= {0.2 0.2 0.2};
```

### Concatenation Operator, Horizontal: ||

```
matrix1 || matrix2
```

The horizontal concatenation operator (||) produces a new matrix by horizontally joining **matrix1** and **matrix2**. The matrices must have the same number of rows, which is also the number of rows in the new

matrix. The number of columns in the new matrix is the number of columns in **matrix1** plus the number of columns in **matrix2**.

For example, `{1 1 1, 7 7 7} || {0 0 0, 8 8 8}` returns `{1 1 1 0 0 0, 7 7 7 8 8 8}`.

### *Concatenation Operator, Vertical: //*

**matrix1 // matrix2**

The vertical concatenation operator (//) produces a new matrix by vertically joining **matrix1** and **matrix2**. The matrices must have the same number of columns, which is also the number of columns in the new matrix. The number of rows in the new matrix is the number of rows in **matrix1** plus the number of rows in **matrix2**.

For example, `{1 1 1} // {0 0 0, 8 8 8}` returns `{1 1 1, 0 0 0, 8 8 8}`.

### *Direct Product Operator: @*

**matrix1 @ matrix2**

The direct product operator (@) computes a new matrix that is the direct product (also called the *Kronecker product*) of **matrix1** and **matrix2**. For matrices $\mathbf{A}$ and $\mathbf{B}$, the direct product is denoted by $\mathbf{A} \otimes \mathbf{B}$. The number of rows in the new matrix equals the product of the number of rows in **matrix1** and the number of rows in **matrix2**; the number of columns in the new matrix equals the product of the number of columns in **matrix1** and the number of columns in **matrix2**.

Specifically, if $\mathbf{A}$ is an $n \times p$ matrix and $\mathbf{B}$ is a $m \times q$ matrix, then the Kronecker product $\mathbf{A} \otimes \mathbf{B}$ is the following $nm \times pq$ block matrix:

$$\mathbf{A} \otimes \mathbf{B} = \begin{bmatrix} A_{11}B & \cdots & A_{1p}B \\ \vdots & \ddots & \vdots \\ A_{n1}B & \cdots & A_{np}B \end{bmatrix}$$

For example, `{1 2, 3 4} @ {0 2}` returns `{0 2 0 4, 0 6 0 8}`, and `{0 2} @ {1 2, 3 4}` returns `{0 0 2 4, 0 0 6 8}`. Note that the direct product of two matrices is not commutative.

### *Index Creation Operator: :*

**value1 : value2**

The index creation operator (:) creates a column vector whose first element is **value1**, whose second element is **value1**+1, and so on, until the last element, which is less than or equal to **value2**.

For example, `3 : 6` returns `{3 4 5 6}`.

If **value1** is greater than **value2**, a reverse-order index is created. For example, `6 : 3` returns `{6 5 4 3}`.

Neither **value1** nor **value2** is required to be an integer.

### *Multiplication Operator, Elementwise: #*

**matrix1 # matrix2**

**matrix # scalar**

**matrix # vector**

The elementwise multiplication operator (#) computes a new matrix whose elements are the products of the corresponding elements of **matrix1** and **matrix2**.

For example, `{1 2, 3 4} # {4 8, 0 5}` returns `{4 16, 0 20}`.

In addition to multiplying matrices that have the same dimensions, you can use the elementwise multiplication operator to multiply a matrix and a scalar:

- When either argument is a scalar, each element in **matrix** is multiplied by the scalar value.

When you use the **matrix** # **vector** form, each row or column of the $n \times p$ matrix is multiplied by a corresponding element of the vector:

- If you multiply by an $n \times 1$ column vector, each row of the matrix is multiplied by the corresponding row of the vector.
- If you multiply by a $1 \times p$ row vector, each column of the matrix is multiplied by the corresponding column of the vector.

For example, a $2 \times 3$ matrix can be multiplied on either side by a $2 \times 3$, $1 \times 3$, $2 \times 1$, or $1 \times 1$ scalar.

The product of elementwise multiplication is also known as the Schur or Hadamard product. Elementwise multiplication (which uses the # operator) should not be confused with matrix multiplication (which uses the * operator).

### *Multiplication Operator, Matrix: **

```
matrix1 * matrix2
```

The matrix multiplication operator (*) computes a new matrix by performing matrix multiplication. The first matrix must have the same number of columns as the second matrix has rows. The new matrix has the same number of rows as the first matrix and the same number of columns as the second matrix. That is, if $\boldsymbol{A}$ is an $n \times p$ matrix and $\boldsymbol{B}$ is a $p \times m$ matrix, then the product $A * B$ is an $n \times m$ matrix. The $(i, j)$ element of the product is the sum $\sum_{k=1}^{p} A_{ik} B_{kj}$.

For example, `{1 2, 3 4} * {1, 2}` returns `{5, 11}`.

### *Sign Reversal Operator: –*

```
- matrix
```

The sign reversal operator (−) computes a new matrix whose elements are formed by reversing the sign of each element in **matrix**. The sign reversal operator is also called the *unary minus* operator.

For example, `-{-1 7 6, 2 0 -8}` returns `{1 -7 -6, -2 0 8}`.

### *Subscripts: [ ]*

```
matrix[rows, columns]

matrix[elements]
```

Subscripts are used with matrices to select submatrices, where **rows**, **columns**, and **elements** are expressions that evaluate to scalars or vectors. If these expressions are numeric, they must contain valid subscript values of rows and columns, or the indices, in the argument matrix.

For example, `{1 2 3, 4 5 6, 7 8 9}[2,3]` returns `6`, `{1 2 3, 4 5 6, 7 8 9}[2,1:3]` returns `{4 5 6}`, and `{1 2 3, 4 5 6, 7 8 9}[,3]` returns `{3, 6, 9}`. Because the VARMAX procedure stores matrices in row-major order, `{11 22 33, 44 55 66, 77 88 99}[{3 5 9}]` returns `{33, 55, 99}`.

#### Subtraction Operator: –

```
matrix1 - matrix2

matrix - scalar

matrix - vector
```

The subtraction operator (−) computes a new matrix whose elements are formed by subtracting the corresponding elements of **matrix2** from those of **matrix1**.

In addition to subtracting conformable matrices, you can also use the subtraction operator to subtract a scalar from a matrix or subtract a vector from a matrix:

- When either argument is a scalar, the VARMAX procedure performs the subtraction between the scalar and each element of the matrix argument. For example, when you use the **matrix - scalar** form, the scalar value is subtracted from each element of the matrix.
- When you use the **matrix - vector** form, the vector is subtracted from each row or column of the $n \times p$ matrix.
  - If you subtract an $n \times 1$ column vector, each row of the vector is subtracted from each row of the matrix.
  - If you subtract a $1 \times p$ row vector, each column of the vector is subtracted from each column of the matrix.

For example, `{1 2 3, 4 5 6} - {1 1 1, 1 1 1}` returns `{0 1 2, 3 4 5}`. The same results can be obtained by `{1 2 3, 4 5 6} - 1` or `{1 2 3, 4 5 6} - {1 1 1}` or `{1 2 3, 4 5 6} - {1, 1}`.

#### Transpose Operator: `

```
matrix`
```

The transpose operator, denoted by the backquote character (`), exchanges the rows and columns of **matrix**, producing the transpose of **matrix**. If $v$ is the value in the $i$th row and $j$th column of **matrix**, then the transpose of **matrix** contains $v$ in the $j$th row and $i$th column. If **matrix** contains $n$ rows and $p$ columns, the transpose has $p$ rows and $n$ columns.

For example, `{1 2, 3 4, 5 6}`` returns `{1 3 5, 2 4 6}`.

## Details of Functions

#### DIAG Function

```
DIAG(matrix)
```

The **DIAG** function creates a diagonal matrix from a vector or extracts the diagonal elements of a matrix. The **matrix** argument can be either a square matrix or a vector.

If **matrix** is a vector, the **DIAG** function creates a matrix whose diagonal elements are the values in the vector. All off-diagonal elements are zeros.

If **matrix** is a square matrix, the **DIAG** function creates a vector from the diagonal elements of the matrix.

For example, **DIAG({1 2 3, 4 5 6, 7 8 9})** returns **{1, 5, 9}**. Also, **DIAG({1 5 9})** or **DIAG({1, 5, 9})** or **DIAG(DIAG({1 2 3, 4 5 6, 7 8 9}))** returns **{1 0 0, 0 5 0, 0 0 9}**.

### I Function

**I(dim)**

The **I** function creates an identity matrix that contains **dim** rows and columns. The diagonal elements of an identity matrix are ones; all other elements are zeros. The value of **dim** must be an integer greater than or equal to 1. Noninteger operands are rounded to the nearest integer.

For example, **I(3)** returns **{1 0 0, 0 1 0, 0 0 1}**.

### J Function

**J(nrow, ncol, value)**

The **J** function creates a matrix that contains **nrow** rows and **ncol** columns, in which all elements are equal to **value**.

The arguments **nrow** and **ncol** are both integers; **value** can be any expression that returns a linear combination of scalar constants and parameters.

For example, **J(2, 3, 1)** returns **{1 1 1, 1 1 1}**. **J(2, 3, 5+2*AR(1,1,1))** returns the same result as **J(2, 3, 1) * (5+2*AR(1,1,1))**.

### SHAPE Function

**SHAPE(matrix, nrow, ncol)**

The **SHAPE** function creates a new matrix from data in **matrix**. The values **nrow** and **ncol** specify the number of rows and columns, respectively, in the new matrix. The **SHAPE** function produces the result matrix by traversing the argument matrix in row-major order until it reaches the specified number of elements. If necessary, the SHAPE function reuses elements.

For example, **SHAPE({1 2 3, 4 5 6}, 3, 2)** returns **{1 2, 3 4, 5 6}**; **SHAPE({1 2 3, 4 5 6}, 5, 2)** returns **{1 2, 3 4, 5 6, 1 2, 3 4}**; and **SHAPE({1 2 3, 4 5 6}, 1, 4)** returns **{1 2 3 4}**.

## TEST Statement

**TEST** *restriction, . . . , restriction* **;**

The TEST statement performs the Wald test for the joint linear hypothesis that is specified in the statement. Each restriction specifies a linear hypothesis to be tested. If you specify more than one *restriction*, separate them with commas. Specify the *restrictions* in the same manner as in the RESTRICT statement. For information about how to define restriction by using matrix expressions, operators, and functions, see the section "RESTRICT Statement" on page 3052. You can specify any number of TEST statements.

To use the TEST statement, you need to know the form of the model. If you do not specify the GARCH statement, the COINTEG statement, or the ECM=, P=, Q=, or XLAG= option in the MODEL statement, then the TEST statement is not applicable. Nonlinear restrictions on parameters are not supported.

For information about the Wald test, see the section "Granger Causality Test" on page 3098.

The following is an example of the TEST statement for a bivariate ($k$=2) VAR(2) model:

```
proc varmax data=one;
   model y1 y2 / p=2;
   test AR(1,1,2) = 0, AR(2,1,2) = 0;
run;
```

After estimating the parameters, the TEST statement tests the null hypothesis that **AR(1,1,2)=0** and **AR(2,1,2)=0**. Like the RESTRICT statement, the preceding TEST statement can be abbreviated as follows:

```
test AR(1,1,2) = AR(2,1,2) = 0;
```

or

```
test AR(1,1,2), AR(2,1,2);
```

Note that the following statements are different from the preceding statement:

```
test AR(1,1,2);
test AR(2,1,2);
```

These two TEST statements are to test two null hypotheses separately: one is **AR(1,1,2)=0**, and the other is **AR(2,1,2)=0**.

For the vector error correction models, you can test the hypothesis on the **AR(1,.,.)** parameters (that is, $\Pi$) by using the TEST statement, because asymptotically these parameters follow a normal distribution and the Wald test can be applied. For the same reason, you can use the **CONST(.)** or **LTREND(.)** function in the TEST statement if the ECTREND option in the COINTEG statement is specified. However, the **BETA(.,.)**, **ECCONST(.)**, and **ECLTREND(.)** functions are not supported in the TEST statement. For example, the following statements are supported:

```
model y1-y4 / p=2;
cointeg rank=1 ectrend;
test AR(1,1,1);
test CONST(2);
```

However, the following statements are not supported:

```
model y1-y4 / p=2;
cointeg rank=1 ectrend;
test BETA(1,1) = BETA(2,1) = 0;
```

or

```
model y1-y4 / p=2;
cointeg rank=1 ectrend;
test ECCONST(1) = 0.2;
```

# Details: VARMAX Procedure

## Missing Values

The VARMAX procedure currently does not support missing values. PROC VARMAX uses the first contiguous group of observations that have no missing values for any of the MODEL statement variables. Observations at the beginning of the data set that have missing values for any MODEL statement variables are not used or included in the output data set. At the end of the data set, observations can have dependent (endogenous) variables with missing values and independent (exogenous) variables with nonmissing values.

## VARMAX Model

The vector autoregressive moving-average model with exogenous variables is called the VARMAX($p$,$q$,$s$) model. The form of the model can be written as

$$\mathbf{y}_t = \sum_{i=1}^{p} \Phi_i \mathbf{y}_{t-i} + \sum_{i=0}^{s} \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t - \sum_{i=1}^{q} \Theta_i \boldsymbol{\epsilon}_{t-i}$$

where the output variables of interest, $\mathbf{y}_t = (y_{1t}, \ldots, y_{kt})'$, can be influenced by other input variables, $\mathbf{x}_t = (x_{1t}, \ldots, x_{rt})'$, which are determined outside of the system of interest. The variables $\mathbf{y}_t$ are referred to as dependent, response, or endogenous variables, and the variables $\mathbf{x}_t$ are referred to as independent, input, predictor, regressor, or exogenous variables. The unobserved noise variables, $\boldsymbol{\epsilon}_t = (\epsilon_{1t}, \ldots, \epsilon_{kt})'$, are a vector white noise process.

The VARMAX($p$,$q$,$s$) model can be written

$$\Phi(B)\mathbf{y}_t = \Theta^*(B)\mathbf{x}_t + \Theta(B)\boldsymbol{\epsilon}_t$$

where

$$\begin{aligned} \Phi(B) &= I_k - \Phi_1 B - \cdots - \Phi_p B^p \\ \Theta^*(B) &= \Theta_0^* + \Theta_1^* B + \cdots + \Theta_s^* B^s \\ \Theta(B) &= I_k - \Theta_1 B - \cdots - \Theta_q B^q \end{aligned}$$

are matrix polynomials in $B$ in the backshift operator, such that $B^i \mathbf{y}_t = \mathbf{y}_{t-i}$, the $\Phi_i$ and $\Theta_i$ are $k \times k$ matrices, and the $\Theta_i^*$ are $k \times r$ matrices.

The following assumptions are made:

- $\mathrm{E}(\boldsymbol{\epsilon}_t) = 0$, $\mathrm{E}(\boldsymbol{\epsilon}_t \boldsymbol{\epsilon}_t') = \Sigma$, which is positive-definite, and $\mathrm{E}(\boldsymbol{\epsilon}_t \boldsymbol{\epsilon}_s') = 0$ for $t \neq s$.
- For stationarity and invertibility of the VARMAX process, the roots of $|\Phi(z)| = 0$ and $|\Theta(z)| = 0$ are outside the unit circle.

- The exogenous (independent) variables $\mathbf{x}_t$ are not correlated with residuals $\boldsymbol{\epsilon}_t$, $\mathrm{E}(\mathbf{x}_t\boldsymbol{\epsilon}_t') = 0$. The exogenous variables can be stochastic or nonstochastic. When the exogenous variables are stochastic and their future values are unknown, forecasts of these future values are needed to forecast the future values of the endogenous (dependent) variables. On occasion, future values of the exogenous variables can be assumed to be known because they are deterministic variables. The VARMAX procedure assumes that the exogenous variables are nonstochastic if future values are available in the input data set. Otherwise, the exogenous variables are assumed to be stochastic and their future values are forecasted by assuming that they follow the VARMA($p$,$q$) model, prior to forecasting the endogenous variables, where $p$ and $q$ are the same as in the VARMAX($p$,$q$,$s$) model.

## State Space Representation

Another representation of the VARMAX($p$,$q$,$s$) model is in the form of a state variable or a state space model, which consists of a state equation

$$\mathbf{z}_t = F\mathbf{z}_{t-1} + K\mathbf{x}_t + G\boldsymbol{\epsilon}_t$$

and an observation equation

$$\mathbf{y}_t = H\mathbf{z}_t$$

where

$$\mathbf{z}_t = \begin{bmatrix} \mathbf{y}_t \\ \vdots \\ \mathbf{y}_{t-p+1} \\ \mathbf{x}_t \\ \vdots \\ \mathbf{x}_{t-s+1} \\ \boldsymbol{\epsilon}_t \\ \vdots \\ \boldsymbol{\epsilon}_{t-q+1} \end{bmatrix}, \quad K = \begin{bmatrix} \Theta_0^* \\ 0_{k\times r} \\ \vdots \\ 0_{k\times r} \\ I_r \\ 0_{r\times r} \\ \vdots \\ 0_{r\times r} \\ 0_{k\times r} \\ \vdots \\ 0_{k\times r} \end{bmatrix}, \quad G = \begin{bmatrix} I_k \\ 0_{k\times k} \\ \vdots \\ 0_{k\times k} \\ 0_{r\times k} \\ \vdots \\ 0_{r\times k} \\ I_{k\times k} \\ 0_{k\times k} \\ \vdots \\ 0_{k\times k} \end{bmatrix}$$

$$F = \begin{bmatrix} \Phi_1 & \cdots & \Phi_{p-1} & \Phi_p & \Theta_1^* & \cdots & \Theta_{s-1}^* & \Theta_s^* & -\Theta_1 & \cdots & -\Theta_{q-1} & -\Theta_q \\ I_k & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & \cdots & I_k & 0 & 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 \\ 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 \\ 0 & \cdots & 0 & 0 & I_r & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & \cdots & 0 & 0 & 0 & \cdots & I_r & 0 & 0 & \cdots & 0 & 0 \\ 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 \\ 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 & I_k & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 & 0 & \cdots & I_k & 0 \end{bmatrix}$$

and

$$H = [I_k, 0_{k\times k}, \ldots, 0_{k\times k}, 0_{k\times r}, \ldots, 0_{k\times r}, 0_{k\times k}, \ldots, 0_{k\times k}]$$

On the other hand, it is assumed that $\mathbf{x}_t$ follows a VARMA($p$,$q$) model

$$\mathbf{x}_t = \sum_{i=1}^{p} A_i \mathbf{x}_{t-i} + \mathbf{a}_t - \sum_{i=1}^{q} C_i \mathbf{a}_{t-i}$$

The model can also be expressed as

$$A(B)\mathbf{x}_t = C(B)\mathbf{a}_t$$

where $A(B) = I_r - A_1 B - \cdots - A_p B^p$ and $C(B) = I_r - C_1 B - \cdots - C_q B^q$ are matrix polynomials in $B$, and the $A_i$ and $C_i$ are $r \times r$ matrices. Without loss of generality, the AR and MA orders can be taken to be the same as the VARMAX($p$,$q$,$s$) model, and $\mathbf{a}_t$ and $\boldsymbol{\epsilon}_t$ are independent white noise processes.

Under suitable conditions such as stationarity, $\mathbf{x}_t$ is represented by an infinite order moving-average process

$$\mathbf{x}_t = A(B)^{-1}C(B)\mathbf{a}_t = \Psi^x(B)\mathbf{a}_t = \sum_{j=0}^{\infty} \Psi_j^x \mathbf{a}_{t-j}$$

where $\Psi^x(B) = A(B)^{-1}C(B) = \sum_{j=0}^{\infty} \Psi_j^x B^j$.

The optimal minimum mean squared error (minimum MSE) $i$-step-ahead forecast of $\mathbf{x}_{t+i}$ is

$$\begin{aligned} \mathbf{x}_{t+i|t} &= \sum_{j=i}^{\infty} \Psi_j^x \mathbf{a}_{t+i-j} \\ \mathbf{x}_{t+i|t+1} &= \mathbf{x}_{t+i|t} + \Psi_{i-1}^x \mathbf{a}_{t+1} \end{aligned}$$

For $i > q$,

$$\mathbf{x}_{t+i|t} = \sum_{j=1}^{p} A_j \mathbf{x}_{t+i-j|t}$$

The VARMAX($p$,$q$,$s$) model has an absolutely convergent representation as

$$\begin{aligned} \mathbf{y}_t &= \Phi(B)^{-1}\Theta^*(B)\mathbf{x}_t + \Phi(B)^{-1}\Theta(B)\boldsymbol{\epsilon}_t \\ &= \Psi^*(B)\Psi^x(B)\mathbf{a}_t + \Phi(B)^{-1}\Theta(B)\boldsymbol{\epsilon}_t \\ &= V(B)\mathbf{a}_t + \Psi(B)\boldsymbol{\epsilon}_t \end{aligned}$$

or

$$\mathbf{y}_t = \sum_{j=0}^{\infty} V_j \mathbf{a}_{t-j} + \sum_{j=0}^{\infty} \Psi_j \boldsymbol{\epsilon}_{t-j}$$

where $\Psi(B) = \Phi(B)^{-1}\Theta(B) = \sum_{j=0}^{\infty} \Psi_j B^j$, $\Psi^*(B) = \Phi(B)^{-1}\Theta^*(B)$, and $V(B) = \Psi^*(B)\Psi^x(B) = \sum_{j=0}^{\infty} V_j B^j$.

The optimal (minimum MSE) $i$-step-ahead forecast of $\mathbf{y}_{t+i}$ is

$$\begin{aligned}\mathbf{y}_{t+i|t} &= \sum_{j=i}^{\infty} V_j \mathbf{a}_{t+i-j} + \sum_{j=i}^{\infty} \Psi_j \boldsymbol{\epsilon}_{t+i-j} \\ \mathbf{y}_{t+i|t+1} &= \mathbf{y}_{t+i|t} + V_{i-1}\mathbf{a}_{t+1} + \Psi_{i-1}\boldsymbol{\epsilon}_{t+1}\end{aligned}$$

for $i = 1, \ldots, v$ with $v = \max(p, q+1)$. For $i > q$,

$$\begin{aligned}\mathbf{y}_{t+i|t} &= \sum_{j=1}^{p} \Phi_j \mathbf{y}_{t+i-j|t} + \sum_{j=0}^{s} \Theta_j^* \mathbf{x}_{t+i-j|t} \\ &= \sum_{j=1}^{p} \Phi_j \mathbf{y}_{t+i-j|t} + \Theta_0^* \mathbf{x}_{t+i|t} + \sum_{j=1}^{s} \Theta_j^* \mathbf{x}_{t+i-j|t} \\ &= \sum_{j=1}^{p} \Phi_j \mathbf{y}_{t+i-j|t} + \Theta_0^* \sum_{j=1}^{p} A_j \mathbf{x}_{t+i-j|t} + \sum_{j=1}^{s} \Theta_j^* \mathbf{x}_{t+i-j|t} \\ &= \sum_{j=1}^{p} \Phi_j \mathbf{y}_{t+i-j|t} + \sum_{j=1}^{u} (\Theta_0^* A_j + \Theta_j^*) \mathbf{x}_{t+i-j|t}\end{aligned}$$

where $u = \max(p, s)$.

Define $\Pi_j = \Theta_0^* A_j + \Theta_j^*$. For $i = v > q$ with $v = \max(p, q+1)$, you obtain

$$\begin{aligned}\mathbf{y}_{t+v|t} &= \sum_{j=1}^{p} \Phi_j \mathbf{y}_{t+v-j|t} + \sum_{j=1}^{u} \Pi_j \mathbf{x}_{t+v-j|t} \quad \text{for } u \le v \\ \mathbf{y}_{t+v|t} &= \sum_{j=1}^{p} \Phi_j \mathbf{y}_{t+v-j|t} + \sum_{j=1}^{r} \Pi_j \mathbf{x}_{t+v-j|t} \quad \text{for } u > v\end{aligned}$$

From the preceding relations, a state equation is

$$\mathbf{z}_{t+1} = F\mathbf{z}_t + K\mathbf{x}_t^* + G\mathbf{e}_{t+1}$$

and an observation equation is

$$\mathbf{y}_t = H\mathbf{z}_t$$

where

$$\mathbf{z}_t = \begin{bmatrix} \mathbf{y}_t \\ \mathbf{y}_{t+1|t} \\ \vdots \\ \mathbf{y}_{t+v-1|t} \\ \mathbf{x}_t \\ \mathbf{x}_{t+1|t} \\ \vdots \\ \mathbf{x}_{t+v-1|t} \end{bmatrix}, \quad \mathbf{x}_t^* = \begin{bmatrix} \mathbf{x}_{t+v-u} \\ \mathbf{x}_{t+v-u+1} \\ \vdots \\ \mathbf{x}_{t-1} \end{bmatrix}, \quad \mathbf{e}_{t+1} = \begin{bmatrix} \mathbf{a}_{t+1} \\ \boldsymbol{\epsilon}_{t+1} \end{bmatrix}$$

$$F = \begin{bmatrix} 0 & I_k & 0 & \cdots & 0 & 0 & 0 & 0 & \cdots & 0 \\ 0 & 0 & I_k & \cdots & 0 & 0 & 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ \Phi_v & \Phi_{v-1} & \Phi_{v-2} & \cdots & \Phi_1 & \Pi_v & \Pi_{v-1} & \Pi_{v-2} & \cdots & \Pi_1 \\ 0 & 0 & 0 & \cdots & 0 & 0 & I_r & 0 & \cdots & 0 \\ 0 & 0 & 0 & \cdots & 0 & 0 & 0 & I_r & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & 0 & A_v & A_{v-1} & A_{v-2} & \cdots & A_1 \end{bmatrix}$$

$$K = \begin{bmatrix} 0 & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ \Pi_u & \Pi_{u-1} & \cdots & \Pi_{v+1} \\ 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 0 \end{bmatrix}, \quad G = \begin{bmatrix} V_0 & I_k \\ V_1 & \Psi_1 \\ \vdots & \vdots \\ V_{v-1} & \Psi_{v-1} \\ I_r & 0_{r\times k} \\ \Psi_1^x & 0_{r\times k} \\ \vdots & \vdots \\ \Psi_{v-1}^x & 0_{r\times k} \end{bmatrix}$$

and

$$H = [I_k, 0_{k\times k}, \ldots, 0_{k\times k}, 0_{k\times r}, \ldots, 0_{k\times r}]$$

Note that the matrix $K$ and the input vector $\mathbf{x}_t^*$ are defined only when $u > v$.

## Dynamic Simultaneous Equations Modeling

In the econometrics literature, the VARMAX($p$,$q$,$s$) model is sometimes written in a form that is slightly different than the one shown in the previous section. This alternative form is referred to as a *dynamic simultaneous equations* model or a *dynamic structural equations* model.

Because $\mathrm{E}(\boldsymbol{\epsilon}_t \boldsymbol{\epsilon}_t') = \Sigma$ is assumed to be positive-definite, there exists a lower triangular matrix $A_0$ that has ones on the diagonals such that $A_0 \Sigma A_0' = \Sigma^d$, where $\Sigma^d$ is a diagonal matrix that has positive diagonal elements.

$$A_0 \mathbf{y}_t = \sum_{i=1}^{p} A_i \mathbf{y}_{t-i} + \sum_{i=0}^{s} C_i^* \mathbf{x}_{t-i} + A_0 \boldsymbol{\epsilon}_t - \sum_{i=1}^{q} C_i A_0 \boldsymbol{\epsilon}_{t-i}$$

where $A_i = A_0 \Phi_i$, $C_i^* = A_0 \Theta_i^*$, and $C_i = A_0 \Theta_i A_0^{-1}$.

As an alternative form,

$$A_0 \mathbf{y}_t = \sum_{i=1}^{p} A_i \mathbf{y}_{t-i} + \sum_{i=0}^{s} C_i^* \mathbf{x}_{t-i} + \mathbf{a}_t - \sum_{i=1}^{q} C_i \mathbf{a}_{t-i}$$

where $A_i = A_0 \Phi_i$, $C_i^* = A_0 \Theta_i^*$, $C_i = A_0 \Theta_i A_0^{-1}$, and $\mathbf{a}_t = A_0 \boldsymbol{\epsilon}_t$. The covariance matrix of $\mathbf{a}_t$ is the diagonal matrix $\Sigma^d$. The PRINT=(DYNAMIC) option returns the parameter estimates that result from estimating the model in this form.

A dynamic simultaneous equations model involves a leading (lower triangular) coefficient matrix for $\mathbf{y}_t$ at lag 0 or a leading coefficient matrix for $\boldsymbol{\epsilon}_t$ at lag 0. Such a representation of the VARMAX($p$,$q$,$s$) model can be more useful in certain circumstances than the standard representation. From the linear combination of the dependent variables obtained by $A_0\mathbf{y}_t$, you can easily see the relationship between the dependent variables in the current time.

The following statements provide the dynamic simultaneous equations of the VAR(1) model:

```
proc iml;
   sig = {1.0  0.5, 0.5 1.25};
   phi = {1.2 -0.5, 0.6 0.3};
   /* simulate the vector time series */
   call varmasim(y,phi) sigma = sig n = 100 seed = 34657;
   cn = {'y1' 'y2'};
   create simul1 from y[colname=cn];
   append from y;
quit;

data simul1;
   set simul1;
   date = intnx( 'year', '01jan1900'd, _n_-1 );
   format date year4.;
run;

proc varmax data=simul1;
   model y1 y2 / p=1 noint print=(dynamic);
run;
```

This is the same data set and model used in the section "Getting Started: VARMAX Procedure" on page 2978. You can compare the results of the VARMA model form and the dynamic simultaneous equations model form.

**Figure 43.44** Dynamic Simultaneous Equations (DYNAMIC Option)

**The VARMAX Procedure**

| Covariances of Innovations | | |
|---|---|---|
| **Variable** | **y1** | **y2** |
| **y1** | 1.28875 | 0.00000 |
| **y2** | 0.00000 | 1.29578 |

| AR | | | |
|---|---|---|---|
| **Lag** | **Variable** | **y1** | **y2** |
| **0** | **y1** | 1.00000 | 0.00000 |
| | **y2** | -0.30845 | 1.00000 |
| **1** | **y1** | 1.15977 | -0.51058 |
| | **y2** | 0.18861 | 0.54247 |

| Dynamic Model Parameter Estimates | | | | | | |
|---|---|---|---|---|---|---|
| **Equation** | **Parameter** | **Estimate** | **Standard Error** | **t Value** | **Pr > \|t\|** | **Variable** |
| **y1** | **AR1_1_1** | 1.15977 | 0.05508 | 21.06 | 0.0001 | y1(t-1) |
| | **AR1_1_2** | -0.51058 | 0.07140 | -7.15 | 0.0001 | y2(t-1) |
| **y2** | **AR0_2_1** | 0.30845 | | | | y1(t) |
| | **AR1_2_1** | 0.18861 | 0.05779 | 3.26 | 0.0015 | y1(t-1) |
| | **AR1_2_2** | 0.54247 | 0.07491 | 7.24 | 0.0001 | y2(t-1) |

In Figure 43.4 in the section "Getting Started: VARMAX Procedure" on page 2978, the covariance of $\boldsymbol{\epsilon}_t$ estimated from the VARMAX model form is

$$\Sigma_{\boldsymbol{\epsilon}} = \begin{pmatrix} 1.28875 & 0.39751 \\ 0.39751 & 1.41839 \end{pmatrix}$$

Figure 43.44 shows the results from estimating the model as a dynamic simultaneous equations model. By the decomposition of $\Sigma_{\boldsymbol{\epsilon}}$, you get a diagonal matrix ($\Sigma_{\mathbf{a}}$) and a lower triangular matrix ($A_0$) such as $\Sigma_{\mathbf{a}} = A_0 \Sigma_{\boldsymbol{\epsilon}} A_0'$ where

$$\Sigma_{\mathbf{a}} = \begin{pmatrix} 1.28875 & 0 \\ 0 & 1.29578 \end{pmatrix} \text{ and } A_0 = \begin{pmatrix} 1 & 0 \\ -0.30845 & 1 \end{pmatrix}$$

The lower triangular matrix ($A_0$) is shown in the left side of the simultaneous equations model. The parameter estimates in equations system are shown in the right side of the two-equations system.

The simultaneous equations model is written as

$$\begin{pmatrix} 1 & 0 \\ -0.30845 & 1 \end{pmatrix} \mathbf{y}_t = \begin{pmatrix} 1.15977 & -0.51058 \\ 0.18861 & 0.54247 \end{pmatrix} \mathbf{y}_{t-1} + \mathbf{a}_t$$

The resulting two-equation system can be written as

$$\begin{aligned} y_{1t} &= 1.15977y_{1,t-1} - 0.51058y_{2,t-1} + a_{1t} \\ y_{2t} &= 0.30845y_{1t} + 0.18861y_{1,t-1} + 0.54247y_{2,t-1} + a_{2t} \end{aligned}$$

## Impulse Response Function

### Simple Impulse Response Function (IMPULSE=SIMPLE Option)

The VARMAX($p$,$q$,$s$) model has a convergent representation

$$\mathbf{y}_t = \Psi^*(B)\mathbf{x}_t + \Psi(B)\boldsymbol{\epsilon}_t$$

where $\Psi^*(B) = \Phi(B)^{-1}\Theta^*(B) = \sum_{j=0}^{\infty} \Psi_j^* B^j$ and $\Psi(B) = \Phi(B)^{-1}\Theta(B) = \sum_{j=0}^{\infty} \Psi_j B^j$.

The elements of the matrices $\Psi_j$ from the operator $\Psi(B)$, called the impulse response, can be interpreted as the response of a variable to a shock in another variable. Let $\psi_{j,in}$ be the $(i, n)$ element of $\Psi_j$ at lag $j$, where $n$ is the index for the impulse variable, and $i$ is the index for the response variable (impulse $\rightarrow$ response); that is to say, $\psi_{j,in}$ shows the reaction of the $i$-th variable to a unit shock in variable $n$, $j$ periods ago, assuming that the effect is not contaminated by other shocks (Lütkepohl 1993). For instance, $\psi_{j,11}$ is an impulse response to $y_{1t} \rightarrow y_{1t}$, and $\psi_{j,12}$ is an impulse response to $y_{2t} \rightarrow y_{1t}$.

### Accumulated Impulse Response Function (IMPULSE=ACCUM Option)

The accumulated impulse response function is the cumulative sum of the impulse response function, $\Psi_l^a = \sum_{j=0}^{l} \Psi_j$.

### Orthogonalized Impulse Response Function (IMPULSE=ORTH Option)

The MA representation of a VARMA($p$,$q$) model with a standardized white noise innovation process offers another way to interpret a VARMA($p$,$q$) model. Since $\Sigma$ is positive-definite, there is a lower triangular matrix $P$ such that $\Sigma = PP'$. The alternate MA representation of a VARMA($p$,$q$) model is written as

$$\mathbf{y}_t = \Psi^o(B)\mathbf{u}_t$$

where $\Psi^o(B) = \sum_{j=0}^{\infty} \Psi_j^o B^j$, $\Psi_j^o = \Psi_j P$, and $\mathbf{u}_t = P^{-1}\boldsymbol{\epsilon}_t$.

The elements of the matrices $\Psi_j^o$, called the *orthogonal impulse response*, can be interpreted as the effects of the components of the standardized shock process $\mathbf{u}_t$ on the process $\mathbf{y}_t$ at lag $j$.

### Impulse Response of Transfer Function (IMPULSX=SIMPLE Option)

The coefficient matrix $\Psi_j^*$ from the transfer function operator $\Psi^*(B)$ can be interpreted as the effects that changes in the exogenous variables $\mathbf{x}_t$ have on the output variable $\mathbf{y}_t$ at lag $j$; it is called an impulse response matrix in the transfer function.

### Accumulated Impulse Response of Transfer Function (IMPULSX=ACCUM Option)

The accumulated impulse response in the transfer function is the cumulative sum of the impulse response in the transfer function, $\Psi_l^{*a} = \sum_{j=0}^{l} \Psi_j^*$.

The asymptotic distributions of the impulse functions can be seen in the section "VAR and VARX Modeling" on page 3095.

The following statements provide the impulse response and the accumulated impulse response in the transfer function for a VARX(1,0) model:

```
proc varmax data=grunfeld plot=impulse;
   model y1-y3 = x1 x2 / p=1 lagmax=5
                         printform=univariate
                         print=(impulsx=(all) estimates);
run;
```

In Figure 43.45, the variables $x1$ and $x2$ are impulses, and the variables $y1$, $y2$, and $y3$ are responses. The keyword STD stands for the standard errors of the elements. You can read the table that matches the $impulse \rightarrow response$ pairs, such as $x1 \rightarrow y1$, $x1 \rightarrow y2$, $x1 \rightarrow y3$, $x2 \rightarrow y1$, $x2 \rightarrow y2$, and $x2 \rightarrow y3$. In the pair $x1 \rightarrow y1$, you can see the long-run responses of $y1$ to an impulse in $x1$ (the values are 1.69281, 0.35399, 0.09090, and so on for lag 0, lag 1, lag 2, and so on, respectively).

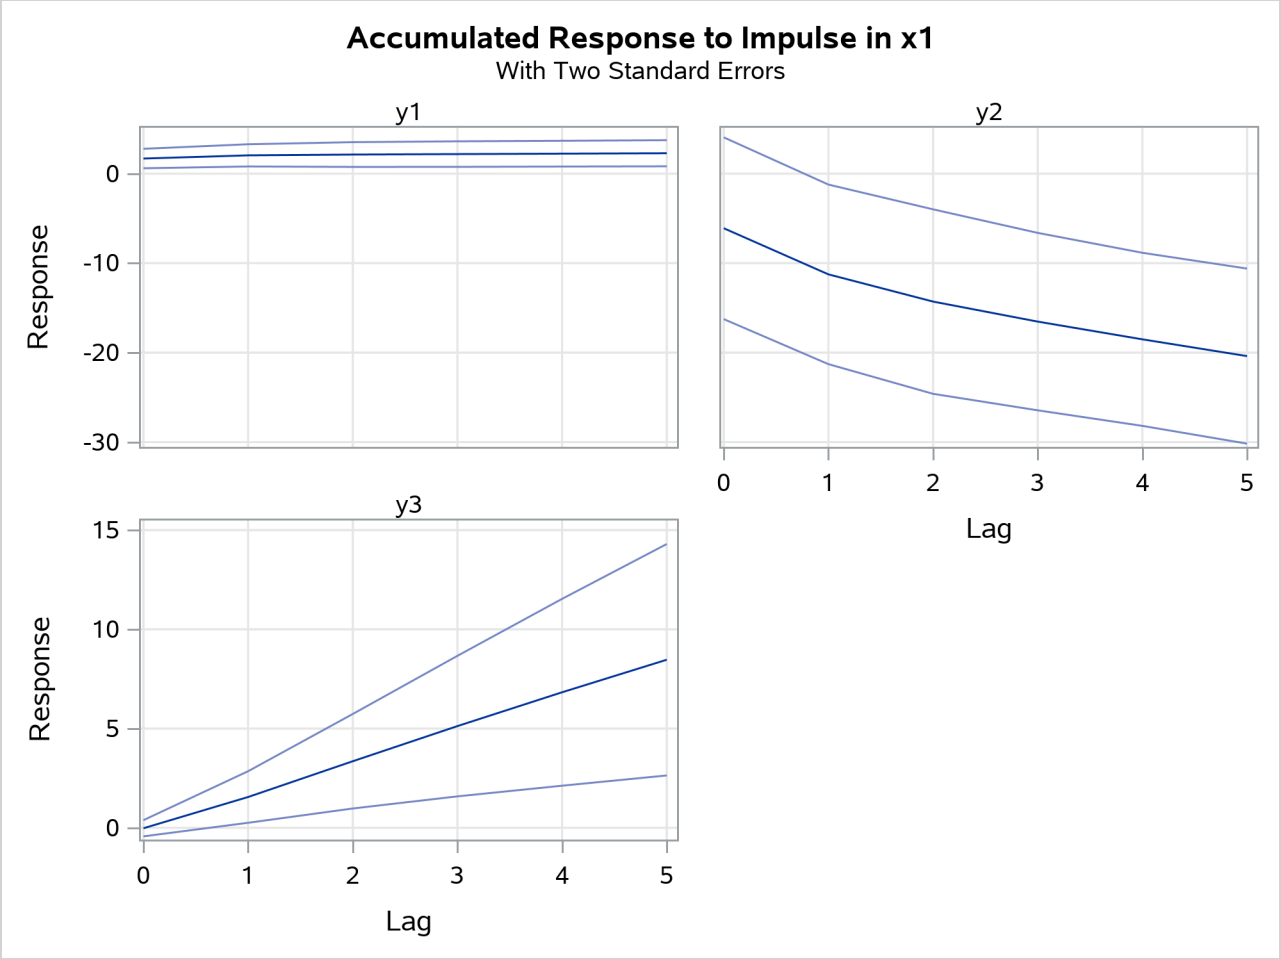
Figure 43.48 shows the accumulated responses of $y1$, $y2$, and $y3$ to a forecast error impulse in $x1$.

**Figure 43.48** Plot of Accumulated Impulse Response in Transfer Function



The following statements provide the impulse response function, the accumulated impulse response function, and the orthogonalized impulse response function with their standard errors for a VAR(1) model. Parts of the VARMAX procedure output are shown in Figure 43.49, Figure 43.51, and Figure 43.53.

```
proc varmax data=simul1 plot=impulse;
   model y1 y2 / p=1 noint lagmax=5
                 print=(impulse=(all))
                 printform=univariate;
run;
```

Figure 43.49 is the output in a univariate format associated with the PRINT=(IMPULSE=) option for the impulse response function. The keyword STD stands for the standard errors of the elements. The matrix in terms of the lag 0 does not print since it is the identity. In Figure 43.49, the variables $y1$ and $y2$ of the first row are impulses, and the variables $y1$ and $y2$ of the first column are responses. You can read the table matching the $impulse \rightarrow response$ pairs, such as $y1 \rightarrow y1$, $y1 \rightarrow y2$, $y2 \rightarrow y1$, and $y2 \rightarrow y2$. For example, in the pair of $y1 \rightarrow y1$ at lag 3, the response is 0.8055. This represents the impact on y1 of one-unit change in $y1$ after 3 periods. As the lag gets higher, you can see the long-run responses of $y1$ to an impulse in itself.

**Figure 43.49** Impulse Response Function (IMPULSE= Option)

**The VARMAX Procedure**

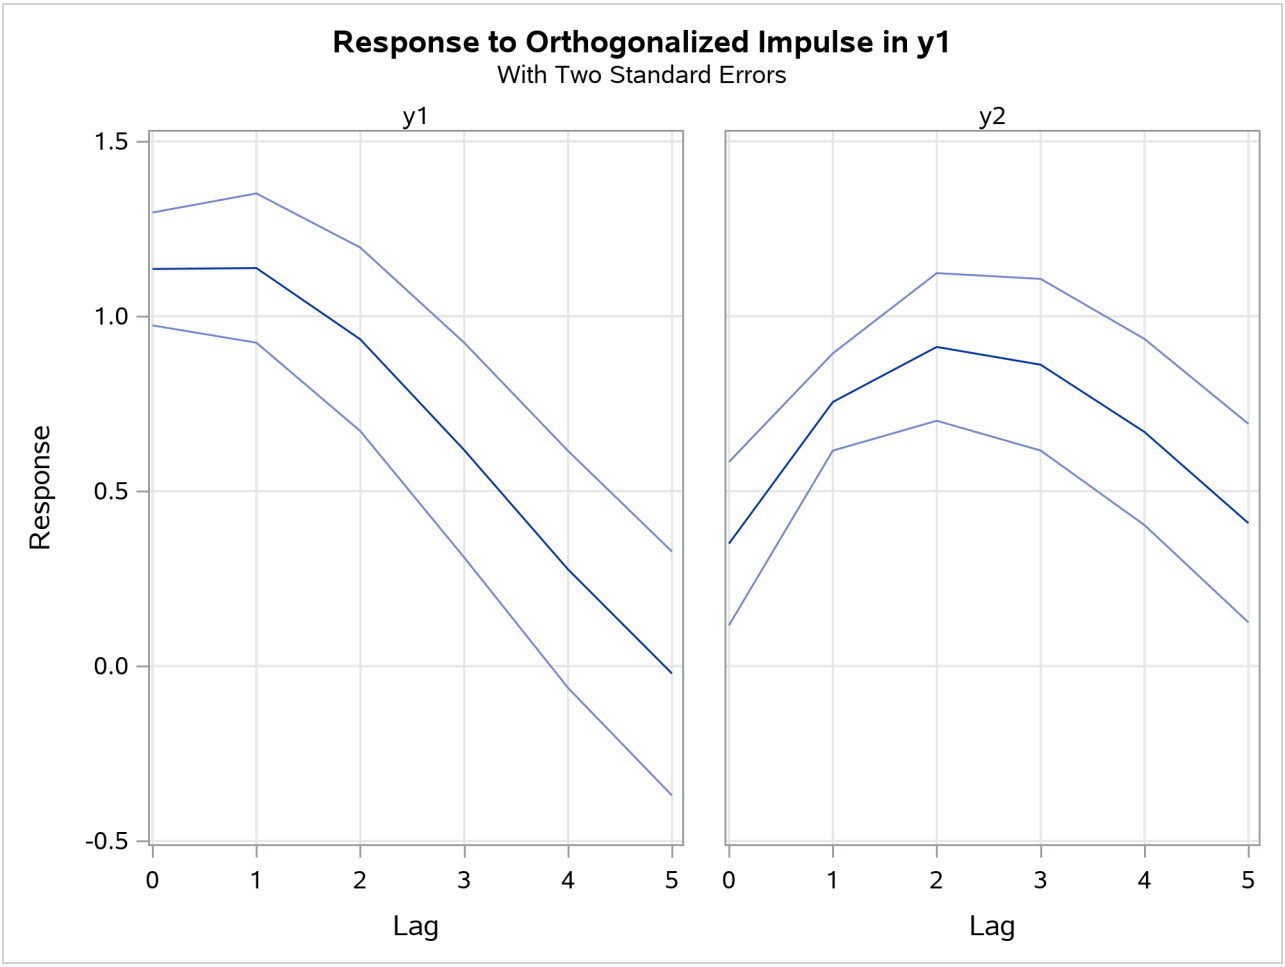
In Figure 43.4, there is a positive correlation between $\varepsilon_{1t}$ and $\varepsilon_{2t}$. Therefore, shock in $y1$ can be accompanied by a shock in $y2$ in the same period. For example, in the pair of $y1_innovation \rightarrow y2$, you can see the long-run responses of $y2$ to an impulse in $y1_innovation$.

Figure 43.54 shows the orthogonalized responses of $y1$ and $y2$ to a forecast error impulse in $y1$ with two standard errors.

**Figure 43.54** Plot of Orthogonalized Impulse Response



## Forecasting

The optimal (minimum MSE) $l$-step-ahead forecast of $\mathbf{y}_{t+l}$ is

$$\mathbf{y}_{t+l|t} = \sum_{j=1}^{p} \Phi_j \mathbf{y}_{t+l-j|t} + \sum_{j=0}^{s} \Theta_j^* \mathbf{x}_{t+l-j|t} - \sum_{j=l}^{q} \Theta_j \boldsymbol{\epsilon}_{t+l-j}, \quad l \le q$$

$$\mathbf{y}_{t+l|t} = \sum_{j=1}^{p} \Phi_j \mathbf{y}_{t+l-j|t} + \sum_{j=0}^{s} \Theta_j^* \mathbf{x}_{t+l-j|t}, \quad l > q$$

where $\mathbf{y}_{t+l-j|t} = \mathbf{y}_{t+l-j}$ and $\mathbf{x}_{t+l-j|t} = \mathbf{x}_{t+l-j}$ for $l \le j$. For information about the forecasts $\mathbf{x}_{t+l-j|t}$, see the section "State Space Representation" on page 3067.

## Covariance Matrices of Prediction Errors without Exogenous (Independent) Variables

Under the stationarity assumption, the optimal (minimum MSE) $l$-step-ahead forecast of $\mathbf{y}_{t+l}$ has an infinite moving-average form, $\mathbf{y}_{t+l|t} = \sum_{j=l}^{\infty} \Psi_j \boldsymbol{\epsilon}_{t+l-j}$. The prediction error of the optimal $l$-step-ahead forecast is $\mathbf{e}_{t+l|t} = \mathbf{y}_{t+l} - \mathbf{y}_{t+l|t} = \sum_{j=0}^{l-1} \Psi_j \boldsymbol{\epsilon}_{t+l-j}$, with zero mean and covariance matrix,

$$\Sigma(l) = \mathrm{Cov}(\mathbf{e}_{t+l|t}) = \sum_{j=0}^{l-1} \Psi_j \Sigma \Psi_j' = \sum_{j=0}^{l-1} \Psi_j^o \Psi_j^{o'}$$

where $\Psi_j^o = \Psi_j P$ with a lower triangular matrix $P$ such that $\Sigma = PP'$. Under the assumption of normality of the $\boldsymbol{\epsilon}_t$, the $l$-step-ahead prediction error $\mathbf{e}_{t+l|t}$ is also normally distributed as multivariate $N(0, \Sigma(l))$. Hence, it follows that the diagonal elements $\sigma_{ii}^2(l)$ of $\Sigma(l)$ can be used, together with the point forecasts $y_{i,t+l|t}$, to construct $l$-step-ahead prediction intervals of the future values of the component series, $y_{i,t+l}$.

The following statements use the COVPE option to compute the covariance matrices of the prediction errors for a VAR(1) model. The parts of the VARMAX procedure output are shown in Figure 43.55 and Figure 43.56.

```
proc varmax data=simul1;
   model y1 y2 / p=1 noint lagmax=5
                 printform=both
                 print=(decompose(5) impulse=(all) covpe(5));
run;
```

Figure 43.55 is the output in a matrix format associated with the COVPE option for the prediction error covariance matrices.

**Figure 43.55** Covariances of Prediction Errors (COVPE Option)

**The VARMAX Procedure**

**Prediction Error Covariances**

| Lead | Variable | y1 | y2 |
|---|---|---|---|
| 1 | y1 | 1.28875 | 0.39751 |
| | y2 | 0.39751 | 1.41839 |
| 2 | y1 | 2.92119 | 1.00189 |
| | y2 | 1.00189 | 2.18051 |

| | 5 | 3.85346 | 5.07010 |

## Covariance Matrices of Prediction Errors in the Presence of Exogenous (Independent) Variables

Exogenous variables can be both stochastic and nonstochastic (deterministic) variables. Considering the forecasts in the VARMAX($p$,$q$,$s$) model, there are two cases.

**When exogenous (independent) variables are stochastic (future values not specified):**

As defined in the section "State Space Representation" on page 3067, $\mathbf{y}_{t+l|t}$ has the representation

$$\mathbf{y}_{t+l|t} = \sum_{j=l}^{\infty} V_j \mathbf{a}_{t+l-j} + \sum_{j=l}^{\infty} \Psi_j \boldsymbol{\epsilon}_{t+l-j}$$

and hence

$$\mathbf{e}_{t+l|t} = \sum_{j=0}^{l-1} V_j \mathbf{a}_{t+l-j} + \sum_{j=0}^{l-1} \Psi_j \boldsymbol{\epsilon}_{t+l-j}$$

Therefore, the covariance matrix of the $l$-step-ahead prediction error is given as

$$\Sigma(l) = \mathrm{Cov}(\mathbf{e}_{t+l|t}) = \sum_{j=0}^{l-1} V_j \Sigma_a V_j' + \sum_{j=0}^{l-1} \Psi_j \Sigma_\epsilon \Psi_j'$$

where $\Sigma_a$ is the covariance of the white noise series $\mathbf{a}_t$, and $\mathbf{a}_t$ is the white noise series for the VARMA($p$,$q$) model of exogenous (independent) variables, which is assumed not to be correlated with $\boldsymbol{\epsilon}_t$ or its lags.

**When future exogenous (independent) variables are specified:**

The optimal forecast $\mathbf{y}_{t+l|t}$ of $\mathbf{y}_t$ conditioned on the past information and also on known future values $\mathbf{x}_{t+1}, \ldots, \mathbf{x}_{t+l}$ can be represented as

$$\mathbf{y}_{t+l|t} = \sum_{j=0}^{\infty} \Psi_j^* \mathbf{x}_{t+l-j} + \sum_{j=l}^{\infty} \Psi_j \boldsymbol{\epsilon}_{t+l-j}$$

and the forecast error is

$$\mathbf{e}_{t+l|t} = \sum_{j=0}^{l-1} \Psi_j \boldsymbol{\epsilon}_{t+l-j}$$

Thus, the covariance matrix of the $l$-step-ahead prediction error is given as

$$\Sigma(l) = \mathrm{Cov}(\mathbf{e}_{t+l|t}) = \sum_{j=0}^{l-1} \Psi_j \Sigma_{\epsilon} \Psi_j'$$

## Decomposition of Prediction Error Covariances

In the relation $\Sigma(l) = \sum_{j=0}^{l-1} \Psi_j^o \Psi_j^{o\prime}$, the diagonal elements can be interpreted as providing a decomposition of the $l$-step-ahead prediction error covariance $\sigma_{ii}^2(l)$ for each component series $y_{it}$ into contributions from the components of the standardized innovations $\boldsymbol{\epsilon}_t$.

If you denote the $(i, n)$ element of $\Psi_j^o$ by $\psi_{j,in}$, the MSE of $y_{i,t+h|t}$ is

$$\mathrm{MSE}(y_{i,t+h|t}) = \mathrm{E}(y_{i,t+h} - y_{i,t+h|t})^2 = \sum_{j=0}^{l-1} \sum_{n=1}^{k} \psi_{j,in}^2$$

Note that $\sum_{j=0}^{l-1} \psi_{j,in}^2$ is interpreted as the contribution of innovations in variable $n$ to the prediction error covariance of the $l$-step-ahead forecast of variable $i$.

The proportion, $\omega_{l,in}$, of the $l$-step-ahead forecast error covariance of variable $i$ accounting for the innovations in variable $n$ is

$$\omega_{l,in} = \sum_{j=0}^{l-1} \psi_{j,in}^2 / \mathrm{MSE}(y_{i,t+h|t})$$

The following statements use the DECOMPOSE option to compute the decomposition of prediction error covariances and their proportions for a VAR(1) model:

```
proc varmax data=simul1;
   model y1 y2 / p=1 noint print=(decompose(15))
                 printform=univariate;
run;
```

The proportions of decomposition of prediction error covariances of two variables are given in Figure 43.57. The output explains that about 91.356% of the one-step-ahead prediction error covariances of the variable $y_{2t}$ is accounted for by its own innovations and about 8.644% is accounted for by $y_{1t}$ innovations.

**Figure 43.57** Decomposition of Prediction Error Covariances (DECOMPOSE Option)

| Proportions of Prediction Error Covariances by Variable | | | |
|---|---|---|---|
| Variable | Lead | y1 | y2 |
| y1 | 1 | 1.00000 | 0.00000 |
| | 2 | 0.88436 | 0.11564 |
| | 3 | 0.75132 | 0.24868 |
| | 4 | 0.64897 | 0.35103 |
| | 5 | 0.58460 | 0.41540 |
| y2 | 1 | 0.08644 | 0.91356 |
| | 2 | 0.31767 | 0.68233 |
| | 3 | 0.50247 | 0.49753 |
| | 4 | 0.55607 | 0.44393 |
| | 5 | 0.53549 | 0.46451 |

## Forecasting of the Centered Series

If the CENTER option is specified, the sample mean vector is added to the forecast.

## Forecasting of the Differenced Series

If dependent (endogenous) variables are differenced, the final forecasts and their prediction error covariances are produced by integrating those of the differenced series. However, if the PRIOR option is specified, the forecasts and their prediction error variances of the differenced series are produced.

Let $\mathbf{z}_t$ be the original series with some appended zero values that correspond to the unobserved past observations. Let $\Delta(B)$ be the $k \times k$ matrix polynomial in the backshift operator that corresponds to the differencing specified by the MODEL statement. The off-diagonal elements of $\Delta_i$ are zero, and the diagonal elements can be different. Then $\mathbf{y}_t = \Delta(B)\mathbf{z}_t$.

This gives the relationship

$$\mathbf{z}_t = \Delta^{-1}(B)\mathbf{y}_t = \sum_{j=0}^{\infty} \Lambda_j \mathbf{y}_{t-j}$$

where $\Delta^{-1}(B) = \sum_{j=0}^{\infty} \Lambda_j B^j$ and $\Lambda_0 = I_k$.

The $l$-step-ahead prediction of $\mathbf{z}_{t+l}$ is

$$\mathbf{z}_{t+l|t} = \sum_{j=0}^{l-1} \Lambda_j \mathbf{y}_{t+l-j|t} + \sum_{j=l}^{\infty} \Lambda_j \mathbf{y}_{t+l-j}$$

The $l$-step-ahead prediction error of $\mathbf{z}_{t+l}$ is

$$\sum_{j=0}^{l-1} \Lambda_j \left(\mathbf{y}_{t+l-j} - \mathbf{y}_{t+l-j|t}\right) = \sum_{j=0}^{l-1} \left( \sum_{u=0}^{j} \Lambda_u \Psi_{j-u} \right) \boldsymbol{\epsilon}_{t+l-j}$$

Letting $\Sigma_{\mathbf{z}}(0) = 0$, the covariance matrix of the $l$-step-ahead prediction error of $\mathbf{z}_{t+l}$, $\Sigma_{\mathbf{z}}(l)$, is

$$\begin{aligned}\Sigma_{\mathbf{z}}(l) &= \sum_{j=0}^{l-1}\left(\sum_{u=0}^{j}\Lambda_u\Psi_{j-u}\right)\Sigma_\epsilon\left(\sum_{u=0}^{j}\Lambda_u\Psi_{j-u}\right)' \\ &= \Sigma_{\mathbf{z}}(l-1)+\left(\sum_{j=0}^{l-1}\Lambda_j\Psi_{l-1-j}\right)\Sigma_\epsilon\left(\sum_{j=0}^{l-1}\Lambda_j\Psi_{l-1-j}\right)'\end{aligned}$$

If there are stochastic exogenous (independent) variables, the covariance matrix of the $l$-step-ahead prediction error of $\mathbf{z}_{t+l}$, $\Sigma_{\mathbf{z}}(l)$, is

$$\begin{aligned}\Sigma_{\mathbf{z}}(l) &= \Sigma_{\mathbf{z}}(l-1)+\left(\sum_{j=0}^{l-1}\Lambda_j\Psi_{l-1-j}\right)\Sigma_\epsilon\left(\sum_{j=0}^{l-1}\Lambda_j\Psi_{l-1-j}\right)' \\ &\quad +\left(\sum_{j=0}^{l-1}\Lambda_j V_{l-1-j}\right)\Sigma_a\left(\sum_{j=0}^{l-1}\Lambda_j V_{l-1-j}\right)'\end{aligned}$$

## Tentative Order Selection

### Sample Cross-Covariance and Cross-Correlation Matrices

Given a stationary multivariate time series $\mathbf{y}_t$, cross-covariance matrices are

$$\Gamma(l) = \mathrm{E}[(\mathbf{y}_t - \boldsymbol{\mu})(\mathbf{y}_{t+l} - \boldsymbol{\mu})']$$

where $\boldsymbol{\mu} = \mathrm{E}(\mathbf{y}_t)$, and cross-correlation matrices are

$$\rho(l) = D^{-1}\Gamma(l)D^{-1}$$

where $D$ is a diagonal matrix with the standard deviations of the components of $\mathbf{y}_t$ on the diagonal.

The sample cross-covariance matrix at lag $l$, denoted as $C(l)$, is computed as

$$\hat{\Gamma}(l) = C(l) = \frac{1}{T}\sum_{t=1}^{T-l}\tilde{\mathbf{y}}_t\tilde{\mathbf{y}}'_{t+l}$$

where $\tilde{\mathbf{y}}_t$ is the centered data and $T$ is the number of nonmissing observations. Thus, the $(i, j)$ element of $\hat{\Gamma}(l)$ is $\hat{\gamma}_{ij}(l) = c_{ij}(l)$. The sample cross-correlation matrix at lag $l$ is computed as

$$\hat{\rho}_{ij}(l) = c_{ij}(l)/[c_{ii}(0)c_{jj}(0)]^{1/2}, \quad i, j = 1, \ldots, k$$

The following statements use the CORRY option to compute the sample cross-correlation matrices and their summary indicator plots in terms of $+$, $-$, and $\cdot$, where + indicates significant positive cross-correlations, $-$ indicates significant negative cross-correlations, and $\cdot$ indicates insignificant cross-correlations:

```
proc varmax data=simul1;
   model y1 y2 / p=1 noint lagmax=3 print=(corry)
                 printform=univariate;
run;
```

Figure 43.58 shows the sample cross-correlation matrices of $y_{1t}$ and $y_{2t}$. As shown, the sample autocorrelation functions for each variable decay quickly, but are significant with respect to two standard errors.

**Figure 43.58** Cross-Correlations (CORRY Option)

**The VARMAX Procedure**

**Cross Correlations of Dependent Series by Variable**

| Variable | Lag | y1 | y2 |
|---|---|---|---|
| y1 | 0 | 1.00000 | 0.67041 |
| | 1 | 0.83143 | 0.84330 |

**+ is > 2*std error, - is < -2*std error, . is between**

## Partial Autoregressive Matrices

For each $m = 1, 2, \ldots, p$, you can define a sequence of matrices $\Phi_{mm}$, which is called the partial autoregression matrices of lag $m$, as the solution for $\Phi_{mm}$ to the Yule-Walker equations of order $m$,

$$\Gamma(l) = \sum_{i=1}^{m} \Gamma(l-i)\Phi_{im}', \quad l = 1, 2, \ldots, m$$

The sequence of the partial autoregression matrices $\Phi_{mm}$ of order $m$ has the characteristic property that if the process follows the AR($p$), then $\Phi_{pp} = \Phi_p$ and $\Phi_{mm} = 0$ for $m > p$. Hence, the matrices $\Phi_{mm}$ have the cutoff property for a VAR($p$) model, and so they can be useful in the identification of the order of a pure VAR model.

The following statements use the PARCOEF option to compute the partial autoregression matrices:

```
proc varmax data=simul1;
   model y1 y2 / p=1 noint lagmax=3
                 printform=univariate
                print=(corry parcoef pcorr
```

```
                        pcancorr roots);
run;
```

Figure 43.59 shows that the model can be obtained by an AR order $m = 1$ since partial autoregression matrices are insignificant after lag 1 with respect to two standard errors. The matrix for lag 1 is the same as the Yule-Walker autoregressive matrix.

**Figure 43.59** Partial Autoregression Matrices (PARCOEF Option)

**The VARMAX Procedure**

| Partial Autoregression | | | |

## Partial Correlation Matrices

Define the forward autoregression

$$\mathbf{y}_t = \sum_{i=1}^{m-1} \Phi_{i,m-1}\mathbf{y}_{t-i} + \mathbf{u}_{m,t}$$

and the backward autoregression

$$\mathbf{y}_{t-m} = \sum_{i=1}^{m-1} \Phi^*_{i,m-1}\mathbf{y}_{t-m+i} + \mathbf{u}^*_{m,t-m}$$

The matrices $P(m)$ defined by Ansley and Newbold (1979) are given by

$$P(m) = \Sigma^{*1/2}_{m-1}\Phi'_{mm}\Sigma^{-1/2}_{m-1}$$

where

$$\Sigma_{m-1} = \mathrm{Cov}(\mathbf{u}_{m,t}) = \Gamma(0) - \sum_{i=1}^{m-1}\Gamma(-i)\Phi'_{i,m-1}$$

and

$$\Sigma^*_{m-1} = \mathrm{Cov}(\mathbf{u}^*_{m,t-m}) = \Gamma(0) - \sum_{i=1}^{m-1} \Gamma(m-i)\Phi^{*'}_{m-i,m-1}$$

$P(m)$ are the partial cross-correlation matrices at lag $m$ between the elements of $\mathbf{y}_t$ and $\mathbf{y}_{t-m}$, given $\mathbf{y}_{t-1}, \ldots, \mathbf{y}_{t-m+1}$. The matrices $P(m)$ have the cutoff property for a VAR($p$) model, and so they can be useful in the identification of the order of a pure VAR structure.

The following statements use the PCORR option to compute the partial cross-correlation matrices:

```
proc varmax data=simul1;
   model y1 y2 / p=1 noint lagmax=3
                 print=(pcorr)
                 printform=univariate;
run;
```

The partial cross-correlation matrices in Figure 43.60 are insignificant after lag 1 with respect to two standard errors. This indicates that an AR order of $m = 1$ can be an appropriate choice.

**Figure 43.60** Partial Correlations (PCORR Option)

**The VARMAX Procedure**

**Partial Cross Correlations by Variable**

+ is > 2*std error, - is < -2*std error, . is between

## Partial Canonical Correlation Matrices

The partial canonical correlations at lag $m$ between the vectors $\mathbf{y}_t$ and $\mathbf{y}_{t-m}$, given $\mathbf{y}_{t-1}, \ldots, \mathbf{y}_{t-m+1}$, are $1 \geq \rho_1(m) \geq \rho_2(m) \cdots \geq \rho_k(m)$. The partial canonical correlations are the canonical correlations between the residual series $\mathbf{u}_{m,t}$ and $\mathbf{u}^*_{m,t-m}$, where $\mathbf{u}_{m,t}$ and $\mathbf{u}^*_{m,t-m}$ are defined in the previous section. Thus, the squared partial canonical correlations $\rho^2_i(m)$ are the eigenvalues of the matrix

$$\{\mathrm{Cov}(\mathbf{u}_{m,t})\}^{-1}\mathrm{E}(\mathbf{u}_{m,t}\mathbf{u}^{*'}_{m,t-m})\{\mathrm{Cov}(\mathbf{u}^*_{m,t-m})\}^{-1}\mathrm{E}(\mathbf{u}^*_{m,t-m}\mathbf{u}'_{m,t}) = \Phi^{*'}_{mm}\Phi'_{mm}$$

It follows that the test statistic to test for $\Phi_m = 0$ in the VAR model of order $m > p$ is approximately

$$(T-m)\ \mathrm{tr}\ \{\Phi^{*'}_{mm}\Phi'_{mm}\} \approx (T-m)\sum_{i=1}^{k}\rho_i^2(m)$$

and has an asymptotic chi-square distribution with $k^2$ degrees of freedom for $m > p$.

The following statements use the PCANCORR option to compute the partial canonical correlations:

```
proc varmax data=simul1;
   model y1 y2 / p=1 noint lagmax=3 print=(pcancorr);
run;
```

Figure 43.61 shows that the partial canonical correlations $\rho_i(m)$ between $\mathbf{y}_t$ and $\mathbf{y}_{t-m}$ are $\{0.918, 0.773\}$, $\{0.092, 0.018\}$, and $\{0.109, 0.011\}$ for lags $m$ =1 to 3. After lag $m$ =1, the partial canonical correlations are insignificant with respect to the 0.05 significance level, indicating that an AR order of $m = 1$ can be an appropriate choice.

**Figure 43.61** Partial Canonical Correlations (PCANCORR Option)

**The VARMAX Procedure**

**Partial Canonical Correlations**

| Lag | Correlation1 | Correlation2 | DF | Chi-Square | Pr > ChiSq |
|---|---|---|---|---|---|
| 1 | 0.91783 | 0.77335 | 4 | 142.61 | <.0001 |
| 2 | 0.09171 | 0.01816 | 4 | 0.86 | 0.9307 |
| 3 | 0.10861 | 0.01078 | 4 | 1.16 | 0.8854 |

## The Minimum Information Criterion (MINIC) Method

The minimum information criterion (MINIC) method can tentatively identify the orders of a VARMA($p$,$q$) process (Spliid 1983; Koreisha and Pukkila 1989; Quinn 1980). The first step of this method is to obtain estimates of the innovations series, $\boldsymbol{\epsilon}_t$, from the VAR($p_\epsilon$), where $p_\epsilon$ is chosen sufficiently large. The choice of the autoregressive order, $p_\epsilon$, is determined by use of a selection criterion. From the selected VAR($p_\epsilon$) model, you obtain estimates of residual series

$$\tilde{\boldsymbol{\epsilon}}_t = \mathbf{y}_t - \sum_{i=1}^{p_\epsilon}\hat{\Phi}_i^{p_\epsilon}\mathbf{y}_{t-i} - \hat{\boldsymbol{\delta}}^{p_\epsilon},\quad t = p_\epsilon+1,\ldots,T$$

In the second step, you select the order $(p,q)$ of the VARMA model for $p$ in $(p_{min} : p_{max})$ and $q$ in $(q_{min} : q_{max})$

$$\mathbf{y}_t = \boldsymbol{\delta} + \sum_{i=1}^{p}\Phi_i\mathbf{y}_{t-i} - \sum_{i=1}^{q}\Theta_i\tilde{\boldsymbol{\epsilon}}_{t-i} + \boldsymbol{\epsilon}_t$$

which minimizes a selection criterion like SBC or HQ.

According to Lütkepohl (1993), the information criteria, namely Akaike's information criterion (AIC), the corrected Akaike's information criterion (AICC), the final prediction error criterion (FPE), the Hannan-Quinn criterion (HQC), and the Schwarz Bayesian criterion (SBC), are defined as

$$
\begin{aligned}
\text{AIC} &= \log(|\tilde{\Sigma}|) + 2r_b k/T \\
\text{AICC} &= \log(|\tilde{\Sigma}|) + 2r_b k/(T - r_b) \\
\text{FPE} &= \left(\frac{T + r_b}{T - r_b}\right)^k |\tilde{\Sigma}| \\
\text{HQC} &= \log(|\tilde{\Sigma}|) + 2r_b k \log(\log(T))/T \\
\text{SBC} &= \log(|\tilde{\Sigma}|) + r_b k \log(T)/T
\end{aligned}
$$

where $\tilde{\Sigma}$ is the maximum likelihood estimate of the innovation covariance matrix $\Sigma$, $r_b$ is the number of parameters in each mean equation, $k$ is the number of dependent variables, and $T$ is the number of observations used to estimate the model. Compared to the definitions of AIC, AICC, HQC, and SBC discussed in the section "Multivariate Model Diagnostic Checks" on page 3114, the preceding definitions omit some constant terms and are normalized by $T$. More specifically, only the parameters in each of the mean equations are counted; the parameters in the innovation covariance matrix $\Sigma$ are not counted.

The following statements use the MINIC= option to compute a table that contains the information criterion associated with various AR and MA orders:

```
proc varmax data=simul1;
   model y1 y2 / p=1 noint minic=(p=3 q=3);
run;
```

Figure 43.62 shows the output associated with the MINIC= option. The criterion takes the smallest value at AR order 1.

**Figure 43.62** MINIC= Option

**The VARMAX Procedure**

**Minimum Information Criterion Based on AICC**

| Lag | MA 0 | MA 1 | MA 2 | MA 3 |

## VAR and VARX Modeling

The $p$th-order VAR process is written as

$$\mathbf{y}_t - \boldsymbol{\mu} = \sum_{i=1}^{p} \Phi_i(\mathbf{y}_{t-i} - \boldsymbol{\mu}) + \boldsymbol{\epsilon}_t \quad \text{or} \quad \Phi(B)(\mathbf{y}_t - \boldsymbol{\mu}) = \boldsymbol{\epsilon}_t$$

with $\Phi(B) = I_k - \sum_{i=1}^{p} \Phi_i B^i$.

Equivalently, it can be written as

$$\mathbf{y}_t = \boldsymbol{\delta} + \sum_{i=1}^{p} \Phi_i \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t \quad \text{or} \quad \Phi(B)\mathbf{y}_t = \boldsymbol{\delta} + \boldsymbol{\epsilon}_t$$

with $\boldsymbol{\delta} = (I_k - \sum_{i=1}^{p} \Phi_i)\boldsymbol{\mu}$.

### Stationarity

For stationarity, the VAR process must be expressible in the convergent causal infinite MA form as

$$\mathbf{y}_t = \boldsymbol{\mu} + \sum_{j=0}^{\infty} \Psi_j \boldsymbol{\epsilon}_{t-j}$$

where $\Psi(B) = \Phi(B)^{-1} = \sum_{j=0}^{\infty} \Psi_j B^j$ with $\sum_{j=0}^{\infty} ||\Psi_j|| < \infty$, where $||A||$ denotes a norm for the matrix $A$ such as $||A||^2 = \mathrm{tr}\{A'A\}$. The matrix $\Psi_j$ can be recursively obtained from the relation $\Phi(B)\Psi(B) = I$; it is

$$\Psi_j = \Phi_1\Psi_{j-1} + \Phi_2\Psi_{j-2} + \cdots + \Phi_p\Psi_{j-p}$$

where $\Psi_0 = I_k$ and $\Psi_j = 0$ for $j < 0$.

The stationarity condition is satisfied if all roots of $|\Phi(z)| = 0$ are outside of the unit circle. The stationarity condition is equivalent to the condition in the corresponding VAR(1) representation, $\mathbf{Y}_t = \Phi\mathbf{Y}_{t-1} + \boldsymbol{\varepsilon}_t$, that all eigenvalues of the $kp \times kp$ companion matrix $\Phi$ be less than one in absolute value, where $\mathbf{Y}_t = (\mathbf{y}_t', \ldots, \mathbf{y}_{t-p+1}')'$, $\boldsymbol{\varepsilon}_t = (\boldsymbol{\epsilon}_t', 0', \ldots, 0')'$, and

$$\Phi = \begin{bmatrix} \Phi_1 & \Phi_2 & \cdots & \Phi_{p-1} & \Phi_p \\ I_k & 0 & \cdots & 0 & 0 \\ 0 & I_k & \cdots & 0 & 0 \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & \cdots & I_k & 0 \end{bmatrix}$$

If the stationarity condition is not satisfied, a nonstationary model (a differenced model or an error correction model) might be more appropriate.

The following statements estimate a VAR(1) model and use the ROOTS option to compute the characteristic polynomial roots:

```
proc varmax data=simul1;
   model y1 y2 / p=1 noint print=(roots);
run;
```

Figure 43.63 shows the output associated with the ROOTS option, which indicates that the series is stationary since the modulus of the eigenvalue is less than one.

**Figure 43.63** Stationarity (ROOTS Option)

**The VARMAX Procedure**

**Roots of AR Characteristic Polynomial**

| Index | Real | Imaginary | Modulus | Radian | Degree |
|---|---|---|---|---|---|
| 1 | 0.77238 | 0.35899 | 0.8517 | 0.4351 | 24.9284 |
| 2 | 0.77238 | -0.35899 | 0.8517 | -0.4351 | -24.9284 |

## Parameter Estimation

Consider the stationary VAR($p$) model

$$\mathbf{y}_t = \boldsymbol{\delta} + \sum_{i=1}^{p} \Phi_i \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t$$

where $\mathbf{y}_{-p+1}, \ldots, \mathbf{y}_0$ are assumed to be available (for convenience of notation). This can be represented by the general form of the multivariate linear model,

$$Y = XB + E \quad \text{or} \quad \mathbf{y} = (X \otimes I_k)\boldsymbol{\beta} + \mathbf{e}$$

where

$$\begin{aligned}
Y &= (\mathbf{y}_1, \ldots, \mathbf{y}_T)' \\
B &= (\boldsymbol{\delta}, \Phi_1, \ldots, \Phi_p)' \\
X &= (X_0, \ldots, X_{T-1})' \\
X_t &= (1, \mathbf{y}_t', \ldots, \mathbf{y}_{t-p+1}')' \\
E &= (\boldsymbol{\epsilon}_1, \ldots, \boldsymbol{\epsilon}_T)' \\
\mathbf{y} &= \mathrm{vec}(Y') \\
\boldsymbol{\beta} &= \mathrm{vec}(B') \\
\mathbf{e} &= \mathrm{vec}(E')
\end{aligned}$$

with *vec* denoting the column stacking operator.

The conditional least squares estimator of $\boldsymbol{\beta}$ is

$$\hat{\boldsymbol{\beta}} = ((X'X)^{-1}X' \otimes I_k)\mathbf{y}$$

and the estimate of $\Sigma$ is

$$\hat{\Sigma} = (T - (kp + 1))^{-1} \sum_{t=1}^{T} \hat{\boldsymbol{\epsilon}}_t \hat{\boldsymbol{\epsilon}}_t{}'$$

where $\hat{\boldsymbol{\epsilon}}_t$ is the residual vectors. Consistency and asymptotic normality of the LS estimator are that

$$\sqrt{T}(\hat{\boldsymbol{\beta}} - \boldsymbol{\beta}) \xrightarrow{d} N(0, \Gamma_p^{-1} \otimes \Sigma)$$

where $X'X/T$ converges in probability to $\Gamma_p$ and $\xrightarrow{d}$ denotes convergence in distribution.

The (conditional) maximum likelihood estimator in the VAR($p$) model is equal to the (conditional) least squares estimator on the assumption of normality of the error vectors.

## Asymptotic Distributions of Impulse Response Functions

As before, *vec* denotes the column stacking operator and *vech* is the corresponding operator that stacks the elements on and below the diagonal. For any $k \times k$ matrix $A$, the commutation matrix $K_k$ is defined as $K_k \mathrm{vec}(A) = \mathrm{vec}(A')$; the duplication matrix $D_k$ is defined as $D_k \mathrm{vech}(A) = \mathrm{vec}(A)$; the elimination matrix $L_k$ is defined as $L_k \mathrm{vec}(A) = \mathrm{vech}(A)$.

The asymptotic distribution of the impulse response function (Lütkepohl 1993) is

$$\sqrt{T}\mathrm{vec}(\hat{\Psi}_j - \Psi_j) \xrightarrow{d} N(0, G_j \Sigma_{\boldsymbol{\beta}} G_j') \quad j = 1, 2, \ldots$$

where $\Sigma_{\boldsymbol{\beta}} = \Gamma_p^{-1} \otimes \Sigma$ and

$$G_j = \frac{\partial \mathrm{vec}(\Psi_j)}{\partial \boldsymbol{\beta}'} = \sum_{i=0}^{j-1} \mathbf{J}(\boldsymbol{\Phi}')^{j-1-i} \otimes \Psi_i$$

where $\mathbf{J} = [I_k, 0, \ldots, 0]$ is a $k \times kp$ matrix and $\boldsymbol{\Phi}$ is a $kp \times kp$ companion matrix.

The asymptotic distribution of the accumulated impulse response function is

$$\sqrt{T}\mathrm{vec}(\hat{\Psi}_l^a - \Psi_l^a) \xrightarrow{d} N(0, F_l \Sigma_{\boldsymbol{\beta}} F_l') \quad l = 1, 2, \ldots$$

where $F_l = \sum_{j=1}^{l} G_j$.

The asymptotic distribution of the orthogonalized impulse response function is

$$\sqrt{T}\mathrm{vec}(\hat{\Psi}_j^o - \Psi_j^o) \xrightarrow{d} N(0, C_j \Sigma_{\boldsymbol{\beta}} C_j' + \bar{C}_j \Sigma_{\boldsymbol{\sigma}} \bar{C}_j') \quad j = 0, 1, 2, \ldots$$

where $C_0 = 0$, $C_j = (\Psi_0^{o'} \otimes I_k) G_j$, $\bar{C}_j = (I_k \otimes \Psi_j) H$,

$$H = \frac{\partial \mathrm{vec}(\Psi_0^o)}{\partial \boldsymbol{\sigma}'} = L_k' \{L_k (I_{k^2} + K_k)(\Psi_0^o \otimes I_k) L_k'\}^{-1}$$

and $\Sigma_{\boldsymbol{\sigma}} = 2D_k^+ (\Sigma \otimes \Sigma) D_k^{+'}$ with $D_k^+ = (D_k' D_k)^{-1} D_k'$ and $\boldsymbol{\sigma} = \mathrm{vech}(\Sigma)$.

## Granger Causality Test

Let $\mathbf{y}_t$ be arranged and partitioned in subgroups $\mathbf{y}_{1t}$ and $\mathbf{y}_{2t}$ with dimensions $k_1$ and $k_2$, respectively ($k = k_1 + k_2$); that is, $\mathbf{y}_t = (\mathbf{y}'_{1t}, \mathbf{y}'_{2t})'$ with the corresponding white noise process $\boldsymbol{\epsilon}_t = (\boldsymbol{\epsilon}'_{1t}, \boldsymbol{\epsilon}'_{2t})'$. Consider the VAR($p$) model with partitioned coefficients $\Phi_{ij}(B)$ for $i, j = 1, 2$ as follows:

$$\begin{bmatrix} \Phi_{11}(B) & \Phi_{12}(B) \\ \Phi_{21}(B) & \Phi_{22}(B) \end{bmatrix} \begin{bmatrix} \mathbf{y}_{1t} \\ \mathbf{y}_{2t} \end{bmatrix} = \begin{bmatrix} \boldsymbol{\delta}_1 \\ \boldsymbol{\delta}_2 \end{bmatrix} + \begin{bmatrix} \boldsymbol{\epsilon}_{1t} \\ \boldsymbol{\epsilon}_{2t} \end{bmatrix}$$

The variables $\mathbf{y}_{1t}$ are said to cause $\mathbf{y}_{2t}$, but $\mathbf{y}_{2t}$ do not cause $\mathbf{y}_{1t}$ if $\Phi_{12}(B) = 0$. The implication of this model structure is that future values of the process $\mathbf{y}_{1t}$ are influenced only by its own past and not by the past of $\mathbf{y}_{2t}$, where future values of $\mathbf{y}_{2t}$ are influenced by the past of both $\mathbf{y}_{1t}$ and $\mathbf{y}_{2t}$. If the future $\mathbf{y}_{1t}$ are not influenced by the past values of $\mathbf{y}_{2t}$, then it can be better to model $\mathbf{y}_{1t}$ separately from $\mathbf{y}_{2t}$.

Consider testing $H_0: C\boldsymbol{\beta} = c$, where $C$ is a $s \times (k^2 p + k)$ matrix of rank $s$ and $c$ is an $s$-dimensional vector where $s = k_1 k_2 p$. Assuming that

$$\sqrt{T}(\hat{\boldsymbol{\beta}} - \boldsymbol{\beta}) \xrightarrow{d} N(0, \Gamma_p^{-1} \otimes \Sigma)$$

you get the Wald statistic

$$T(C\hat{\boldsymbol{\beta}} - c)'[C(\hat{\Gamma}_p^{-1} \otimes \hat{\Sigma})C']^{-1}(C\hat{\boldsymbol{\beta}} - c) \xrightarrow{d} \chi^2(s)$$

For the Granger causality test, the matrix $C$ consists of zeros or ones and $c$ is the zero vector. For more information about the Granger causality test, see Lütkepohl (1993).

## VARX Modeling

The vector autoregressive model with exogenous variables is called the VARX($p$,$s$) model. The form of the VARX($p$,$s$) model can be written as

$$\mathbf{y}_t = \boldsymbol{\delta} + \sum_{i=1}^{p} \Phi_i \mathbf{y}_{t-i} + \sum_{i=0}^{s} \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

The parameter estimates can be obtained by representing the general form of the multivariate linear model,

$$Y = XB + E \quad \text{or} \quad \mathbf{y} = (X \otimes I_k)\boldsymbol{\beta} + \mathbf{e}$$

where

$$\begin{aligned}
Y &= (\mathbf{y}_1, \ldots, \mathbf{y}_T)' \\
B &= (\boldsymbol{\delta}, \Phi_1, \ldots, \Phi_p, \Theta_0^*, \ldots, \Theta_s^*)' \\
X &= (X_0, \ldots, X_{T-1})' \\
X_t &= (1, \mathbf{y}'_t, \ldots, \mathbf{y}'_{t-p+1}, \mathbf{x}'_{t+1}, \ldots, \mathbf{x}'_{t-s+1})' \\
E &= (\boldsymbol{\epsilon}_1, \ldots, \boldsymbol{\epsilon}_T)' \\
\mathbf{y} &= \text{vec}(Y') \\
\boldsymbol{\beta} &= \text{vec}(B') \\
\mathbf{e} &= \text{vec}(E')
\end{aligned}$$

The conditional least squares estimator of $\beta$ can be obtained by using the same method in a VAR($p$) modeling. If the multivariate linear model has different independent variables that correspond to dependent variables, the SUR (seemingly unrelated regression) method is used to improve the regression estimates.

The following example fits the ordinary regression model:

```
proc varmax data=one;
   model y1-y3 = x1-x5;
run;
```

This is equivalent to the REG procedure in the SAS/STAT software:

```
proc reg data=one;
   model y1 = x1-x5;
   model y2 = x1-x5;
   model y3 = x1-x5;
run;
```

The following example fits the second-order lagged regression model:

```
proc varmax data=two;
   model y1 y2 = x / xlag=2;
run;
```

This is equivalent to the REG procedure in the SAS/STAT software:

```
data three;
   set two;
   xlag1 = lag1(x);
   xlag2 = lag2(x);
run;

proc reg data=three;
   model y1 = x xlag1 xlag2;
   model y2 = x xlag1 xlag2;
run;
```

The following example fits the ordinary regression model with different regressors:

```
proc varmax data=one;
   model y1 = x1-x3, y2 = x2 x3;
run;
```

This is equivalent to the following SYSLIN procedure statements:

```
proc syslin data=one vardef=df sur;
   endogenous y1 y2;
   model y1 = x1-x3;
   model y2 = x2 x3;
run;
```

From the output in Figure 43.25 in the section "Getting Started: VARMAX Procedure" on page 2978, you can see that the parameters, XL0_1_2, XL0_2_1, XL0_3_1, and XL0_3_2 associated with the exogenous variables, are not significant. The following example fits the VARX(1,0) model with different regressors:

```
proc varmax data=grunfeld;
   model y1 = x1, y2 = x2, y3 / p=1 print=(estimates);
run;
```

**Figure 43.64** Parameter Estimates for the VARX(1, 0) Model

**The VARMAX Procedure**

| | | XLag | |
|---|---|---|---|
| Lag | Variable | x1 | x2 |
| 0 | y1 | 1.83231 | _ |
| | y2 | _ | 2.42110 |
| | y3 | _ | _ |

As you can see in Figure 43.64, the symbol '_' in the elements of matrix corresponds to endogenous variables that do not take the denoted exogenous variables.

## Seasonal Dummies and Time Trends

You can use the NSEASON= option to introduce seasonal dummies into the model, and the TREND= option to introduce linear trend or both linear and quadratic trends into the model. The definition of the seasonal dummies and trends starts from the first observation after skipping the presample and the observations that have missing values. The size of the presample is $\max(p, s)$, where $p$ is the maximum number of lags of AR terms and $s$ is the maximum number of lags of exogenous variables; that is, the presample contains $\{\mathbf{y}_{-l+1}, \mathbf{x}_{-l+1}, \ldots, \mathbf{y}_0, \mathbf{x}_0\}$, where $l = \max(p, s)$.

The following statements fit a bivariate VARX(1, 2) model that has four seasonal periods and both linear and quadratic time trends:

```
data One;
   format date date9.;
   do obs = 1 to 100;
      date=intnx('quarter','01Jan1990'd,obs-1);
      y1 = normal(1); y2 = normal(1); x = normal(1);
      output;
   end;
run;

proc varmax data=One;
   model y1 y2 = x / nseason=4 xlag=2 p=1 trend=quad;
run;
```

In the following statements, the seasonal dummies and time trends are explicitly defined in the data set, together with the lags of dependent and exogenous variables, and then the equivalent model is fit by the REG procedure in SAS/STAT software:

```
data Two;
   set one;

## Bayesian VAR and VARX Modeling

Consider the VAR($p$) model

$$\mathbf{y}_t = \boldsymbol{\delta} + \Phi_1 \mathbf{y}_{t-1} + \cdots + \Phi_p \mathbf{y}_{t-p} + \boldsymbol{\epsilon}_t$$

or

$$\mathbf{y} = (X \otimes I_k)\boldsymbol{\beta} + \mathbf{e}$$

When the parameter vector $\boldsymbol{\beta}$ has a prior multivariate normal distribution with known mean $\boldsymbol{\beta}^*$ and covariance matrix $V_\beta$, the prior density is written as

$$f(\boldsymbol{\beta}) = (\frac{1}{2\pi})^{k^2 p/2} |V_\beta|^{-1/2} \exp[-\frac{1}{2}(\boldsymbol{\beta} - \boldsymbol{\beta}^*) V_\beta^{-1} (\boldsymbol{\beta} - \boldsymbol{\beta}^*)]$$

The likelihood function for the Gaussian process becomes

$$\begin{aligned} \ell(\boldsymbol{\beta}|\mathbf{y}) &= (\frac{1}{2\pi})^{kT/2} |I_T \otimes \Sigma|^{-1/2} \times \\ &\quad \exp[-\frac{1}{2}(\mathbf{y} - (X \otimes I_k)\boldsymbol{\beta})'(I_T \otimes \Sigma^{-1})(\mathbf{y} - (X \otimes I_k)\boldsymbol{\beta})] \end{aligned}$$

Therefore, the posterior density is derived as

$$f(\boldsymbol{\beta}|\mathbf{y}) \propto \exp[-\frac{1}{2}(\boldsymbol{\beta} - \bar{\boldsymbol{\beta}})' \bar{\Sigma}_\beta^{-1} (\boldsymbol{\beta} - \bar{\boldsymbol{\beta}})]$$

where the posterior mean is

$$\bar{\boldsymbol{\beta}} = [V_\beta^{-1} + (X'X \otimes \Sigma^{-1})]^{-1} [V_\beta^{-1} \boldsymbol{\beta}^* + (X' \otimes \Sigma^{-1})\mathbf{y}]$$

and the posterior covariance matrix is

$$\bar{\Sigma}_\beta = [V_\beta^{-1} + (X'X \otimes \Sigma^{-1})]^{-1}$$

In practice, the prior mean $\boldsymbol{\beta}^*$ and the prior variance $V_\beta$ need to be specified. If all the parameters are considered to shrink toward zero, the null prior mean should be specified. According to Litterman (1986), the prior variance can be given by

$$v_{ij}(l) = \begin{cases} (\lambda/l)^2 & \text{if } i = j \\ (\lambda\theta\sigma_{ii}/l\sigma_{jj})^2 & \text{if } i \neq j \end{cases}$$

where $v_{ij}(l)$ is the prior variance of the $(i, j)$ element of $\Phi_l$, $\lambda$ is the prior standard deviation of the diagonal elements of $\Phi_l$, $\theta$ is a constant in the interval $(0, 1)$, and $\sigma_{ii}^2$ is the $i$th diagonal element of $\Sigma$. The

deterministic terms have diffused prior variance. In practice, you replace the $\sigma_{ii}^2$ by the diagonal element of the ML estimator of $\Sigma$ in the nonconstrained model.

For example, for a bivariate BVAR(2) model,

$$\begin{aligned} y_{1t} &= 0 + \phi_{1,11} y_{1,t-1} + \phi_{1,12} y_{2,t-1} + \phi_{2,11} y_{1,t-2} + \phi_{2,12} y_{2,t-2} + \epsilon_{1t} \\ y_{2t} &= 0 + \phi_{1,21} y_{1,t-1} + \phi_{1,22} y_{2,t-1} + \phi_{2,21} y_{1,t-2} + \phi_{2,22} y_{2,t-2} + \epsilon_{2t} \end{aligned}$$

with the prior covariance matrix

$$\begin{aligned} V_\beta = \text{Diag} \quad ( \quad & \infty, \lambda^2, (\lambda\theta\sigma_1/\sigma_2)^2, (\lambda/2)^2, (\lambda\theta\sigma_1/2\sigma_2)^2, \\ & \infty, (\lambda\theta\sigma_2/\sigma_1)^2, \lambda^2, (\lambda\theta\sigma_2/2\sigma_1)^2, (\lambda/2)^2 \ ) \end{aligned}$$

For the Bayesian estimation of integrated systems, the prior mean is set to the first lag of each variable equal to one in its own equation and all other coefficients at zero. For example, for a bivariate BVAR(2) model,

$$\begin{aligned} y_{1t} &= 0 + 1\ y_{1,t-1} + 0\ y_{2,t-1} + 0\ y_{1,t-2} + 0\ y_{2,t-2} + \epsilon_{1t} \\ y_{2t} &= 0 + 0\ y_{1,t-1} + 1\ y_{2,t-1} + 0\ y_{1,t-2} + 0\ y_{2,t-2} + \epsilon_{2t} \end{aligned}$$

## Forecasting of BVAR Modeling

The mean squared error (MSE) is used to measure forecast accuracy (Litterman 1986). The MSE of the $s$-step-ahead forecast is

$$\text{MSE}_s = \frac{1}{J-s+1} \sum_{j=1}^{J-s+1} (A_{t_j} - F_{t_j}^s)^2$$

where $J$ is the number specified by NREP= option, $t_j$ is the time index of the observation to be forecasted in repetition $j$, $A_{t_j}$ is the actual value at time $t_j$, and $F_{t_j}^s$ is the forecast made $s$ periods earlier. If there are not enough observations, some MSEs might not be calculated.

## Bayesian VARX Modeling

The Bayesian vector autoregressive model with exogenous variables is called the BVARX($p$,$s$) model. The form of the BVARX($p$,$s$) model can be written as

$$\mathbf{y}_t = \boldsymbol{\delta} + \sum_{i=1}^{p} \Phi_i \mathbf{y}_{t-i} + \sum_{i=0}^{s} \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

The parameter estimates can be obtained by representing the general form of the multivariate linear model,

$$\mathbf{y} = (X \otimes I_k)\boldsymbol{\beta} + \mathbf{e}$$

The prior means for the AR coefficients are the same as those specified in BVAR($p$). The prior means for the exogenous coefficients are set to zero.

Some examples of the Bayesian VARX model are as follows:

```
model y1 y2 = x1 / p=1 xlag=1 prior;

model y1 y2 = x1 / p=(1 3) xlag=1 nocurrentx
                   prior=(lambda=0.9 theta=0.1);
```

## VARMA and VARMAX Modeling

A zero-mean VARMA($p, q$) process is written as

$$\mathbf{y}_t = \sum_{i=1}^{p} \Phi_i \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t - \sum_{i=1}^{q} \Theta_i \boldsymbol{\epsilon}_{t-i}$$

or

$$\Phi(B)\mathbf{y}_t = \Theta(B)\boldsymbol{\epsilon}_t$$

where $\Phi(B) = I_k - \sum_{i=1}^{p} \Phi_i B^i$ and $\Theta(B) = I_k - \sum_{i=1}^{q} \Theta_i B^i$.

### Stationarity and Invertibility

For stationarity and invertibility of the VARMA process, the roots of $|\Phi(z)| = 0$ and $|\Theta(z)| = 0$ are outside the unit circle.

### Parameter Estimation

Under the assumption of normality of the $\boldsymbol{\epsilon}_t$ with zero-mean vector and nonsingular covariance matrix $\Sigma$, the conditional (approximate) log-likelihood function of a zero-mean VARMA($p$,$q$) model is considered.

Define $Y = (\mathbf{y}_1, \ldots, \mathbf{y}_T)'$ and $E = (\boldsymbol{\epsilon}_1, \ldots, \boldsymbol{\epsilon}_T)'$ with $B^i Y = (\mathbf{y}_{1-i}, \ldots, \mathbf{y}_{T-i})'$ and $B^i E = (\boldsymbol{\epsilon}_{1-i}, \ldots, \boldsymbol{\epsilon}_{T-i})'$; define $\mathbf{y} = \mathrm{vec}(Y')$ and $\mathbf{e} = \mathrm{vec}(E')$. Then

$$\mathbf{y} - \sum_{i=1}^{p} (I_T \otimes \Phi_i) B^i \mathbf{y} = \mathbf{e} - \sum_{i=1}^{q} (I_T \otimes \Theta_i) B^i \mathbf{e}$$

where $B^i \mathbf{y} = \mathrm{vec}[(B^i Y)']$ and $B^i \mathbf{e} = \mathrm{vec}[(B^i E)']$.

Then, the conditional (approximate) log-likelihood function can be written as (Reinsel 1997)

$$\begin{aligned} \ell &= -\frac{T}{2} \log|\Sigma| - \frac{1}{2} \sum_{t=1}^{T} \boldsymbol{\epsilon}_t' \Sigma^{-1} \boldsymbol{\epsilon}_t \\ &= -\frac{T}{2} \log|\Sigma| - \frac{1}{2} \mathbf{w}' \Theta'^{-1} (I_T \otimes \Sigma^{-1}) \Theta^{-1} \mathbf{w} \end{aligned}$$

where $\mathbf{w} = \mathbf{y} - \sum_{i=1}^{p}(I_T \otimes \Phi_i)B^i\mathbf{y}$ and $\Theta$ is such that $\mathbf{e} - \sum_{i=1}^{q}(I_T \otimes \Theta_i)B^i\mathbf{e} = \Theta\mathbf{e}$. You can specify METHOD=CML in the MODEL statement to apply conditional maximum likelihood estimation.

For the exact log-likelihood function of a VARMA model, the VARMA model is transformed into the equivalent state space form and then the Kalman filtering method is applied.

The state space form of the zero-mean VARMA($p$,$q$) model consists of a state equation

$$\mathbf{z}_t = F\mathbf{z}_{t-1} + G\boldsymbol{\epsilon}_t$$

and an observation equation

$$\mathbf{y}_t = H\mathbf{z}_t$$

where

$$\mathbf{z}_t = (\mathbf{y}_t', \mathbf{y}_{t-1}', \ldots, \mathbf{y}_{t-(v-1)}', \boldsymbol{\epsilon}_t', \boldsymbol{\epsilon}_{t-1}, \ldots, \boldsymbol{\epsilon}_{t-(q-1)}')'$$

$$F = \begin{bmatrix} \Phi_1 & \cdots & \Phi_{v-1} & \Phi_v & -\Theta_1 & \cdots & -\Theta_{q-1} & -\Theta_q \\ I_k & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 \\ \vdots & \ddots & 0 & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \cdots & I_k & 0 & 0 & \cdots & 0 & 0 \\ 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 \\ 0 & \cdots & 0 & 0 & I_k & \cdots & 0 & 0 \\ \vdots & \ddots & 0 & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \cdots & 0 & 0 & 0 & \cdots & I_k & 0 \end{bmatrix}, \quad G = \begin{bmatrix} I_k \\ 0_{k(v-1)\times k} \\ I_k \\ 0_{k(q-1)\times k} \end{bmatrix}$$

and

$$H = [I_k, 0_{k(v+q-1)\times k}]$$

where $v = \max(p, 1)$ and $\Phi_i = 0$ for $i > p$.

The Kalman filtering approach is used to evaluate the likelihood function. The updating equation is

$$\hat{\mathbf{z}}_{t|t} = \hat{\mathbf{z}}_{t|t-1} + K_t\boldsymbol{\epsilon}_{t|t-1}$$

where

$$K_t = P_{t|t-1}H'[HP_{t|t-1}H']^{-1}$$

The prediction equation is

$$\hat{\mathbf{z}}_{t|t-1} = F\hat{\mathbf{z}}_{t-1|t-1}, \quad P_{t|t-1} = FP_{t-1|t-1}F' + G\Sigma G'$$

where $P_{t|t} = [I - K_tH]P_{t|t-1}$ for $t = 1, 2, \ldots, n$.

The log-likelihood function can be expressed as

$$\ell = -\frac{1}{2}\sum_{t=1}^{T}[\log|\Sigma_{t|t-1}| + (\mathbf{y}_t - \hat{\mathbf{y}}_{t|t-1})'\Sigma_{t|t-1}^{-1}(\mathbf{y}_t - \hat{\mathbf{y}}_{t|t-1})]$$

where $\hat{\mathbf{y}}_{t|t-1}$ and $\Sigma_{t|t-1}$ are determined recursively from the Kalman filtering method. To construct the likelihood function from Kalman filtering, you obtain $\hat{\mathbf{y}}_{t|t-1} = H\hat{\mathbf{z}}_{t|t-1}$, $\hat{\boldsymbol{\epsilon}}_{t|t-1} = \mathbf{y}_t - \hat{\mathbf{y}}_{t|t-1}$, and $\Sigma_{t|t-1} = HP_{t|t-1}H'$.

When you specify METHOD=ML in the MODEL statement, the exact log likelihood is evaluated and used in the maximum likelihood estimation.

Define the vector $\boldsymbol{\beta}$ as

$$\boldsymbol{\beta} = (\phi_1', \ldots, \phi_p', \theta_1', \ldots, \theta_q', \mathrm{vech}(\Sigma))'$$

where $\phi_i = \mathrm{vec}(\Phi_i)$ and $\theta_i = \mathrm{vec}(\Theta_i)$. All elements of $\boldsymbol{\beta}$ are estimated through the preceding (conditional) maximum likelihood method. The estimates of $\Phi_i, i = 1, \ldots, p$, and $\Theta_i, i = 1, \ldots, q$, are output in the ParameterEstimates ODS table. The estimates of the covariance matrix ($\Sigma$) are output in the CovarianceParameterEstimates ODS table. If you specify the OUTEST=, OUTCOV, PRINT=(COVB), or PRINT=(CORRB) option, you can see all elements of $\boldsymbol{\beta}$, including the covariance matrix $\Sigma$, in the parameter estimates, covariance of parameter estimates, or correlation of parameter estimates. You can also apply the BOUND, INITIAL, RESTRICT, and TEST statements to any elements of $\boldsymbol{\beta}$, including the covariance matrix $\Sigma$. For more information, see the syntax of the corresponding statement.

The (conditional) log-likelihood equations are solved by iterative numerical methods such as quasi-Newton optimization. The starting values for the AR and MA parameters are obtained from the least squares estimates. Although the small-sample properties of CML estimates might not be as good as the ML estimates, the CML method is much faster than the ML method. Depending on the sample size and number of parameters to be estimated, the CML method can be hundreds or even thousands of times faster than the ML method. In the following example code, the CML method is about 100 times faster than the ML method, with very similar estimation and forecast results:

```
proc iml;
   phi = (0.9 * I(4)) // (-0.7* I(4));
   theta = 0.8 * I(4);
   sig = I(4);
   /* to simulate the vector time series */
   call varmasim(y,phi,theta) sigma=sig n=400 seed=2;

   cn = {'y1' 'y2' 'y3' 'y4'};
   create simul6 from y[colname=cn];
   append from y;
   close;
quit;

proc varmax data=simul6;
   model y1 y2 y3 y4 / noint p=2 q=1 method=cml;
   nloptions pall maxit=5000 tech=qn;
   output out=ocml back=12 lead=24;
run;

proc varmax data=simul6;
   model y1 y2 y3 y4 / noint p=2 q=1 method=ml;
   nloptions pall maxit=5000 tech=qn;
   output out=oml back=12 lead=24;
run;
```

## Asymptotic Distribution of the Parameter Estimates

Under the assumptions of stationarity and invertibility for the VARMA model and the assumption that $\boldsymbol{\epsilon}_t$ is a white noise process, $\hat{\boldsymbol{\beta}}$ is a consistent estimator for $\boldsymbol{\beta}$ and $\sqrt{T}(\hat{\boldsymbol{\beta}} - \boldsymbol{\beta})$ converges in distribution to the multivariate normal $N(0, V^{-1})$ as $T \to \infty$, where $V$ is the asymptotic information matrix of $\boldsymbol{\beta}$.

## Asymptotic Distributions of Impulse Response Functions

Defining the vector $\boldsymbol{\beta}$

$$\boldsymbol{\beta} = (\phi_1', \ldots, \phi_p', \theta_1', \ldots, \theta_q')'$$

the asymptotic distribution of the impulse response function for a VARMA$(p, q)$ model is

$$\sqrt{T}\mathrm{vec}(\hat{\Psi}_j - \Psi_j) \xrightarrow{d} N(0, G_j \Sigma_{\boldsymbol{\beta}} G_j') \quad j = 1, 2, \ldots$$

where $\Sigma_{\boldsymbol{\beta}}$ is the covariance matrix of the parameter estimates and

$$G_j = \frac{\partial \mathrm{vec}(\Psi_j)}{\partial \boldsymbol{\beta}'} = \sum_{i=0}^{j-1} \mathbf{H}'(\mathbf{A}')^{j-1-i} \otimes \mathbf{J}\mathbf{A}^i\mathbf{J}'$$

where $\mathbf{H} = [I_k, 0, \ldots, 0, I_k, 0, \ldots, 0]'$ is a $k(p+q) \times k$ matrix with the second $I_k$ following after $p$ block matrices; $\mathbf{J} = [I_k, 0, \ldots, 0]$ is a $k \times k(p+q)$ matrix; $\mathbf{A}$ is a $k(p+q) \times k(p+q)$ matrix,

$$\mathbf{A} = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix}$$

where

$$A_{11} = \begin{bmatrix} \Phi_1 & \Phi_2 & \cdots & \Phi_{p-1} & \Phi_p \\ I_k & 0 & \cdots & 0 & 0 \\ 0 & I_k & \cdots & 0 & 0 \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & \cdots & I_k & 0 \end{bmatrix} \quad A_{12} = \begin{bmatrix} -\Theta_1 & \cdots & -\Theta_{q-1} & -\Theta_q \\ 0 & \cdots & 0 & 0 \\ 0 & \cdots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots \\ 0 & \cdots & 0 & 0 \end{bmatrix}$$

$A_{21}$ is a $kq \times kp$ zero matrix, and

$$A_{22} = \begin{bmatrix} 0 & 0 & \cdots & 0 & 0 \\ I_k & 0 & \cdots & 0 & 0 \\ 0 & I_k & \cdots & 0 & 0 \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & \cdots & I_k & 0 \end{bmatrix}$$

## An Example of a VARMA(1,1) Model

Consider a VARMA(1,1) model with mean zero,

$$\mathbf{y}_t = \Phi_1 \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t - \Theta_1 \boldsymbol{\epsilon}_{t-1}$$

where $\boldsymbol{\epsilon}_t$ is the white noise process with a mean zero vector and the positive-definite covariance matrix $\Sigma$.

The following IML procedure statements simulate a bivariate vector time series from this model to provide test data for the VARMAX procedure:

```
proc iml;
   sig = {1.0  0.5, 0.5 1.25};
   phi = {1.2 -0.5, 0.6 0.3};
   theta = {0.5 -0.2, 0.1 0.3};
   /* to simulate the vector time series */
   call varmasim(y,phi,theta) sigma=sig n=100 seed=34657;
   cn = {'y1' 'y2'};
   create simul3 from y[colname=cn];
   append from y;
run;
```

The following statements fit a VARMA(1,1) model to the simulated data. You specify the order of the autoregressive model by using the P= option and specify the order of moving-average model by using the Q= option. You specify the quasi-Newton optimization in the NLOPTIONS statement as an optimization method.

```
proc varmax data=simul3;
   nloptions tech=qn;
   model y1 y2 / p=1 q=1 noint print=(estimates);
run;
```

Figure 43.66 shows the initial values of parameters. The initial values were estimated by using the least squares method.

The fitted VARMA(1,1) model with estimated standard errors in parentheses is given as

$$\mathbf{y}_t = \begin{pmatrix} 1.01846 & -0.38682 \\ (0.10256) & (0.09644) \\ 0.39182 & 0.55281 \\ (0.10062) & (0.08422) \end{pmatrix} \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t - \begin{pmatrix} 0.32292 & -0.02160 \\ (0.14524) & (0.14203) \\ -0.16501 & 0.58576 \\ (0.15704) & (0.14115) \end{pmatrix} \boldsymbol{\epsilon}_{t-1}$$

and

$$\boldsymbol{\epsilon}_t \sim \text{iid } N(0, \begin{pmatrix} 1.25202 & 0.37950 \\ (0.17697) & (0.13401) \\ 0.37950 & 1.31315 \\ (0.13401) & (0.18610) \end{pmatrix}$$

## VARMAX Modeling

A general VARMAX$(p, q, s)$ process is written as

$$\mathbf{y}_t = \boldsymbol{\delta}_t + \sum_{i=1}^{p} \Phi_i \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t - \sum_{i=1}^{q} \Theta_i \boldsymbol{\epsilon}_{t-i}$$

or

$$\Phi(B)\mathbf{y}_t = \boldsymbol{\delta}_t + \Theta(B)\boldsymbol{\epsilon}_t$$

where $\Phi(B) = I_k - \sum_{i=1}^{p} \Phi_i B^i$ and $\Theta(B) = I_k - \sum_{i=1}^{q} \Theta_i B^i$. The vector $\boldsymbol{\delta}_t$ consists of all possible deterministic terms, namely constant, seasonal dummies, linear trend, quadratic trend, and exogenous variables. The vector $\boldsymbol{\delta}_t = \Delta \mathbf{c}_t$, where $\mathbf{c}_t = (D_t' \ \mathbf{x}_t' \ \ldots \ \mathbf{x}_{t-s}')'$; $D_t = (1 \ d_{t,1} \ \ldots \ d_{t,n_s-1} \ t \ t^2)'$; $d_{t,i}, i = 1, \ldots, n_s - 1$, are seasonal dummies and $n_s$ is based on the NSEASON= option; $\Delta = (A \ \Theta_0^* \ \ldots \Theta_s^*)$; $A$ is the parameter matrix corresponding to $D_t$ and $\Theta_i^*$ for $\mathbf{x}_{t-i}, i = 0, \ldots, s$.

The state space form of the VARMAX($p$,$q$,$s$) model consists of a state equation

$$\mathbf{z}_t = F\mathbf{z}_{t-1} + \mathbf{w}_t + G\boldsymbol{\epsilon}_t$$

and an observation equation

$$\mathbf{y}_t = H\mathbf{z}_t$$

where

$$\mathbf{z}_t = (\mathbf{y}_t', \mathbf{y}_{t-1}', \ldots, \mathbf{y}_{t-(v-1)}', \boldsymbol{\epsilon}_t', \boldsymbol{\epsilon}_{t-1}, \ldots, \boldsymbol{\epsilon}_{t-(q-1)}', \mathbf{c}_{t+1}')'$$

$$F = \begin{bmatrix} \Phi_1 & \cdots & \Phi_{v-1} & \Phi_v & -\Theta_1 & \cdots & -\Theta_{q-1} & -\Theta_q & \Delta \\ I_k & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 & 0 \\ \vdots & \ddots & 0 & \vdots & \vdots & \ddots & \vdots & \vdots & \vdots \\ 0 & \cdots & I_k & 0 & 0 & \cdots & 0 & 0 & 0 \\ 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 & 0 \\ 0 & \cdots & 0 & 0 & I_k & \cdots & 0 & 0 & 0 \\ \vdots & \ddots & 0 & \vdots & \vdots & \ddots & \vdots & \vdots & \vdots \\ 0 & \cdots & 0 & 0 & 0 & \cdots & I_k & 0 & 0 \end{bmatrix}, \quad G = \begin{bmatrix} I_k \\ 0_{k(v-1)\times k} \\ I_k \\ 0_{k(q-1)\times k} \\ 0_{u\times k} \end{bmatrix}$$

and

$$H = [I_k, 0_{(k(v+q-1)+u)\times k}]$$

where $v = \max(p, 1)$, $\Phi_i = 0$ for $i > p$, and $u$ is the dimension of $c_t$.

Kalman filtering is used to evaluate the likelihood function. The updating equation is

$$\hat{\mathbf{z}}_{t|t} = \hat{\mathbf{z}}_{t|t-1} + K_t \boldsymbol{\epsilon}_{t|t-1}$$

where

$$K_t = P_{t|t-1} H' [H P_{t|t-1} H']^{-1}$$

The prediction equation is

$$\hat{\mathbf{z}}_{t|t-1} = F \hat{\mathbf{z}}_{t-1|t-1} + \mathbf{w}_t, \quad P_{t|t-1} = F P_{t-1|t-1} F' + G \Sigma G'$$

where $P_{t|t} = [I - K_t H] P_{t|t-1}$ for $t = 1, 2, \ldots, n$.

The log-likelihood function can be expressed as

$$\ell = -\frac{1}{2} \sum_{t=1}^{T} [\log |\Sigma_{t|t-1}| + (\mathbf{y}_t - \hat{\mathbf{y}}_{t|t-1})' \Sigma_{t|t-1}^{-1} (\mathbf{y}_t - \hat{\mathbf{y}}_{t|t-1})]$$

where $\hat{\mathbf{y}}_{t|t-1}$ and $\Sigma_{t|t-1}$ are determined recursively from Kalman filtering. To construct the likelihood function from Kalman filtering, you obtain $\hat{\mathbf{y}}_{t|t-1} = H \hat{\mathbf{z}}_{t|t-1}$, $\hat{\boldsymbol{\epsilon}}_{t|t-1} = \mathbf{y}_t - \hat{\mathbf{y}}_{t|t-1}$, and $\Sigma_{t|t-1} = H P_{t|t-1} H'$.

In the preceding state space form of a VARMAX model, the exogenous variables are treated as determined terms, which implies that the values of the exogenous variables must be provided to forecast the out-of-sample dependent variables. If you do not have the future values of the exogenous variables, either you predict the exogenous variables in a separate model, or you express both the exogenous variables and the dependent variables in one combined model and predict them together (Reinsel 1997).

The dimension of the state space vector of the Kalman filtering method for the VARMAX(*p*,*q*,*s*) model might be large, so it might take a lot of time and memory for computing.

Two examples of VARMAX modeling follow:

```
model y1 y2 = x1 / q=1;
nloptions tech=qn;

model y1 y2 = x1 / p=1 q=1 xlag=1 nocurrentx;
nloptions tech=qn;
```

# Model Diagnostic Checks

## Multivariate Model Diagnostic Checks

### Log Likelihood

The log-likelihood function for the fitted model is reported in the LogLikelihood ODS table. The log-likelihood functions for different models are defined as follows:

- For VARMAX models that are estimated through the (conditional) maximum likelihood method, see the section "VARMA and VARMAX Modeling" on page 3104.
- For Bayesian VAR and VARX models, see the section "Bayesian VAR and VARX Modeling" on page 3102.
- For (Bayesian) vector error correction models, see the section "Vector Error Correction Modeling" on page 3119.
- For multivariate GARCH models, see the section "Multivariate GARCH Modeling" on page 3139.
- For VARFIMA and VARFIMAX models, see the section "VARFIMA and VARFIMAX Modeling" on page 3150.
- For VAR and VARX models that are estimated through the least squares (LS) method, the log likelihood is defined as

$$\ell = -\frac{1}{2}(T \log|\tilde{\Sigma}| + kT)$$

where $\tilde{\Sigma}$ is the maximum likelihood estimate of the innovation covariance matrix, $k$ is the number of dependent variables, and $T$ is the number of observations used in the estimation.

### Information Criteria

The information criteria include Akaike's information criterion (AIC), the corrected Akaike's information criterion (AICC), the final prediction error criterion (FPE), the Hannan-Quinn criterion (HQC), and the Schwarz Bayesian criterion (SBC, also referred to as BIC). These criteria are defined as

$$\begin{aligned}
\text{AIC} &= -2\ell + 2r \\
\text{AICC} &= -2\ell + 2rT/(T-r-1) \\
\text{FPE} &= (\frac{T+r_b}{T-r_b})^k|\tilde{\Sigma}| \\
\text{HQC} &= -2\ell + 2r\log(\log(T)) \\
\text{SBC} &= -2\ell + r\log(T)
\end{aligned}$$

where $\ell$ is the log likelihood, $r$ is the total number of parameters in the model, $k$ is the number of dependent variables, $T$ is the number of observations that are used to estimate the model, $r_b$ is the number of parameters

in each mean equation, and $\tilde{\Sigma}$ is the maximum likelihood estimate of $\Sigma$. As suggested by Burnham and Anderson (2004) for least squares estimation, the total number of parameters, $r$, must include the parameters in the innovation covariance matrix. When comparing models, choose the model that has the smallest criterion values.

For an example of the output, see Figure 43.4 earlier in this chapter.

#### *Portmanteau Statistic*

The portmanteau statistic, $Q_s$, is used to test whether correlation remains on the model residuals. The null hypothesis is that the residuals are uncorrelated. Let $C_\epsilon(l)$ be the residual cross-covariance matrices, $\hat{\rho}_\epsilon(l)$ be the residual cross-correlation matrices as

$$C_\epsilon(l) = T^{-1} \sum_{t=1}^{T-l} \boldsymbol{\epsilon}_t \boldsymbol{\epsilon}'_{t+l}$$

and

$$\hat{\rho}_\epsilon(l) = \hat{V}_\epsilon^{-1/2} C_\epsilon(l) \hat{V}_\epsilon^{-1/2} \text{ and } \hat{\rho}_\epsilon(-l) = \hat{\rho}_\epsilon(l)'$$

where $\hat{V}_\epsilon = \text{Diag}(\hat{\sigma}_{11}^2, \ldots, \hat{\sigma}_{kk}^2)$ and $\hat{\sigma}_{ii}^2$ are the diagonal elements of $\hat{\Sigma}$. The multivariate portmanteau test defined in Hosking (1980) is

$$Q_s = T^2 \sum_{l=1}^{s} (T-l)^{-1} \text{tr}\{\hat{\rho}_\epsilon(l) \hat{\rho}_\epsilon(0)^{-1} \hat{\rho}_\epsilon(-l) \hat{\rho}_\epsilon(0)^{-1}\}$$

The statistic $Q_s$ has approximately the chi-square distribution with $k^2(s-p-q)$ degrees of freedom. An example of the output is displayed in Figure 43.7.

### Univariate Model Diagnostic Checks

There are various ways to perform diagnostic checks for a univariate model. For more information, see the section "Testing for Nonlinear Dependence: Heteroscedasticity Tests" on page 405 in Chapter 9, "The AUTOREG Procedure." An example of the output is displayed in Figure 43.8 and Figure 43.9.

- Durbin-Watson (DW) statistics: The DW test statistics test for the first order autocorrelation in the residuals.
- Jarque-Bera normality test: This test is helpful in determining whether the model residuals represent a white noise process. This tests the null hypothesis that the residuals have normality.
- $F$ tests for autoregressive conditional heteroscedastic (ARCH) disturbances: $F$ test statistics test for the heteroscedastic disturbances in the residuals. This tests the null hypothesis that the residuals have equal covariances
- $F$ tests for AR disturbance: These test statistics are computed from the residuals of the univariate AR(1), AR(1,2), AR(1,2,3), and AR(1,2,3,4) models to test the null hypothesis that the residuals are uncorrelated.

## Cointegration

This section briefly introduces the concepts of cointegration (Johansen 1995a).

**Definition 1.** (Engle and Granger 1987): If a series $y_t$ with no deterministic components can be represented by a stationary and invertible ARMA process after differencing $d$ times, the series is integrated of order $d$, that is, $y_t \sim I(d)$.

**Definition 2.** (Engle and Granger 1987): If all elements of the vector $\mathbf{y}_t$ are $I(d)$ and there exists a cointegrating vector $\boldsymbol{\beta} \neq 0$ such that $\boldsymbol{\beta}'\mathbf{y}_t \sim I(d-b)$ for any $b > 0$, the vector process is said to be cointegrated $CI(d,b)$.

A simple example of a cointegrated process is the following bivariate system:

$$\begin{aligned} y_{1t} &= \gamma y_{2t} + \epsilon_{1t} \\ y_{2t} &= y_{2,t-1} + \epsilon_{2t} \end{aligned}$$

with $\epsilon_{1t}$ and $\epsilon_{2t}$ being uncorrelated white noise processes. In the second equation, $y_{2t}$ is a random walk, $\Delta y_{2t} = \epsilon_{2t}$, $\Delta \equiv 1 - B$. Differencing the first equation results in

$$\Delta y_{1t} = \gamma \Delta y_{2t} + \Delta \epsilon_{1t} = \gamma \epsilon_{2t} + \epsilon_{1t} - \epsilon_{1,t-1}$$

Thus, both $y_{1t}$ and $y_{2t}$ are $I(1)$ processes, but the linear combination $y_{1t} - \gamma y_{2t}$ is stationary. Hence $\mathbf{y}_t = (y_{1t}, y_{2t})'$ is cointegrated with a cointegrating vector $\boldsymbol{\beta} = (1, -\gamma)'$.

In general, if the vector process $\mathbf{y}_t$ has $k$ components, then there can be more than one cointegrating vector $\boldsymbol{\beta}'$. It is assumed that there are $r$ linearly independent cointegrating vectors with $r < k$, which make the $k \times r$ matrix $\boldsymbol{\beta}$. The rank of matrix $\boldsymbol{\beta}$ is $r$, which is called the *cointegration rank* of $\mathbf{y}_t$.

### Common Trends

This section briefly discusses the implication of cointegration for the moving-average representation. Let $\mathbf{y}_t$ be cointegrated $CI(1,1)$, then $\Delta\mathbf{y}_t$ has the Wold representation:

$$\Delta\mathbf{y}_t = \boldsymbol{\delta} + \Psi(B)\boldsymbol{\epsilon}_t$$

where $\boldsymbol{\epsilon}_t$ is iid$(0, \Sigma)$, $\Psi(B) = \sum_{j=0}^{\infty} \Psi_j B^j$ with $\Psi_0 = I_k$, and $\sum_{j=0}^{\infty} j|\Psi_j| < \infty$.

Assume that $\boldsymbol{\epsilon}_t = 0$ if $t \leq 0$ and $\mathbf{y}_0$ is a nonrandom initial value. Then the difference equation implies that

$$\mathbf{y}_t = \mathbf{y}_0 + \boldsymbol{\delta} t + \Psi(1) \sum_{i=0}^{t} \boldsymbol{\epsilon}_i + \Psi^*(B)\boldsymbol{\epsilon}_t$$

where $\Psi^*(B) = (1-B)^{-1}(\Psi(B) - \Psi(1))$ and $\Psi^*(B)$ is absolutely summable.

Assume that the rank of $\Psi(1)$ is $m = k - r$. When the process $\mathbf{y}_t$ is cointegrated, there is a cointegrating $k \times r$ matrix $\boldsymbol{\beta}$ such that $\boldsymbol{\beta}'\mathbf{y}_t$ is stationary.

Premultiplying $\mathbf{y}_t$ by $\boldsymbol{\beta}'$ results in

$$\boldsymbol{\beta}'\mathbf{y}_t = \boldsymbol{\beta}'\mathbf{y}_0 + \boldsymbol{\beta}'\Psi^*(B)\boldsymbol{\epsilon}_t$$

because $\boldsymbol{\beta}'\Psi(1) = 0$ and $\boldsymbol{\beta}'\boldsymbol{\delta} = 0$.

Stock and Watson (1988) showed that the cointegrated process $\mathbf{y}_t$ has a common trends representation derived from the moving-average representation. Since the rank of $\Psi(1)$ is $m = k - r$, there is a $k \times r$ matrix $H_1$ with rank $r$ such that $\Psi(1)H_1 = 0$. Let $H_2$ be a $k \times m$ matrix with rank $m$ such that $H_2'H_1 = 0$; then $A = C(1)H_2$ has rank $m$. The $H = (H_1, H_2)$ has rank $k$. By construction of $\mathbf{H}$,

$$\Psi(1)H = [0, A] = AS_m$$

where $S_m = (0_{m\times r}, I_m)$. Since $\boldsymbol{\beta}'\Psi(1) = 0$ and $\boldsymbol{\beta}'\boldsymbol{\delta} = 0$, $\boldsymbol{\delta}$ lies in the column space of $\Psi(1)$ and can be written

$$\boldsymbol{\delta} = \Psi(1)\tilde{\boldsymbol{\delta}}$$

where $\tilde{\boldsymbol{\delta}}$ is a $k$-dimensional vector. The common trends representation is written as

$$\begin{aligned}
\mathbf{y}_t &= \mathbf{y}_0 + \Psi(1)[\tilde{\boldsymbol{\delta}}t + \sum_{i=0}^{t}\boldsymbol{\epsilon}_i] + \Psi^*(B)\boldsymbol{\epsilon}_t \\
&= \mathbf{y}_0 + \Psi(1)H[H^{-1}\tilde{\delta}t + H^{-1}\sum_{i=0}^{t}\boldsymbol{\epsilon}_i] + \mathbf{a}_t \\
&= \mathbf{y}_0 + A\boldsymbol{\tau}_t + \mathbf{a}_t
\end{aligned}$$

and

$$\boldsymbol{\tau}_t = \pi + \boldsymbol{\tau}_{t-1} + \mathbf{v}_t$$

where $\mathbf{a}_t = \Psi^*(B)\boldsymbol{\epsilon}_t$, $\pi = S_m H^{-1}\tilde{\boldsymbol{\delta}}$, $\boldsymbol{\tau}_t = S_m[H^{-1}\tilde{\boldsymbol{\delta}}t + H^{-1}\sum_{i=0}^{t}\boldsymbol{\epsilon}_i]$, and $\mathbf{v}_t = S_m H^{-1}\boldsymbol{\epsilon}_t$.

Stock and Watson showed that the common trends representation expresses $\mathbf{y}_t$ as a linear combination of $m$ random walks ($\boldsymbol{\tau}_t$) with drift $\pi$ plus $I(0)$ components ($\mathbf{a}_t$).

## Test for the Common Trends

Stock and Watson (1988) proposed statistics for common trends testing. The null hypothesis is that the $k$-dimensional time series $\mathbf{y}_t$ has $m$ common stochastic trends, where $m \leq k$ and the alternative is that it has $s$ common trends, where $s < m$ . The test procedure of $m$ versus $s$ common stochastic trends is performed based on the first-order serial correlation matrix of $\mathbf{y}_t$. Let $\boldsymbol{\beta}_\perp$ be a $k \times m$ matrix orthogonal to the cointegrating matrix such that $\boldsymbol{\beta}_\perp'\boldsymbol{\beta} = 0$ and $\boldsymbol{\beta}_\perp\boldsymbol{\beta}_\perp' = I_m$. Let $\mathbf{z}_t = \boldsymbol{\beta}'\mathbf{y}_t$ and $\mathbf{w}_t = \boldsymbol{\beta}_\perp'\mathbf{y}_t$. Then

$$\mathbf{w}_t = \boldsymbol{\beta}_\perp'\mathbf{y}_0 + \boldsymbol{\beta}_\perp'\boldsymbol{\delta}t + \boldsymbol{\beta}_\perp'\Psi(1)\sum_{i=0}^{t}\boldsymbol{\epsilon}_i + \boldsymbol{\beta}_\perp'\Psi^*(B)\boldsymbol{\epsilon}_t$$

Combining the expression of $\mathbf{z}_t$ and $\mathbf{w}_t$,

$$\begin{bmatrix} \mathbf{z}_t \\ \mathbf{w}_t \end{bmatrix} = \begin{bmatrix} \boldsymbol{\beta}'\mathbf{y}_0 \\ \boldsymbol{\beta}_\perp'\mathbf{y}_0 \end{bmatrix} + \begin{bmatrix} 0 \\ \boldsymbol{\beta}_\perp'\boldsymbol{\delta} \end{bmatrix} t + \begin{bmatrix} 0 \\ \boldsymbol{\beta}_\perp'\Psi(1) \end{bmatrix} \sum_{i=1}^{t} \boldsymbol{\epsilon}_i + \begin{bmatrix} \boldsymbol{\beta}'\Psi^*(B) \\ \boldsymbol{\beta}_\perp'\Psi^*(B) \end{bmatrix} \boldsymbol{\epsilon}_t$$

The Stock-Watson common trends test is performed based on the component $\mathbf{w}_t$ by testing whether $\boldsymbol{\beta}_\perp'\Psi(1)$ has rank $m$ against rank $s$.

The following statements perform the Stock-Watson test for common trends:

```
proc iml;
   sig = 100*i(2);
   phi = {-0.2 0.1, 0.5 0.2, 0.8 0.7, -0.4 0.6};
   call varmasim(y,phi) sigma=sig n=100 initial=0
                        seed=45876;
   cn = {'y1' 'y2'};
   create simul2 from y[colname=cn];
   append from y;
quit;

data simul2;
   set simul2;
   date = intnx( 'year', '01jan1900'd, _n_-1 );
   format date year4. ;
run;

proc varmax data=simul2;
   model y1 y2 / p=2 cointtest=(sw);
run;
```

In Figure 43.71, the first column is the null hypothesis that $\mathbf{y}_t$ has $m \leq k$ common trends; the second column is the alternative hypothesis that $\mathbf{y}_t$ has $s < m$ common trends; the third column contains the eigenvalues used for the test statistics; the fourth column contains the test statistics using AR($p$) filtering of the data. The table shows the output of the case $p = 2$.

**Figure 43.71** Common Trends Test (COINTTEST=(SW) Option)

**The VARMAX Procedure**

**Common Trend Test**

| H0: Rank=m | H1: Rank=s | Eigenvalue | Filter | 5% Critical Value | Lag |
|---|---|---|---|---|---|
| **1** | **0** | 1.000906 | 0.09 | -14.10 | 2 |
| **2** | **0** | 0.996763 | -0.32 | -8.80 | |
| | **1** | 0.648908 | -35.11 | -23.00 | |

The test statistic for testing for 2 versus 1 common trends is more negative (–35.1) than the critical value (–23.0). Therefore, the test rejects the null hypothesis, which means that the series has a single common trend.

## Vector Error Correction Modeling

This section discusses the implication of cointegration for the autoregressive representation.

Consider the vector autoregressive process that has Gaussian errors defined by

$$\mathbf{y}_t = \sum_{i=1}^{p} \Phi_i \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t$$

or

$$\Phi(B)\mathbf{y}_t = \boldsymbol{\epsilon}_t$$

where the initial values, $\mathbf{y}_{-p+1}, \ldots, \mathbf{y}_0$, are fixed and $\boldsymbol{\epsilon}_t \sim N(0, \Sigma)$. The AR operator $\Phi(B)$ can be re-expressed as

$$\Phi(B) = \Phi^*(B)(1 - B) + \Phi(1)B$$

where

$$\Phi(1) = I_k - \Phi_1 - \Phi_2 - \cdots - \Phi_p, \Phi^*(B) = I_k - \sum_{i=1}^{p-1} \Phi_i^* B^i, \Phi_i^* = -\sum_{j=i+1}^{p} \Phi_j$$

The vector error correction model (VECM), also called the vector equilibrium correction model, is defined as

$$\Phi^*(B)(1 - B)\mathbf{y}_t = \boldsymbol{\alpha}\boldsymbol{\beta}'\mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t$$

or

$$\Delta\mathbf{y}_t = \boldsymbol{\alpha}\boldsymbol{\beta}'\mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta\mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t$$

where $\boldsymbol{\alpha}\boldsymbol{\beta}' = -\Phi(1)$.

### Granger Representation Theorem

Engle and Granger (1987) define

$$\Pi(z) \equiv (1 - z)I_k - \boldsymbol{\alpha}\boldsymbol{\beta}'z - \sum_{i=1}^{p-1} \Phi_i^*(1 - z)z^i$$

and the following assumptions hold:

1. $|\Pi(z)| = 0 \Rightarrow |z| > 1$ or $z = 1$.
2. The number of unit roots, $z = 1$, is exactly $k - r$.

3. $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ are $k \times r$ matrices, and their ranks are both $r$.

Then $y_t$ has the representation

$$y_t = C \sum_{i=1}^{t} \boldsymbol{\epsilon}_i + C^*(B)\boldsymbol{\epsilon}_t + y_0^*$$

where the Granger representation coefficient, $C$, is

$$C = \boldsymbol{\beta}_\perp \left[\boldsymbol{\alpha}_\perp' \Phi(1) \boldsymbol{\beta}_\perp\right]^{-1} \boldsymbol{\alpha}_\perp'$$

where the full-rank $k \times (k-r)$ matrix $\boldsymbol{\beta}_\perp$ is orthogonal to $\boldsymbol{\beta}$ and the full-rank $k \times (k-r)$ matrix $\boldsymbol{\alpha}_\perp$ is orthogonal to $\boldsymbol{\alpha}$. $C^*(B)\boldsymbol{\epsilon}_t = \sum_{j=1}^{\infty} C_j^* \boldsymbol{\epsilon}_{t-j}$ is an $I(0)$ process, and $y_0^*$ depends on the initial values.

The Granger representation coefficient $C$ can be defined only when the $(k-r) \times (k-r)$ matrix $\boldsymbol{\alpha}_\perp' \Phi(1) \boldsymbol{\beta}_\perp$ is invertible.

One motivation for the VECM($p$) form is to consider the relation $\boldsymbol{\beta}' \mathbf{y}_t = \mathbf{c}$ as defining the underlying economic relations. Assume that agents react to the disequilibrium error $\boldsymbol{\beta}' \mathbf{y}_t - \mathbf{c}$ through the adjustment coefficient $\boldsymbol{\alpha}$ to restore equilibrium. The cointegrating vector, $\boldsymbol{\beta}$, is sometimes called the long-run parameter.

Consider a vector error correction model that has a deterministic term, $D_t$, which can contain a constant, a linear trend, and seasonal dummy variables. Exogenous variables can also be included in the model. The model has the form

$$\Delta \mathbf{y}_t = \Pi \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + A D_t + \sum_{i=0}^{s} \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

where $\Pi = \boldsymbol{\alpha}\boldsymbol{\beta}'$.

The alternative vector error correction representation considers the error correction term at lag $t-p$ and is written as

$$\Delta \mathbf{y}_t = \sum_{i=1}^{p-1} \Phi_i^\sharp \Delta \mathbf{y}_{t-i} + \Pi^\sharp \mathbf{y}_{t-p} + A D_t + \sum_{i=0}^{s} \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

If the matrix $\Pi$ has a full rank ($r = k$), all components of $\mathbf{y}_t$ are $I(0)$. On the other hand, $\mathbf{y}_t$ are stationary in difference if $\mathrm{rank}(\Pi) = 0$. When the rank of the matrix $\Pi$ is $r < k$, there are $k - r$ linear combinations that are nonstationary and $r$ stationary cointegrating relations. Note that the linearly independent vector $\mathbf{z}_t = \boldsymbol{\beta}' \mathbf{y}_t$ is stationary and this transformation is not unique unless $r = 1$. There does not exist a unique cointegrating matrix $\boldsymbol{\beta}$ because the coefficient matrix $\Pi$ can also be decomposed as

$$\Pi = \boldsymbol{\alpha} M M^{-1} \boldsymbol{\beta}' = \boldsymbol{\alpha}^* \boldsymbol{\beta}^{*'}$$

where $M$ is an $r \times r$ nonsingular matrix.

## Test for Cointegration

The cointegration rank test determines the linearly independent columns of $\Pi$. Johansen and Juselius proposed the cointegration rank test by using the reduced rank regression (Johansen 1988, 1995b; Johansen and Juselius 1990).

### *Different Specifications of Deterministic Trends*

When you construct the VECM($p$) form from the VAR($p$) model, the deterministic terms in the VECM($p$) form can differ from those in the VAR($p$) model. When there are deterministic cointegrated relationships among variables, deterministic terms in the VAR($p$) model are not present in the VECM($p$) form. On the other hand, if there are stochastic cointegrated relationships in the VAR($p$) model, deterministic terms appear in the VECM($p$) form via the error correction term or as an independent term in the VECM($p$) form. There are five different specifications of deterministic trends in the VECM($p$) form.

- **Case 1:** There is no separate drift in the VECM($p$) form.

$$\Delta \mathbf{y}_t = \boldsymbol{\alpha}\boldsymbol{\beta}'\mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t$$

- **Case 2:** There is no separate drift in the VECM($p$) form, but a constant enters only via the error correction term.

$$\Delta \mathbf{y}_t = \boldsymbol{\alpha}(\boldsymbol{\beta}', \boldsymbol{\beta}_0)(\mathbf{y}_{t-1}', 1)' + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t$$

- **Case 3:** There is a separate drift and no separate linear trend in the VECM($p$) form.

$$\Delta \mathbf{y}_t = \boldsymbol{\alpha}\boldsymbol{\beta}'\mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \boldsymbol{\delta}_0 + \boldsymbol{\epsilon}_t$$

- **Case 4:** There is a separate drift and no separate linear trend in the VECM($p$) form, but a linear trend enters only via the error correction term.

$$\Delta \mathbf{y}_t = \boldsymbol{\alpha}(\boldsymbol{\beta}', \boldsymbol{\beta}_1)(\mathbf{y}_{t-1}', t)' + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \boldsymbol{\delta}_0 + \boldsymbol{\epsilon}_t$$

- **Case 5:** There is a separate linear trend in the VECM($p$) form.

$$\Delta \mathbf{y}_t = \boldsymbol{\alpha}\boldsymbol{\beta}'\mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \boldsymbol{\delta}_0 + \boldsymbol{\delta}_1 t + \boldsymbol{\epsilon}_t$$

First, focus on Cases 1, 3, and 5 to test the null hypothesis that there are at most $r$ cointegrating vectors. Let

$$\begin{aligned}
Z_{0t} &= \Delta \mathbf{y}_t \\
Z_{1t} &= \mathbf{y}_{t-1} \\
Z_{2t} &= [\Delta \mathbf{y}_{t-1}', \ldots, \Delta \mathbf{y}_{t-p+1}', D_t]' \\
Z_0 &= [Z_{01}, \ldots, Z_{0T}]' \\
Z_1 &= [Z_{11}, \ldots, Z_{1T}]' \\
Z_2 &= [Z_{21}, \ldots, Z_{2T}]'
\end{aligned}$$

where $D_t$ can be empty for Case 1, 1 for Case 3, and $(1, t)$ for Case 5.

In Case 2, $Z_{1t}$ and $Z_{2t}$ are defined as

$$\begin{aligned} Z_{1t} &= [\mathbf{y}'_{t-1}, 1]' \\ Z_{2t} &= [\Delta\mathbf{y}'_{t-1}, \ldots, \Delta\mathbf{y}'_{t-p+1}]' \end{aligned}$$

In Case 4, $Z_{1t}$ and $Z_{2t}$ are defined as

$$\begin{aligned} Z_{1t} &= [\mathbf{y}'_{t-1}, t]' \\ Z_{2t} &= [\Delta\mathbf{y}'_{t-1}, \ldots, \Delta\mathbf{y}'_{t-p+1}, 1]' \end{aligned}$$

Let $\Psi$ be the matrix of parameters consisting of $\Phi^*_1, \ldots, \Phi^*_{p-1}$, $A$, and $\Theta^*_0, \ldots, \Theta^*_s$, where parameter $A$ corresponds with the regressors $D_t$. Then the VECM($p$) form is rewritten in these variables as

$$Z_{0t} = \boldsymbol{\alpha}\boldsymbol{\beta}' Z_{1t} + \Psi Z_{2t} + \boldsymbol{\epsilon}_t$$

The log-likelihood function is given by

$$\begin{aligned} \ell &= -\frac{kT}{2}\log 2\pi - \frac{T}{2}\log|\Sigma| \\ &\quad -\frac{1}{2}\sum_{t=1}^{T}(Z_{0t} - \boldsymbol{\alpha}\boldsymbol{\beta}' Z_{1t} - \Psi Z_{2t})'\Sigma^{-1}(Z_{0t} - \boldsymbol{\alpha}\boldsymbol{\beta}' Z_{1t} - \Psi Z_{2t}) \end{aligned}$$

The residuals, $R_{0t}$ and $R_{1t}$, are obtained by regressing $Z_{0t}$ and $Z_{1t}$ on $Z_{2t}$, respectively. The regression equation of residuals is

$$R_{0t} = \boldsymbol{\alpha}\boldsymbol{\beta}' R_{1t} + \hat{\boldsymbol{\epsilon}}_t$$

The crossproducts matrices are computed

$$S_{ij} = \frac{1}{T}\sum_{t=1}^{T} R_{it} R'_{jt}, \quad i, j = 0, 1$$

Then the maximum likelihood estimator for $\boldsymbol{\beta}$ is obtained from the eigenvectors that correspond to the $r$ largest eigenvalues of the following equation:

$$|\lambda S_{11} - S_{10} S_{00}^{-1} S_{01}| = 0$$

The eigenvalues of the preceding equation are squared canonical correlations between $R_{0t}$ and $R_{1t}$, and the eigenvectors that correspond to the $r$ largest eigenvalues are the $r$ linear combinations of $\mathbf{y}_{t-1}$, which have the largest squared partial correlations with the stationary process $\Delta\mathbf{y}_t$ after correcting for lags and deterministic terms. Such an analysis calls for a reduced rank regression of $\Delta\mathbf{y}_t$ on $\mathbf{y}_{t-1}$ corrected for $(\Delta\mathbf{y}_{t-1}, \ldots, \Delta\mathbf{y}_{t-p+1}, D_t)$, as discussed by Anderson (1951). Johansen (1988) suggests two test statistics to test the null hypothesis that there are at most $r$ cointegrating vectors

$$\mathrm{H}_0 : \lambda_i = 0 \text{ for } i = r+1, \ldots, k$$

### *Trace Test*

The trace statistic for testing the null hypothesis that there are at most $r$ cointegrating vectors is as follows:

$$\lambda_{\text{trace}} = -T \sum_{i=r+1}^{k} \log(1 - \lambda_i)$$

The asymptotic distribution of this statistic is given by

$$\text{tr}\left\{ \int_0^1 (dW)\tilde{W}' \left( \int_0^1 \tilde{W}\tilde{W}' dr \right)^{-1} \int_0^1 \tilde{W}(dW)' \right\}$$

where $\text{tr}(A)$ is the trace of a matrix $A$, $W$ is the $k - r$ dimensional Brownian motion, and $\tilde{W}$ is the Brownian motion itself, or the de-meaned or detrended Brownian motion according to the different specifications of deterministic trends in the vector error correction model.

### *Maximum Eigenvalue Test*

The maximum eigenvalue statistic for testing the null hypothesis that there are at most $r$ cointegrating vectors is as follows:

$$\lambda_{\max} = -T \log(1 - \lambda_{r+1})$$

The asymptotic distribution of this statistic is given by

$$\max\{ \int_0^1 (dW)\tilde{W}' ( \int_0^1 \tilde{W}\tilde{W}' dr )^{-1} \int_0^1 \tilde{W}(dW)' \}$$

where $\max(A)$ is the maximum eigenvalue of a matrix $A$. Osterwald-Lenum (1992) provided detailed tables of the critical values of these statistics.

The following statements use the JOHANSEN option to compute the Johansen cointegration rank trace test of integrated order 1:

```
proc varmax data=simul2;
   model y1 y2 / p=2 cointtest=(johansen=(normalize=y1));
run;
```

Figure 43.72 shows the output based on the model specified in the MODEL statement. An intercept term is assumed. In the "Cointegration Rank Test Using Trace" table, the column Drift in ECM indicates that there is no separate drift in the error correction model, and the column Drift in Process indicates that the process has a constant drift before differencing. The "Cointegration Rank Test Using Trace" table shows the trace statistics and $p$-values based on Case 3, and the "Cointegration Rank Test Using Trace under Restriction" table shows the trace statistics and $p$-values based on Case 2. For a specified significance level, such as 5%, the output indicates that the null hypothesis that the series are not cointegrated (H0: Rank = 0) can be rejected, because the $p$-values for both Case 2 and Case 3 are less than 0.05. The output also shows that the null hypothesis that the series are cointegrated with rank 1 (H0: Rank = 1) cannot be rejected for either Case 2 or Case 3, because the $p$-values for these tests are both greater than 0.05.

**Figure 43.72** Cointegration Rank Test (COINTTEST=(JOHANSEN=) Option)

**The VARMAX Procedure**

**Cointegration Rank Test Using Trace**

| H0: Rank=r | H1: Rank>r | Eigenvalue | Trace | Pr > Trace | Drift in ECM | Drift in Process |
|---|---|---|---|---|---|---|
| 0 | 0 | 0.4644 | 61.7522 | <.0001 | Constant | Linear |
| 1 | 1 | 0.0056 | 0.5552 | 0.4559 | | |

**Cointegration Rank Test Using Trace Under Restriction**

| H0: Rank=r | H1: Rank>r | Eigenvalue | Trace | Pr > Trace | Drift in ECM | Drift in Process |
|---|---|---|---|---|---|---|
| 0 | 0 | 0.5209 | 76.3788 | <.0001 | Constant | Constant |
| 1 | 1 | 0.0426 | 4.2680 | 0.3741 | | |

Figure 43.73 shows which result, either Case 2 (the hypothesis H0) or Case 3 (the hypothesis H1), is appropriate depending on the significance level. Since the cointegration rank is chosen to be 1 by the result in Figure 43.72, look at the last row that corresponds to rank=1. Since the *p*-value is 0.054, the Case 2 cannot be rejected at the significance level 5%, but it can be rejected at the significance level 10%. For modeling of the two Case 2 and Case 3, see Figure 43.76 and Figure 43.77.

**Figure 43.73** Cointegration Rank Test, Continued

**Hypothesis of the Restriction**

| Hypothesis | Drift in ECM | Drift in Process |
|---|---|---|
| H0(Case 2) | Constant | Constant |
| H1(Case 3) | Constant | Linear |

**Hypothesis Test of the Restriction**

| Rank | Eigenvalue | Restricted Eigenvalue | DF | Chi-Square | Pr > ChiSq |
|---|---|---|---|---|---|
| 0 | 0.4644 | 0.5209 | 2 | 14.63 | 0.0007 |
| 1 | 0.0056 | 0.0426 | 1 | 3.71 | 0.0540 |

Figure 43.74 shows the estimates of long-run parameter (Beta) and adjustment coefficients (Alpha) based on Case 3.

**Figure 43.74** Cointegration Rank Test, Continued

**Beta**

| Variable | 1 | 2 |
|---|---|---|
| y1 | 1.00000 | 1.00000 |
| y2 | -2.04869 | -0.02854 |

**Alpha**

| Variable | 1 | 2 |
|---|---|---|
| y1 | -0.46421 | -0.00502 |
| y2 | 0.17535 | -0.01275 |

Using the NORMALIZE= option, the first row of the "Beta" table has 1. Considering that the cointegration rank is 1, the long-run relationship of the series is

$$\begin{aligned} \boldsymbol{\beta}' y_t &= \begin{bmatrix} 1 & -2.04869 \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix} \\ &= y_{1t} - 2.04869 y_{2t} \\ y_{1t} &= 2.04869 y_{2t} \end{aligned}$$

Figure 43.75 shows the estimates of long-run parameter (Beta) and adjustment coefficients (Alpha) based on Case 2.

**Figure 43.75** Cointegration Rank Test, Continued

| Beta Under Restriction | | |
|---|---|---|
| **Variable** | **1** | **2** |
| **y1** | 1.00000 | 1.00000 |
| **y2** | -2.04366 | -2.75773 |
| **1** | 6.75919 | 101.37051 |

| Alpha Under Restriction | | |
|---|---|---|
| **Variable** | **1** | **2** |
| **y1** | -0.48015 | 0.01091 |
| **y2** | 0.12538 | 0.03722 |

Considering that the cointegration rank is 1, the long-run relationship of the series is

$$\begin{aligned} \boldsymbol{\beta}' y_t &= \begin{bmatrix} 1 & -2.04366 & 6.75919 \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \\ 1 \end{bmatrix} \\ &= y_{1t} - 2.04366\, y_{2t} + 6.75919 \\ y_{1t} &= 2.04366\, y_{2t} - 6.75919 \end{aligned}$$

## Estimation of Vector Error Correction Model

The preceding log-likelihood function is maximized for

$$\begin{aligned} \hat{\boldsymbol{\beta}} &= S_{11}^{-1/2}[v_1, \ldots, v_r] \\ \hat{\boldsymbol{\alpha}} &= S_{01}\hat{\boldsymbol{\beta}}(\hat{\boldsymbol{\beta}}' S_{11} \hat{\boldsymbol{\beta}})^{-1} \\ \hat{\Pi} &= \hat{\boldsymbol{\alpha}}\hat{\boldsymbol{\beta}}' \\ \hat{\Psi}' &= (Z_2' Z_2)^{-1} Z_2' (Z_0 - Z_1 \hat{\Pi}') \\ \hat{\Sigma} &= (Z_0 - Z_2\hat{\Psi}' - Z_1\hat{\Pi}')'(Z_0 - Z_2\hat{\Psi}' - Z_1\hat{\Pi}')/T \end{aligned}$$

The estimators of the orthogonal complements of $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ are

$$\hat{\boldsymbol{\beta}}_\perp = S_{11}[v_{r+1}, \ldots, v_k]$$

and

$$\hat{\boldsymbol{\alpha}}_{\perp} = S_{00}^{-1} S_{01}[v_{r+1}, \ldots, v_k]$$

Let $\vartheta$ denote the parameter vector $(\mathrm{vec}(\boldsymbol{\alpha}, \Psi)', \mathrm{vech}(\Sigma)')'$. The covariance of parameter estimates $\hat{\vartheta}$ is obtained as the inverse of the negative Hessian matrix $H \equiv \frac{\partial^2 \ell}{\partial \vartheta \partial \vartheta'}$. Because $\hat{\Pi} = \hat{\boldsymbol{\alpha}}\hat{\boldsymbol{\beta}}'$, the variance of $\hat{\Pi}$ and the covariance between $\hat{\Pi}$ and $\hat{\vartheta}$ are calculated as follows:

$$\mathrm{cov}(\mathrm{vec}(\hat{\Pi}), \mathrm{vec}(\hat{\Pi})) = (\hat{\boldsymbol{\beta}} \otimes I_k)\mathrm{cov}(\mathrm{vec}(\hat{\boldsymbol{\alpha}}), \mathrm{vec}(\hat{\boldsymbol{\alpha}}))(\hat{\boldsymbol{\beta}} \otimes I_k)'$$

$$\mathrm{cov}(\mathrm{vec}(\hat{\Pi}), \hat{\vartheta}) = (\hat{\boldsymbol{\beta}} \otimes I_k)\mathrm{cov}(\mathrm{vec}(\hat{\boldsymbol{\alpha}}), \hat{\vartheta})$$

For Case 2 (Case 4), because the coefficient vector $\hat{\boldsymbol{\delta}}_0$ ($\hat{\boldsymbol{\delta}}_1$) for the constant term (the linear trend term) is the product of $\hat{\boldsymbol{\alpha}}$ and $\hat{\boldsymbol{\beta}}_0$ ($\hat{\boldsymbol{\beta}}_1$), the variance of $\hat{\boldsymbol{\delta}}_0$ ($\hat{\boldsymbol{\delta}}_1$) and the covariance between $\hat{\boldsymbol{\delta}}_0$ ($\hat{\boldsymbol{\delta}}_1$) and $\hat{\vartheta}$ are calculated as follows:

$$\mathrm{cov}(\hat{\boldsymbol{\delta}}_i, \hat{\boldsymbol{\delta}}_i) = (\hat{\boldsymbol{\beta}}_i' \otimes I_k)\mathrm{cov}(\mathrm{vec}(\hat{\boldsymbol{\alpha}}), \mathrm{vec}(\hat{\boldsymbol{\alpha}}))(\hat{\boldsymbol{\beta}}_i' \otimes I_k)', \quad i = 0 \text{ or } 1$$

$$\mathrm{cov}(\hat{\boldsymbol{\delta}}_i, \hat{\vartheta}) = (\hat{\boldsymbol{\beta}}_i' \otimes I_k)\mathrm{cov}(\mathrm{vec}(\hat{\boldsymbol{\alpha}}), \hat{\vartheta}), \quad i = 0 \text{ or } 1$$

The following statements are examples of fitting the five different cases of the vector error correction models mentioned in the previous section.

For fitting Case 1,

```
model y1 y2 / p=2 noint;
cointeg rank=1 normalize=y1;
```

For fitting Case 2,

```
model y1 y2 / p=2;
cointeg rank=1 normalize=y1 ectrend;
```

For fitting Case 3,

```
model y1 y2 / p=2;
cointeg rank=1 normalize=y1;
```

For fitting Case 4,

```
model y1 y2 / p=2 trend=linear;
cointeg rank=1 normalize=y1 ectrend;
```

For fitting Case 5,

```
model y1 y2 / p=2 trend=linear;
cointeg rank=1 normalize=y1;
```

In the previous example, the output from the COINTTEST=(JOHANSEN) option shown in Figure 43.73 indicates that you can fit the model by using either Case 2 or Case 3 because the test of the restriction was not significant at the 0.05 level, but was significant at the 0.10 level. Following both models are fit to show the differences in the displayed output. Figure 43.76 is for Case 2, and Figure 43.77 is for Case 3.

For Case 2,

```
proc varmax data=simul2;
   model y1 y2 / p=2 print=(estimates);
   cointeg rank=1 normalize=y1 ectrend;
run;
```

| | AR2_2_2 | -0.51194 | 0.05643 | -9.07 | <.0001 | D_y2(t-1) |

Figure 43.77 can be reported as follows:

$$\Delta \mathbf{y}_t = \begin{bmatrix} -0.46421 & 0.95103 \\ 0.17535 & -0.35293 \end{bmatrix} \mathbf{y}_{t-1} + \begin{bmatrix} -0.74052 & -0.76305 \\ 0.34820 & -0.51194 \end{bmatrix} \Delta \mathbf{y}_{t-1} + \begin{bmatrix} -2.60825 \\ 3.43005 \end{bmatrix} + \boldsymbol{\epsilon}_t$$

## A Test for the Long-Run Relations

Consider the example with the variables $m_t$ log real money, $y_t$ log real income, $i_t^d$ deposit interest rate, and $i_t^b$ bond interest rate. It seems a natural hypothesis that in the long-run relation, money and income have equal coefficients with opposite signs. This can be formulated as the hypothesis that the cointegrated relation contains only $m_t$ and $y_t$ through $m_t - y_t$. For the analysis, you can express these restrictions in the parameterization of **H** such that $\boldsymbol{\beta} = H\phi$, where **H** is a known $k \times s$ matrix and $\psi$ is the $s \times r (r \leq s < k)$ parameter matrix to be estimated. For this example, **H** is given by

$$H = \begin{bmatrix} 1 & 0 & 0 \\ -1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

**Restriction** $H_0: \boldsymbol{\beta} = H\phi$

When the linear restriction $\boldsymbol{\beta} = H\phi$ is given, it implies that the same restrictions are imposed on all cointegrating vectors. You obtain the maximum likelihood estimator of $\boldsymbol{\beta}$ by reduced rank regression of $\Delta \mathbf{y}_t$ on $H\mathbf{y}_{t-1}$ corrected for $(\Delta \mathbf{y}_{t-1}, \ldots, \Delta \mathbf{y}_{t-p+1}, D_t)$, solving the following equation,

$$|\rho H' S_{11} H - H' S_{10} S_{00}^{-1} S_{01} H| = 0$$

for the eigenvalues $1 > \rho_1 > \cdots > \rho_s > 0$ and eigenvectors $(v_1, \ldots, v_s)$, $S_{ij}$ given in the preceding section. Then choose $\hat{\phi} = (v_1, \ldots, v_r)$ that corresponds to the $r$ largest eigenvalues, and the $\hat{\boldsymbol{\beta}}$ is $H\hat{\phi}$.

The test statistic for $H_0: \boldsymbol{\beta} = H\phi$ is given by

$$T \sum_{i=1}^{r} \log\{(1-\rho_i)/(1-\lambda_i)\} \xrightarrow{d} \chi^2_{r(k-s)}$$

If the series has no deterministic trend, the constant term should be restricted by $\boldsymbol{\alpha}'_{\perp} \boldsymbol{\delta}_0 = 0$ as in Case 2. Then **H** is given by

$$H = \begin{bmatrix} 1 & 0 & 0 & 0 \\ -1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

The following statements test that $2\,\beta_1 + \beta_2 = 0$:

```
proc varmax data=simul2;
   model y1 y2 / p=2;
   cointeg rank=1 h=(1,-2) normalize=y1;
run;
```

Figure 43.78 shows the results of testing $H_0: 2\beta_1 + \beta_2 = 0$. The input **H** matrix is $H = (1 - 2)'$. The adjustment coefficient is reestimated under the restriction, and the test indicates that you cannot reject the null hypothesis.

## Test for the Weak Exogeneity and Restrictions of Alpha

Consider a vector error correction model:

$$\Delta \mathbf{y}_t = \boldsymbol{\alpha}\boldsymbol{\beta}'\mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + A D_t + \boldsymbol{\epsilon}_t$$

Divide the process $\mathbf{y}_t$ into $(\mathbf{y}_{1t}', \mathbf{y}_{2t}')'$ with dimension $k_1$ and $k_2$ and the $\Sigma$ into

$$\Sigma = \begin{bmatrix} \Sigma_{11} & \Sigma_{12} \\ \Sigma_{21} & \Sigma_{22} \end{bmatrix}$$

Similarly, the parameters can be decomposed as follows:

$$\boldsymbol{\alpha} = \begin{bmatrix} \boldsymbol{\alpha}_1 \\ \boldsymbol{\alpha}_2 \end{bmatrix} \quad \Phi_i^* = \begin{bmatrix} \Phi_{1i}^* \\ \Phi_{2i}^* \end{bmatrix} \quad A = \begin{bmatrix} A_1 \\ A_2 \end{bmatrix}$$

Then the VECM($p$) form can be rewritten by using the decomposed parameters and processes:

$$\begin{bmatrix} \Delta \mathbf{y}_{1t} \\ \Delta \mathbf{y}_{2t} \end{bmatrix} = \begin{bmatrix} \boldsymbol{\alpha}_1 \\ \boldsymbol{\alpha}_2 \end{bmatrix} \boldsymbol{\beta}' \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \begin{bmatrix} \Phi_{1i}^* \\ \Phi_{2i}^* \end{bmatrix} \Delta \mathbf{y}_{t-i} + \begin{bmatrix} A_1 \\ A_2 \end{bmatrix} D_t + \begin{bmatrix} \boldsymbol{\epsilon}_{1t} \\ \boldsymbol{\epsilon}_{2t} \end{bmatrix}$$

The conditional model for $\mathbf{y}_{1t}$ given $\mathbf{y}_{2t}$ is

$$\begin{aligned} \Delta \mathbf{y}_{1t} &= \omega \Delta \mathbf{y}_{2t} + (\alpha_1 - \omega\alpha_2)\boldsymbol{\beta}'\mathbf{y}_{t-1} + \sum_{i=1}^{p-1} (\Phi_{1i}^* - \omega\Phi_{2i}^*)\Delta \mathbf{y}_{t-i} \\ &\quad + (A_1 - \omega A_2) D_t + \boldsymbol{\epsilon}_{1t} - \omega \boldsymbol{\epsilon}_{2t} \end{aligned}$$

and the marginal model of $\mathbf{y}_{2t}$ is

$$\Delta \mathbf{y}_{2t} = \alpha_2 \boldsymbol{\beta}' \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_{2i}^* \Delta \mathbf{y}_{t-i} + A_2 D_t + \boldsymbol{\epsilon}_{2t}$$

where $\omega = \Sigma_{12}\Sigma_{22}^{-1}$.

The test of weak exogeneity of $\mathbf{y}_{2t}$ for the parameters $(\alpha_1, \boldsymbol{\beta})$ determines whether $\alpha_2 = 0$. Weak exogeneity means that there is no information about $\boldsymbol{\beta}$ in the marginal model or that the variables $\mathbf{y}_{2t}$ do not react to a disequilibrium.

**Restriction** $H_0: \boldsymbol{\alpha} = J\psi$

Consider the null hypothesis $H_0: \boldsymbol{\alpha} = J\psi$, where $J$ is a $k \times m$ matrix with $r \leq m < k$.

From the previous residual regression equation

$$R_{0t} = \boldsymbol{\alpha}\boldsymbol{\beta}' R_{1t} + \hat{\boldsymbol{\epsilon}}_t = J\psi\boldsymbol{\beta}' R_{1t} + \hat{\boldsymbol{\epsilon}}_t$$

you can obtain

$$\begin{aligned} \bar{J}' R_{0t} &= \psi\boldsymbol{\beta}' R_{1t} + \bar{J}'\hat{\boldsymbol{\epsilon}}_t \\ J_\perp' R_{0t} &= J_\perp'\hat{\boldsymbol{\epsilon}}_t \end{aligned}$$

where $\bar{J} = J(J'J)^{-1}$ and $J_\perp$ is orthogonal to $J$ such that $J_\perp' J = 0$.

Define

$$\Sigma_{JJ_\perp} = \bar{J}'\Sigma J_\perp \text{ and } \Sigma_{J_\perp J_\perp} = J_\perp'\Sigma J_\perp$$

and let $\omega = \Sigma_{JJ_\perp}\Sigma_{J_\perp J_\perp}^{-1}$. Then $\bar{J}' R_{0t}$ can be written as

$$\bar{J}' R_{0t} = \psi\boldsymbol{\beta}' R_{1t} + \omega J_\perp' R_{0t} + \bar{J}'\hat{\boldsymbol{\epsilon}}_t - \omega J_\perp'\hat{\boldsymbol{\epsilon}}_t$$

Using the marginal distribution of $J_\perp' R_{0t}$ and the conditional distribution of $\bar{J}' R_{0t}$, the new residuals are computed as

$$\begin{aligned} \tilde{R}_{Jt} &= \bar{J}' R_{0t} - S_{JJ_\perp} S_{J_\perp J_\perp}^{-1} J_\perp' R_{0t} \\ \tilde{R}_{1t} &= R_{1t} - S_{1J_\perp} S_{J_\perp J_\perp}^{-1} J_\perp' R_{0t} \end{aligned}$$

where

$$S_{JJ_\perp} = \bar{J}' S_{00} J_\perp, \quad S_{J_\perp J_\perp} = J_\perp' S_{00} J_\perp, \text{ and } S_{J_\perp 1} = J_\perp' S_{01}$$

In terms of $\tilde{R}_{Jt}$ and $\tilde{R}_{1t}$, the MLE of $\boldsymbol{\beta}$ is computed by using the reduced rank regression. Let

$$S_{ij.J_\perp} = \frac{1}{T}\sum_{t=1}^{T} \tilde{R}_{it}\tilde{R}_{jt}', \text{ for } i, j = 1, J$$

Under the null hypothesis $H_0: \boldsymbol{\alpha} = J\psi$, the MLE $\tilde{\boldsymbol{\beta}}$ is computed by solving the equation

$$|\rho S_{11.J_\perp} - S_{1J.J_\perp} S_{JJ.J_\perp}^{-1} S_{J1.J_\perp}| = 0$$

Then $\tilde{\boldsymbol{\beta}} = (v_1, \ldots, v_r)$, where the eigenvectors correspond to the $r$ largest eigenvalues and are normalized such that $\tilde{\boldsymbol{\beta}}' S_{11.J_\perp} \tilde{\boldsymbol{\beta}} = I_r$; $\tilde{\boldsymbol{\alpha}} = J S_{J1.J_\perp} \tilde{\boldsymbol{\beta}}$. The likelihood ratio test for $H_0: \boldsymbol{\alpha} = J\psi$ is

$$T \sum_{i=1}^{r} \log\{(1-\rho_i)/(1-\lambda_i)\} \xrightarrow{d} \chi^2_{r(k-m)}$$

For more information, see Theorem 6.1 in Johansen and Juselius (1990).

The test of weak exogeneity of $\mathbf{y}_{2t}$ is a special case of the test $\boldsymbol{\alpha} = J\psi$, considering $J = (I_{k_1}, 0)'$. Consider the previous example with four variables ( $m_t, y_t, i_t^b, i_t^d$ ). If $r = 1$, you formulate the weak exogeneity of $(y_t, i_t^b, i_t^d)$ for $m_t$ as $J = [0, I_3]'$ and the weak exogeneity of $i_t^d$ for $(m_t, y_t, i_t^b)$ as $J = [I_3, 0]'$.

The following statements test the weak exogeneity of other variables, assuming $r = 1$:

```
proc varmax data=simul2;
   model y1 y2 / p=2;
   cointeg rank=1 exogeneity normalize=y1;
run;
```

Figure 43.79 shows that each variable is not the weak exogeneity of other variable.

**Figure 43.79** Testing of Weak Exogeneity (EXOGENEITY Option)

**The VARMAX Procedure**

**Testing Weak Exogeneity of Each Variable**

| Variable | DF | Chi-Square | Pr > ChiSq |
|---|---|---|---|
| y1 | 1 | 53.46 | <.0001 |
| y2 | 1 | 8.76 | 0.0031 |

## General Tests and Restrictions on Parameters

The previous sections discuss some special forms of tests on $\boldsymbol{\beta}$ and $\boldsymbol{\alpha}$, namely the long-run relations that are expressed in the form $H_0: \boldsymbol{\beta} = \mathbf{H}\boldsymbol{\phi}$, the weak exogeneity test, and the null hypotheses on $\boldsymbol{\alpha}$ in the form $H_0: \boldsymbol{\alpha} = \mathbf{J}\boldsymbol{\psi}$. In fact, with the help of the RESTRICT and BOUND statements, you can estimate the models that have linear restrictions on any parameters to be estimated, which means that you can implement the likelihood ratio (LR) test for any linear relationship between the parameters.

The restricted error correction model must be estimated through numerical optimization. You might need to use the NLOPTIONS statement to try different options for the optimizer and the INITIAL statement to try different starting points. This is essentially important because the $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ are usually not identifiable.

You can also use the TEST statement to apply the Wald test for any linear relationships between parameters that are not long-run. Even more, you can test the constraints on $\Pi(= \boldsymbol{\alpha}\boldsymbol{\beta}')$ and $\boldsymbol{\delta}_0(= \boldsymbol{\alpha}\boldsymbol{\beta}_0)$ in Case 2 or $\boldsymbol{\delta}_1(= \boldsymbol{\alpha}\boldsymbol{\beta}_1)$ in Case 4 when the constant term or linear trend is restricted to the error correction term.

For more information and examples, see the section "Example 43.3: Analysis of Restricted Cointegrated Systems" on page 3197.

## Forecasting of the VECM

Consider the cointegrated moving-average representation of the differenced process of $\mathbf{y}_t$

$$\Delta \mathbf{y}_t = \boldsymbol{\delta} + \Psi(B)\boldsymbol{\epsilon}_t$$

Assume that $\mathbf{y}_0 = 0$. The linear process $\mathbf{y}_t$ can be written as

$$\mathbf{y}_t = \boldsymbol{\delta} t + \sum_{i=1}^{t} \sum_{j=0}^{t-i} \Psi_j \boldsymbol{\epsilon}_i$$

Therefore, for any $l > 0$,

$$\mathbf{y}_{t+l} = \boldsymbol{\delta}(t+l) + \sum_{i=1}^{t} \sum_{j=0}^{t+l-i} \Psi_j \boldsymbol{\epsilon}_i + \sum_{i=1}^{l} \sum_{j=0}^{l-i} \Psi_j \boldsymbol{\epsilon}_{t+i}$$

The $l$-step-ahead forecast is derived from the preceding equation:

$$\mathbf{y}_{t+l|t} = (t+l) + \sum_{i=1}^{t} \sum_{j=0}^{t+l-i} \Psi_j \boldsymbol{\epsilon}_i$$

Note that

$$\lim_{l \to \infty} \boldsymbol{\beta}' \mathbf{y}_{t+l|t} = 0$$

since $\lim_{l\to\infty} \sum_{j=0}^{t+l-i} \Psi_j = \Psi(1)$ and $\boldsymbol{\beta}'\Psi(1) = 0$. The long-run forecast of the cointegrated system shows that the cointegrated relationship holds, although there might exist some deviations from the equilibrium status in the short-run. The covariance matrix of the predict error $\mathbf{e}_{t+l|t} = \mathbf{y}_{t+l} - \mathbf{y}_{t+l|t}$ is

$$\Sigma(l) = \sum_{i=1}^{l} [(\sum_{j=0}^{l-i} \Psi_j) \Sigma (\sum_{j=0}^{l-i} \Psi_j')]$$

When the linear process is represented as a VECM($p$) model, you can obtain

$$\Delta \mathbf{y}_t = \Pi \mathbf{y}_{t-1} + \sum_{j=1}^{p-1} \Phi_j^* \Delta \mathbf{y}_{t-j} + \boldsymbol{\delta} + \boldsymbol{\epsilon}_t$$

The transition equation is defined as

$$\mathbf{z}_t = F \mathbf{z}_{t-1} + \mathbf{e}_t$$

where $\mathbf{z}_t = (\mathbf{y}'_{t-1}, \Delta\mathbf{y}'_t, \Delta\mathbf{y}'_{t-1}, \ldots, \Delta\mathbf{y}'_{t-p+2})'$ is a state vector and the transition matrix is

$$F = \begin{bmatrix} I_k & I_k & 0 & \cdots & 0 \\ \Pi & (\Pi + \Phi_1^*) & \Phi_2^* & \cdots & \Phi_{p-1}^* \\ 0 & I_k & 0 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & I_k & 0 \end{bmatrix}$$

where 0 is a $k \times k$ zero matrix. The observation equation can be written

$$\mathbf{y}_t = \boldsymbol{\delta} t + H\mathbf{z}_t$$

where $H = [I_k, I_k, 0, \ldots, 0]$.

The $l$-step-ahead forecast is computed as

$$\mathbf{y}_{t+l|t} = \boldsymbol{\delta}(t+l) + HF^l\mathbf{z}_t$$

## Cointegration with Exogenous Variables

The error correction model with exogenous variables can be written as follows:

$$\Delta\mathbf{y}_t = \boldsymbol{\alpha}\boldsymbol{\beta}'\mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta\mathbf{y}_{t-i} + AD_t + \sum_{i=0}^{s} \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

The following statements demonstrate how to fit VECMX($p, s$), where $p = 2$ and $s = 1$ from the P=2 and XLAG=1 options:

```
proc varmax data=simul3;
   model y1 y2 = x1 / p=2 xlag=1;
   cointeg rank=1;
run;
```

The following statements demonstrate how to BVECMX(2,1):

```
proc varmax data=simul3;
   model y1 y2 = x1 / p=2 xlag=1
                      prior=(lambda=0.9 theta=0.1);
   cointeg rank=1;
run;
```

## I(2) Model

The VARX($p$,$s$) model can be written in the error correction form:

$$\Delta \mathbf{y}_t = \boldsymbol{\alpha}\boldsymbol{\beta}'\mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + AD_t + \sum_{i=0}^{s} \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

Let $\Phi^* = I_k - \sum_{i=1}^{p-1} \Phi_i^*$.

If $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ have full-rank $r$, and $\mathrm{rank}(\boldsymbol{\alpha}'_\perp \Phi^* \boldsymbol{\beta}_\perp) = k - r$, then $\mathbf{y}_t$ is an $I(1)$ process.

If the condition $\mathrm{rank}(\boldsymbol{\alpha}'_\perp \Phi^* \boldsymbol{\beta}_\perp) = k - r$ fails and $\boldsymbol{\alpha}'_\perp \Phi^* \boldsymbol{\beta}_\perp$ has reduced-rank $\boldsymbol{\alpha}'_\perp \Phi^* \boldsymbol{\beta}_\perp = \boldsymbol{\xi}\boldsymbol{\eta}'$ where $\boldsymbol{\xi}$ and $\boldsymbol{\eta}$ are $(k-r) \times s$ matrices with $s \le k - r$, then $\boldsymbol{\alpha}_\perp$ and $\boldsymbol{\beta}_\perp$ are defined as $k \times (k-r)$ matrices of full rank such that $\boldsymbol{\alpha}'\boldsymbol{\alpha}_\perp = 0$ and $\boldsymbol{\beta}'\boldsymbol{\beta}_\perp = 0$.

If $\boldsymbol{\xi}$ and $\boldsymbol{\eta}$ have full-rank $s$, then the process $\mathbf{y}_t$ is $I(2)$, which has the implication of $I(2)$ model for the moving-average representation.

$$\mathbf{y}_t = B_0 + B_1 t + C_2 \sum_{j=1}^{t} \sum_{i=1}^{j} \boldsymbol{\epsilon}_i + C_1 \sum_{i=1}^{t} \boldsymbol{\epsilon}_i + C_0(B)\boldsymbol{\epsilon}_t$$

The matrices $C_1$, $C_2$, and $C_0(B)$ are determined by the cointegration properties of the process, and $B_0$ and $B_1$ are determined by the initial values. For more information, see Johansen (1995b).

The implication of the $I(2)$ model for the autoregressive representation is given by

$$\Delta^2 \mathbf{y}_t = \Pi \mathbf{y}_{t-1} - \Phi^* \Delta \mathbf{y}_{t-1} + \sum_{i=1}^{p-2} \Psi_i \Delta^2 \mathbf{y}_{t-i} + AD_t + \sum_{i=0}^{s} \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

where $\Psi_i = -\sum_{j=i+1}^{p-1} \Phi_i^*$ and $\Phi^* = I_k - \sum_{i=1}^{p-1} \Phi_i^*$.

### Test for I(2)

The $I(2)$ cointegrated model is given by the following parameter restrictions:

$$H_{r,s}\colon \Pi = \boldsymbol{\alpha}\boldsymbol{\beta}' \text{ and } \boldsymbol{\alpha}'_\perp \Phi^* \boldsymbol{\beta}_\perp = \boldsymbol{\xi}\boldsymbol{\eta}'$$

where $\boldsymbol{\xi}$ and $\boldsymbol{\eta}$ are $(k-r) \times s$ matrices with $0 \le s \le k - r$. Let $H_r^0$ represent the $I(1)$ model where $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ have full-rank $r$, let $H_{r,s}^0$ represent the $I(2)$ model where $\boldsymbol{\xi}$ and $\boldsymbol{\eta}$ have full-rank $s$, and let $H_{r,s}$ represent the $I(2)$ model where $\boldsymbol{\xi}$ and $\boldsymbol{\eta}$ have rank $\le s$. Table 43.6 shows the relation between the $I(1)$ models and the $I(2)$ models.

**Table 43.6** Relation between the $I(1)$ and $I(2)$ Models

| | $I(2)$ | | | | | | | | | | $I(1)$ |
|---|---|---|---|---|---|---|---|---|---|---|---|
| $r\backslash k-r-s$ | $k$ | | $k-1$ | | $\cdots$ | | 1 | | | | |
| 0 | $H_{00}$ | $\subset$ | $H_{01}$ | $\subset$ | $\cdots$ | $\subset$ | $H_{0,k-1}$ | $\subset$ | $H_{0k}$ | = | $H_0^0$ |
| 1 | | | $H_{10}$ | $\subset$ | $\cdots$ | $\subset$ | $H_{1,k-2}$ | $\subset$ | $H_{1,k-1}$ | = | $H_1^0$ |
| $\vdots$ | | | | | | | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ |
| $k-1$ | | | | | | | $H_{k-1,0}$ | $\subset$ | $H_{k-1,1}$ | = | $H_{k-1}^0$ |

Johansen (1995b) proposed the two-step procedure to analyze the $I(2)$ model. In the first step, the values of $(r, \boldsymbol{\alpha}, \boldsymbol{\beta})$ are estimated using the reduced rank regression analysis, performing the regression analysis $\Delta^2\mathbf{y}_t$, $\Delta\mathbf{y}_{t-1}$, and $\mathbf{y}_{t-1}$ on $\Delta^2\mathbf{y}_{t-1}, \ldots, \Delta^2\mathbf{y}_{t-p+2}$, and $D_t$. This gives residuals $R_{0t}$, $R_{1t}$, and $R_{2t}$, and residual product moment matrices

$$M_{ij} = \frac{1}{T}\sum_{t=1}^{T} R_{it}R'_{jt} \quad \text{for } i, j = 0, 1, 2$$

Perform the reduced rank regression analysis $\Delta^2\mathbf{y}_t$ on $\mathbf{y}_{t-1}$ corrected for $\Delta\mathbf{y}_{t-1}$, $\Delta^2\mathbf{y}_{t-1}, \ldots, \Delta^2\mathbf{y}_{t-p+2}$, and $D_t$, and solve the eigenvalue problem of the equation

$$|\lambda M_{22.1} - M_{20.1}M_{00.1}^{-1}M_{02.1}| = 0$$

where $M_{ij.1} = M_{ij} - M_{i1}M_{11}^{-1}M_{1j}$ for $i, j = 0, 2$.

In the second step, if $(r, \boldsymbol{\alpha}, \boldsymbol{\beta})$ are known, the values of $(s, \boldsymbol{\xi}, \boldsymbol{\eta})$ are determined using the reduced rank regression analysis, regressing $\hat{\boldsymbol{\alpha}}'_\perp\Delta^2\mathbf{y}_t$ on $\hat{\boldsymbol{\beta}}'_\perp\Delta\mathbf{y}_{t-1}$ corrected for $\Delta^2\mathbf{y}_{t-1}, \ldots, \Delta^2\mathbf{y}_{t-p+2}$, $D_t$, and $\hat{\boldsymbol{\beta}}'\Delta\mathbf{y}_{t-1}$.

The reduced rank regression analysis reduces to the solution of an eigenvalue problem for the equation

$$|\rho M_{\boldsymbol{\beta}_\perp\boldsymbol{\beta}_\perp.\boldsymbol{\beta}} - M_{\boldsymbol{\beta}_\perp\boldsymbol{\alpha}_\perp.\boldsymbol{\beta}}M^{-1}_{\boldsymbol{\alpha}_\perp\boldsymbol{\alpha}_\perp.\boldsymbol{\beta}}M_{\boldsymbol{\alpha}_\perp\boldsymbol{\beta}_\perp.\boldsymbol{\beta}}| = 0$$

where

$$\begin{aligned}
M_{\boldsymbol{\beta}_\perp\boldsymbol{\beta}_\perp.\boldsymbol{\beta}} &= \boldsymbol{\beta}'_\perp(M_{11} - M_{11}\boldsymbol{\beta}(\boldsymbol{\beta}'M_{11}\boldsymbol{\beta})^{-1}\boldsymbol{\beta}'M_{11})\boldsymbol{\beta}_\perp \\
M'_{\boldsymbol{\beta}_\perp\boldsymbol{\alpha}_\perp.\boldsymbol{\beta}} &= M_{\boldsymbol{\alpha}_\perp\boldsymbol{\beta}_\perp.\boldsymbol{\beta}} = \bar{\boldsymbol{\alpha}}'_\perp(M_{01} - M_{01}\boldsymbol{\beta}(\boldsymbol{\beta}'M_{11}\boldsymbol{\beta})^{-1}\boldsymbol{\beta}'M_{11})\boldsymbol{\beta}_\perp \\
M_{\boldsymbol{\alpha}_\perp\boldsymbol{\alpha}_\perp.\boldsymbol{\beta}} &= \bar{\boldsymbol{\alpha}}'_\perp(M_{00} - M_{01}\boldsymbol{\beta}(\boldsymbol{\beta}'M_{11}\boldsymbol{\beta})^{-1}\boldsymbol{\beta}'M_{10})\bar{\boldsymbol{\alpha}}_\perp
\end{aligned}$$

where $\bar{\boldsymbol{\alpha}} = \boldsymbol{\alpha}(\boldsymbol{\alpha}'\boldsymbol{\alpha})^{-1}$.

The solution gives eigenvalues $1 > \rho_1 > \cdots > \rho_s > 0$ and eigenvectors $(v_1, \ldots, v_s)$. Then, the ML estimators are

$$\begin{aligned}
\hat{\boldsymbol{\eta}} &= (v_1, \ldots, v_s) \\
\hat{\boldsymbol{\xi}} &= M_{\boldsymbol{\alpha}_\perp\boldsymbol{\beta}_\perp.\boldsymbol{\beta}}\hat{\eta}
\end{aligned}$$

The likelihood ratio test for the reduced rank model $H_{r,s}$ with rank $\leq s$ in the model $H_{r,k-r} = H_r^0$ is given by

$$Q_{r,s} = -T \sum_{i=s+1}^{k-r} \log(1-\rho_i), \quad s = 0, \ldots, k-r-1$$

The following statements simulate an I(2) process and compute the rank test to test for cointegrated order 2:

```
proc iml;
   alpha  = { 1, 1};    * alphaOrthogonal = { 1, -1};
   beta   = { 1, -0.5}; * betaOrthogonal  = { 1, 2};
   * alphaOrthogonal' * phiStar * betaOrthogonal = 0;
   phiStar = { 1 0, 0 0.5};
   A1 = 2 * I(2) + alpha * beta` - phiStar;
   A2 = phiStar - I(2);
   phi = A1 // A2;
   sig = I(2);
   /* to simulate the vector time series */
   call varmasim(y,phi) sigma=sig n=200 seed=2;
   cn = {'y1' 'y2'};
   create simul4 from y[colname=cn];
   append from y;
   close;
quit;

proc varmax data=simul4;
   model y1 y2 /noint p=2 cointtest=(johansen=(iorder=2));
run;
```

The last two columns in Figure 43.80 explain the cointegration rank test with integrated order 1. For a specified significance level, such as 5%, the output indicates that the null hypothesis that the series are not cointegrated (H0: $r = 0$) is rejected, because the $p$-value for this test, shown in the column Pr > Trace of I(1), is less than 0.05. The results also indicate that the null hypothesis that there is a cointegrated relationship with cointegration rank 1 (H0: $r = 1$) cannot be rejected at the 5% significance level, because the $p$-value for the test statistic, 0.7961, is greater than 0.05. Because of this latter result, the rows in the table that are associated with $r = 1$ are further examined. The test statistic, 0.0257, tests the null hypothesis that the series are cointegrated order 2. The $p$-value that is associated with this test is 0.8955, which indicates that the null hypothesis cannot be rejected at the 5% significance level.

## Vector Error Correction Model in ARMA Form

The vector error correction model in ARMA form (the VEC-ARMA model) introduces MA terms and is defined as follows:

$$\Delta \mathbf{y}_t = \boldsymbol{\alpha}\boldsymbol{\beta}'\mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t - \sum_{i=1}^{q} \Theta_i \boldsymbol{\epsilon}_{t-i}$$

The determined terms and the exogenous variables can also be introduced into the model. Similar to the VECM that has only AR terms, the constant term is constrained in the error correction term in Case 2 and the linear trend term is similarly constrained in Case 4.

The model is estimated through the maximum likelihood method. The log likelihood of the model is defined as

$$\ell = -\frac{T}{2}\log|\Sigma| - \frac{1}{2}\sum_{t=1}^{T} \mathbf{e}_t' \Sigma^{-1} \mathbf{e}_t$$

where

$$\mathbf{e}_t = \Delta \mathbf{y}_t - \boldsymbol{\alpha}\boldsymbol{\beta}'\mathbf{y}_{t-1} - \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \sum_{i=1}^{q} \Theta_i \mathbf{e}_{t-i}$$

conditional on the presample $\{y_0, \ldots, y_{1-p}\}$, and $e_s = 0, s \leq 0$.

You can specify a VEC-ARMA(2,1) model with cointegration rank 2 on the three-dimensional time series by the following statements:

```
model y1-y3 / p=2 q=1;
cointeg rank=2;
```

For more information about modeling the cointegrated VARMA processes, see Lütkepohl (2007, Chapter 14).

## Multivariate GARCH Modeling

Stochastic volatility modeling is important in many areas, particularly in finance. To study the volatility of time series, GARCH models are widely used because they provide a good approach to conditional variance modeling.

### BEKK Representation

Engle and Kroner (1995) propose a general multivariate GARCH model and call it a BEKK representation. Let $\mathcal{F}(t-1)$ be the sigma field generated by the past values of $\boldsymbol{\epsilon}_t$, and let $H_t$ be the conditional covariance matrix of the $k$-dimensional random vector $\boldsymbol{\epsilon}_t$. Let $H_t$ be measurable with respect to $\mathcal{F}(t-1)$; then the multivariate GARCH model can be written as

$$\begin{aligned} \boldsymbol{\epsilon}_t|\mathcal{F}(t-1) &\sim N(0, H_t) \\ H_t &= C + \sum_{i=1}^{q} A_i' \boldsymbol{\epsilon}_{t-i} \boldsymbol{\epsilon}_{t-i}' A_i + \sum_{i=1}^{p} G_i' H_{t-i} G_i \end{aligned}$$

where $C$, $A_i$, and $G_i$ are $k \times k$ parameter matrices.

Consider the bivariate GARCH(1,1) model

$$\begin{aligned} H_t &= \begin{bmatrix} c_{11} & c_{12} \\ c_{12} & c_{22} \end{bmatrix} + \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}' \begin{bmatrix} \epsilon_{1,t-1}^2 & \epsilon_{1,t-1}\epsilon_{2,t-1} \\ \epsilon_{2,t-1}\epsilon_{1,t-1} & \epsilon_{2,t-1}^2 \end{bmatrix} \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \\ &\quad + \begin{bmatrix} g_{11} & g_{12} \\ g_{21} & g_{22} \end{bmatrix}' H_{t-1} \begin{bmatrix} g_{11} & g_{12} \\ g_{21} & g_{22} \end{bmatrix} \end{aligned}$$

or, representing the univariate model,

$$\begin{aligned} h_{11,t} &= c_{11} + a_{11}^2\epsilon_{1,t-1}^2 + 2a_{11}a_{21}\epsilon_{1,t-1}\epsilon_{2,t-1} + a_{21}^2\epsilon_{2,t-1}^2 \\ &\quad + g_{11}^2 h_{11,t-1} + 2g_{11}g_{21}h_{12,t-1} + g_{21}^2 h_{22,t-1} \\ h_{12,t} &= c_{12} + a_{11}a_{12}\epsilon_{1,t-1}^2 + (a_{21}a_{12} + a_{11}a_{22})\epsilon_{1,t-1}\epsilon_{2,t-1} + a_{21}a_{22}\epsilon_{2,t-1}^2 \\ &\quad + g_{11}g_{12}h_{11,t-1} + (g_{21}g_{12} + g_{11}g_{22})h_{12,t-1} + g_{21}g_{22}h_{22,t-1} \\ h_{22,t} &= c_{22} + a_{12}^2\epsilon_{1,t-1}^2 + 2a_{12}a_{22}\epsilon_{1,t-1}\epsilon_{2,t-1} + a_{22}^2\epsilon_{2,t-1}^2 \\ &\quad + g_{12}^2 h_{11,t-1} + 2g_{12}g_{22}h_{12,t-1} + g_{22}^2 h_{22,t-1} \end{aligned}$$

For the BEKK representation of the bivariate GARCH(1,1) model, the SAS statements are

```
model y1 y2;
garch q=1 p=1 form=bekk;
```

The multistep forecast of the conditional covariance matrix, $H_{t+h|t}, h = 1, 2, \ldots,$ is obtained recursively through the formula

$$H_{t+h|t} = C + \sum_{i=1}^{h-1} A_i' H_{t+h-i|t} A_i + \sum_{i=h}^{q} A_i' \epsilon_{t+h-i} \epsilon_{t+h-i}' A_i + \sum_{i=1}^{p} G_i' H_{t+h-i|t} G_i$$

where $H_{s|t} = H_s$ for $s \leq t$.

## CCC Representation

Bollerslev (1990) proposes a multivariate GARCH model with time-varying conditional variances and covariances but constant conditional correlations.

The conditional covariance matrix $H_t$ consists of

$$H_t = D_t S D_t$$

where $D_t$ is a $k \times k$ stochastic diagonal matrix with element $\sigma_{i,t}$ and $S$ is a $k \times k$ time-invariant correlation matrix with the typical element $s_{ij}$.

The element of $H_t$ is

$$h_{ij,t} = s_{ij} \sigma_{i,t} \sigma_{j,t} \quad i, j = 1, \ldots, k$$

Note that $h_{ii,t} = \sigma_{i,t}^2, i = 1, \ldots, k$.

If you specify CORRCONSTANT=EXPECT, the element $s_{ij}$ of the time-invariant correlation matrix $S$ is

$$s_{ij} = \frac{1}{T} \sum_{t=1}^{T} \frac{\epsilon_{i,t}}{\sqrt{h_{ii,t}}} \frac{\epsilon_{j,t}}{\sqrt{h_{jj,t}}}$$

where $T$ is the sample size.

By default, or when you specify SUBFORM=GARCH, $\sigma_{i,t}^2$ follows a univariate GARCH process,

$$\sigma_{i,t}^2 = c_i + \sum_{l=1}^{q} a_{ii,l} \epsilon_{i,t-l}^2 + \sum_{l=1}^{p} g_{ii,l} \sigma_{i,t-1}^2 \quad i = 1, \ldots, k$$

As shown in many empirical studies, positive and negative innovations have different impacts on future volatility. There is a long list of variations of univariate GARCH models that consider the asymmetricity. Four typical variations follow:

- exponential GARCH (EGARCH) model (Nelson and Cao 1992)

- quadratic GARCH (QGARCH) model (Engle and Ng 1993)
- threshold GARCH (TGARCH) model (Glosten, Jaganathan, and Runkle 1993; Zakoian 1994)
- power GARCH (PGARCH) model (Ding, Granger, and Engle 1993)

For more information about the asymmetric GARCH models, see Engle and Ng (1993). You can choose the type of GARCH model of interest by specifying the SUBFORM= option.

The EGARCH model was proposed by Nelson (1991). Nelson and Cao (1992) argue that the nonnegativity constraints in the GARCH model are too restrictive. The GARCH model, implicitly or explicitly, imposes the nonnegative constraints on the parameters, whereas these parameters have no restrictions in the EGARCH model. In the EGARCH model, the conditional variance is an asymmetric function of lagged disturbances,

$$\ln(\sigma_{i,t}^2) = c_i + \sum_{l=1}^{q} a_{ii,l}\left(b_{ii,l}\frac{\epsilon_{i,t-l}}{\sigma_{i,t-l}} + |\frac{\epsilon_{i,t-l}}{\sigma_{i,t-l}}| - \sqrt{\frac{2}{\pi}}\right) + \sum_{l=1}^{p} g_{ii,l}\ln(\sigma_{i,t-l}^2) \quad i = 1,\ldots,k$$

In the QGARCH model, the lagged errors' centers are shifted from zero to some constant values,

$$\sigma_{i,t}^2 = c_i + \sum_{l=1}^{q} a_{ii,l}(\epsilon_{i,t-l} - b_{ii,l})^2 + \sum_{l=1}^{p} g_{ii,l}\sigma_{i,t-1}^2 \quad i = 1,\ldots,k$$

In the TGARCH model, each lagged squared error has an extra slope coefficient,

$$\sigma_{i,t}^2 = c_i + \sum_{l=1}^{q}(a_{ii,l} + 1_{\epsilon_{i,t-l}<0}b_{ii,l})\epsilon_{i,t-l}^2 + \sum_{l=1}^{p} g_{ii,l}\sigma_{i,t-1}^2 \quad i = 1,\ldots,k$$

where the indicator function $1_{\epsilon_{i,t}<0}$ is one if $\epsilon_{i,t} < 0$ and zero otherwise.

The PGARCH model not only considers the asymmetric effect but also provides a way to model the long memory property in the volatility,

$$\sigma_{i,t}^{2\lambda_i} = c_i + \sum_{l=1}^{q} a_{ii,l}(|\epsilon_{i,t-l}| - b_{ii,l}\epsilon_{i,t-l})^{2\lambda_i} + \sum_{l=1}^{p} g_{ii,l}\sigma_{i,t-1}^{2\lambda_i} \;\; i = 1,\ldots,k$$

where $\lambda_i > 0$ and $|b_{ii,l}| \leq 1, l = 1,\ldots,q, i = 1,\ldots,k$.

Note that the implemented TGARCH model is also well known as GJR-GARCH (Glosten, Jaganathan, and Runkle 1993), which is similar to the threshold GARCH model proposed by Zakoian (1994) but not exactly the same. In Zakoian's model, the conditional standard deviation is a linear function of the past values of the white noise. Zakoian's model can be regarded as a special case of the PGARCH model when $\lambda_i = 1/2$.

The following formulas are recursively implemented to obtain the multistep forecast of conditional error variance $\sigma_{i,t+h|t}^2, i = 1,\ldots,k$ and $h = 1,2,\ldots$:

- for the GARCH($p$, $q$) model:

$$\sigma^2_{i,t+h|t} = c_i + \sum_{l=1}^{h-1} a_{ii,l}\sigma^2_{i,t+h-l|t} + \sum_{l=h}^{q} a_{ii,l}\epsilon^2_{i,t+h-l} + \sum_{l=1}^{p} g_{ii,l}\sigma^2_{i,t+h-1|t}$$

- for the EGARCH($p$, $q$) model:

$$\ln(\sigma^2_{i,t+h|t}) = c_i + \sum_{l=h}^{q} a_{ii,l}\left(b_{ii,l}\frac{\epsilon_{i,t+h-l}}{\sigma_{i,t+h-l}} + |\frac{\epsilon_{i,t+h-l}}{\sigma_{i,t+h-l}}| - \sqrt{\frac{2}{\pi}}\right) + \sum_{l=1}^{p} g_{ii,l}\ln(\sigma^2_{i,t+h-l|t})$$

- for the QGARCH($p$, $q$) model:

$$\begin{aligned}\sigma^2_{i,t+h|t} &= c_i + \sum_{l=1}^{h-1} a_{ii,l}(\sigma^2_{i,t+h-l|t} + b^2_{ii,l}) + \sum_{l=h}^{q} a_{ii,l}(\epsilon_{i,t+h-l} - b_{ii,l})^2 \\ &\quad + \sum_{l=1}^{p} g_{ii,l}\sigma^2_{i,t+h-1|t}\end{aligned}$$

- for the TGARCH($p$, $q$) model:

$$\begin{aligned}\sigma^2_{i,t+h|t} &= c_i + \sum_{l=1}^{h-1}(a_{ii,l} + b_{ii,l}/2)\sigma^2_{i,t+h-1|t} + \sum_{l=h}^{q}(a_{ii,l} + 1_{\epsilon_{i,t-l}<0}b_{ii,l})\epsilon^2_{i,t-l} \\ &\quad + \sum_{l=1}^{p} g_{ii,l}\sigma^2_{i,t+h-1|t}\end{aligned}$$

- for the PGARCH($p$, $q$) model:

$$\begin{aligned}\sigma^{2\lambda_i}_{i,t+h|t} &= c_i + \sum_{l=1}^{h-1} a_{ii,l}((1 + b_{ii,l})^{2\lambda_i} + (1 - b_{ii,l})^{2\lambda_i})\sigma^{2\lambda_i}_{i,t+h-l|t}/2 \\ &\quad + \sum_{l=h}^{q} a_{ii,l}(|\epsilon_{i,t-l}| - b_{ii,l}\epsilon_{i,t-l})^{2\lambda_i} + \sum_{l=1}^{p} g_{ii,l}\sigma^{2\lambda_i}_{i,t+h-1|t}\end{aligned}$$

In the preceding equations, $\sigma_{i,s|t} = \sigma_{i,s}$ for $s \leq t$. Then, the multistep forecast of conditional covariance matrix $H_{t+h|t}, h = 1, 2, \ldots$, is calculated by

$$H_{t+h|t} = D_{t+h|t} S D_{t+h|t}$$

where $D_{t+h|t}$ is the diagonal matrix with element $\sigma_{i,t+h|t}, i = 1, \ldots, k$.

### DCC Representation

Engle (2002) proposes a parsimonious parametric multivariate GARCH model that has time-varying conditional covariances and correlations.

The conditional covariance matrix $H_t$ consists of

$$H_t = D_t \Gamma_t D_t$$

where $D_t$ is a $k \times k$ stochastic diagonal matrix with the element $\sigma_{i,t}$ and $\Gamma_t$ is a $k \times k$ time-varying matrix with the typical element $\rho_{ij,t}$.

The element of $H_t$ is

$$h_{ij,t} = \rho_{ij,t}\sigma_{i,t}\sigma_{j,t} \quad i,j = 1,\ldots,k$$

Note that $h_{ii,t} = \sigma_{i,t}^2, i = 1,\ldots,k$.

As in the CCC GARCH model, you can choose the type of GARCH model of interest by specifying the SUBFORM= option.

In the GARCH model,

$$\sigma_{i,t}^2 = c_i + \sum_{l=1}^{q} a_{ii,l}\epsilon_{i,t-l}^2 + \sum_{l=1}^{p} g_{ii,l}\sigma_{i,t-1}^2 \quad i = 1,\ldots,k$$

In the EGARCH model, the conditional variance is an asymmetric function of lagged disturbances,

$$\ln(\sigma_{i,t}^2) = c_i + \sum_{l=1}^{q} a_{ii,l}\left(b_{ii,l}\frac{\epsilon_{i,t-l}}{\sigma_{i,t-l}} + \left|\frac{\epsilon_{i,t-l}}{\sigma_{i,t-l}}\right| - \sqrt{\frac{2}{\pi}}\right) + \sum_{l=1}^{p} g_{ii,l}\ln(\sigma_{i,t-l}^2) \quad i = 1,\ldots,k$$

In the QGARCH model, the lagged errors' centers are shifted from zero to some constant values,

$$\sigma_{i,t}^2 = c_i + \sum_{l=1}^{q} a_{ii,l}(\epsilon_{i,t-l} - b_{ii,l})^2 + \sum_{l=1}^{p} g_{ii,l}\sigma_{i,t-1}^2 \quad i = 1,\ldots,k$$

In the TGARCH model, each lagged squared error has an extra slope coefficient,

$$\sigma_{i,t}^2 = c_i + \sum_{l=1}^{q}(a_{ii,l} + 1_{\epsilon_{i,t-l}<0}b_{ii,l})\epsilon_{i,t-l}^2 + \sum_{l=1}^{p} g_{ii,l}\sigma_{i,t-1}^2 \quad i = 1,\ldots,k$$

where the indicator function $1_{\epsilon_{i,t}<0}$ is one if $\epsilon_{i,t} < 0$ and zero otherwise.

The PGARCH model not only considers the asymmetric effect but also provides another way to model the long memory property in the volatility,

$$\sigma_{i,t}^{2\lambda_i} = c_i + \sum_{l=1}^{q} a_{ii,l}(|\epsilon_{i,t-l}| - b_{ii,l}\epsilon_{i,t-l})^{2\lambda_i} + \sum_{l=1}^{p} g_{ii,l}\sigma_{i,t-1}^{2\lambda_i} \quad i = 1, \ldots, k$$

where $\lambda_i > 0$ and $|b_{ii,l}| \leq 1, l = 1, \ldots, q; i = 1, \ldots, k$.

The conditional correlation estimator $\rho_{ij,t}$ is

$$\begin{aligned} \rho_{ij,t} &= \frac{q_{ij,t}}{\sqrt{q_{ii,t}q_{jj,t}}} \quad i, j = 1, \ldots, k \\ q_{ij,t} &= (1-\alpha-\beta)s_{ij} + \alpha\frac{\epsilon_{i,t-1}}{\sigma_{i,t-1}}\frac{\epsilon_{j,t-1}}{\sigma_{j,t-1}} + \beta q_{ij,t-1} \end{aligned}$$

where $s_{ij}$ is the element of $S$, the unconditional correlation matrix.

If you specify CORRCONSTANT=EXPECT, the element $s_{ij}$ of the unconditional correlation matrix $S$ is

$$s_{ij} = \frac{1}{T}\sum_{t=1}^{T}\frac{\epsilon_{i,t}}{\sigma_{i,t}}\frac{\epsilon_{j,t}}{\sigma_{j,t}}$$

where $T$ is the sample size.

As shown in the CCC GARCH models, the following formulas are recursively implemented to obtain the multistep forecast of conditional error variance $\sigma_{i,t+h|t}^2, i = 1, \ldots, k$ and $h = 1, 2, \ldots$:

- for the GARCH($p$, $q$) model:

$$\sigma_{i,t+h|t}^2 = c_i + \sum_{l=1}^{h-1} a_{ii,l}\sigma_{i,t+h-l|t}^2 + \sum_{l=h}^{q} a_{ii,l}\epsilon_{i,t+h-l}^2 + \sum_{l=1}^{p} g_{ii,l}\sigma_{i,t+h-1|t}^2$$

- for the EGARCH($p$, $q$) model:

$$\ln(\sigma_{i,t+h|t}^2) = c_i + \sum_{l=h}^{q} a_{ii,l}\left(b_{ii,l}\frac{\epsilon_{i,t+h-l}}{\sigma_{i,t+h-l}} + |\frac{\epsilon_{i,t+h-l}}{\sigma_{i,t+h-l}}| - \sqrt{\frac{2}{\pi}}\right) + \sum_{l=1}^{p} g_{ii,l}\ln(\sigma_{i,t+h-l|t}^2)$$

- for the QGARCH($p$, $q$) model:

$$\begin{aligned} \sigma_{i,t+h|t}^2 = c_i &+ \sum_{l=1}^{h-1} a_{ii,l}(\sigma_{i,t+h-l|t}^2 + b_{ii,l}^2) + \sum_{l=h}^{q} a_{ii,l}(\epsilon_{i,t+h-l} - b_{ii,l})^2 \\ &+ \sum_{l=1}^{p} g_{ii,l}\sigma_{i,t+h-1|t}^2 \end{aligned}$$

- for the TGARCH($p$, $q$) model:

$$\begin{aligned}\sigma^2_{i,t+h|t} &= c_i + \sum_{l=1}^{h-1}(a_{ii,l} + b_{ii,l}/2)\sigma^2_{i,t+h-1|t} + \sum_{l=h}^{q}(a_{ii,l} + 1_{\epsilon_{i,t-l}<0}b_{ii,l})\epsilon^2_{i,t-l} \\ &\quad + \sum_{l=1}^{p} g_{ii,l}\sigma^2_{i,t+h-1|t}\end{aligned}$$

- for the PGARCH($p$, $q$) model:

$$\begin{aligned}\sigma^{2\lambda_i}_{i,t+h|t} &= c_i + \sum_{l=1}^{h-1} a_{ii,l}((1+b_{ii,l})^{2\lambda_i} + (1-b_{ii,l})^{2\lambda_i})\sigma^{2\lambda_i}_{i,t+h-l|t}/2 \\ &\quad + \sum_{l=h}^{q} a_{ii,l}(|\epsilon_{i,t-l}| - b_{ii,l}\epsilon_{i,t-l})^{2\lambda_i} + \sum_{l=1}^{p} g_{ii,l}\sigma^{2\lambda_i}_{i,t+h-1|t}\end{aligned}$$

In the preceding equations, $\sigma_{i,s|t} = \sigma_{i,s}$ for $s \le t$. Then, the multistep forecast of conditional covariance matrix $H_{t+h|t}, h = 1, 2, \ldots$, is calculated by

$$H_{t+h|t} = D_{t+h|t}\Gamma_{t+h|t}D_{t+h|t}$$

where $D_{t+h|t}$ is the diagonal matrix with element $\sigma_{i,t+h|t}, i = 1, \ldots, k$, and $\Gamma_{t+h|t}$ is the matrix with element $\rho_{ij,t+h|t}, i, j = 1, \ldots, k$,

$$\begin{aligned}\rho_{ij,t+h|t} &= \frac{q_{ij,t+h|t}}{\sqrt{q_{ii,t+h|t}q_{jj,t+h|t}}} \\ q_{ij,t+h|t} &= \begin{cases}(1-\alpha-\beta)s_{ij} + \alpha\frac{\epsilon_{i,t}}{\sigma_{i,t}}\frac{\epsilon_{j,t}}{\sigma_{j,t}} + \beta q_{ij,t} & h = 1 \\ (1-\alpha-\beta)s_{ij} + \alpha q_{ij,t+h-1|t} + \beta q_{ij,t+h-1|t} & h > 1\end{cases}\end{aligned}$$

## Estimation of GARCH Model

The log-likelihood function of the multivariate GARCH model is written without a constant term as

$$\ell = -\frac{1}{2}\sum_{t=1}^{T}[\log|H_t| + \epsilon_t' H_t^{-1}\epsilon_t]$$

where $\epsilon_t$ is calculated from the first-moment model (that is, the VARMAX model or VEC-ARMA model). The log-likelihood function is maximized by an iterative numerical method such as quasi-Newton optimization. The starting values for the regression parameters are obtained from the least squares estimates. The covariance of $\epsilon_t$ is used as the starting value for the GARCH constant parameters, and the starting values for the other GARCH parameters are either $10^{-6}$ or $10^{-3}$, depending on the GARCH model's representation.

## Prediction of Endogenous (Dependent) Variables

In multivariate GARCH models, the optimal (minimum MSE) $l$-step-ahead forecast of endogenous variables $\mathbf{y}_{t+l|t}$ uses the same formula as shown in the section "Forecasting" on page 3084. However, the exogenous (independent) variables, if present, are always assumed to be nonstochastic (deterministic); that is, to predict the endogenous variables, you must specify the future values of the exogenous variables. The prediction error of the optimal $l$-step-ahead forecast is $\mathbf{e}_{t+l|t} = \mathbf{y}_{t+l} - \mathbf{y}_{t+l|t} = \sum_{j=0}^{l-1} \Psi_j \boldsymbol{\epsilon}_{t+l-j}$, with zero mean and covariance matrix,

$$\Sigma_t(l) = \mathrm{Cov}(\mathbf{e}_{t+l|t}) = \sum_{j=0}^{l-1} \Psi_j H_{t+l-j|t} \Psi_j'$$

where $H_{t+h|t}, h = 1, \ldots, l$, is the $h$-step-ahead forecast of the conditional covariance matrix. As emphasized by the subscript $t$, $\Sigma_t(l)$ is time-dependent. In the OUT= data set, the forecast standard errors and prediction intervals are constructed according to $\Sigma_t(l)$. If you specify the COVPE option, the prediction error covariances that are output in the CovPredictError and CovPredictErrorbyVar ODS tables are based on the time-independent formula

$$\Sigma(l) = \sum_{j=0}^{l-1} \Psi_j \Sigma \Psi_j'$$

where $\Sigma$ is the unconditional covariance matrix of innovations. The decomposition of the prediction error covariances is also based on $\Sigma(l)$.

## Covariance Stationarity

Define the multivariate GARCH process as

$$\mathbf{h}_t = \sum_{i=1}^{\infty} G(B)^{i-1}[\mathbf{c} + A(B)\boldsymbol{\eta}_t]$$

where $\mathbf{h}_t = \mathrm{vec}(H_t)$, $\mathbf{c} = \mathrm{vec}(C_0)$, and $\boldsymbol{\eta}_t = \mathrm{vec}(\boldsymbol{\epsilon}_t \boldsymbol{\epsilon}_t')$. This representation is equivalent to a GARCH$(p, q)$ model by the following algebra:

$$\begin{aligned}
\mathbf{h}_t &= \mathbf{c} + A(B)\boldsymbol{\eta}_t + \sum_{i=2}^{\infty} G(B)^{i-1}[\mathbf{c} + A(B)\boldsymbol{\eta}_t] \\
&= \mathbf{c} + A(B)\boldsymbol{\eta}_t + G(B) \sum_{i=1}^{\infty} G(B)^{i-1}[tmbc + A(B)\boldsymbol{\eta}_t] \\
&= \mathbf{c} + A(B)\boldsymbol{\eta}_t + G(B)\mathbf{h}_t
\end{aligned}$$

Defining $A(B) = \sum_{i=1}^{q} (A_i \otimes A_i)' B^i$ and $G(B) = \sum_{i=1}^{p} (G_i \otimes G_i)' B^i$ gives a BEKK representation.

The necessary and sufficient conditions for covariance stationarity of the multivariate GARCH process are that all the eigenvalues of $A(1) + G(1)$ are less than 1 in modulus.

## An Example of a VAR(1)–ARCH(1) Model

The following DATA step simulates a bivariate vector time series to provide test data for the multivariate GARCH model:

```
data garch;
   retain seed 16587;
   esq1 = 0; esq2 = 0;
   ly1 = 0;  ly2 = 0;
   do i = 1 to 1000;
      ht = 6.25 + 0.5*esq1;
      call rannor(seed,ehat);
      e1 = sqrt(ht)*ehat;
      ht = 1.25 + 0.7*esq2;
      call rannor(seed,ehat);
      e2 = sqrt(ht)*ehat;
      y1 = 2 + 1.2*ly1 - 0.5*ly2 + e1;
      y2 = 4 + 0.6*ly1 + 0.3*ly2 + e2;
      if i>500 then output;
      esq1 = e1*e1; esq2 = e2*e2;
      ly1 = y1;  ly2 = y2;
   end;
   keep y1 y2;
run;
```

The following statements fit a VAR(1)–ARCH(1) model to the data. For a VAR-ARCH model, you specify the order of the autoregressive model with the P=1 option in the MODEL statement and the Q=1 option in the GARCH statement. In order to produce the initial and final values of parameters, the TECH=QN option is specified in the NLOPTIONS statement.

```
proc varmax data=garch;
   model y1 y2 / p=1
         print=(roots estimates diagnose);
   garch q=1;
   nloptions tech=qn;
run;
```

Figure 43.81 through Figure 43.85 show the details of this example. Figure 43.81 shows the initial values of parameters.

## VARFIMA and VARFIMAX Modeling

VAR and VARMA series are short-range dependent (SRD) in the sense that their autocovariance function dies out exponentially fast with the increasing lag. However, in many financial and macroeconomics applications, stationary yet persistent series arise, calling for models that have a slowly decaying autocovariance function and that are therefore more suitable to capture long-range dependence in the data.

The VARFIMA model captures both long-range and short-range dependence dynamics in a multivariate series. For a $k$-dimensional series $\mathbf{y}_t = (y_{1t}, \ldots, y_{kt})', \ t = 1, \ldots, T$, the VARFIMA$(p, D, q)$ model is defined as

$$\Phi(B)\mathbf{y}_t = (I - B)^{-D}\Theta(B)\boldsymbol{\epsilon}_t$$

where $B$ and $I$ are the backshift and identity operators; $D = \mathrm{diag}(d_j)$ $d_j \in (-1/2, 1/2)$, are the LRD parameters of the component series $\{y_{jt}\}_{t\in\mathrm{Z}}$, $j = 1, \ldots, k$; and $\{\boldsymbol{\epsilon}_t\}_{t\in\mathrm{Z}}$ is a $k$-dimensional white noise series with zero mean $\mathrm{E}\boldsymbol{\epsilon}_t = 0$ and covariance $\mathrm{E}\boldsymbol{\epsilon}_t\boldsymbol{\epsilon}_t' = \Sigma$.

The fractional integration operator $(I - B)^{-D}$ allows for long memory in the series. On the other hand, $\Phi(z)$ and $\Theta(z)$, which are the typical autoregressive and moving average matrix polynomials of orders $p$ and $q$, respectively, capture the short-range dependence.

The VARFIMA$(p, D, q)$ series satisfies the multivariate long-range dependence definitions given in Kechagias and Pipiras (2015). Moreover, each component series $\{y_{jt}\}_{t\in\mathrm{Z}}$, $j = 1, \ldots, k$, satisfies the univariate time and frequency domain LRD definitions given in Beran et al. (2013). The following sections briefly review these definitions and show how you can detect long-range dependence in the data before fitting a VARFIMA model.

## Autocorrelation and Spectral Density of VARFIMA Series

The diagonal components of the autocorrelation matrix function of a VARFIMA$(p, D, q)$ series satisfy the univariate LRD time domain definition

$$\rho_i(n) \sim c_1 n^{2d_i - 1},\ i = 1, \ldots, k, \quad \text{as} \quad n \to \infty$$

where $a_n \sim b_n$ implies that $\lim_{n\to\infty} a_n/b_n = 1$ and $c_1 > 0$. Similarly, the diagonal components of the spectral density matrix function of a VARFIMA$(p, D, q)$ series satisfy

$$f_i(\lambda) \sim c_2 \lambda^{-2d_i},\ i = 1, \ldots, k, \quad \text{as} \quad \lambda \to 0^+$$

for some $c_2 > 0$.

To obtain preliminary estimates of the LRD parameters, you can plot the logged periodogram values against the log of the Fourier frequencies $\lambda_j = 2\pi j/T$, $j = 1, \ldots, T/2$, and then fit a line for frequencies near 0. The slope of this line is expected to be equal to $-2d_i$ (the exponent in the right-hand side of the preceding relation). The following statements demonstrate this procedure for a synthetic VARFIMA$(1, D, 1)$ series with $T = 2{,}000$ and true parameters $d_1 = 0.4$, $d_2 = 0.3$, $\Phi_{11} = \Sigma_{11} = \Sigma_{22} = 3$, $\Sigma_{12} = 0.5$, $\Phi_{11} = 0.8$, $\Phi_{12} = 0.3$, $\Phi_{21} = -0.2$, $\Phi_{22} = 0.1$, $\Theta_{11} = 0.2$, $\Theta_{12} = 0.4$, $\Theta_{21} = 0$, and $\Theta_{22} = 0.3$:

```
data VARFIMA1D1;
   time = _N_;

/* Compute the two periodograms */
proc spectra data = VARFIMA1D1 out = spectra;
   var y1 y2;
run;

/* Convert to log scale */
data logspectra;
   set spectra(firstobs=2);
   /* compute Fourier frequencies */
   j = _N_;
   pi = constant('pi');
   logfreq = log(2*pi*j/2000);

   logpdg1 = log(P_01);
   logpdg2 = log(P_02);

   /* Introduce weights where regression will be performed */
   wt = (1<= j <=100);
   keep wt logfreq logpdg1 logpdg2;
run;
```

```
/* Regression for log-periodogram of y1*/
proc autoreg data = logspectra(obs = 100);
   model logpdg1 = logfreq;
run;

/* Regression for log-periodogram of y1*/
proc autoreg data = logspectra(obs = 100);
         model logpdg2 = logfreq;
run;
```

The output from the two regressions is shown in Figure 43.86 and Figure 43.87.

**Figure 43.86** Regression Estimates for y1

**The AUTOREG Procedure**

**Parameter Estimates**

| Variable | DF | Estimate | Standard Error | t Value | Approx Pr > \|t\| |
|---|---|---|---|---|---|
| Intercept | 1 | 4.3279 | 0.2885 | 15.00 | <.0001 |
| logfreq | 1 | -0.9051 | 0.1245 | -7.27 | <.0001 |

**Figure 43.87** Regression Estimates for y2

**The AUTOREG Procedure**

**Parameter Estimates**

| Variable | DF | Estimate | Standard Error | t Value | Approx Pr > \|t\| |
|---|---|---|---|---|---|
| Intercept | 1 | 2.0811 | 0.3172 | 6.56 | <.0001 |
| logfreq | 1 | -0.5227 | 0.1369 | -3.82 | 0.0002 |

The following statements produce log-log plots of the two periodograms along with the regression lines:

```
/*Plot the periodograms in log-log scale*/
ods graphics on;

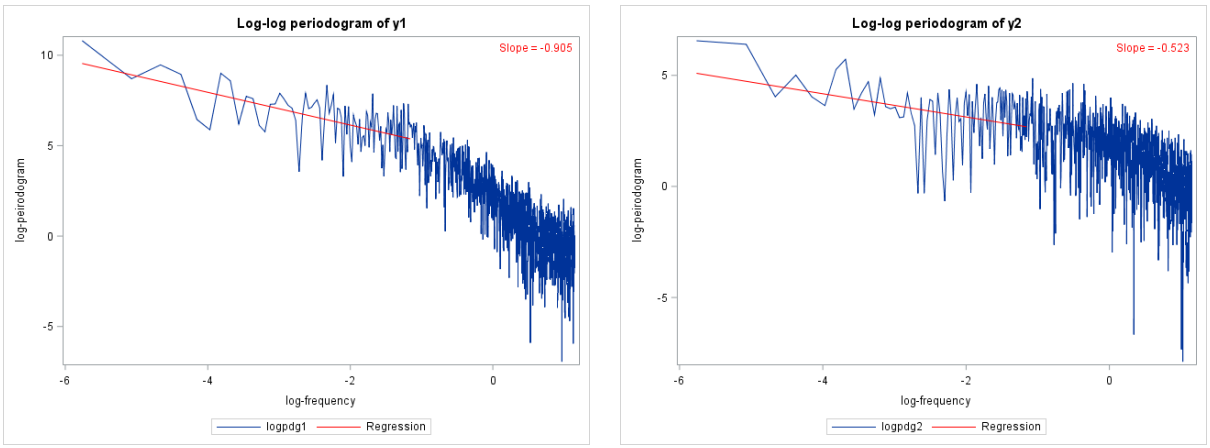
proc sgplot data = logspectra;
         series x = logfreq y = logpdg1 / lineattrs = (pattern = solid);
         reg y = logpdg1 x = logfreq / nomarkers weight = wt lineattrs =
                                       (thickness = 1 color = 'red' );
         inset "Slope = -0.905" / position = topright textattrs = (color = 'red');
         xaxis label = 'log-frequency';
         yaxis label = 'log-periodogram';
         title 'Log-periodogram of y1';
run;

proc sgplot data = logspectra;
         series x = logfreq y = logpdg2 / lineattrs = (pattern = solid);
         reg y = logpdg2 x = logfreq / nomarkers weight = wt lineattrs =
                                       (thickness = 1 color = 'red' );
         inset "Slope = -0.523" / position = topright textattrs = (color = 'red');
         xaxis label = 'log-frequency';
```

```
          yaxis label = 'log-periodogram';
          title 'Log-periodogram of y2';
run;
```

The final plots are shown in Figure 43.88.

**Figure 43.88** Log-Log Periodogram Plots for the Two Series



Dividing the slopes by 2 and removing the negative signs yields preliminary estimates for the LRD parameters, $\widehat{d}_1 = 0.45$ and $\widehat{d}_2 = 0.26$.

## Estimation

Estimation of all the parameters in the VARFIMA model is performed using the conditional likelihood Durbin-Levinson (CLDL) algorithm of Tsay (2010). This method uses the multivariate Durbin-Levinson algorithm, whose order of complexity is $O(T^2)$, making it computationally feasible for small or medium sample sizes.

The initial values of the LRD parameters are obtained by the semiparametric estimator of Geweke and Porter-Hudak (1983). The initial values of the AR and MA parameters are obtained from least squares estimation on the fractionally differenced series $(I - B)^D \mathbf{y}_t$. The LRD parameters are restricted in the range $(-1/2, 1/2)$. If an initial LRD parameter estimate is outside this range, then the chosen starting value is either $-1/2 + 10^{-6}$ or $1/2 - 10^{-6}$ for negative or positive initial semiparametric estimates, respectively.

## Forecasting

One-step-ahead and multi-step-ahead forecasts for the VARFIMA series are based on a finite past. However, the $h$-step-ahead forecast errors for $h > 1$ are based on the infinite past except for VARFIMA series that have only MA components. In the latter case, the forecast errors are also based on a finite past.

The following statements plot the $h$-step-ahead forecasts, $h = 1, \ldots, 36$, for a bivariate synthetic VARFIMA$(1, D, 1)$ series with $T = 400$ and true parameters $d_1 = 0.4$, $d_2 = 0.3$, $\Phi_{11} = \Sigma_{11} = \Sigma_{22} = 3$, $\Sigma_{12} = 0.5$, $\Phi_{11} = 0.8$, $\Phi_{12} = 0.3$, $\Phi_{21} = -0.2$, $\Phi_{22} = 0.1$, $\Theta_{11} = 0.2$, $\Theta_{12} = 0.4$, $\Theta_{21} = 0$, and $\Theta_{22} = 0.3$. The statements also specify initial values for $d_1$ and $d_2$ close to the true parameter values.

```
data VARFIMA1D1N4;
   time = _N_;
   input y1 y2;
```

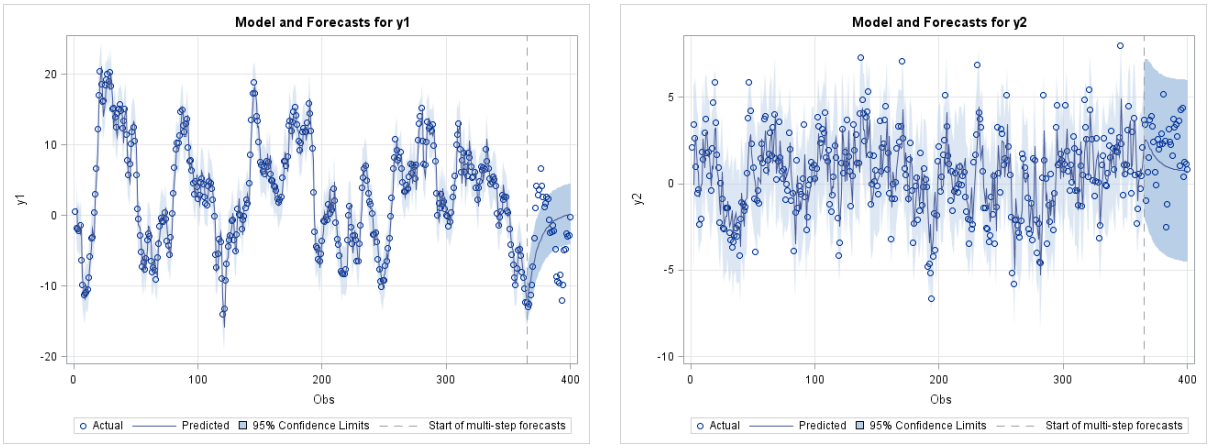
```
datalines;
0.55596529 2.114409393
-1.842925215 3.415027987

   ... more lines ...

-2.86707489 1.147627529
-0.195787414 0.820107072
;

proc varmax data = VARFIMA1D1N4 plots = (forecasts);
         model y1 y2 / noint fi p=1 q=1;
         initial d(1) = 0.45, d(2) = 0.25;
         output out = forec back = 36 lead = 36;
run;
```

**Figure 43.89** Plot of the Two Series and $h$-Step-Ahead Forecasts, $h = 1, \ldots, 36$



The BACK option in the preceding SAS statements is used to specify the point where the historical data ends and multi-step-ahead forecasting begins. Note that the BACK option does not affect estimation. The latter is performed using the whole data set, even when you specify the BACK option.

## Impulse Response Functions

The impulse response functions of the VARFIMA series are calculated using the methodology of Chung (2001). The following statements produce the first 12 simple, accumulated and orthogonal impulse response functions and their corresponding standard errors for the VARFIMA(1, $D$, 1) series of the preceding example.

```
proc varmax data = VARFIMA1D1N4 plots = (impulse);
         model y1 y2 / noint fi p=1 q=1 print = (impulse = (all));
run;
```

### VARFIMAX Modeling

The VARFIMAX$(p, D, q, s)$ series is defined as

$$\Phi(B)\mathbf{y}_t + \Theta^*(B)\mathbf{x}_t = (I - B)^{-D}\Theta(B)\boldsymbol{\epsilon}_t$$

where $\mathbf{x}_t = (x_{1t}, \ldots, x_{rt})'$, $t = 1, \ldots, T$, is an $r$-dimensional time series vector of exogenous variables and $\Theta^*(z)$ is the order $s$ matrix polynomial defined as $\Theta^*(z) = \Theta_0^* + \Theta_1^* z + \cdots + \Theta_s^* z^s$ for some $k \times r$ real matrices $\Theta_i^*$, $i = 1, \ldots, s$.

The following statements estimate a bivariate VARFIMAX$(1, D, 1, 0)$ model:

```
model y1 y2 = x1 / fi p=1 q=1;
```

## Conditional Forecasts and Scenario Analysis

Conditional forecasts and scenario analysis have been widely applied in macroeconomics. If you have no knowledge of any future dependent variables or cannot use such information, you can perform only unconditional forecasts. In contrast, conditional forecasts are forecasts conditional on some future paths of dependent variables. Some typical examples of the usage of conditional forecasts and scenario analysis are the stress tests that are conducted by the US Federal Reserve Board in the Comprehensive Capital Analysis and Review (CCAR) and by the European Banking Authority (EBA) on euro area banks that are directly supervised by the European Central Bank (ECB). For more information about conditional forecasts and scenario analysis, see Waggoner and Zha (1999), Karlsson (2013), Bańbura, Giannone, and Lenza (2015), Clark and McCracken (2017), and references therein.

According to Waggoner and Zha (1999), the conditions can be classified into two groups: soft conditions and hard conditions. The soft conditions belong to the set of conditions in which the future values of some dependent variables are restricted within certain ranges. The hard conditions belong to the set of conditions in which the future values of some dependent variables are fixed to some single values.

In order to obtain the conditional forecasts under the soft conditions, you perform unconditional forecasts first, and then select the simulated forecasts that satisfy the soft conditions. For example, for a trivariate VAR model on y1, y2 and y3, two future y3 values are bounded—$y_{3,T+1} \leq 0.10$ and $y_{3,T+2} \geq 0.15$, where $T$ is the in-sample sample size. The following statement performs the unconditional forecasts and outputs the simulated forecasts to the data set oucfsim:

```
condfore outsim=oucfsim;
```

The following statements select the forecasts that satisfy the soft conditions. The forecasts in the data set scForecasts are the conditional forecasts under the soft conditions. You can use the UNIVARIATE procedure or other procedures to get the mean, standard error, or quantiles of any future series of interest.

```
data scForecasts;
   set oucfsim;
   if (y3_1<=0.10 and y3_2>=0.15);
run;
```

You can define the hard conditions in a data set and then use the VARMAX procedure to pick up that data set by specifying the SDATA= option in the CONDFORE statement. For example, for a trivariate VAR model on y1, y2 and y3, two future y3 values are fixed—$y_{3,T+1} = 0.05$ and $y_{3,T+2} = 0.10$, where $T$ is the

in-sample sample size. The following statements define the hard conditions (that is, the scenario) in the data set scenario1:

```
data scenario1;
  y1=.; y2=.; y3 = 0.05; output;
  y1=.; y2=.; y3 = 0.10; output;
run;
```

The following statements use the scenario data set and output the (statistics of the simulated) forecasts to data set ocf:

```
condfore sdata=scenario1 out=ocf;
```

In fact, if all future values for a variable are missing, that variable can be omitted; that is, the following statements generate a scenario equivalent to the one in scenario1:

```
data scenario2;
  y3 = 0.05; output;
  y3 = 0.10; output;
run;
```

If there is more than one scenario, you can put the additional scenarios in one data set and distinguish them by using a numeric variable. The following statements define two scenarios and distinguish them with myScenario. In the first scenario (myscenario=1), the future values of y3 are available in two periods: $y_{3,T+1} = 0.05$ and $y_{3,T+2} = 0.10$. In the second scenario (myscenario=2), the future values of y3 are available in four periods: $y_{3,T+1} = 0.05$, $y_{3,T+2} = 0.10$, $y_{3,T+3} = 0.15$, and $y_{3,T+4} = 0.20$.

```
data scenario3;
  y3 = 0.05; myscenario=1; output;
  y3 = 0.10; myscenario=1; output;
  y3 = 0.05; myscenario=2; output;
  y3 = 0.10; myscenario=2; output;
  y3 = 0.15; myscenario=2; output;
  y3 = 0.20; myscenario=2; output;
run;
```

The following statements use the scenarios in the data set scenario3 and output the (statistics of the simulated) forecasts for two scenarios to data set ocf2:

```
condfore sdata=scenario3 sid=myscenario out=ocf2;
```

Future values of exogenous variables can be included in the scenario data set. The following list shows how PROC VARMAX treats various cases of how future values of exogenous variables are provided:

- If you do not include any future values of exogenous variables in the DATA= data set in the PROC VARMAX statement, you must include all future values of all exogenous variables for all forecast horizons for all scenarios in the SDATA= data set in the CONDFORE statement. These values are used in the conditional forecasts.
- If you include future values of exogenous variables for all forecast horizons in the DATA= data set in the PROC VARMAX statement and you do not include any future values of exogenous variables in the SDATA= data set in the CONDFORE statement, the future values of exogenous variables in the DATA= data set in the PROC VARMAX statement are used in the conditional forecasts.

- If you include future values of exogenous variables in both the DATA= data set in the PROC VARMAX statement and the SDATA= data set in the CONDFORE statement, the future values in both data sets are merged. During merging, nonmissing future values in the SDATA= data set in the CONDFORE statement override the corresponding future values in the DATA= data set in the PROC VARMAX statement. The merged future values of exogenous variables for all forecast horizons for each scenario should not contain any missing values because they are used in the conditional forecasts.

Regardless of whether you use the DIF option or the DIFX option on exogenous variables, the future values in the data set that is specified in the SDATA= option in the CONDFORE statement should be the future values of original exogenous variables. However, if you use DIF or DIFY option on a dependent variable, the future values of the correspondingly differenced dependent variable should be included in that data set.

Specifying the OUT= option in the CONDFORE statement creates a data set that contains the statistics of the simulated $h$-step-ahead forecasts for each dependent variable in each scenario. The following output variables can be created:

- the BY variables
- the ID variable
- STEP, a numeric variable that describes the forecast horizon
- *variable_name*_MEAN, a numeric variable that contains the mean of forecasts for the dependent variable *variable_name*
- *variable_name*_STDERR, a numeric variable that contains the standard error of forecasts for the dependent variable *variable_name*
- *variable_name*_MEDIAN, a numeric variable that contains the median of forecasts for the dependent variable *variable_name*
- *variable_name*_LB, a numeric variable that contains the lower bound of the credible interval of forecasts for the dependent variable *variable_name*
- *variable_name*_UB, a numeric variable that contains the upper bound of the credible interval of the dependent variable *variable_name*
- the SID variable

Specifying the OUTSIM= option in the CONDFORE statement creates a data set that contains the simulated forecasts for each Monte Carlo iteration. The following output variables can be created:

- the BY variables
- SIMID, a numeric variable that contains the index of Monte Carlo iterations
- *variable_name_h*, numeric variable that contains the $h$-step-ahead forecast for dependent variable *variable_name* in the Monte Carlo iteration The range of $h$ is from 1 to H when you specify LEAD=H in the CONDFORE statement.
- the SID variable

An example that has more details is illustrated in the section "Example 43.5: Conditional Forecasts and Scenario Analysis" on page 3217.

## Output Data Sets

The VARMAX procedure can create the OUT=, OUTEST=, OUTHT=, and OUTSTAT= data sets. In general, if processing fails, the output is not recorded or is set to missing in the relevant output data set, and appropriate error and/or warning messages are recorded in the log.

### OUT= Data Set

The OUT= data set contains the forecast values that the OUTPUT statement produces. The following output variables can be created:

- the BY variables
- the ID variable
- dependent (endogenous) variables in the MODEL statement. These variables contain the actual values from the input data set.
- FOR*i*, numeric variables that contain the forecasts. The FOR*i* variables contain the forecasts for the *i*th endogenous variable in the MODEL statement list. Forecasts are one-step-ahead predictions until the end of the data or until the observation that is specified in the BACK= option. Multistep forecasts can be computed after that point according to the LEAD= option.
- RES*i*, numeric variables that contain the residual for the forecast of the *i*th endogenous variable in the MODEL statement list. For multistep forecast observations, the actual values are missing and the RES*i* variables contain missing values.
- STD*i*, numeric variables that contain the standard deviation for the forecast of the *i*th endogenous variable in the MODEL statement list. The values of the STD*i* variables can be used to construct univariate confidence limits for the corresponding forecasts.
- LCI*i*, numeric variables that contain the lower confidence limits for the corresponding forecasts of the *i*th endogenous variable in the MODEL statement list
- UCI*i*, numeric variables that contain the upper confidence limits for the corresponding forecasts of the *i*th endogenous variable in the MODEL statement list

The OUT= data set contains the values shown in Table 43.7 and Table 43.8 for a bivariate case.

**Table 43.7** OUT= Data Set

| Obs | ID Variable | y1 | FOR1 | RES1 | STD1 | LCI1 | UCI1 |
|---|---|---|---|---|---|---|---|
| 1 | date | $y_{11}$ | $f_{11}$ | $r_{11}$ | $\sigma_{11}$ | $l_{11}$ | $u_{11}$ |
| 2 | date | $y_{12}$ | $f_{12}$ | $r_{12}$ | $\sigma_{11}$ | $l_{12}$ | $u_{12}$ |
| ⋮ | | | | | | | |

**Table 43.8** OUT= Data Set Continued

| Obs | y2 | FOR2 | RES2 | STD2 | LCI2 | UCI2 |
|---|---|---|---|---|---|---|
| 1 | $y_{21}$ | $f_{21}$ | $r_{21}$ | $\sigma_{22}$ | $l_{21}$ | $u_{21}$ |
| 2 | $y_{22}$ | $f_{22}$ | $r_{22}$ | $\sigma_{22}$ | $l_{22}$ | $u_{22}$ |
| ⋮ | | | | | | |

Consider the following example:

```
proc varmax data=simul1 noprint;
   id date interval=year;
   model y1 y2 / p=1 noint;
   output out=out lead=5;
run;

proc print data=out(firstobs=98);
run;
```

The output in Figure 43.90 shows part of the results of the OUT= data set for the preceding example.

## OUTEST= Data Set

The OUTEST= data set contains estimation results of the fitted model produced by the VARMAX statement. The following output variables can be created:

- BY variables
- NAME, a character variable that contains the name of the endogenous (dependent) variables or the name of the parameters for the covariance of the matrix of the parameter estimates if you specify the OUTCOV option
- TYPE, a character variable that contains the value EST for parameter estimates, the value STD for standard error of parameter estimates, and the value COV for the covariance of the matrix of the parameter estimates if you specify the OUTCOV option

- CONST, a numeric variable that contains the estimates of constant parameters and their standard errors
- SEASON_*i*, a numeric variable that contains the estimates of seasonal dummy parameters and their standard errors, where $i = 1, \ldots, (nseason - 1)$, and $nseason$ is based on the NSEASON= option
- LTREND, a numeric variable that contains the estimates of linear trend parameters and their standard errors
- QTREND, a numeric variable that contains the estimates of quadratic trend parameters and their standard errors
- XL*l*_*i*, numeric variables that contain the estimates of exogenous parameters and their standard errors, where *l* is the lag *l*th coefficient matrix and $i = 1, \ldots, r$, where *r* is the number of exogenous variables
- AR*l*_*i*, numeric variables that contain the estimates of autoregressive parameters and their standard errors, where *l* is the lag *l*th coefficient matrix and $i = 1, \ldots, k$, where *k* is the number of endogenous variables
- MA*l*_*i*, numeric variables that contain the estimates of moving-average parameters and their standard errors, where *l* is the lag *l*th coefficient matrix and $i = 1, \ldots, k$, where *k* is the number of endogenous variables
- COV_*i*, numeric variables that contain the estimates of the covariance of innovations parameters when the maximum likelihood method is applied, where $i = 1, \ldots, k$
- DCCAB, a numeric variable that contains the estimates of $\alpha$ or $\beta$ in the correlation equation for DCC representation and their standard errors
- CCC_*i*, numeric variables that contain the estimates of the conditional constant correlation parameters for CCC representation, where $i = 2, \ldots, k$
- DCCS_*i*, numeric variables that contain the estimates of the unconditional correlation parameters for DCC representation, where $i = 2, \ldots, k$
- GCHC_*i*, numeric variables that contain the estimates of the constant parameters of the covariance matrix and their standard errors, where $i = 1, \ldots, k$ for BEKK representation, *k* is the number of endogenous variables, and $i = 1$ for CCC and DCC representations
- ACH*l*_*i*, numeric variables that contain the estimates of the ARCH parameters of the covariance matrix and their standard errors, where *l* is the lag *l*th coefficient matrix and $i = 1, \ldots, k$ for BEKK, CCC, and DCC representations, where *k* is the number of endogenous variables
- EACH*l*_*i*, numeric variables that contain the estimates of the exponential ARCH parameters of the covariance matrix and their standard errors, where *l* is the lag *l*th coefficient matrix and $i = 1, \ldots, k$ for CCC and DCC representations, where *k* is the number of endogenous variables
- PACH*l*_*i*, numeric variables that contain the estimates of the power ARCH parameters of the covariance matrix and their standard errors, where *l* is the lag *l*th coefficient matrix and $i = 1, \ldots, k$ for CCC and DCC representations, where *k* is the number of endogenous variables
- QACH*l*_*i*, numeric variables that contain the estimates of the quadratic ARCH parameters of the covariance matrix and their standard errors, where *l* is the lag *l*th coefficient matrix and $i = 1, \ldots, k$ for CCC and DCC representations, where *k* is the number of endogenous variables

- TACH*l*_*i*, numeric variables that contain the estimates of the threshold ARCH parameters of the covariance matrix and their standard errors, where *l* is the lag *l*th coefficient matrix and $i = 1, \ldots, k$ for CCC and DCC representations, where *k* is the number of endogenous variables
- GCH*l*_*i*, numeric variables that contain the estimates of the GARCH parameters of the covariance matrix and their standard errors, where *l* is the lag *l*th coefficient matrix and $i = 1, \ldots, k$ for BEKK, CCC, and DCC representations, where *k* is the number of endogenous variables
- LAMBDA, a numeric variable that contains the estimates of power parameters in the PGARCH model for CCC and DCC representations and their standard errors

The OUTEST= data set contains the values shown in Table 43.9 for a bivariate case.

**Table 43.9** OUTEST= Data Set

| Obs | NAME | TYPE | CONST | AR1_1 | AR1_2 | AR2_1 | AR2_2 |
|---|---|---|---|---|---|---|---|
| 1 | y1 | EST | $\delta_1$ | $\phi_{1,11}$ | $\phi_{1,12}$ | $\phi_{2,11}$ | $\phi_{2,12}$ |
| 2 | | STD | se($\delta_1$) | se($\phi_{1,11}$) | se($\phi_{1,12}$) | se($\phi_{2,11}$) | se($\phi_{2,12}$) |
| 3 | y2 | EST | $\delta_2$ | $\phi_{1,21}$ | $\phi_{1,22}$ | $\phi_{2,21}$ | $\phi_{2,22}$ |
| 4 | | STD | se($\delta_2$) | se($\phi_{1,21}$) | se($\phi_{1,22}$) | se($\phi_{2,21}$) | se($\phi_{2,22}$) |

Consider the following example:

```
proc varmax data=simul2 outest=est;
   model y1 y2 / p=2 noint noprint;
   cointeg rank=1 normalize=y1;
run;

proc print data=est;
run;
```

The output in Figure 43.91 shows the results of the OUTEST= data set.

**Figure 43.91** OUTEST= Data Set

**Log-periodogram of y2**

| Obs | NAME | TYPE | AR1_1 | AR1_2 | AR2_1 | AR2_2 | COV_1 | COV_2 | ALPHA1 | BETA1 |

## OUTHT= Data Set

The OUTHT= data set contains predictions of conditional covariance matrices of innovations of the fitted GARCH model that the GARCH statement produces. The following output variables can be created:

- the BY variables, if BY-group processing is performed
- the ID variable, if the ID statement is specified
- H$i$_$j$, numeric variables that contain the prediction of covariance, where $1 \leq i \leq j \leq k$, where $k$ is the number of dependent variables

The OUTHT= data set contains the values shown in Table 43.10 for a bivariate case.

**Table 43.10** OUTHT= Data Set

| Obs | H1_1 | H1_2 | H2_2 |
|---|---|---|---|
| 1 | h111 | h121 | h221 |
| 2 | h112 | h122 | h222 |
| : | : | : | : |

The OUTHT= data set has the same number of observations as the OUT= data set. Both the OUTHT= and OUT= data sets include any observations at the beginning of the data set that are skipped because of the DIF=, DIFY=, DIFX=, P=, or XLAG= option and include the predicted observations at the end of the data set, which correspond with the LEAD= specification. If you specify an ID statement together with the OUTHT= and OUT= options, then the values of the ID variable in the two data sets correspond with one another.

Consider the following example of the OUTHT= option:

```
data garch;
   set garch;
   date = intnx( 'month', '01may1972'd, _n_-1 );
   format date yymms.;
run;

proc varmax data=garch;
   id date interval=month;
   model y1 y2 / p=1;
   garch q=1 outht=ht;
   output out=og lead=6;
run;

proc print data=og(obs=8);
   var date y1 for1 std1 lci1 uci1 y2 for2 std2 lci2 uci2;
run;

proc print data=ht(obs=8);
run;
```

```
proc print data=og(firstobs=499);
   var date y1 for1 std1 lci1 uci1 y2 for2 std2 lci2 uci2;
run;

proc print data=ht(firstobs=499);
run;
```

The output in Figure 43.92 and Figure 43.93 shows the first eight observations in the OUT= and OUTHT= data sets, respectively. The first observation is skipped in the GARCH model estimation because of the P=1 option, resulting in the missing values in the first observations in the OUT= and OUTHT= data sets. The output in Figure 43.94 and Figure 43.95 shows the last eight observations in the OUT= and OUTHT= data sets, respectively. In the OUT= data set, the standard deviations of the forecast of dependent variables are time-variant. The last six observations in OUTHT= data set are the multistep forecast of conditional covariance matrices of innovations.

## OUTSTAT= Data Set

The OUTSTAT= data set contains estimation results of the fitted model produced by the VARMAX statement. The following output variables can be created. The subindex $i$ is $1, \ldots, k$, where $k$ is the number of endogenous variables.

- the BY variables
- NAME, a character variable that contains the name of endogenous (dependent) variables
- SIGMA_$i$, numeric variables that contain the estimate of the innovation covariance matrix
- AICC, a numeric variable that contains the corrected Akaike's information criterion value
- HQC, a numeric variable that contains the Hannan-Quinn's information criterion value
- AIC, a numeric variable that contains the Akaike's information criterion value
- SBC, a numeric variable that contains the Schwarz Bayesian's information criterion value
- FPEC, a numeric variable that contains the final prediction error criterion value

- LOGLIK, a numeric variable that contains the value of the log-likelihood function calculated at the parameter estimates
- RSquare, a numeric variable that contains the value of the coefficient of determination
- FValue, a numeric variable that contains the $F$ statistics
- PValue, a numeric variable that contains $p$-value for the $F$ statistics

If the JOHANSEN= option is specified, the following items are added:

- Eigenvalue, a numeric variable that contains eigenvalues for the cointegration rank test of integrated order 1
- RestrictedEigenvalue, a numeric variable that contains eigenvalues for the cointegration rank test of integrated order 1 when the NOINT option is not specified
- Beta_$i$, numeric variables that contain long-run effect parameter estimates, $\boldsymbol{\beta}$
- Alpha_$i$, numeric variables that contain adjustment parameter estimates, $\boldsymbol{\alpha}$

If the JOHANSEN=(IORDER=2) option is specified, the following items are added:

- EValueI2_$i$, numeric variables that contain eigenvalues for the cointegration rank test of integrated order 2
- EValueI1, a numeric variable that contains eigenvalues for the cointegration rank test of integrated order 1
- Eta_$i$, numeric variables that contain the parameter estimates in integrated order 2, $\boldsymbol{\eta}$
- Xi_$i$, numeric variables that contain the parameter estimates in integrated order 2, $\boldsymbol{\xi}$

The OUTSTAT= data set contains the values shown Table 43.11 for a bivariate case.

**Table 43.11** OUTSTAT= Data Set

| 1 | $\alpha_{11}$ | $\alpha_{12}$ | $\eta_{11}$ | $\eta_{12}$ | $\xi_{11}$ | $\xi_{12}$ |
| 2 | $\alpha_{21}$ | $\alpha_{22}$ | $\eta_{21}$ | $\eta_{22}$ | $\xi_{21}$ | $\xi_{22}$ |

Consider the following example:

```
proc varmax data=simul2 outstat=stat;
   model y1 y2 / p=2 noint noprint
                 cointtest=(johansen=(iorder=2));
   cointeg rank=1 normalize=y1;
run;

proc print data=stat;
run;
```

The output in Figure 43.96 shows the results of the OUTSTAT= data set.

## Printed Output

The default printed output produced by the VARMAX procedure is described in the following list:

- descriptive statistics, which include the number of observations used, the names of the variables, their means and standard deviations (STD), their minimums and maximums, the differencing operations used, and the labels of the variables
- a type of model to fit the data and an estimation method
- a table of parameter estimates that shows the following for each parameter: the variable name for the left-hand side of equation, the parameter name, the parameter estimate, the approximate standard error, $t$ value, the approximate probability ($Pr > |t|$), and the variable name for the right-hand side of equations in terms of each parameter

- the innovation covariance matrix
- the information criteria

If PRINT=ESTIMATES is specified, the VARMAX procedure prints the following list with the default printed output:

- the estimates of the constant vector (or seasonal constant matrix), the trend vector, the coefficient matrices of the distributed lags, the AR coefficient matrices, and the MA coefficient matrices
- the ALPHA and BETA parameter estimates for the error correction model
- the schematic representation of parameter estimates

If PRINT=DIAGNOSE is specified, the VARMAX procedure prints the following list with the default printed output:

- the cross-covariance and cross-correlation matrices of the residuals
- the tables of test statistics for the hypothesis that the residuals of the model are white noise:
  - Durbin-Watson (DW) statistics
  - *F* test for autoregressive conditional heteroscedastic (ARCH) disturbances
  - *F* test for AR disturbance
  - Jarque-Bera normality test
  - portmanteau test

## ODS Table Names

The VARMAX procedure assigns a name to each table that it creates. You can use these names to reference the table when using the Output Delivery System (ODS) to select tables and create output data sets. These names are listed in Table 43.12.

**Table 43.12** ODS Tables Produced in the VARMAX Procedure

| ODS Table Name | Description | Option |
|---|---|---|
| **ODS Tables Created by the MODEL Statement** | | |
| AccumImpulse | Accumulated impulse response matrices | IMPULSE=(ACCUM)<br>IMPULSE=(ALL) |
| AccumImpulsebyVar | Accumulated impulse response by variable | IMPULSE=(ACCUM)<br>IMPULSE=(ALL) |

Note that the ODS table names suffixed by "byVar" can be obtained with the PRINTFORM=UNIVARIATE option.

## ODS Graphics

This section describes the use of ODS for creating statistical graphs with the VARMAX procedure.

When ODS GRAPHICS are in effect, the VARMAX procedure produces a variety of plots for each dependent variable.

The plots available are as follows:

- The procedure displays the following plots for each dependent variable in the MODEL statement with the PLOT= option in the VARMAX statement:
  - impulse response function
  - impulse response of the transfer function
  - time series and predicted series
  - prediction errors
  - distribution of the prediction errors
  - normal quantile of the prediction errors
  - ACF of the prediction errors
  - PACF of the prediction errors

  - IACF of the prediction errors
  - log scaled white noise test of the prediction errors

- The procedure displays forecast plots for each dependent variable in the OUTPUT statement with the PLOT= option in the VARMAX statement.

## ODS Graph Names

The VARMAX procedure assigns a name to each graph it creates by using ODS. You can use these names to reference the graphs when using ODS. The names are listed in Table 43.13.

**Table 43.13** ODS Graphics Produced in the VARMAX Procedure

| ODS Table Name | Plot Description | Statement |
|---|---|---|
| ErrorACFPlot | Autocorrelation function of prediction errors | MODEL |
| ErrorIACFPlot | Inverse autocorrelation function of prediction errors | MODEL |
| ErrorPACFPlot | Partial autocorrelation function of prediction errors | MODEL |
| ErrorDiagnosticsPanel | Diagnostics of prediction errors | MODEL |
| ErrorNormalityPanel | Histogram and Q-Q plot of prediction errors | MODEL |
| ErrorDistribution | Distribution of prediction errors | MODEL |
| ErrorQQPlot | Q-Q plot of prediction errors | MODEL |
| ErrorWhiteNoisePlot | White noise test of prediction errors | MODEL |
| ErrorPlot | Prediction errors | MODEL |

| ForecastsOnlyPlot | Forecasts | OUTPUT |

# Computational Issues

## Computational Method

The VARMAX procedure uses numerous linear algebra routines and frequently uses the sweep operator (Goodnight 1979) and the Cholesky root (Golub and Van Loan 1983).

In addition, the VARMAX procedure uses the nonlinear optimization (NLO) subsystem to perform nonlinear optimization tasks for the maximum likelihood estimation. The optimization requires intensive computation.

## Convergence Problems

For some data sets, the computation algorithm can fail to converge. Nonconvergence can result from a number of causes, including flat or ridged likelihood surfaces and ill-conditioned data.

If you experience convergence problems, the following points might be helpful:

- Data that contain extreme values can affect results in PROC VARMAX. Rescaling the data can improve stability.
- Changing the TECH=, MAXITER=, and MAXFUNC= options in the NLOPTIONS statement can improve the stability of the optimization process.
- Specifying a different model that might fit the data more closely and might improve convergence.

## Memory

Let $T$ be the length of each series, $k$ be the number of dependent variables, $p$ be the order of autoregressive terms, and $q$ be the order of moving-average terms. The number of parameters to estimate for a VARMA$(p,q)$ model is

$$k + (p+q)k^2 + k * (k+1)/2$$

As $k$ increases, the number of parameters to estimate increases very quickly. Furthermore, the memory requirement for VARMA$(p,q)$ quadratically increases as $k$ and $T$ increase.

For a VARMAX$(p,q,s)$ model and GARCH-type multivariate conditional heteroscedasticity models, the number of parameters to estimate and the memory requirements are considerable.

## Computing Time

PROC VARMAX is computationally intensive, and execution times can be long. Extensive CPU time is often required to compute the maximum likelihood estimates.

# Examples: VARMAX Procedure

## Example 43.1: Analysis of United States Economic Variables

Consider the following four-dimensional system of US economic variables. Quarterly data for the years 1954 to 1987 are used (Lütkepohl 1993, Table E.3.).

```
title 'Analysis of US Economic Variables';
data us_money;
   date=intnx( 'qtr', '01jan54'd, _n_-1 );
   format date yyq. ;
   input y1 y2 y3 y4 @@;
   y1=log(y1);
   y2=log(y2);
   label y1='log(real money stock M1)'
         y2='log(GNP in bil. of 1982 dollars)'
         y3='Discount rate on 91-day T-bills'
         y4='Yield on 20-year Treasury bonds';
datalines;
450.9 1406.8  0.010800000 0.026133333
453.0 1401.2 0.0081333333 0.025233333
459.1 1418.0 0.0087000000 0.024900000

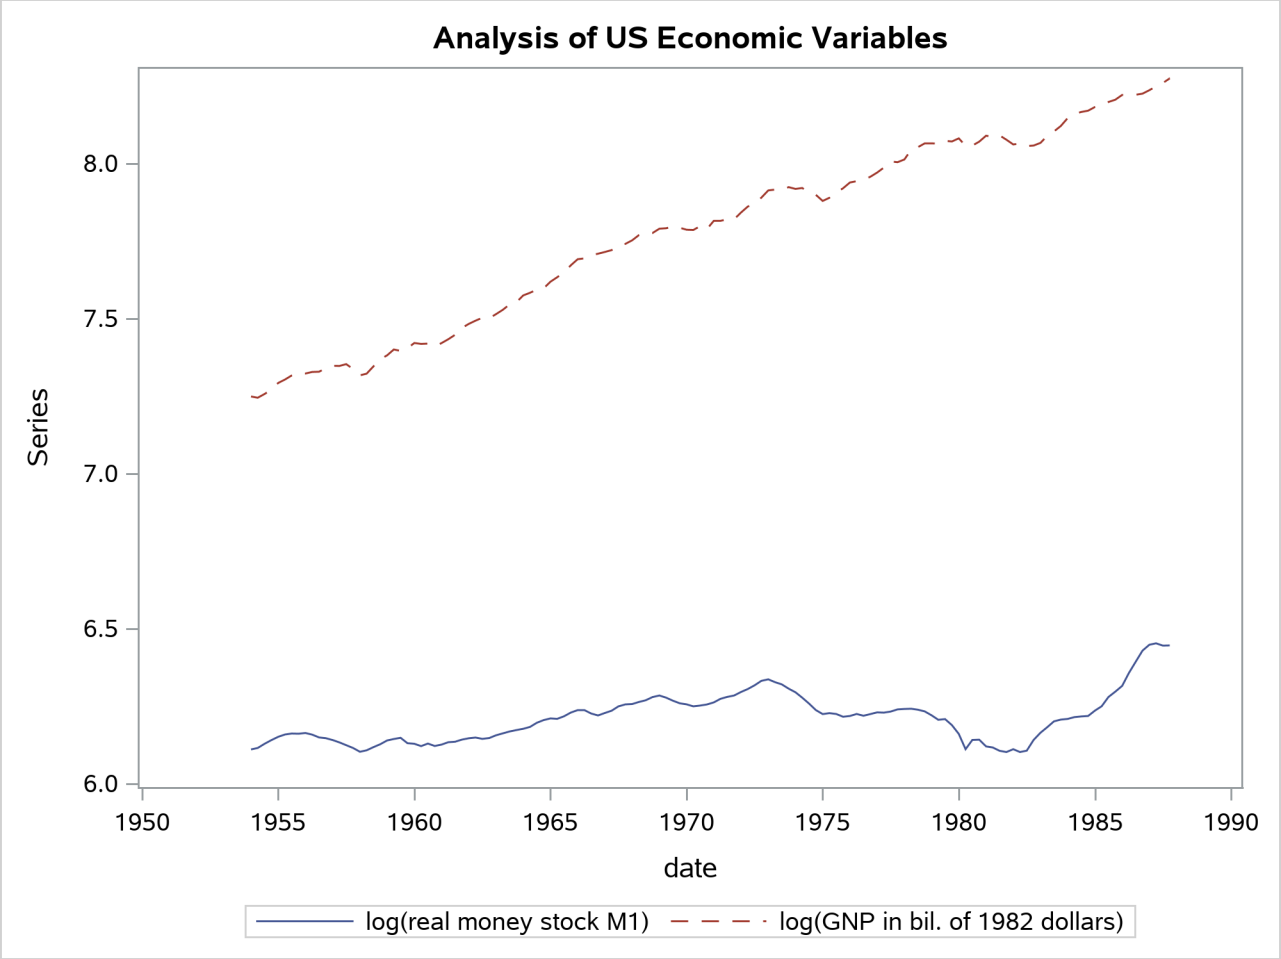
   ... more lines ...
```

The following statements plot the series:

```
proc sgplot data=us_money;
   series x=date y=y1 / lineattrs=(pattern=solid);
   series x=date y=y2 / lineattrs=(pattern=dash);
   yaxis label="Series";
run;
```

Output 43.1.1 shows the plot of the variables $y1$ and $y2$.

**Output 43.1.1** Plot of Data

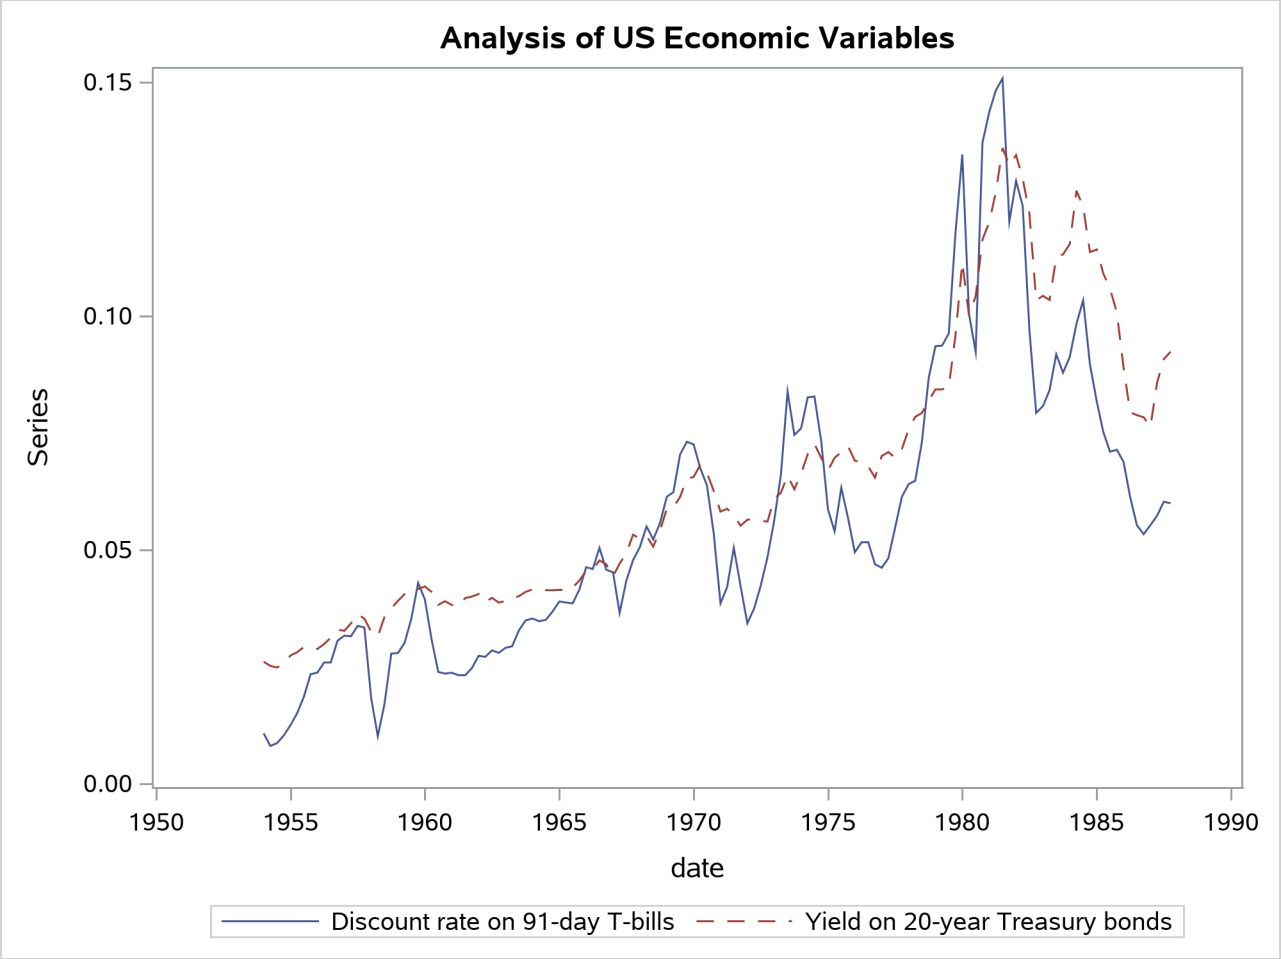


The following statements plot the variables $y3$ and $y4$:

```
proc sgplot data=us_money;
   series x=date y=y3 / lineattrs=(pattern=solid);
   series x=date y=y4 / lineattrs=(pattern=dash);
   yaxis label="Series";
run;
```

Output 43.1.2 shows the plot of the variables $y3$ and $y4$.

**Output 43.1.2** Plot of Data



The following statements perform the Dickey-Fuller test for stationarity, the Johansen cointegrated test integrated order 2, and the exogeneity test. The VECM(2) is fit to the data.

```
proc varmax data=us_money;
   id date interval=qtr;
   model y1-y4 / p=2 lagmax=6 dftest
                 print=(iarr(3) estimates diagnose)
                 cointtest=(johansen=(iorder=2));
   cointeg rank=1 normalize=y1 exogeneity;
run;
```

From the outputs shown in Output 43.1.5, you can see that the series has unit roots and is cointegrated in

rank 1 with integrated order 1. The fitted VECM(2) is given as

$$\Delta \mathbf{y}_t = \begin{pmatrix} 0.0408 \\ 0.0860 \\ 0.0052 \\ -0.0144 \end{pmatrix} + \begin{pmatrix} -0.0140 & 0.0065 & -0.2026 & 0.1306 \\ -0.0281 & 0.0131 & -0.4080 & 0.2630 \\ -0.0022 & 0.0010 & -0.0312 & 0.0201 \\ 0.0051 & -0.0024 & 0.0741 & -0.0477 \end{pmatrix} \mathbf{y}_{t-1} + \begin{pmatrix} 0.3460 & 0.0913 & -0.3535 & -0.9690 \\ 0.0994 & 0.0379 & 0.2390 & 0.2866 \\ 0.1812 & 0.0786 & 0.0223 & 0.4051 \\ 0.0322 & 0.0496 & -0.0329 & 0.1857 \end{pmatrix} \Delta \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t$$

The $\Delta$ prefixed to a variable name implies differencing.

Output 43.1.3 through Output 43.1.16 show the details. Output 43.1.3 shows the descriptive statistics.

**Output 43.1.3** Descriptive Statistics

**Analysis of US Economic Variables**

**The VARMAX Procedure**

| | |
|---|---|
| **Number of Observations** | 136 |
| **Number of Pairwise Missing** | 0 |

**Simple Summary Statistics**

| Variable | Type | N | Mean | Standard Deviation | Min | Max | Label |
|---|---|---|---|---|---|---|---|
| **y1** | **Dependent** | 136 | 6.21295 | 0.07924 | 6.10278 | 6.45331 | log(real money stock M1) |
| **y2** | **Dependent** | 136 | 7.77890 | 0.30110 | 7.24508 | 8.27461 | log(GNP in bil. of 1982 dollars) |

Output 43.1.4 shows the output for Dickey-Fuller tests for the nonstationarity of each series. The null hypothesis is that there exists a unit root. All series have a unit root.

**Output 43.1.4** Unit Root Tests

**Unit Root Test**

| Variable | Type | Rho | Pr < Rho | Tau | Pr < Tau |
|---|---|---|---|---|---|
| **y1** | **Zero Mean** | 0.05 | 0.6934 | 1.14 | 0.9343 |
| | **Single Mean** | -2.97 | 0.6572 | -0.76 | 0.8260 |
| | **Trend** | -5.91 | 0.7454 | -1.34 | 0.8725 |
| **y2** | **Zero Mean** | 0.13 | 0.7124 | 5.14 | 0.9999 |
| | **Single Mean** | -0.43 | 0.9309 | -0.79 | 0.8176 |
| | **Trend** | -9.21 | 0.4787 | -2.16 | 0.5063 |
| **y3** | **Zero Mean** | -1.28 | 0.4255 | -0.69 | 0.4182 |
| | **Single Mean** | -8.86 | 0.1700 | -2.27 | 0.1842 |
| | **Trend** | -18.97 | 0.0742 | -2.86 | 0.1803 |
| **y4** | **Zero Mean** | 0.40 | 0.7803 | 0.45 | 0.8100 |
| | **Single Mean** | -2.79 | 0.6790 | -1.29 | 0.6328 |
| | **Trend** | -12.12 | 0.2923 | -2.33 | 0.4170 |

The Johansen cointegration rank test shows whether the series is integrated order either 1 or 2 as shown in Output 43.1.5. The last two columns in Output 43.1.5 explain the cointegration rank test with integrated order 1. The results indicate that there is a cointegrated relationship with cointegration rank 1 with respect to the 0.05 significance level because the test statistic for the null hypothesis H0: $r = 0$ is 55.9633 and its corresponding $p$-value is 0.0072, less than 0.05 (indicating that H0: $r = 0$ should be rejected), and the test statistic for the null hypothesis H0: $r = 1$ is 20.6542 and its corresponding $p$-value is 0.3775, greater than 0.05 (indicating that H0: $r = 1$ cannot be rejected). Now, look at the row associated with $r = 1$. All $p$-values of the tests for the null hypothesis that the series are integrated order 2 are zeros, less than 0.05 significance level (indicating that the null hypothesis should be rejected).

**Output 43.1.5** Cointegration Rank Test

| Cointegration Rank Test for I(2) | | | | | | |
|---|---|---|---|---|---|---|
| r\k-r-s | 4 | 3 | 2 | 1 | Trace of I(1) | Pr > Trace of I(1) |
| 0 | 384.6090 | 214.3790 | 107.9378 | 37.0252 | 55.9633 | 0.0072 |

## Example 43.2: Analysis of German Economic Variables

This example considers a three-dimensional VAR(2) model. The model contains the logarithms of a quarterly, seasonally adjusted West German fixed investment, disposable income, and consumption expenditures. The data used are in Lütkepohl (1993, Table E.1).

```
title 'Analysis of German Economic Variables';
data west;
   date = intnx( 'qtr', '01jan60'd, _n_-1 );
   format date yyq. ;
   input y1 y2 y3 @@;
   y1 = log(y1);
   y2 = log(y2);
   y3 = log(y3);
   label y1 = 'logarithm of investment'
         y2 = 'logarithm of income'
         y3 = 'logarithm of consumption';
datalines;
180  451  415 179  465  421 185  485  434 192  493  448
211  509  459 202  520  458 207  521  479 214  540  487

   ... more lines ...

data use;
   set west;
   where  date < '01jan79'd;
   keep date y1 y2 y3;
run;

proc varmax data=use;
   id date interval=qtr;
   model y1-y3 / p=2 dify=(1)
                 print=(decompose(6) impulse=(stderr) estimates diagnose)
                 printform=both lagmax=3;
   causal group1=(y1) group2=(y2 y3);
   output lead=5;
run;
```

First, the differenced data are modeled as a VAR(2) with the following result:

$$\Delta \mathbf{y}_t = \begin{pmatrix} -0.01672 \\ 0.01577 \\ 0.01293 \end{pmatrix} + \begin{pmatrix} -0.31963 & 0.14599 & 0.96122 \\ 0.04393 & -0.15273 & 0.28850 \\ -0.00242 & 0.22481 & -0.26397 \end{pmatrix} \Delta \mathbf{y}_{t-1} + \begin{pmatrix} -0.16055 & 0.11460 & 0.93439 \\ 0.05003 & 0.01917 & -0.01020 \\ 0.03388 & 0.35491 & -0.02223 \end{pmatrix} \Delta \mathbf{y}_{t-2} + \boldsymbol{\epsilon}_t$$

The parameter estimates AR1_1_2, AR1_1_3, AR2_1_2, and AR2_1_3 are insignificant, and the VARX model is fitted in the next step.

The detailed output is shown in Output 43.2.1 through Output 43.2.8.

Output 43.2.1 shows the descriptive statistics.

Output 43.2.6 is the output in a matrix format associated with the PRINT=(IMPULSE=) option for the impulse response function and standard errors. The $y3$ variable in the first row is an impulse variable. The $y1$ variable in the first column is a response variable. The numbers, 0.96122, 0.41555, –0.40789 at lag 1 to 3 are decreasing.

**Output 43.2.6** Impulse Response Function

The proportions of decomposition of the prediction error covariances of three variables are given in Output 43.2.7. If you see the $y3$ variable in the first column, then the output explains that about 64.713% of the one-step-ahead prediction error covariances of the variable $y_{3t}$ is accounted for by its own innovations, about 7.995% is accounted for by $y_{1t}$ innovations, and about 27.292% is accounted for by $y_{2t}$ innovations.

**Output 43.2.7** Proportions of Prediction Error Covariance Decomposition

| Proportions of Prediction Error Covariances by Variable | | | | |

Output 43.2.9 shows that you cannot reject Granger noncausality from $(y2, y3)$ to $y1$ using the 0.05 significance level.

**Output 43.2.9** Granger Causality Tests

| Granger-Causality Wald Test | | | |
|---|---|---|---|
| Test | DF | Chi-Square | Pr > ChiSq |
| 1 | 4 | 6.37 | 0.1734 |

| | | |
|---|---|---|
| Test 1: | Group 1 Variables: | y1 |
| | Group 2 Variables: | y2 y3 |

The following SAS statements show that the variable $y1$ is the exogenous variable and fit the VARX(2,1) model to the data:

```
proc varmax data=use;
   id date interval=qtr;
   model y2 y3 = y1 / p=2 dify=(1) difx=(1) xlag=1 lagmax=3
                      print=(estimates diagnose);
run;
```

The fitted VARX(2,1) model is written as

$$\begin{aligned}\begin{pmatrix} \Delta y_{2t} \\ \Delta y_{3t} \end{pmatrix} &= \begin{pmatrix} 0.01542 \\ 0.01319 \end{pmatrix} + \begin{pmatrix} 0.02520 \\ 0.05130 \end{pmatrix} \Delta y_{1t} + \begin{pmatrix} 0.03870 \\ 0.00363 \end{pmatrix} \Delta y_{1,t-1} \\ &\quad + \begin{pmatrix} -0.12258 & 0.25811 \\ 0.24367 & -0.31809 \end{pmatrix} \begin{pmatrix} \Delta y_{2,t-1} \\ \Delta y_{3,t-1} \end{pmatrix} \\ &\quad + \begin{pmatrix} 0.01651 & 0.03498 \\ 0.34921 & -0.01664 \end{pmatrix} \begin{pmatrix} \Delta y_{2,t-2} \\ \Delta y_{3,t-2} \end{pmatrix} + \begin{pmatrix} \epsilon_{1t} \\ \epsilon_{2t} \end{pmatrix}\end{aligned}$$

The detailed output is shown in Output 43.2.10 through Output 43.2.13.

Output 43.2.10 shows the parameter estimates in terms of the constant, the current and the lag one coefficients of the exogenous variable, and the lag two coefficients of the dependent variables.

## Example 43.3: Analysis of Restricted Cointegrated Systems

The structural relationships between economic time series have been of interest for decades. Because of the cointegration, the vector error correction model (VECM), introduced by Engle and Granger (1987), is one of the most important tools for performing such analysis. Although there exist analytical solutions for a nonrestricted VECM and some restricted VECMs in special forms, the estimation of a generally restricted VECM relies on numerical methods. This section illustrates how to use the RESTRICT (or BOUND) and TEST statements, together with the COINTEG statement, to estimate the restricted VECM and perform the statistical tests. For more information about this topic, see Boswijk and Doornik (2004) and references therein.

The data are simulated based on the VECM,

$$
\begin{aligned}
\Delta \mathbf{y}_t &= \boldsymbol{\alpha}\boldsymbol{\beta}'\mathbf{y}_{t-1} + \Phi_1^*\Delta\mathbf{y}_{t-1} + \Theta_0^*\mathbf{x}_t + \boldsymbol{\epsilon}_t \\
&= \begin{bmatrix} 0.01 & -0.02 \\ -0.03 & 0.04 \\ 0.05 & -0.06 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 1 & 0 & -1 & 0 \\ 0 & 1 & 0 & -1 \end{bmatrix} \mathbf{y}_{t-1} \\
&\quad + \begin{bmatrix} -0.01 & 0.03 & 0.05 & -0.02 \\ 0.02 & -0.04 & 0.06 & 0.03 \\ 0 & 0 & 0.10 & 0 \\ 0 & 0 & 0 & 0.04 \end{bmatrix} \Delta\mathbf{y}_{t-1} + \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix} \mathbf{x}_t + \boldsymbol{\epsilon}_t, \\
\boldsymbol{\epsilon}_t &\sim \text{iid } N(0, \Sigma), \Sigma = I_4
\end{aligned}
$$

where $I_4$ is the $4 \times 4$ identity matrix.

The following statements implement the simulation:

```
title 'Analysis of Restricted Cointegrated Systems';
proc iml;
   alpha = {0.01 -0.02, -0.03 0.04, 0.05 -0.06, 0 0};
   beta = {1 0, 0 1, -1 0, 0 -1};
   phiStar = {-0.01  0.03 0.05 -0.02,
               0.02 -0.04 0.06  0.03,
                  0     0 0.10     0,
                  0     0    0  0.04};
   Pi = alpha * beta` ;
   A1 = I(4) + Pi+ phiStar;
   A2 = -phiStar;
   phi = A1 // A2;
   sig = I(4);

   /* to simulate the vector time series */
   T = 600;
   myseed = 2;
   call varmasim(y,phi) sigma=sig n=T seed=myseed;
   x = J(T,1,0);
   do i = 1 to T;
      x[i] = normal(myseed);
   end;
   y = y || x;

   cn = {'y1' 'y2' 'y3' 'y4' 'x'};
   create simul5 from y[colname=cn];
   append from y;
   close;
quit;
```

## Weak Exogeneity Tests

This example shows different methods for checking weak exogeneity.

The first method uses the EXOGENEITY option in the following statements, and the test results are shown in Output 43.3.1:

```
/* Method 1 -- To use the EXOGENEITY option */
ods output LogLikelihood = tbl_ll_g;
proc varmax data=simul5;
   model y1 y2 y3 y4 = x / noint p=2;
   cointeg rank=2 exogeneity;
run;
```

**Output 43.3.1** Test Weak Exogeneity with the EXOGENEITY Option

**Analysis of Restricted Cointegrated Systems**

**The VARMAX Procedure**

**Testing Weak Exogeneity of Each Variable**

| Variable | DF | Chi-Square | Pr > ChiSq |
|---|---|---|---|
| **y1** | 2 | 102.96 | <.0001 |
| **y2** | 2 | 116.12 | <.0001 |
| **y3** | 2 | 200.80 | <.0001 |
| **y4** | 2 | 3.99 | 0.1357 |

The second method uses the RESTRICT statement and then the likelihood ratio (LR) test in the following statements. The results are shown in Output 43.3.2. In theory, the first and second methods should have exactly same statistics and $p$-values because they implement the same LR tests. However, because of the difference between the analytical solution and the numerical solution for the restricted VECM, the statistics are a little different, although for the 0.05 significance level they lead to the same correct conclusion: the variable $y1$ is not the weak exogeneity of variables $y2$, $y3$, and $y4$; the variable $y2$ is not the weak exogeneity of variables $y1$, $y3$, and $y4$; the variable $y3$ is not the weak exogeneity of variables $y1$, $y2$, and $y4$; the variable $y4$ is the weak exogeneity of variables $y1$, $y2$, and $y3$.

```
/* Method 2 -- Use the RESTRICT statement and implement LR test */
%macro LRTestForVECM();
   %do i = 1 %to 4;
      ods output LogLikelihood = tbl_ll_r1_&i.;
      proc varmax data=simul5;
         model y1 y2 y3 y4 = x / noint p=2;
         cointeg rank=2;
         restrict alpha(&i.,1:2) = 0;
      run;
   %end;
   proc iml;
      use tbl_ll_g;
      read all var {nValue1} into ll_g;
      close;
      %do i = 1 %to 4;
         use tbl_ll_r1_&i.;
         read all var {nValue1} into ll_r_&i.;
         close;
      %end;
      DF = J(4,1,2);
      ll_r = ll_r_1 // ll_r_2 // ll_r_3 // ll_r_4;
      Stat = -2*(ll_r - ll_g);
      pValue = 1-cdf("CHISQUARE", Stat, DF);
      Test =  {"H0: Alpha(1,)=0"} // {"H0: Alpha(2,)=0"}
           // {"H0: Alpha(3,)=0"} // {"H0: Alpha(4,)=0"};
      print  Test DF Stat pValue;
   quit;
%mend;
%LRTestForVECM();
```

**Output 43.3.2** Test Weak Exogeneity with the RESTRICT Statement and LR Tests

**Analysis of Restricted Cointegrated Systems**

| Test | DF | Stat | pValue |
|---|---|---|---|
| H0: Alpha(1,)=0 | 2 | 109.05157 | 0 |
| H0: Alpha(2,)=0 | 2 | 124.56535 | 0 |
| H0: Alpha(3,)=0 | 2 | 238.35505 | 0 |
| H0: Alpha(4,)=0 | 2 | 5.0877698 | 0.0785606 |

The third method uses the TEST statement, which implements the Wald tests. Asymptotically, the Wald test has the same distribution as the LR test.

```
/* Method 3 -- To use the TEST statement and the Wald test */
proc varmax data=simul5;
   model y1 y2 y3 y4 = x / noint p=2;
   cointeg rank=2;
   test alpha(1,1:2) = 0;
   test alpha(2,1:2) = 0;
   test alpha(3,1:2) = 0;
   test alpha(4,1:2) = 0;
run;
```

Based on the test results shown in Output 43.3.3, the same correct conclusion can be obtained at the 0.05 significance level: the variable $y1$ is not the weak exogeneity of variables $y2$, $y3$, and $y4$; the variable $y2$ is not the weak exogeneity of variables $y1$, $y3$, and $y4$; the variable $y3$ is not the weak exogeneity of variables $y1$, $y2$, and $y4$; the variable $y4$ is the weak exogeneity of variables $y1$, $y2$, and $y3$.

**Output 43.3.3** Test Weak Exogeneity with the TEST Statement, Wald Tests

**Analysis of Restricted Cointegrated Systems**

**The VARMAX Procedure**

| Testing of the Parameters | | | |
|---|---|---|---|
| Test | DF | Chi-Square | Pr > ChiSq |
| 1 | 2 | 113.27 | <.0001 |
| 2 | 2 | 129.15 | <.0001 |
| 3 | 2 | 245.21 | <.0001 |
| 4 | 2 | 4.81 | 0.0903 |

## Identification

This example shows how important it is to identify $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ when applying the Wald test on $\boldsymbol{\alpha}$. First, in the following statements, there are no constraints on $\boldsymbol{\beta}$:

```
proc varmax data=simul5;
   model y1 y2 y3 y4 = x / noint p=2;
   cointeg rank=2;
   test alpha(1,2) = alpha(2,2) + alpha(3,2);
run;
```

As shown in Output 43.3.4, based on the test results, the null hypothesis H0: $\boldsymbol{\alpha}[1,2] = \boldsymbol{\alpha}[2,2] + \boldsymbol{\alpha}[3,2]$ should be rejected at the 0.05 significance level, although the true parameter values for the data generating process indicate that H0 is correct.

**Output 43.3.4** Importance of Identifying $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ in the Wald Test

**Analysis of Restricted Cointegrated Systems**

**The VARMAX Procedure**

| Testing of the Parameters | | | |
|---|---|---|---|
| Test | DF | Chi-Square | Pr > ChiSq |
| 1 | 1 | 21.44 | <.0001 |

In the following statements, $r^2$ constraints are now imposed on $\boldsymbol{\beta}$, where $r$ is the cointegration rank:

```
proc varmax data=simul5;
   model y1 y2 y3 y4 = x / noint p=2;
   cointeg rank=2;
   restrict beta(3:4,1:2) = -I(2);
   test alpha(1,2) = alpha(2,2) + alpha(3,2);
run;
```

As shown in Output 43.3.5, the null hypothesis cannot be rejected at 0.05 significance level; that is to say, the correct conclusion is achieved.

**Output 43.3.5** Importance of Identifying $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ in the Wald Test, Continued

**Analysis of Restricted Cointegrated Systems**

**The VARMAX Procedure**

| Testing of the Parameters | | | |
|---|---|---|---|
| Test | DF | Chi-Square | Pr > ChiSq |
| 1 | 1 | 0.16 | 0.6869 |

Besides $\boldsymbol{\alpha}$, other short-run parameters in a VECM can also be tested by using the TEST statement. Because short-run parameters other than $\boldsymbol{\alpha}$ are identified in a VECM, it is not necessary to impose additional constraints on $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$. The following statements test the null hypothesis H0: $\Phi_1^* = 0$:

```
proc varmax data=simul5;
   model y1 y2 y3 y4 = x / noint p=2;
   cointeg rank=2;
   test ar(2);
run;
```

According to the results shown in Output 43.3.6, the null hypothesis should be rejected at the 0.05 significance level.

**Output 43.3.6** Wald Tests for Short-Run Parameters

**Analysis of Restricted Cointegrated Systems**

**The VARMAX Procedure**

| Testing of the Parameters | | | |
|---|---|---|---|
| Test | DF | Chi-Square | Pr > ChiSq |
| 1 | 16 | 32.79 | 0.0079 |

The following statements test the null hypothesis H0: $\Theta_0^* = 0$:

```
proc varmax data=simul5;
   model y1 y2 y3 y4 = x / noint p=2;
   cointeg rank=2;
   test xl;
run;
```

According to the results shown in Output 43.3.7, the null hypothesis cannot be rejected at the 0.05 significance level.

**Output 43.3.7** Wald Tests for Short-Run Parameters, Continued

**Analysis of Restricted Cointegrated Systems**

**The VARMAX Procedure**

| Testing of the Parameters | | | |
|---|---|---|---|
| Test | DF | Chi-Square | Pr > ChiSq |
| 1 | 4 | 6.01 | 0.1982 |

Besides the parameters that are estimated in a VECM, you can also use the TEST statement on $\Pi(= \boldsymbol{\alpha}\boldsymbol{\beta}')$, and $\boldsymbol{\delta}_0$ or $\boldsymbol{\delta}_1$ for Case 2 or 4 when the constant or linear trend, respectively, is restricted in the error correction term. However, keep in mind that the covariance matrix for these parameter estimates is singular when the cointegration rank is less than the number of dependent variables; hence, you might not get the results for some tests.

```
proc varmax data=simul5;
   model y1 y2 y3 y4 = x / noint p=2;
   cointeg rank=2;
   test ar(1,4,1:4);
   test ar(1,4,{1 3});
run;
```

As shown in Output 43.3.8, the first test on H0: $\Pi[4,] = 0$ cannot be calculated, whereas the second test on H0: $\Pi[4,1] = \Pi[4,3] = 0$ can be.

**Output 43.3.8** Wald Tests for $\Pi$

**Analysis of Restricted Cointegrated Systems**

**The VARMAX Procedure**

| Testing of the Parameters | | | |
|---|---|---|---|
| Test | DF | Chi-Square | Pr > ChiSq |
| 1 | 4 | | |
| 2 | 2 | 4.81 | 0.0903 |

## Tests for Long-Run Parameter

This example focuses on testing the relationships on the long-run parameter $\boldsymbol{\beta}$. Here, only the following specific form of hypothesis is discussed,

$$\text{H0: } \boldsymbol{\beta} = (\mathbf{H}, \boldsymbol{\phi})$$

where $\mathbf{H}$ is a known $k \times r_1$ matrix, $\boldsymbol{\phi}$ is a freely varying $k \times (r - r_1)$ parameter matrix, $k$ is the number of dependent variables, $r$ is the cointegration rank, and $0 \leq r_1 \leq r$. Other forms of hypothesis—for example, H0: $\boldsymbol{\beta} = (\mathbf{H}_1\boldsymbol{\phi}_1, \ldots, \mathbf{H}_r\boldsymbol{\phi}_r)$ or H0: $\mathbf{H}\text{vec}(\boldsymbol{\beta}) = \mathbf{h}$—are omitted, although they can also be implemented in the same logic. The following statements test the null hypothesis that $(1\ 0\ -1\ 0)'$ is in the cointegrating space that is spanned by $\boldsymbol{\beta}$:

```
/* Use the RESTRICT statement and LR test for restrictions on Beta. */
/* H0: Beta = [ H, phi ] where H is known and phi is free */
ods output LogLikelihood = tbl_ll_r2;
proc varmax data=simul5;
   model y1 y2 y3 y4 = x / noint p=2;
   cointeg rank=2;
   restrict beta(,1) = {1, 0, -1, 0};
   nloptions tech=qn maxit=5000;
run;

proc iml;
   use tbl_ll_g;
   read all var {nValue1} into ll_g;
   close;
   use tbl_ll_r2;
   read all var {nValue1} into ll_r;
   close;
   DF = (4-2)*1; /* DF = (k-r)*r_1 */
   Stat = -2*(ll_r - ll_g);
   pValue = 1-cdf("CHISQUARE", stat, df);
   Test = "H0: Beta[1,1:4] = {1 0 -1 0}'";
   print  Test DF Stat pValue;
quit;
```

According to the result shown in Output 43.3.9, the null hypothesis cannot be rejected at the 0.05 significance level.

**Output 43.3.9** LR Tests on Long-Run Parameter $\beta$

**Analysis of Restricted Cointegrated Systems**

| Test | DF | Stat | pValue |
|---|---|---|---|
| H0: Beta[1,1:4] = {1 0 -1 0}' | 2 | 1.6194924 | 0.444971 |

The following statements test the null hypothesis that the cointegrating space is spanned by $(1\ 0\ -1\ 0, 0\ 1\ 0\ -1)'$:

```
/* H0: Beta = H, where H is the true Beta for DGP */
ods output LogLikelihood = tbl_ll_r3;
proc varmax data=simul5;
   model y1 y2 y3 y4 = x / noint p=2;
   cointeg rank=2;
   restrict beta = I(2) // (-I(2));
   nloptions tech=qn maxit=5000;
run;

proc iml;
   use tbl_ll_g;
   read all var {nValue1} into ll_g;
   close;
   use tbl_ll_r3;
   read all var {nValue1} into ll_r;
   close;
   DF = (4-2)*2; /* DF = (k-r)*r_1 */
   Stat = -2*(ll_r - ll_g);
   pValue = 1-cdf("CHISQUARE", stat, df);
   Test = "H0: Beta = {1 0, 0 1, -1 0, 0 -1}";
   print  Test DF Stat pValue;
quit;
```

According to the result shown in Output 43.3.10, the null hypothesis cannot be rejected at the 0.05 significance level.

**Output 43.3.10** LR Tests on Long-Run Parameter $\beta$, Continued

**Analysis of Restricted Cointegrated Systems**

| Test | DF | Stat | pValue |
|---|---|---|---|
| H0: Beta = {1 0, 0 1, -1 0, 0 -1} | 4 | 1.5815435 | 0.8121055 |

The following statements test the null hypothesis that the cointegrating space is spanned by $(1\ 0\ 1\ 0, 0\ 1\ 0\ 1)'$, the orthogonal matrix to the true $\beta$ for the data generating process:

```
/* H0: Beta = H, where H is the matrix orthogonal
       to the true Beta for DGP */
ods output LogLikelihood = tbl_ll_r4;
proc varmax data=simul5;
   model y1 y2 y3 y4 = x / noint p=2;
   cointeg rank=2;
```

```
   restrict beta = {1 0, 0 1, 1 0, 0 1};
   nloptions tech=qn maxit=5000;
run;

proc iml;
   use tbl_ll_g;
   read all var {nValue1} into ll_g;
   close;
   use tbl_ll_r4;
   read all var {nValue1} into ll_r;
   close;
   DF = (4-2)*2; /* DF = (k-r)*r_1 */
   Stat = -2*(ll_r - ll_g);
   pValue = 1-cdf("CHISQUARE", stat, df);
   Test = "H0: Beta = {1 0, 0 1, 1 0, 0 1}";
   print  Test DF Stat pValue;
quit;
```

According to the result shown in Output 43.3.11, the null hypothesis should be rejected at the 0.05 significance level.

**Output 43.3.11** LR Tests on Long-Run Parameter $\beta$, Continued

**Analysis of Restricted Cointegrated Systems**

| Test | DF | Stat | pValue |
|---|---|---|---|
| H0: Beta = {1 0, 0 1, 1 0, 0 1} | 4 | 227.68902 | 0 |

For the VECM, the BOUND statement can be regarded as an alias of the RESTRICT statement; that is, you can directly replace any RESTRICT statement with a BOUND statement and get the same result. The linear inequality constraints in the restricted cointegrated systems are not discussed in this section, although they are also supported in the BOUND and RESTRICT statements. For more information, see the sections "BOUND Statement" on page 3023 and "RESTRICT Statement" on page 3052.

Obtaining the numerical solution for the restricted VECM is not an easy task in most cases. You might need to use the INITIAL and NLOPTIONS statements to tune the process. For more information, see the sections "INITIAL Statement" on page 3033 and "NLOPTIONS Statement" on page 3051.

## Example 43.4: Analysis of Euro Foreign Exchange Reference Rates

This example illustrates how to use and select the VARMA-GARCH model for exchange rates, a general type of financial data. As shown in much of the literature, the financial variables are cross-correlated and autocorrelated not only on first moments, but also on second moments. The VARMA-GARCH model and the vector error correction GARCH model are often used to catch the stylized fact.

The data, downloaded from European Central Bank website (`https://www.ecb.europa.eu`), consist of four pairs of daily foreign exchange reference rates: the euro and the Australian dollar (AUD), the euro and the British pound sterling (GBP), the euro and the Japanese yen (JPY), and the euro and the US dollar (USD). The full sample covers the period from January 4, 1999, to February 12, 2015 (4,127 days). In the following statements, the series are logarithmically transformed, and the returns (in percentage) are calculated:

```
title 'Analysis of Euro Foreign Exchange Reference Rates';
data eurofxrr;
   input date : MMDDYY10. aud gbp jpy usd;
   label aud='The euro and the Australian dollar'
         usd='The euro and the U.S. dollar'
         jpy='The euro and the Japanese yen'
         gbp='The euro and the British pound sterling';
   logAUD = log(AUD); logGBP = log(GBP);
   logJPY = log(JPY); logUSD = log(USD);
   rAUD = (logAUD - lag(logAUD))*100;
   rGBP = (logGBP - lag(logGBP))*100;
   rJPY = (logJPY - lag(logJPY))*100;
   rUSD = (logUSD - lag(logUSD))*100;
datalines;
01/04/1999    1.9100    0.71110    133.73    1.1789
01/05/1999    1.8944    0.71220    130.96    1.1790
01/06/1999    1.8820    0.70760    131.42    1.1743
01/07/1999    1.8474    0.70585    129.43    1.1632

   ... more lines ...

02/10/2015    1.4522    0.74200    134.67    1.1297
02/11/2015    1.4606    0.73960    135.50    1.1314
02/12/2015    1.4761    0.73760    135.72    1.1328
;
```

Although it is well known that unit roots exist in the exchange rate series and they are not cointegrated, you can use the following statements to verify:

```
/*--- Unit Roots and Cointegration in Log Exchange Rates ---*/

proc varmax data=eurofxrr;
   model logAUD logGBP logJPY logUSD / p=2 dftest cointtest;
run;
```

According to the results of the Dickey-Fuller unit root tests shown in Output 43.4.1, the null hypothesis that there is a unit root in each series cannot be rejected at the 5% significance level. The results of the Johansen cointegration rank trace tests shown in Output 43.4.2 confirm that there is no cointegration between series because the null hypothesis that the cointegration rank is 0, in both unrestricted and restricted cases, cannot be rejected at the 5% significance level. Because there is no cointegration, you do not need to consider vector error correction models; otherwise, the final selected model might be a vector error correction GARCH model, instead of a VARMA-GARCH model.

**Output 43.4.1** Dickey-Fuller Unit Root Tests

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Unit Root Test | | | | | |
|---|---|---|---|---|---|
| Variable | Type | Rho | Pr < Rho | Tau | Pr < Tau |
| logAUD | Zero Mean | -1.05 | 0.4644 | -1.08 | 0.2549 |

Before modeling returns, you can test whether unit roots still exist in the differenced data with the following statement:

```
/*--- Unit Roots in Returns and Model Specification ---*/
proc varmax data=eurofxrr;
   model rAUD rGBP rJPY rUSD / p=2 dftest;
   test const; test ar(1); test ar(2);
run;
```

Output 43.4.3 shows that there is no unit root in each differenced series.

**Output 43.4.3** Dickey-Fuller Unit Root Tests

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Unit Root Test | | | | | |
|---|---|---|---|---|---|
| Variable | Type | Rho | Pr < Rho | Tau | Pr < Tau |
| rAUD | Zero Mean | -4242.7 | 0.0001 | -46.04 | <.0001 |
| | Single Mean | -4243.7 | 0.0001 | -46.04 | <.0001 |
| | Trend | -4244.2 | 0.0001 | -46.04 | <.0001 |
| rGBP | Zero Mean | -4358.4 | 0.0001 | -46.67 | <.0001 |
| | Single Mean | -4358.4 | 0.0001 | -46.67 | <.0001 |
| | Trend | -4358.5 | 0.0001 | -46.66 | <.0001 |
| rJPY | Zero Mean | -4181.4 | 0.0001 | -45.72 | <.0001 |
| | Single Mean | -4181.4 | 0.0001 | -45.72 | <.0001 |
| | Trend | -4181.9 | 0.0001 | -45.72 | <.0001 |
| rUSD | Zero Mean | -4306.8 | 0.0001 | -46.40 | <.0001 |
| | Single Mean | -4306.8 | 0.0001 | -46.39 | <.0001 |
| | Trend | -4307.4 | 0.0001 | -46.39 | <.0001 |

The preceding statements also test whether the constant and each of two lags of AR terms are 0. The test results are shown in Output 43.4.4.

**Output 43.4.4** Tests on Constant and AR Terms

| Testing of the Parameters | | | |
|---|---|---|---|
| Test | DF | Chi-Square | Pr > ChiSq |
| 1 | 4 | 0.46 | 0.9776 |
| 2 | 16 | 59.42 | <.0001 |
| 3 | 16 | 15.67 | 0.4759 |

The null hypothesis that the constant term is 0 and the null hypothesis that the second lag AR term is 0 are both accepted at the 5% significance level. However, the null hypothesis that the first lag AR term is 0 is rejected at the 5% significance level. In the remaining model selection process, only the first lag AR term is considered.

The following statements estimate a zero-mean VAR(1) model and also print some diagnostic results:

```
/*--- VAR Model ---*/

proc varmax data=eurofxrr;
   model rAUD rGBP rJPY rUSD / noint p=1 print=(diagnose);
run;
```

Output 43.4.5 shows the information criteria for the estimated zero-mean VAR(1) model. In this example, AICC is used as the criterion for model selection: the smaller the AICC, the better the model.

**Output 43.4.5** Information Criteria for the VAR Model

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Information Criteria | |
|---|---|
| AICC | -1745.29 |
| HQC | -1687.44 |
| AIC | -1745.64 |
| SBC | -1581.19 |
| FPEC | 0.011938 |

Diagnostics are printed because the PRINT=(DIAGNOSE) option is specified. As shown in Output 43.4.6, the null hypotheses that there is no ARCH effect in each series are all rejected at the 5% significance level.

**Output 43.4.6** Tests on ARCH Effects

| Univariate Model White Noise Diagnostics | | | | | |
|---|---|---|---|---|---|
| | | Normality | | ARCH | |
| Variable | Durbin Watson | Chi-Square | Pr > ChiSq | F Value | Pr > F |
| rAUD | 1.99811 | 8277.31 | <.0001 | 217.35 | <.0001 |
| rGBP | 1.99601 | 2537.71 | <.0001 | 315.25 | <.0001 |
| rJPY | 2.00007 | 2456.22 | <.0001 | 149.75 | <.0001 |
| rUSD | 1.99959 | 1398.54 | <.0001 | 157.85 | <.0001 |

To find the right GARCH model, you can start with the VAR(1)-CCC-GARCH(1,1) model (which is usually the fastest one to be estimated) as in the following statement:

```
/*--- VAR CCC GARCH Model ---*/

proc varmax data=eurofxrr;
   model rAUD rGBP rJPY rUSD / noint p=1;
   garch p=1 q=1 form=ccc;
run;
```

Compared to the AICC for the zero-mean VAR(1) model (shown in Output 43.4.5), the AICC for VAR(1)-CCC-GARCH(1,1) model, as shown in Output 43.4.7, dramatically decreases, which means that the ARCH effects do play an important role and should be modeled.

**Output 43.4.7** Information Criteria for VAR CCC GARCH Model

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Information Criteria | |
|---|---|
| AICC | -4646.77 |
| HQC | -4571.24 |
| AIC | -4647.35 |
| SBC | -4432.31 |
| FPEC | 0.011966 |

As indicated by its name, a basic assumption of the CCC GARCH model is that the conditional correlation is time-invariant, which might not be true. The following statements estimate a BEKK GARCH model to see whether modeling the conditional correlation could improve the model performance:

```
/*---  VAR BEKK GARCH Model ---*/

proc varmax data=eurofxrr outest=oediagbekk;
   model rAUD rGBP rJPY rUSD / noint p=1;
   garch p=1 q=1 form=bekk;
run;
```

As shown in Output 43.4.8, the AICC for the VAR BEKK GARCH model does get smaller than the AICC for the CCC GARCH model (shown in Output 43.4.7). The smaller AICC implies that the assumption of the CCC GARCH model might be inaccurate.

**Output 43.4.8** Information Criteria for VAR BEKK GARCH Model

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Information Criteria | |
|---|---|
| AICC | -5667.7 |
| HQC | -5539.55 |
| AIC | -5669.38 |
| SBC | -5302.54 |
| FPEC | 0.011979 |

One shortcoming of the BEKK GARCH model is that it has too many parameters. In practice, especially for a large number of dependent variables, the scalar BEKK GARCH model and the diagonal BEKK GARCH model are often applied, as shown in the following statements. In the RESTRICT statement, matrix operations are used; using matrix operations is much more concise than restricting tens of ARCH and GARCH parameters one by one.

```
/*--- VAR Scalar BEKK GARCH Model ---*/

proc varmax data=eurofxrr outest=oediagbekk;
   model rAUD rGBP rJPY rUSD / noint p=1;
   garch p=1 q=1 form=bekk;
   restrict ach(1)=ach(1,1,1)*I(4), gch(1)=gch(1,1,1)*I(4);
run;

/*--- VAR Diagonal BEKK GARCH Model ---*/

proc varmax data=eurofxrr outest=oediagbekk;
   model rAUD rGBP rJPY rUSD / noint p=1;
   garch p=1 q=1 form=bekk;
   restrict ach(1)=ach(1)#I(4), gch(1)=gch(1)#I(4);
run;
```

The AICCs for the scalar and diagonal BEKK GARCH models are shown in Output 43.4.9 and Output 43.4.10, respectively, and both of them are larger than the AICC for the BEKK GARCH model (shown in Output 43.4.8). Hence, so far, the VAR BEKK GARCH model is the best.

**Output 43.4.9** Information Criteria for VAR Scalar BEKK GARCH Model

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Information Criteria | |
|---|---|
| AICC | -5615.11 |
| HQC | -5552.83 |
| AIC | -5615.51 |
| SBC | -5438.41 |
| FPEC | 0.011974 |

**Output 43.4.10** Information Criteria for VAR Diagonal BEKK GARCH Model

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Information Criteria | |
|---|---|
| AICC | -5630.31 |
| HQC | -5554.78 |
| AIC | -5630.89 |
| SBC | -5415.85 |
| FPEC | 0.011978 |

Another type of multivariate GARCH model that is suitable for modeling the time-varying conditional correlation is the dynamic conditional correlation (DCC) GARCH model, as indicated by its name. The following statements estimate the DCC GARCH model:

```
/*--- VAR DCC GARCH Model ---*/

proc varmax data=eurofxrr;
   model rAUD rGBP rJPY rUSD / noint p=1;
   garch p=1 q=1 form=dcc;
run;
```

As shown in Output 43.4.11, the AICC for the VAR DCC GARCH model is smaller than the AICC for the VAR BEKK GARCH model (shown in Output 43.4.8), implying that the best model should be in the class of DCC GARCH models.

**Output 43.4.11** Information Criteria for VAR DCC GARCH Model

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Information Criteria | |
|---|---|
| AICC | -5689.43 |
| HQC | -5609.5 |
| AIC | -5690.08 |
| SBC | -5462.39 |
| FPEC | 0.011973 |

Could the DCC GARCH model be more parsimonious? The following statements use the sample correlation matrix of the standardized residuals (saving six parameters) to calculate the unconditional correlation matrix in the DCC GARCH model:

```
/*--- Parsimonious VAR DCC GARCH Model ---*/

proc varmax data=eurofxrr;
   model rAUD rGBP rJPY rUSD / noint p=1;
   garch p=1 q=1 form=dcc corrconst=expect;
run;
```

The AICC of the parsimonious VAR DCC GARCH model, as shown in Output 43.4.12, becomes a little smaller. Hence, the best model so far is the parsimonious VAR DCC GARCH model.

**Output 43.4.12** Information Criteria for the Parsimonious VAR DCC GARCH Model

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Information Criteria | |
|---|---|
| AICC | -5694.89 |
| HQC | -5628.19 |
| AIC | -5695.35 |
| SBC | -5505.6 |
| FPEC | 0.011973 |

Another way to refine the model is to try different subforms of GARCH models for each series. The following statements estimate the VAR DCC EGARCH model and produce Output 43.4.13:

```
/*--- VAR DCC EGARCH Model ---*/

proc varmax data=eurofxrr;
   model rAUD rGBP rJPY rUSD / noint p=1;
   garch p=1 q=1 form=dcc subform=egarch corrconst=expect;
   nloptions maxit=5000 pall;
run;
```

The following statements estimate the VAR DCC PGARCH model and produce Output 43.4.14:

```
/*--- VAR DCC PGARCH Model ---*/

proc varmax data=eurofxrr;
   model rAUD rGBP rJPY rUSD / noint p=1;
   garch p=1 q=1 form=dcc subform=pgarch corrconst=expect;
   nloptions maxit=5000 pall;
run;
```

The following statements estimate the VAR DCC QGARCH model and produce Output 43.4.15:

```
/*--- VAR DCC QGARCH Model ---*/

proc varmax data=eurofxrr;
   model rAUD rGBP rJPY rUSD / noint p=1;
   garch p=1 q=1 form=dcc subform=qgarch corrconst=expect;
   nloptions maxit=5000 pall;
run;
```

The following statements estimate the VAR DCC TGARCH model and produce Output 43.4.16:

```
/*--- VAR DCC TGARCH Model ---*/

proc varmax data=eurofxrr;
   model rAUD rGBP rJPY rUSD / noint p=1;
   garch p=1 q=1 form=dcc subform=tgarch corrconst=expect;
   nloptions maxit=5000 pall;
run;
```

Comparing the AICCs shown in Output 43.4.13 through Output 43.4.16, you find that the AICC for the VAR DCC PGARCH model is the smallest. Hence, the best model becomes the zero-mean VAR(1)-DCC-PGARCH(1,1) model, whose unconditional correlation matrix is estimated by the sample correlation matrix of the standardized residuals.

**Output 43.4.13** Information Criteria for the Parsimonious VAR DCC EGARCH Model

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Information Criteria | |
|---|---|
| **AICC** | -5704.33 |
| **HQC** | -5628.81 |
| **AIC** | -5704.92 |
| **SBC** | -5489.87 |
| **FPEC** | 0.011982 |

**Output 43.4.14** Information Criteria for the Parsimonious VAR DCC PGARCH Model

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Information Criteria | |
|---|---|
| **AICC** | -5724.44 |
| **HQC** | -5640.1 |
| **AIC** | -5725.16 |
| **SBC** | -5484.82 |
| **FPEC** | 0.011974 |

**Output 43.4.15** Information Criteria for the Parsimonious VAR DCC QGARCH Model

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Information Criteria | |
|---|---|
| **AICC** | -5696.97 |
| **HQC** | -5621.44 |
| **AIC** | -5697.55 |
| **SBC** | -5482.51 |
| **FPEC** | 0.011972 |

**Output 43.4.16** Information Criteria for the Parsimonious VAR DCC TGARCH Model

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Information Criteria | |
|---|---|
| AICC | -5705.59 |
| HQC | -5630.06 |
| AIC | -5706.17 |
| SBC | -5491.13 |
| FPEC | 0.011973 |

Output 43.4.17 shows that most of the AR parameter estimates in the VAR DCC PGARCH model are not significant.

**Output 43.4.17** AR Parameter Estimates for the Parsimonious VAR DCC PGARCH Model

**Model Parameter Estimates**

| Equation | Parameter | Estimate | Standard Error | t Value | Pr > \|t\| | Variable |
|---|---|---|---|---|---|---|
| rAUD | AR1_1_1 | 0.05718 | 0.01790 | 3.19 | 0.0014 | rAUD(t-1) |
| | AR1_1_2 | 0.00042 | 0.02396 | 0.02 | 0.9859 | rGBP(t-1) |
| | AR1_1_3 | -0.02305 | 0.01619 | -1.42 | 0.1546 | rJPY(t-1) |

| | AR1_2_3 | -0.00462 | 0.01138 | -0.41 | 0.6845 | rJPY(t-1) |
| | AR1_2_4 | -0.04651 | 0.01475 | -3.15 | 0.0016 | rUSD(t-1) |
| rJPY | AR1_3_1 | 0.05602 | 0.01845 | 3.04 | 0.0024 | rAUD(t-1) |
| | AR1_3_2 | -0.05011 | 0.02697 | -1.86 | 0.0632 | rGBP(t-1) |
| | AR1_3_3 | -0.00181 | 0.01893 | -0.10 | 0.9240 | rJPY(t-1) |
| | AR1_3_4 | -0.00839 | 0.02226 | -0.38 | 0.7061 | rUSD(t-1) |
| rUSD | AR1_4_1 | 0.03852 | 0.01513 | 2.55 | 0.0109 | rAUD(t-1) |
| | AR1_4_2 | 0.00566 | 0.02290 | 0.25 | 0.8048 | rGBP(t-1) |
| | AR1_4_3 | 0.00084 | 0.01477 | 0.06 | 0.9548 | rJPY(t-1) |
| | AR1_4_4 | -0.03202 | 0.02011 | -1.59 | 0.1115 | rUSD(t-1) |

The following statements test the significance of some parameter estimates:

```
/*--- Significance Of Some Parameter Estimates ---*/

proc varmax data=eurofxrr;
   model rAUD rGBP rJPY rUSD / noint p=1;
   garch p=1 q=1 form=dcc subform=pgarch corrconst=expect;
   nloptions maxit=5000 pall;
   test ar(1, 1, 2:4), ar(1, 2, 3), ar(1, 3, 3:4), ar(1, 4, 2:4);
run;
```

As shown in Output 43.4.18, the null hypothesis that all nine of the parameters in the TEST statement are 0 cannot be rejected at the 5% significance level.

**Output 43.4.18** Test on Significance of Some Parameter Estimates

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Testing of the Parameters | | | |
|---|---|---|---|
| Test | DF | Chi-Square | Pr > ChiSq |
| 1 | 9 | 7.36 | 0.6002 |

The following statements estimate the VAR DCC PGARCH model without those insignificant parameters:

```
/*--- VAR DCC PGARCH Model w/o Insignificant Parameters ---*/

proc varmax data=eurofxrr;
   model rAUD rGBP rJPY rUSD / noint p=1;
   garch p=1 q=1 form=dcc subform=pgarch corrconst=expect;
   nloptions maxit=5000 pall;
   restrict ar(1, 1, 2:4), ar(1, 2, 3), ar(1, 3, 3:4), ar(1, 4, 2:4);
run;
```

As shown in Output 43.4.19, the AICC does improve and decrease. Further refining the model is possible but beyond the scope of this example. Hence, the best model, according to the AICC, is the zero-mean VAR(1)-DCC-PGARCH(1,1) model without insignificant AR parameters, and its unconditional correlation matrix is estimated by the sample correlation matrix of the standardized residuals.

**Output 43.4.19** Information Criteria for the VAR DCC PGARCH Model without Insignificant Parameters

**Analysis of Euro Foreign Exchange Reference Rates**

**The VARMAX Procedure**

| Information Criteria | |
|---|---|
| AICC | -5735.05 |
| HQC | -5670.56 |
| AIC | -5735.48 |
| SBC | -5552.06 |
| FPEC | 0.011996 |

This example focuses only on using the information criterion to distinguish models. In practice, the forecast performance of the model might be more important. The VARMAX procedure supports multistep forecasting in both VARMAX-GARCH models and vector error correction GARCH models. Hence, although it is not covered in this example, you can also use the VARMAX procedure and a criterion based on out-of-sample forecast to perform model selection.

## Example 43.5: Conditional Forecasts and Scenario Analysis

Conditional forecasts incorporate future information and the uncertainty of parameters in the forecasts, and they often provide more accurate forecasts than unconditional forecasts do. Clark and McCracken (2017) evaluate conditional forecasts and focus on tests of bias, efficiency, and equal accuracy applied to conditional forecasts from VAR models. In this example, a Monte Carlo experiment is created in order to compare different types of forecasts; that is, 1,000 data sets are generated and the following forecasts are compared: equation-based unconditional forecasts, simulation-based unconditional forecasts, simulation-based conditional forecasts under hard conditions, and simulation-based conditional forecasts under soft conditions.

Consider the following trivariate VAR(2) model:

$$\mathbf{y}_t = \mathbf{c} + \mathbf{A}_1\mathbf{y}_{t-1} + \mathbf{A}_2\mathbf{y}_{t-2} + \boldsymbol{\epsilon}_t, \boldsymbol{\epsilon}_t \sim N(0, \Sigma)$$

where

$$\mathbf{c} = \begin{pmatrix} 2.425 \\ 0.054 \\ -0.110 \end{pmatrix}, \quad \mathbf{A}_1 = \begin{pmatrix} 0.234 & -0.134 & -0.057 \\ 0.029 & 0.575 & 0.200 \\ 0.059 & 0.038 & 1.006 \end{pmatrix}$$

$$\mathbf{A}_2 = \begin{pmatrix} 0.164 & -0.150 & -0.165 \\ -0.039 & 0.138 & -0.184 \\ 0.031 & 0.019 & -0.087 \end{pmatrix}, \quad \Sigma = \begin{pmatrix} 9.265 & 0.296 & 0.553 \\ 0.296 & 1.746 & 0.184 \\ 0.553 & 0.184 & 0.752 \end{pmatrix}$$

As indicated in Clark and McCracken (2017), the parameter values are equal to the OLS (ordinary least squares) estimates of a VAR in GDP (gross domestic product) growth, inflation less a survey-based measure of trend inflation, and the federal funds rate less a survey-based measure of trend, over a sample from 1961 to 2007. Many central banks require forecasts conditional on particular paths of policy instruments. This example analyzes different scenarios of some known future information on the third variable that is related to federal funds rate.

### Conditional Forecasts and Scenario Analysis under Hard Conditions

This section considers the hard conditions, under which some future dependent variables are fixed to some single values.

The following macro generates the data for analysis:

```
title 'Conditional Forecasts and Scenario Analysis';
%macro cfSimulateData(dgpi,T,lead,tblDGP,tblSample);
   * dgpi: index of DGP;
   * T: in-sample sample size;
   * lead: future horizons;
   * tblDGP: output table name for full-sample data;
   * tblSample: output table name for in-sample data;
   proc iml;
      * simulate the data;
      * trivariate VAR(2) model;
      seed = 12345 + &dgpi.; * random seed;
      n = 3;                 * dim of dependent variable;
```

```
      T = &T.;               * in-sample sample size;
      lead = &lead.;         * future horizons;
      p = 2;                 * AR order;
      * parameter values;
      const = {2.425, 0.054, -0.110};
      phi   = {0.234 -0.134 -0.057,
               0.029  0.575  0.200,
               0.059  0.038  1.006,
               0.164 -0.150 -0.165,
              -0.039  0.138 -0.184,
               0.031  0.019 -0.087};
      sigma = {9.265  0.296  0.553,
               0.296  1.746  0.184,
               0.553  0.184  0.752};
      call varmasim(y,phi) sigma = sigma n = T+lead seed = seed;
      mu = (inv(I(3)-phi[1:3,]-phi[4:6,])*const)`;
      y = y + mu;
      name={y1 y2 y3};
      create &tblDGP. from y[colname=name];
      append from y;
      close;
   quit;
   data &tblSample.; set &tblDGP.(obs=&T.); run;
%mend;
```

The following macro constructs four scenarios that contain hard conditions. In scenario $i, i = 1, \ldots, 4$, the first $i$ future values of y3 are fixed (to their true values). In the real world, the true future values cannot be known. Here, the true future values are used so that you can check later whether using more information results in any advantage in conditional forecasts.

```
%macro hcConstructScenarios(T,tblDGP,tblScenarios);
   * T: in-sample sample size;
   * tblDGP: input table name for full-sample data;
   * tblScenarios: output table name for scenarios;
   data &tblScenarios.;
      set &tblDGP.(firstobs=%eval(&T.+1) obs=%eval(&T.+1))
          &tblDGP.(firstobs=%eval(&T.+1) obs=%eval(&T.+2))
          &tblDGP.(firstobs=%eval(&T.+1) obs=%eval(&T.+3))
          &tblDGP.(firstobs=%eval(&T.+1) obs=%eval(&T.+4))
          &tblDGP.(firstobs=%eval(&T.+1) obs=%eval(&T.+1));
      * scenario 1: y3(1) is known;
      if(_N_=1) then do;
         y1=.; y2=.; myscenario=1;
      end;
      * scenario 2: y3(1:2) is known;
      if(_N_>1 and _N_<=3) then do;
         y1=.; y2=.; myscenario=2;
      end;
      * scenario 3: y3(1:3) is known;
      if(_N_>3 and _N_<=6) then do;
         y1=.; y2=.; myscenario=3;
      end;
      * scenario 4: y3(1:4) is known;
      if(_N_>6 and _N_<=10) then do;
```

```
         y1=.; y2=.; myscenario=4;
      end;
      * scenario 5: nothing is known (unconditional forecast);
      if(_N_>10) then do;
         y1=.; y2=.; y3=.; myscenario=5;
      end;
   run;
%mend;
```

The following macro estimates and performs several types of forecasts. The equation-based forecasts are output to the OUT= data set that is specified in the OUTPUT statement. The conditional forecasts for scenarios 1 to 4 and the unconditional forecasts (for scenario 5) are output to the OUT= data set that is specified in the CONDFORE statement.

```
%macro hcEstimateAndForecast(tblSample,tblScenarios,alpha,lead,nmc,
   tblF,tblCf,tblCfSim);
   * tblSample: input table name for in-sample data;
   * tblScenarios: input table name for scenarios;
   * alpha: size of the confidence interval or credible interval;
   * lead: future horizons;
   * nmc: number of Monte Carlo iterations;
   * tblF: output table name of equation-based point and interval forecasts;
   * tblCf: output table name of conditionial point and interval forecasts;
   * tblCfSim: output table name of simulated conditional forecasts;
   proc varmax data=&tblSample.;
      model y1 - y3 / p=2 prior noprint;
      output alpha=&alpha. lead=&lead. out=&tblF. noprint;

         sdata=&tblScenarios. sid=myscenario
         parm=sampling(scenario) nbi=1000 nmc=&nmc.;
   run;
%mend;
```

The following macro saves all types of forecasts for one simulated data set to one data set for evaluation:

```
%macro hcSaveForecasts(dgpi,T,lead,nScenarios,tblDGP,tblF,tblCf,tblAll);
   * dgpi: index of DGP;
   * T: in-sample sample size;
   * lead: future horizons;
   * nScenarios: number of scenarios;
   * tblDGP: input table name for full-sample data;
   * tblF: input table name of equation-based point and interval forecasts;
   * tblCf: input table name of conditionial point and interval forecasts;
   * tblAll: output table name of point and interval forecasts for all DGPs;
   data forecasts;
      set &tblDGP.(firstobs=%eval(&T.+1) obs=%eval(&T.+&lead.) keep=Y1 Y2);
      * for notation convenience, name equation-based forecasts as S0;
      set &tblF.(firstobs=%eval(&T.+1) obs=%eval(&T.+&lead.)
         rename=( for1=Y1_S0 for2=Y2_S0
                  lci1=Y1_LB_S0 uci1=Y1_UB_S0
                  lci2=Y2_LB_S0 uci2=Y2_UB_S0)
         keep=FOR1 LCI1 UCI1 FOR2 LCI2 UCI2);
      %do i = 1 %to &nScenarios.;
         set &tblCf.(where=(myscenario_S&i.=&i.)
```

```
            rename=( Y1_MEDIAN=Y1_S&i. Y2_MEDIAN=Y2_S&i.
                     Y1_LB=Y1_LB_S&i. Y1_UB=Y1_UB_S&i.
                     Y2_LB=Y2_LB_S&i. Y2_UB=Y2_UB_S&i.
                     myscenario=myscenario_S&i.)
            keep=myscenario Y1_MEDIAN Y2_MEDIAN Y1_LB Y1_UB Y2_LB Y2_UB);
         %end;
         dgpIndex = &dgpi.;
         h = _N_;
         drop myscenario_S1 - myscenario_S&nScenarios.;
      run;
      proc append base=&tblAll. data=forecasts; run;
   %mend;
```

The following macro evaluates the forecasts from different methods and under different conditions. The accuracy of point forecasts is measured through the symmetric mean absolute percentage error (sMAPE), which is used in the M4 Forecasting Competition. The sMAPE is defined as

$$\text{sMAPE} = \frac{1}{h}\sum_{i=1}^{h}\frac{2|\mathrm{y}_{T+i} - \hat{\mathrm{y}}_{T+i}|}{|\mathrm{y}_{T+i}| + |\hat{\mathrm{y}}_{T+i}|}$$

where $T$ is the in-sample sample size, $\mathrm{y}_{T+i}$ is the future value at $T+i$, $\hat{\mathrm{y}}_{T+i}$ is the $i$th-step-ahead forecast, and $h$ is the forecasting horizon. The smaller the sMAPE, the better the forecasting method. In order to easily compare the sMAPEs, the relative sMAPEs are calculated. The simulation-based unconditional forecasts are used as the benchmark. As for the interval forecasts (that is, the confidence interval for equation-based forecasts and the credible interval for simulation-based conditional and unconditional forecasts), first the size is checked, and then the lengths of intervals are compared: if the size is correct, the smaller the interval length, the more accurate and better the forecasting method.

```
%macro cfEvaluate(tblAll,lead,nSim,nScenarios,qScenario0,scenarioBM,tblEval);
   * tblAll: input table name of point and interval forecasts for all DGPs;
   * lead: future horizons;
   * nSim: number of DGPs;
   * nScenarios: number of scenarios;
   * qScenario0: whether there is S0 for equation-based forecasts,
                 1 for yes and 0 for no;
   * scenarioBM: the index of the benchmark scenario;
   * tblEval: output table name for evaluation results;

      create &tblEval. from evalResult;
      append from evalResult;
      close;
   quit;
%mend;
```

The following macro incorporates all the previous macros to test the forecasts from different methods (equation-based versus simulation-based) for different scenarios (unconditional versus four types of hard conditions). All point and interval forecasts are saved in the data set that is specified by the tblAll argument. All evaluation results are saved in the data set that is specified by the tblEval argument.

```
%macro hcTest(nSim,T,lead,alpha,nmc,nScenarios,qScenario0,scenarioBM,
   tblAll,tblEval);
   * nSim: number of DGPs;
   * T: in-sample sample size;
   * lead: future horizons;
   * alpha: size of the confidence interval or credible interval;
   * nmc: number of Monte Carlo iterations;
   * nScenarios: number of scenarios;
   * qScenario0: whether there is scenario 0 for equation-based forecasts,
                 1 for yes and 0 for no;
   * scenarioBM: the index of the benchmark scenario;
   * tblAll: output table name of point and interval forecasts for all DGPs;
   * tblEval: output table name for evaluation results;
   %do iSim = 1 %to &nSim.;
      %cfSimulateData(&iSim.,&T.,&lead.,t1,t2);
      %hcConstructScenarios(&T.,t1,t3);
      %hcEstimateAndForecast(t2,t3,&alpha.,&lead.,&nmc.,of,ocf,ocfsim);
      %hcSaveForecasts(&iSim.,&T.,&lead.,&nScenarios.,t1,of,ocf,&tblAll.);
   %end;
   %cfEvaluate(&tblAll.,&lead.,&nSim.,
               &nScenarios.,&qScenario0.,&scenarioBM.,
               &tblEval.);
%mend;
```

The following macro variables and macro set up and perform the test:

```
%let nSim = 1000;
%let T = 200;
%let lead = 4;
%let alpha = 0.05;
%let nmc = 10000;
%let nScenarios = 5;
%let qScenario0 = 1;
%let scenarioBM = 6;

%hcTest(&nSim.,&T.,&lead.,&alpha.,&nmc.,
        &nScenarios.,&qScenario0.,&scenarioBM.,
        hcForecasts,hcEval);
```

In order to show the result in a good style, the following template is created and the macro applies the template to the data set:

```
proc template;
   define table hcEvalTemplate;
      column col3 col4 col5 col6 col7 col8 col9;
      define header hc;
         text "Conditional Forecasts, Hard Conditions";
         start=col5; end=col8;
      end;
      define column col3;
         header="Horizon";
      end;
      define column col4;
         header="Equation Based"; format=7.5;
      end;
      define column col5;
         header="Scenario 1"; format=12.5;
      end;
      define column col6;
         header="Scenario 2"; format=12.5;
      end;
      define column col7;
         header="Scenario 3"; format=12.5;
      end;
      define column col8;
         header="Scenario 4"; format=12.5;
      end;
      define column col9;
         header="Unconditional"; format=12.5;
      end;
   end;
run;
%macro cfPrint(template,data);
   data _NULL_;
      set &data.;
      file print ods=(template="&template.");
      put _ODS_;
   run;
%mend;
```

The following macro calls print the sMAPEs for y1 and y2. Output 43.5.1 and Output 43.5.2 show that as more future information from scenario 1 to 4 is used in the conditional forecasts, the sMAPEs get smaller, which means that the accuracy of forecasts gets better.

```
%cfPrint(hcEvalTemplate, hcEval(where=(col1=1 and col2=1)));

%cfPrint(hcEvalTemplate, hcEval(where=(col1=1 and col2=2)));
```

**Output 43.5.1** The sMAPEs for y1

**Conditional Forecasts and Scenario Analysis**

| Conditional Forecasts, Hard Conditions | | | | | | |
|---|---|---|---|---|---|---|
| Horizon | Equation Based | Scenario 1 | Scenario 2 | Scenario 3 | Scenario 4 | Unconditional |
| 1 | 0.90307 | 0.90101 | 0.89794 | 0.89874 | 0.89419 | 0.90146 |

The following macro calls print the relative interval lengths for y1 and y2. Output 43.5.7 and Output 43.5.8 show that almost all conditional forecasts show smaller relative interval length than the benchmark unconditional forecasts show, which means that the conditional forecasts have better interval forecasts than unconditional forecasts. The relative interval lengths for equation-based forecasts are all greater than 1, which means that equation-based forecasts have worse interval forecasting ability than unconditional forecasts have. The main reason might be that the unconditional forecasts account for the uncertainty of parameters but equation-based forecasts do not.

```
%cfPrint(hcEvalTemplate, hcEval(where=(col1=4 and col2=1)));

%cfPrint(hcEvalTemplate, hcEval(where=(col1=4 and col2=2)));
```

**Output 43.5.7** The Relative Interval Lengths for y1

**Conditional Forecasts and Scenario Analysis**

Conditional Forecasts, Hard Conditions

## Conditional Forecasts and Scenario Analysis under Soft Conditions

This section considers the soft conditions, under which some future dependent variables are bounded within certain ranges instead of fixed to some single values.

The following macro estimates the model and outputs the unconditional forecasts. In the case of soft conditions, only the unconditional forecasts are needed. When the SDATA= option in the CONDFORE statement is not specified, unconditional forecasts are generated. The number of Monte Carlo iterations needs to be large because later the simulated forecasts that satisfy the soft conditions are selected from the pool of all unconditional forecasts.

```
%macro scEstimateAndForecast(tblSample,alpha,lead,nmc,tblUcf,tblUcfSim);
   * tblSample: input table name for in-sample data;
   * alpha: size of the credible interval;
   * lead: future horizons;
   * nmc: number of Monte Carlo iterations;
   * tblUcf: output table name of unconditional point and interval
            forecasts;
   * tblUcfSim: output table name of simulated unconditional forecasts;
   proc varmax data=&tblSample.;
      model y1 - y3 / p=2 prior noprint;
      condfore alpha=&alpha. lead=&lead. out=&tblUcf. outsim=&tblUcfSim.
         parm=sampling nbi=1000 nmc=&nmc.;
   run;
%mend;
```

The scenarios for four types of soft conditions are constructed from the following macro. To set up the correct bounds, both the true DGP (data-generating process) and unconditional forecasts are used. In the real world, the true DGP is not available, and those bound values reflect the scenarios of interest.

```
%macro scConstructScenarios(T,lead,tblDGP,tblUcf);
   * T: in-sample sample size;
   * lead: future horizons;
   * tblDGP: input table name for full-sample data;
   * tblUcf: input table name of unconditional point and interval
            forecasts;
   * four scenarios are implicitly output:
        scenarios i, i=1 to 4: future y3 is known for
           lb_j<=y3_j<=ub_j, j=1 to i, where lb_j and ub_j are lower and
           upper bounds whose values are saved in the corresponding macro
           variables, and y3_j is the j-step-ahead furture value of y3;
   data _NULL_;
      set &tblDGP.(firstobs=%eval(&T.+1) obs=%eval(&T.+&lead.) keep=Y3);
      set &tblUcf.(keep=step Y3_MEDIAN Y3_LB Y3_UB);
      array q[&lead.] q1 - q&lead.;
      array lb[&lead.] lb1 - lb&lead.;
      array ub[&lead.] ub1 - ub&lead.;
      retain q lb ub;
      if(Y3<=Y3_LB) then do;
         q[step] = 1; ub[step] = Y3_LB;
      end;
      if (Y3>Y3_LB and Y3<=Y3_MEDIAN) then do;
         q[step] = 2; lb[step] = Y3_LB; ub[step] = Y3_MEDIAN;
      end;
```

```
      if (Y3>Y3_MEDIAN and Y3<=Y3_UB) then do;
         q[step] = 3; lb[step] = Y3_MEDIAN; ub[step] =Y3_UB;
      end;
      if (Y3>Y3_UB) then do;
         q[step] = 4; lb[step] = Y3_UB;
      end;
      if(_N_=&lead.) then do;
         %do i = 1 %to &lead.;
            call symputx("lb&i.",lb&i.,'G');
            call symputx("ub&i.",ub&i.,'G');
         %end;
      end;
   run;
%mend;
```

The simulated forecasts that satisfy each type of soft condition in each scenario are selected in the following macro:

```
%macro scClassifySimulatedForecasts(lead,tblUcfSim,tblSCSim);
   * lead: future horizons;
   * tblUcfSim: output table name of simulated unconditional forecasts;
   * tblSCSim: output table name of simulated conditional forecasts
               under soft conditioins specified in the scenarios;
   data &tblSCSim.;
      set &tblUcfSim.;
      array lb[&lead.] lb1 - lb&lead.;
      array ub[&lead.] ub1 - ub&lead.;
      array y3f[&lead.] y3_1 - y3_&lead.;
      %do j = 1 %to &lead.;
         lb[&j.]=&&lb&j.; ub[&j.]=&&ub&j.;
      %end;
      do myScenario=1 to 4;
         outputCond = 1;
         do i = 1 to myScenario;
            if(outputCond=1) then do;
               if(lb[i]=.) then do;
                  if(y3f[i]<=ub[i]) then outputCond=1;
                  else outputCond = 0;
               end;
               else do;
                  if(ub[i]=.) then do;
                     if(y3f[i]>lb[i]) then outputCond=1;
                     else outputCond = 0;
                  end;
                  else do;
                     if(y3f[i]>lb[i] and y3f[i]<=ub[i]) then outputCond=1;
                     else outputCond = 0;
                  end;
               end;
            end;
         end;
         if(outputCond=1) then output;
      end;
   run;
```

```
   proc sort data=&tblSCSim.; by myscenario; run;
%mend;
```

The point and interval forecasts for each scenario of soft conditions are generated from the following macro:

```
%macro scGetForecastStats(alpha,lead,tblSCSim,tblSCForecasts);
   * alpha: size of the credible interval;
   * lead: future horizons;
   * tblSCSim: input table name of simulated conditional forecasts
               under soft conditioins specified in the scenarios;
   * tblSCForecasts: output table name of conditional point and interval
               forecasts under soft conditioins specified in the scenarios;
   data _NULL_;
      lbPctl = &alpha./2*100;
      ubPctl = 100-lbPctl;
      call symputx("lbPctl",lbPctl,'G');
      call symputx("ubPctl",ubPctl,'G');
   run;
   proc univariate data=&tblSCSim. noprint;
      var y1_1 - y1_&lead. y2_1 - y2_&lead.;
      output out=oucfx pctlpts=&lbPctl. &ubPctl. 50
         pctlpre=%do j=1 %to &lead.; y1_&j. %end;
                 %do j=1 %to &lead.; y2_&j. %end;
         pctlname=_lb _ub _median;
      by myscenario;
   run;
   data &tblSCForecasts.;
      set oucfx;
      array y1f[&lead.]  %do j=1 %to &lead.; Y1_&j._median %end; ;
      array y1lb[&lead.] %do j=1 %to &lead.; Y1_&j._lb     %end; ;
      array y1ub[&lead.] %do j=1 %to &lead.; Y1_&j._ub     %end; ;
      array y2f[&lead.]  %do j=1 %to &lead.; Y2_&j._median %end; ;
      array y2lb[&lead.] %do j=1 %to &lead.; Y2_&j._lb     %end; ;
      array y2ub[&lead.] %do j=1 %to &lead.; Y2_&j._ub     %end; ;
      do i = 1 to &lead.;
         Y1_MEDIAN = y1f[i];
         Y1_LB = y1lb[i];
         Y1_UB = y1ub[i];
         Y2_MEDIAN = y2f[i];
         Y2_LB = y2lb[i];
         Y2_UB = y2ub[i];
         step = i;
         output;
      end;
      keep myscenario step y1_median y1_lb y1_ub y2_median y2_lb y2_ub;
   run;
%mend;
```

The following macro saves all types of forecasts for one simulated data set to one data set for evaluation:

```
%macro scSaveForecasts(dgpi,T,lead,tblDGP,tblUcf,tblSCForecasts,tblAll);
   * dgpi: index of DGP;
   * T: in-sample sample size;
   * lead: future horizons;
   * tblDGP: input table name for full-sample data;
```

```
   * tblUcf: input table name of unconditional point and interval
            forecasts;
   * tblSCForecasts: input table name of conditional point and interval
                     forecasts under soft conditioins specified in the scenarios;
   * tblAll: output table name of point and interval forecasts for all DGPs;
   data forecasts;
      set &tblDGP.(firstobs=%eval(&T.+1) obs=%eval(&T.+&lead.) keep=Y1 Y2);
      %do i = 1 %to 4;
         set &tblSCForecasts.( where=(myscenario_S&i.=&i.)
            rename=( Y1_MEDIAN=Y1_S&i. Y2_MEDIAN=Y2_S&i.
                     Y1_LB=Y1_LB_S&i. Y1_UB=Y1_UB_S&i.
                     Y2_LB=Y2_LB_S&i. Y2_UB=Y2_UB_S&i.
                     myscenario=myscenario_S&i.)
            keep=myscenario Y1_MEDIAN Y2_MEDIAN Y1_LB Y1_UB Y2_LB Y2_UB);
      %end;
      set &tblUcf.(
            rename=( Y1_MEDIAN=Y1_S5 Y2_MEDIAN=Y2_S5
                     Y1_LB=Y1_LB_S5 Y1_UB=Y1_UB_S5
                     Y2_LB=Y2_LB_S5 Y2_UB=Y2_UB_S5 )
            keep=Y1_MEDIAN Y2_MEDIAN Y1_LB Y1_UB Y2_LB Y2_UB);
      dgpIndex = &dgpi.;
      h = _N_;
      drop myscenario_S1 - myscenario_S4;
   run;

   proc append base=&tblAll. data=forecasts; run;
%mend;
```

The following macro incorporates all previous macros to test the forecasts for different scenarios (unconditional versus four types of soft conditions). All point and interval forecasts are saved in the data set that is specified in the tblAll argument. All evaluation results are saved in the data set that is specified in the tblEval argument.

```
%macro scTest(nSim,T,lead,alpha,nmc,nScenarios,qScenario0,scenarioBM,
   tblAll,tblEval);
   * nSim: number of DGPs;
   * T: in-sample sample size;
   * lead: future horizons;
   * alpha: size of the confidence interval or credible interval;
   * nmc: number of Monte Carlo iterations;
   * nScenarios: number of scenarios;
   * qScenario0: whether there is S0 for equation-based forecasts,
                 1 for yes and 0 for no;
   * scenarioBM: the index of the benchmark scenario;
   * tblAll: output table name of point and interval forecasts for all DGPs;
   * tblEval: output table name for evaluation results;
   %do iSim = 1 %to &nSim.;
      %cfSimulateData(&iSim.,&T.,&lead.,t1,t2);
      %scEstimateAndForecast(t2,&alpha.,&lead.,&nmc.,oucf,oucfsim);
      %scConstructScenarios(&T.,&lead.,t1,oucf);
      %scClassifySimulatedForecasts(&lead.,oucfsim,oucfsimx);
      %scGetForecastStats(&alpha.,&lead.,oucfsimx,oscf);
      %scSaveForecasts(&iSim.,&T.,&lead.,t1,oucf,oscf,&tblAll.);
   %end;
```

```
   %cfEvaluate(&tblAll.,&lead.,&nSim.,
               &nScenarios.,&qScenario0.,&scenarioBM.,
               &tblEval.);
%mend;
```

The following macro variables and macro set up and perform the test:

```
%let nSim = 1000;
%let T = 200;
%let lead = 4;
%let alpha = 0.50;
%let nmc = 100000;
%let nScenarios = 5;
%let qScenario0 = 0;
%let scenarioBM = 5;

%scTest(&nSim., &T.,&lead.,&alpha.,&nmc.,
        &nScenarios.,&qScenario0.,&scenarioBM.,
        scForecasts,scEval);
```

In order to show the result in a good style, the following template is created for the evaluation data set:

```
proc template;
   define table scEvalTemplate;
      column col3 col4 col5 col6 col7 col8;
      define header sc;
         text "Conditional Forecasts, Soft Conditions";
         start=col4; end=col7;
      end;
      define column col3;
         header="Horizon";
      end;
      define column col4;
         header="Scenario 1"; format=12.5;
      end;
      define column col5;
         header="Scenario 2"; format=12.5;
      end;
      define column col6;
         header="Scenario 3"; format=12.5;
      end;
      define column col7;
         header="Scenario 4"; format=12.5;
      end;
      define column col8;
         header="Unconditional"; format=12.5;
      end;
   end;
run;
```

The following macro calls print the sMAPEs for y1 and y2 in Output 43.5.9 and Output 43.5.10, respectively. An interesting fact is that as the horizon increases, the accuracy of forecasts for y1 in each scenario gets better (which is not common) and the accuracy of forecasts for y2 in each scenario gets worse (which is common). However, the forecasting methods can still be compared.

```
%cfPrint(scEvalTemplate, scEval(where=(col1=1 and col2=1)));

%cfPrint(scEvalTemplate, scEval(where=(col1=1 and col2=2)));
```

**Output 43.5.9** The sMAPEs for y1

**Conditional Forecasts and Scenario Analysis**

| Conditional Forecasts, Soft Conditions | | | | | |
|---|---|---|---|---|---|
| Horizon | Scenario 1 | Scenario 2 | Scenario 3 | Scenario 4 | Unconditional |
| 1 | 0.90733 | 0.89925 | 0.90273 | 0.89949 | 0.90144 |
| 2 | 0.88731 | 0.88271 | 0.88282 | 0.87862 | 0.88429 |
| 3 | 0.87891 | 0.87626 | 0.87505 | 0.86820 | 0.87613 |
| 4 | 0.87062 | 0.86864 | 0.86757 | 0.86206 | 0.86852 |

**Output 43.5.10** The sMAPEs for y2

**Conditional Forecasts and Scenario Analysis**

| Conditional Forecasts, Soft Conditions | | | | | |
|---|---|---|---|---|---|
| Horizon | Scenario 1 | Scenario 2 | Scenario 3 | Scenario 4 | Unconditional |
| 1 | 1.06627 | 1.06999 | 1.06861 | 1.06688 | 1.07902 |
| 2 | 1.14420 | 1.14813 | 1.14674 | 1.14376 | 1.16096 |
| 3 | 1.20960 | 1.21150 | 1.20106 | 1.19365 | 1.22223 |
| 4 | 1.26086 | 1.26050 | 1.25022 | 1.24181 | 1.27045 |

The following macro calls print the relative sMAPEs for y1 and y2 in Output 43.5.11 and Output 43.5.12, respectively. Most relative sMAPEs for conditional forecasts under soft conditions are less than 1, which means that those conditional forecasts have a better accuracy than the unconditional forecasts have. The forecasts in scenario 4, compared to other forecasts for each horizon, always have the smallest relative sMAPEs, which means that the conditional forecasts under soft conditions successfully take the advantage of the available future information.

```
%cfPrint(scEvalTemplate, scEval(where=(col1=2 and col2=1)));

%cfPrint(scEvalTemplate, scEval(where=(col1=2 and col2=2)));
```

**Output 43.5.11** The Relative sMAPEs for y1

**Conditional Forecasts and Scenario Analysis**

| Conditional Forecasts, Soft Conditions | | | | | |
|---|---|---|---|---|---|
| Horizon | Scenario 1 | Scenario 2 | Scenario 3 | Scenario 4 | Unconditional |
| 1 | 1.00654 | 0.99757 | 1.00144 | 0.99784 | 1.00000 |

| 3 | 0.50800 | 0.49300 | 0.49500 | 0.49100 | 0.50600 |
| 4 | 0.47800 | 0.46100 | 0.46400 | 0.45900 | 0.47200 |

The following macro calls print the relative interval lengths for y1 and y2 in Output 43.5.15 and Output 43.5.16, respectively. All conditional forecasts under soft conditions have a relative interval length of less than 1, which means that the conditional forecasts provide better interval forecasts than unconditional forecasts, given that all forecasts have the correct size. The smallest relative interval lengths for each horizon almost always lie in the columns of scenario 4, which indicates that more information results in better interval forecasts.

```
%cfPrint(scEvalTemplate, scEval(where=(col1=4 and col2=1)));

%cfPrint(scEvalTemplate, scEval(where=(col1=4 and col2=2)));
```

**Output 43.5.15** The Relative Interval Lengths for y1

**Conditional Forecasts and Scenario Analysis**

| Conditional Forecasts, Soft Conditions | | | | | |
|---|---|---|---|---|---|
| Horizon | Scenario 1 | Scenario 2 | Scenario 3 | Scenario 4 | Unconditional |

| 1 | 0.98772 | 0.98616 | 0.98671 | 0.98540 | 1.00000 |
| 2 | 0.99356 | 0.97818 | 0.97409 | 0.97303 | 1.00000 |
| 3 | 0.99495 | 0.98684 | 0.97211 | 0.96640 | 1.00000 |
| 4 | 0.99775 | 0.99329 | 0.98459 | 0.97166 | 1.00000 |

In summary, you can make the following conclusions from the preceding results:

- Compared to simulation-based unconditional forecasts, equation-based unconditional forecasts have similar accuracy for point forecasts but worse accuracy for interval forecasts, perhaps because the equation-based method does not consider the uncertainty of parameters.
- Compared to simulation-based unconditional forecasts, simulation-based conditional forecasts under hard or soft conditions have better accuracy for both point and interval forecasts. As more future information becomes available, the conditional forecasts can become more accurate.

## Example 43.6: Numerous Examples

The following are examples of syntax for model fitting:

```
/* Data 'a' Generated Process */
proc iml;
   sig = {1.0  0.5, 0.5  1.25};
   phi = {1.2 -0.5, 0.6  0.3};
   call varmasim(y,phi) sigma = sig n = 100 seed = 46859;
   cn = {'y1' 'y2'};
   create a from y[colname=cn];
   append from y;
run;;

/* when the series has a linear trend */
proc varmax data=a;
   model y1 y2 / p=1 trend=linear;
run;

/* Fit subset of AR order 1 and 3 */
proc varmax data=a;
   model y1 y2 / p=(1,3);
run;

/* Check if the series is nonstationary */
proc varmax data=a;
   model y1 y2 / p=1 dftest print=(roots);
run;

/* Fit VAR(1) in differencing */
proc varmax data=a;
   model y1 y2 / p=1 print=(roots) dify=(1);
run;

/* Fit VAR(1) in seasonal differencing */
proc varmax data=a;
   model y1 y2 / p=1 dify=(4) lagmax=5;
run;

/* Fit VAR(1) in both regular and seasonal differencing */
proc varmax data=a;
   model y1 y2 / p=1 dify=(1,4) lagmax=5;
run;

/* Fit VAR(1) in different differencing */
proc varmax data=a;
   model y1 y2 / p=1 dif=(y1(1,4) y2(1)) lagmax=5;
run;

/* Options related to prediction */
proc varmax data=a;
   model y1 y2 / p=1 lagmax=3
                 print=(impulse covpe(5) decompose(5));
```

```
run;

/* Options related to tentative order selection */
proc varmax data=a;
   model y1 y2 / p=1 lagmax=5 minic
                 print=(parcoef pcancorr pcorr);
run;

/* Automatic selection of the AR order */
proc varmax data=a;
   model y1 y2 / minic=(type=aic p=5);
run;

/* Compare results of LS and Yule-Walker Estimators */
proc varmax data=a;
   model y1 y2 / p=1 print=(yw);
run;

run;

/* VARX(1,2) in difference with current Exogenous Variables */
proc varmax data=grunfeld;
   model y1 y2 = x1 / p=1 xlag=2 difx=(1) dify=(1);
run;
```

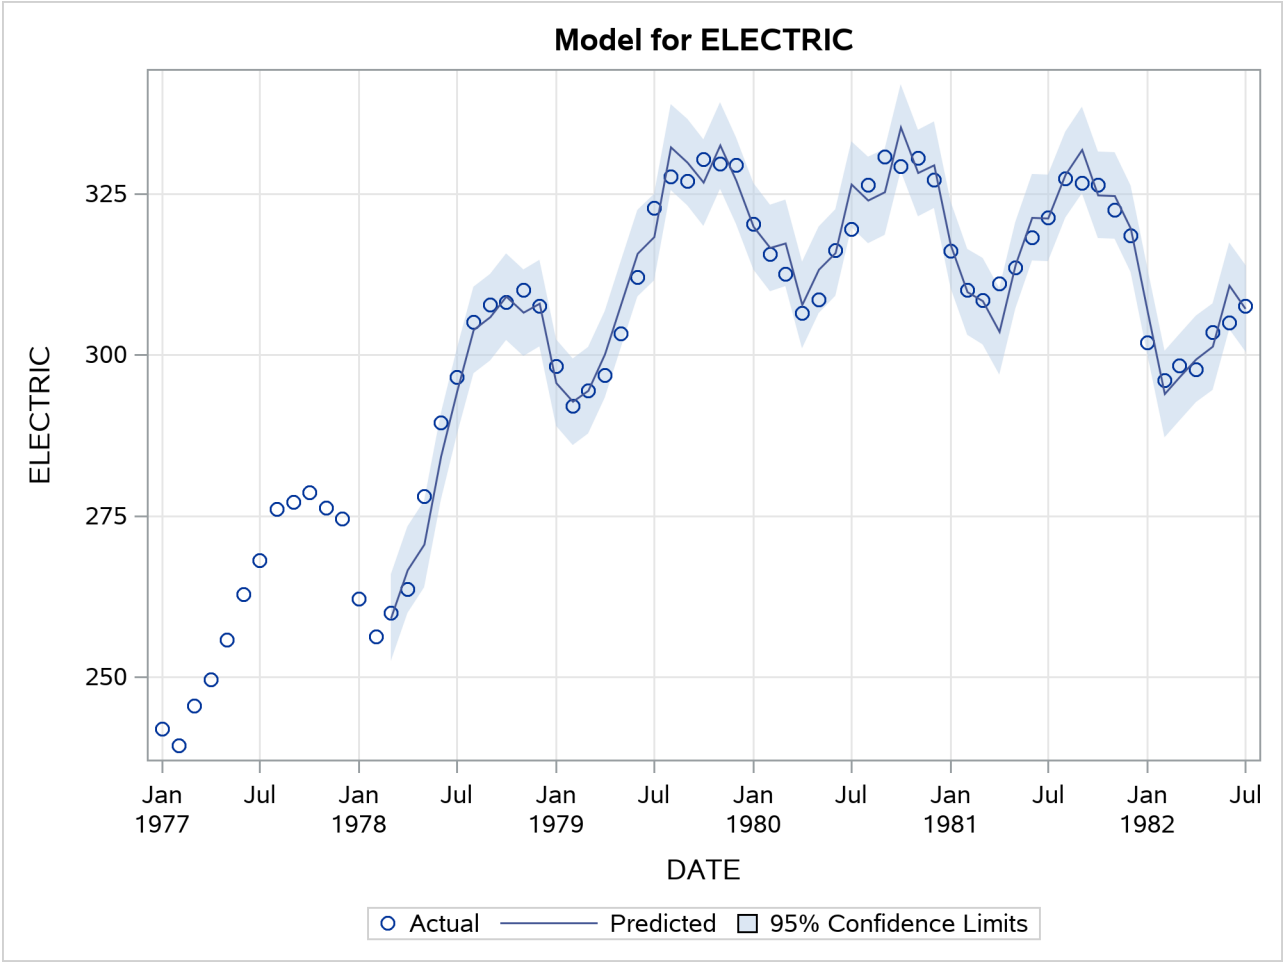
## Example 43.7: Illustration of ODS Graphics

This example illustrates the use of ODS Graphics. For information about the graphics available in the VARMAX procedure, see the section "ODS Graphics" on page 3172.

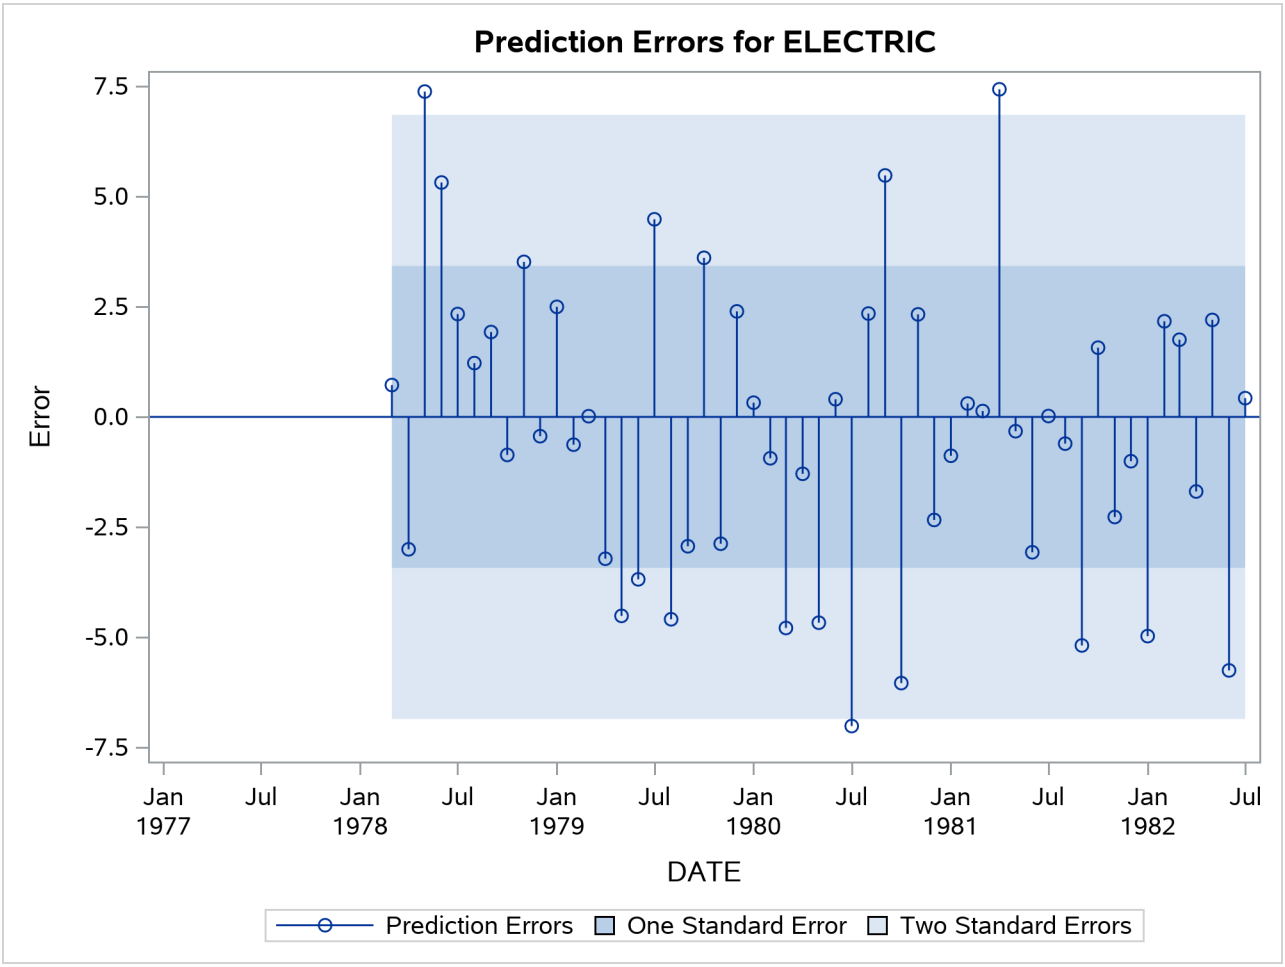
The following statements use the SASHELP.WORKERS data set to study the time series of electrical workers and its interaction with the series of masonry workers. The series and predict plots, the residual plot, and the forecast plot are created in Output 43.7.1 through Output 43.7.3. These are a selection of the plots created by the VARMAX procedure.

```
title "Illustration of ODS Graphics";
proc varmax data=sashelp.workers plot(unpack)=(residual model forecasts);
   id date interval=month;
   model electric masonry / dify=(1,12) noint p=1;
   output lead=12;
run;
```

**Output 43.7.1** Series and Predicted Series Plots



**Output 43.7.2** Residual Plot



**Output 43.7.3** Series and Forecast Plots

# Overview: X11 Procedure

The X11 procedure, an adaptation of the U.S. Bureau of the Census X-11 Seasonal Adjustment program, seasonally adjusts monthly or quarterly time series. The procedure makes additive or multiplicative adjustments and creates an output data set containing the adjusted time series and intermediate calculations.

The X11 procedure also provides the X-11-ARIMA method developed by Statistics Canada. This method fits an ARIMA model to the original series, then uses the model forecast to extend the original series. This extended series is then seasonally adjusted by the standard X-11 seasonal adjustment method. The extension of the series improves the estimation of the seasonal factors and reduces revisions to the seasonally adjusted series as new data become available.

The X11 procedure incorporates sliding spans analysis. This type of analysis provides a diagnostic for determining the suitability of seasonal adjustment for an economic series.

Seasonal adjustment of a series is based on the assumption that seasonal fluctuations can be measured in the original series, $O_t, t = 1, \ldots, n$, and separated from trend cycle, trading-day, and irregular fluctuations. The seasonal component of this time series, $S_t$, is defined as the intrayear variation that is repeated constantly or in an evolving fashion from year to year. The trend cycle component, $C_t$, includes variation due to the long-term trend, the business cycle, and other long-term cyclical factors. The trading-day component, $D_t$, is the variation that can be attributed to the composition of the calendar. The irregular component, $I_t$, is the residual variation. Many economic time series are related in a multiplicative fashion ($O_t = S_t C_t D_t I_t$). A seasonally adjusted time series, $C_t I_t$, consists of only the trend cycle and irregular components.

# Getting Started: X11 Procedure

The most common use of the X11 procedure is to produce a seasonally adjusted series. Eliminating the seasonal component from an economic series facilitates comparison among consecutive months or quarters. A plot of the seasonally adjusted series is often more informative about trends or location in a business cycle than a plot of the unadjusted series.

The following example shows how to use PROC X11 to produce a seasonally adjusted series, $C_t I_t$, from an original series $O_t = S_t C_t D_t I_t$.

In the multiplicative model, the trend cycle component $C_t$ keeps the same scale as the original series $O_t$, while $S_t$, $D_t$, and $I_t$ vary around 1.0. In all printed tables and in the output data set, these latter components are expressed as percentages, and thus will vary around 100.0 (in the additive case, they vary around 0.0).

The naming convention used in PROC X11 for the tables follows the original U.S. Bureau of the Census X-11 Seasonal Adjustment program specification (Shiskin, Young, and Musgrave 1967). Also, see the section "Printed Output" on page 3284. This convention is outlined in Figure 44.1.

The tables corresponding to parts A–C are intermediate calculations. The final estimates of the individual components are found in the D tables: Table D10 contains the final seasonal factors, Table D12 contains the final trend cycle, and Table D13 contains the final irregular series. If you are primarily interested in seasonally adjusting a series without consideration of intermediate calculations or diagnostics, you only need to look at Table D11, the final seasonally adjusted series.

For more information about the X-11-ARIMA tables, see Ladiray and Quenneville (2001).

## Basic Seasonal Adjustment

Suppose you have monthly retail sales data starting in September 1978 in a SAS data set named SALES. At this point you do not suspect that any calendar effects are present, and there are no prior adjustments that need to be made to the data.

In this simplest case, you need only specify the DATE= variable in the MONTHLY statement, which associates a SAS date value to each observation. To see the results of the seasonal adjustment, you must request table D11, the final seasonally adjusted series, in a TABLES statement.

```
data sales;
   input sales @@;
   date = intnx( 'month', '01sep1978'd, _n_-1 );
   format date monyy7.;
datalines;
112 118 132 129 121 135 148 148 136 119 104 118

   ... more lines ...

/*--- X-11 ARIMA ---*/
proc x11 data=sales;
   monthly date=date;
   var sales;
   tables d11;
run;
```

**Figure 44.1** Basic Seasonal Adjustment

**The X11 Procedure**

**Seasonal Adjustment of - sales**

X-11 Seasonal Adjustment Program
U. S. Bureau of the Census
Economic Research and Analysis Division
November 1, 1968

The X-11 program is divided into seven major parts.
Part Description
A. Prior adjustments, if any
B. Preliminary estimates of irregular component weights and regression trading day factors
C. Final estimates of above
D. Final estimates of seasonal, trend-cycle and irregular components
E. Analytical tables
F. Summary measures
G. Charts

Series - sales
Period covered - 9/1978 to 8/1990
Type of run: multiplicative seasonal adjustment.
Selected Tables or Charts.
Sigma limits for graduating extreme values are 1.5 and 2.5
Irregular values outside of 2.5-sigma limits are excluded from trading day regression

**Total: 40324 Mean: 280.03 S.D.: 111.31**

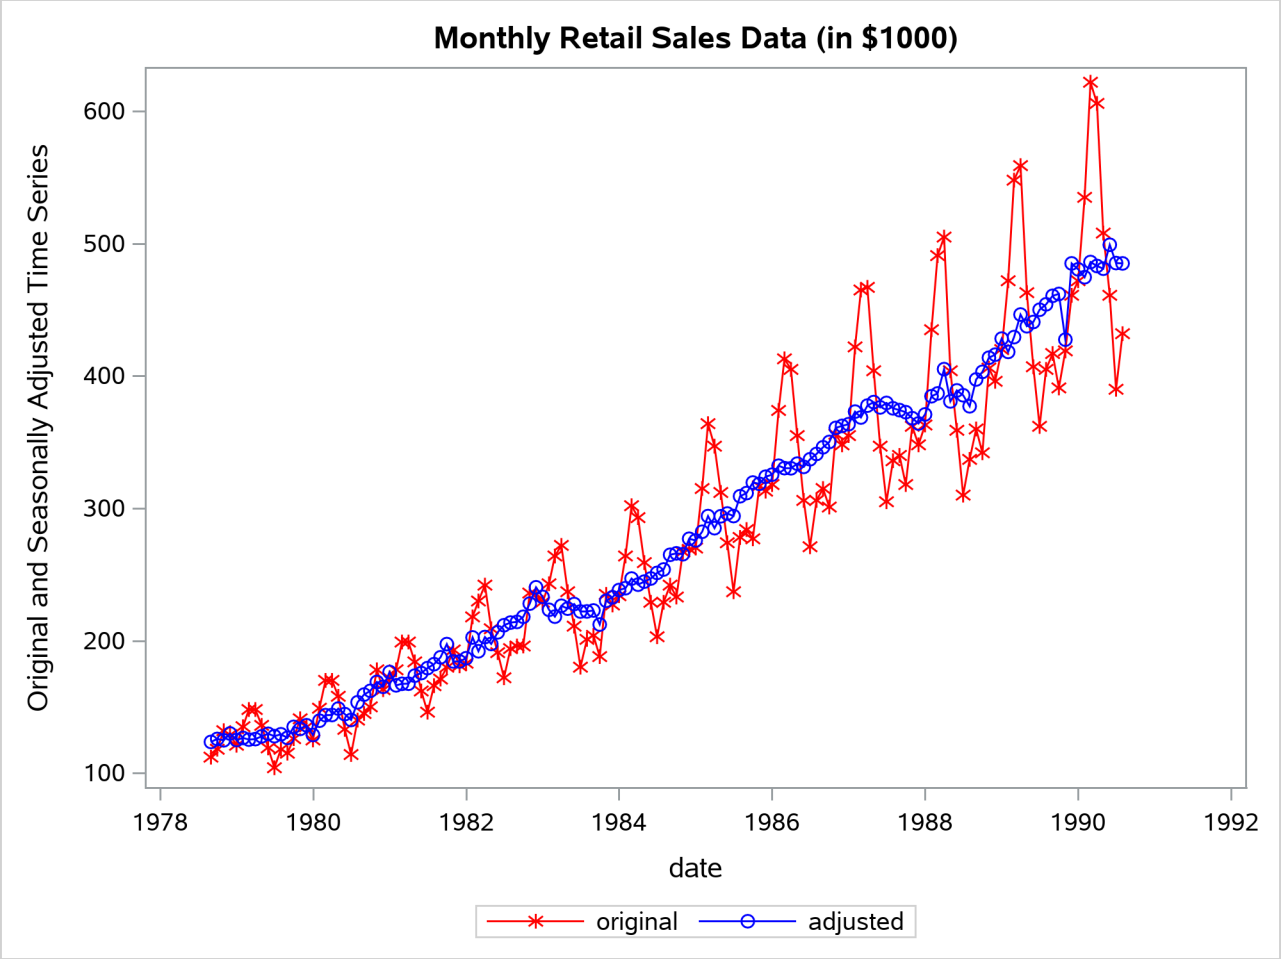
You can compare the original series, Table B1, and the final seasonally adjusted series, Table D11, by plotting them together. These tables are requested and named in the OUTPUT statement.

```
title 'Monthly Retail Sales Data (in $1000)';

proc x11 data=sales noprint;
   monthly date=date;
   var sales;
   output out=out b1=sales d11=adjusted;
run;

proc sgplot data=out;
   series x=date y=sales    / markers
                            markerattrs=(color=red symbol='asterisk')
                            lineattrs=(color=red)
                            legendlabel="original" ;
   series x=date y=adjusted / markers
                            markerattrs=(color=blue symbol='circle')
                            lineattrs=(color=blue)
                            legendlabel="adjusted" ;
   yaxis label='Original and Seasonally Adjusted Time Series';
run;
```

**Figure 44.3** Plot of Original and Seasonally Adjusted Data



## X-11-ARIMA

An inherent problem with the X-11 method is the revision of the seasonal factor estimates as new data become available. The X-11 method uses a set of centered moving averages to estimate the seasonal components. These moving averages apply symmetric weights to all observations except those at the beginning and end of the series, where asymmetric weights have to be applied. These asymmetric weights can cause poor estimates of the seasonal factors, which then can cause large revisions when new data become available.

While large revisions to seasonally adjusted values are not common, they can happen. When they do happen, it undermines the credibility of the X-11 seasonal adjustment method.

A method to address this problem was developed at Statistics Canada (Dagum 1980, 1982a). This method, known as X-11-ARIMA, applies an ARIMA model to the original data (after adjustments, if any) to forecast the series one or more years. This extended series is then seasonally adjusted, allowing symmetric weights to be applied to the end of the original data. This method was tested against a large number of Canadian economic series and was found to greatly reduce the amount of revisions as new data were added.

The X-11-ARIMA method is available in PROC X11 through the use of the ARIMA statement. The ARIMA statement extends the original series either with a user-specified ARIMA model or by an automatic selection process in which the best model from a set of five predefined ARIMA models is used.

The following example illustrates the use of the ARIMA statement. The ARIMA statement does not contain a user-specified model, so the best model is chosen by the automatic selection process. Forecasts from this best model are then used to extend the original series by one year. The following partial listing shows parameter estimates and model diagnostics for the ARIMA model chosen by the automatic selection process:

```
proc x11 data=sales;
   monthly date=date;
   var sales;
   arima;
run;
```

**Figure 44.4** X-11-ARIMA Model Selection

**Monthly Retail Sales Data (in $1000)**

**The X11 Procedure**

**Seasonal Adjustment of - sales**

**Conditional Least Squares Estimation**

| Parameter | Estimate | Approx. Std Error | t Value | Lag |
|---|---|---|---|---|
| **MU** | 0.0001728 | 0.0009596 | 0.18 | 0 |
| **MA1,1** | 0.3739984 | 0.0893427 | 4.19 | 1 |
| **MA1,2** | 0.0231478 | 0.0892154 | 0.26 | 2 |
| **MA2,1** | 0.5727914 | 0.0790835 | 7.24 | 12 |

| **Conditional Least Squares Estimation** | | |
|---|---|---|
| **Variance Estimate =** | 0.0014313 | |
| **Std Error Estimate =** | 0.0378326 | |
| **AIC =** | -482.2412 | * |
| **SBC =** | -470.7404 | * |
| **Number of Residuals=** | 131 | |

*** Does not include log determinant**

Criteria Summary for Model 2: (0,1,2)(0,1,1)s, Log Transform

Box-Ljung Chi-square: 22.03 with 21 df Prob= 0.40
(Criteria prob > 0.05)
Test for over-differencing: sum of MA parameters = 0.57
(must be < 0.90)
MAPE - Last Three Years: 2.84 (Must be < 15.00 %)
- Last Year: 3.04
- Next to Last Year: 1.96
- Third from Last Year: 3.51

Table D11 (final seasonally adjusted series) is now constructed using symmetric weights on observations at the end of the actual data. This should result in better estimates of the seasonal factors and, thus, smaller

revisions in Table D11 as more data become available.

# Syntax: X11 Procedure

The X11 procedure uses the following statements:

```
PROC X11 options ;
    ARIMA options ;
    BY variables ;
    ID variables ;
    MACURVES option ;
    MONTHLY options ;
    OUTPUT OUT=data set options ;
    PDWEIGHTS option ;
    QUARTERLY options ;
    SSPAN options ;
    TABLES table names ;
    VAR variables ;
```

Either the MONTHLY or QUARTERLY statement must be specified, depending on the type of time series data you have. The PDWEIGHTS and MACURVES statements can be used only with the MONTHLY statement. The TABLES statement controls the printing of tables, while the OUTPUT statement controls the creation of the OUT= data set.

## Functional Summary

The statements and options controlling the X11 procedures are summarized in Table 44.1.

**Table 44.1** Functional Summary

| Description | Statement | Option |
|---|---|---|
| **Data Set Options** | | |
| Specify input data set | PROC X11 | DATA= |
| Write the trading-day regression results to an output data set | PROC X11 | OUTTDR= |
| Write the stable seasonality test results to an output data set | PROC X11 | OUTSTB= |
| Write table values to an output data set | OUTPUT | OUT= |
| Add extrapolated values to the output data set | PROC X11 | OUTEX |
| Add year ahead estimates to the output data set | PROC X11 | YRAHEADOUT |
| Write the sliding spans analysis results to an output data set | PROC X11 | OUTSPAN= |
| **Printing Control Options** | | |
| Suppress all printed output | PROC X11 | NOPRINT |

**Table 44.1** *continued*

| Description | Statement | Option |
|---|---|---|
| Suppress all printed ARIMA output | ARIMA | NOPRINT |
| Print all ARIMA output | ARIMA | PRINTALL |
| Print selected tables and charts | TABLES | |
| Print selected groups of tables | MONTHLY | PRINTOUT= |
| | QUARTERLY | PRINTOUT= |
| Print selected groups of charts | MONTHLY | CHARTS= |
| | QUARTERLY | CHARTS= |
| Print preliminary tables associated with ARIMA processing | ARIMA | PRINTFP |
| Specify number of decimals for printed tables | MONTHLY | NDEC= |
| | QUARTERLY | NDEC= |
| Suppress all printed SSPAN output | SSPAN | NOPRINT |
| Print all SSPAN output | SSPAN | PRINTALL |
| **Date Information Options** | | |
| Specify a SAS date variable | MONTHLY | DATE= |
| | QUARTERLY | DATE= |
| Specify the beginning date | MONTHLY | START= |
| | QUARTERLY | START= |
| Specify the ending date | MONTHLY | END= |
| | QUARTERLY | END= |
| Specify beginning year for trading-day regression | MONTHLY | TDCOMPUTE= |
| **Declaring the Role of Variables** | | |
| Specify BY-group processing | BY | |
| Specify the variables to be seasonally adjusted | VAR | |
| Specify identifying variables | ID | |
| Specify the prior monthly factor | MONTHLY | PMFACTOR= |
| **Controlling the Table Computations** | | |
| Use additive adjustment | MONTHLY | ADDITIVE |
| | QUARTERLY | ADDITIVE |
| Specify seasonal factor moving average length | MACURVES | |
| Specify the extreme value limit for trading-day regression | MONTHLY | EXCLUDE= |
| Specify the lower bound for extreme irregulars | MONTHLY | FULLWEIGHT= |
| | QUARTERLY | FULLWEIGHT= |
| Specify the upper bound for extreme irregulars | MONTHLY | ZEROWEIGHT= |
| | QUARTERLY | ZEROWEIGHT= |
| Include the length-of-month in trading-day regression | MONTHLY | LENGTH |
| Specify trading-day regression action | MONTHLY | TDREGR= |

**Table 44.1** *continued*

| Description | Statement | Option |
|---|---|---|
| Compute summary measure only | MONTHLY | SUMMARY |
| | QUARTERLY | SUMMARY |
| Modify extreme irregulars prior to trend | MONTHLY | TRENDADJ |
| Cycle estimation | QUARTERLY | TRENDADJ |
| Specify moving average length in trend | MONTHLY | TRENDMA= |
| Cycle estimation | QUARTERLY | TRENDMA= |
| Specify weights for prior trading-day factors | PDWEIGHTS | |

## PROC X11 Statement

**PROC X11** *options* **;**

The following options can appear in the PROC X11 statement:

**DATA=***SAS-data-set*
specifies the input SAS data set used. If it is omitted, the most recently created SAS data set is used.

**OUTEXTRAP**
adds the extra observations used in ARIMA processing to the output data set.

When ARIMA forecasting/backcasting is requested, extra observations are appended to the ends of the series, and the calculations are carried out on this extended series. The appended observations are not normally written to the OUT= data set. However, if OUTEXTRAP is specified, these extra observations are written to the output data set. If a DATE= variable is specified in the MONTHLY/QUARTERLY statement, the date variable is extrapolated to identify forecasts/backcasts. The OUTEXTRAP option can be abbreviated as OUTEX.

**NOPRINT**
suppresses any printed output. The NOPRINT option overrides any PRINTOUT=, CHARTS=, or TABLES statement and any output associated with the ARIMA statement.

**OUTSPAN=***SAS-data-set*
specifies the output data set to store the sliding spans analysis results. Tables A1, C18, D10, and D11 for each span are written to this data set. For more information, see the section "The OUTSPAN= Data Set" on page 3281.

**OUTSTB=***SAS-data-set*
specifies the output data set to store the stable seasonality test results (Table D8). All the information in the analysis of variance table associated with the stable seasonality test is contained in the variables written to this data set. For more information, see the section "OUTSTB= Data Set" on page 3282.

**OUTTDR=***SAS-data-set*

specifies the output data set to store the trading-day regression results (Tables B15 and C15). All the information in the analysis of variance table associated with the trading-day regression is contained in the variables written to this data set. This option is valid only when TDREGR=PRINT, TEST, or ADJUST is specified in the MONTHLY statement. For more information, see the section "OUTTDR= Data Set" on page 3282.

**YRAHEADOUT**

adds one-year-ahead forecast values to the output data set for Tables C16, C18, and D10. The original purpose of this option was to avoid recomputation of the seasonal adjustment factors when new data became available. While computing costs were an important factor when the X-11 method was developed, this is no longer the case and this option is obsolete. For more information, see the section "The YRAHEADOUT Option" on page 3277.

## ARIMA Statement

**ARIMA** *options* **;**

The ARIMA statement applies the X-11-ARIMA method to the series specified in the VAR statement. This method uses an ARIMA model estimated from the original data to extend the series one or more years. The ARIMA statement options control the ARIMA model used and the estimation, forecasting, and printing of this model.

There are two ways of obtaining an ARIMA model to extend the series. A model can be given explicitly with the MODEL= and TRANSFORM= options. Alternatively, the best-fitting model from a set of five predefined models is found automatically whenever the MODEL= option is absent. For more information, see the section "Details of Model Selection" on page 3278.

**BACKCAST=***n*

specifies the number of years to backcast the series. The default is BACKCAST=0. For more information, see the section "Effect of Backcast and Forecast Length" on page 3278.

**CHICR=***value*

specifies the criteria for the significance level for the Box-Ljung chi-square test for lack of fit when testing the five predefined models. The default is CHICR=0.05. The CHICR= option values must be between 0.01 and 0.90. The hypothesis being tested is that of model adequacy. Nonrejection of the hypothesis is evidence for an adequate model. Making the CHICR= value smaller makes it easier to accept the model. For more information about the CHICR= option, see the section "Criteria Details" on page 3279.

**CONVERGE=***value*

specifies the convergence criterion for the estimation of an ARIMA model. The default value is 0.001. The CONVERGE= value must be positive.

**FORECAST=***n*

specifies the number of years to forecast the series. The default is FORECAST=1. For more information, see the section "Effect of Backcast and Forecast Length" on page 3278.

**MAPECR=***value*

specifies the criteria for the mean absolute percent error (MAPE) when testing the five predefined models. A small MAPE value is evidence for an adequate model; a large MAPE value results in the model being rejected. The MAPECR= value is the boundary for acceptance/rejection. Thus a larger MAPECR= value would make it easier for a model to pass the criteria. The default is MAPECR=15. The MAPECR= option values must be between 1 and 100. For more information about the MAPECR= option, see the section "Criteria Details" on page 3279.

**MAXITER=***n*

specifies the maximum number of iterations in the estimation process. MAXITER must be between 1 and 60; the default value is 15.

**METHOD=CLS**

**METHOD=ULS**

**METHOD=ML**

specifies the estimation method. ML requests maximum likelihood, ULS requests unconditional least squares, and CLS requests conditional least squares. METHOD=CLS is the default. The maximum likelihood estimates are more expensive to compute than the conditional least squares estimates. In some cases, however, they can be preferable. For further information about the estimation methods, see the section "Estimation Details" on page 246 in Chapter 8, "The ARIMA Procedure."

**MODEL= ( P=***n1* **Q=***n2* **SP=***n3* **SQ=***n4* **DIF=***n5* **SDIF=***n6* **< NOINT > < CENTER >)**

specifies the ARIMA model. The AR and MA orders are given by P=*n1* and Q=*n2*, respectively, while the seasonal AR and MA orders are given by SP=*n3* and SQ=*n4*, respectively. The lag corresponding to seasonality is determined by the MONTHLY or QUARTERLY statement. Similarly, differencing and seasonal differencing are given by DIF=*n5* and SDIF=*n6*, respectively.

For example,

```
arima model=( p=2 q=1 sp=1 dif=1 sdif=1 );
```

specifies a (2,1,1)(1,1,0)*s* model, where *s*, the seasonality, is either 12 (monthly) or 4 (quarterly). For more examples of the MODEL= syntax, see the section "Details of Model Selection" on page 3278.

**NOINT**

suppresses the fitting of a constant (or intercept) parameter in the model. (That is, the parameter $\mu$ is omitted.)

**CENTER**

centers each time series by subtracting its sample mean. The analysis is done on the centered data. Later, when forecasts are generated, the mean is added back. Note that centering is done after differencing. The CENTER option is normally used in conjunction with the NOCONSTANT option of the ESTIMATE statement.

For example, to fit an AR(1) model on the centered data without an intercept, use the following ARIMA statement:

```
arima model=( p=1 center noint );
```

**NOPRINT**

suppresses the normal printout generated by the ARIMA statement. Note that the effect of specifying the NOPRINT option in the ARIMA statement is different from the effect of specifying the NOPRINT in the PROC X11 statement, since the former only affects ARIMA output.

**OVDIFCR=***value*

specifies the criteria for the over-differencing test when testing the five predefined models. When the MA parameters in one of these models sum to a number close to 1.0, this is an indication of over-parameterization and the model is rejected. The OVDIFCR= value is the boundary for this rejection; values greater than this value fail the over-differencing test. A larger OVDIFCR= value would make it easier for a model to pass the criteria. The default is OVDIFCR=0.90. The OVDIFCR= option values must be between 0.80 and 0.99. For more information about the OVDIFCR= option, see the section "Criteria Details" on page 3279.

**PRINTALL**

provides the same output as the default printing for all models fit and, in addition, prints an estimation summary and chi-square statistics for each model fit. For more information, see the "Printed Output" on page 3284.

**PRINTFP**

prints the results for the initial pass of X11 made to exclude trading-day effects. This option has an effect only when the TDREGR= option specifies ADJUST, TEST, or PRINT. In these cases, an initial pass of the standard X11 method is required to get rid of calendar effects before doing any ARIMA estimation. Usually this first pass is not of interest, and by default no tables are printed. However, specifying PRINTFP in the ARIMA statement causes any tables printed in the final pass to also be printed for this initial pass.

**TRANSFORM= (LOG) | LOG**

**TRANSFORM= (** *constant ** power* **)**

The ARIMA statement in PROC X11 allows certain transformations on the series before estimation. The specified transformation is applied only to a user-specified model. If TRANSFORM= is specified and the MODEL= option is not specified, the transformation request is ignored and a warning is printed.

The LOG transformation requests that the natural log of the series be used for estimation. The resulting forecast values are transformed back to the original scale.

A general power transformation of the form $X_t \rightarrow (X_t + a)^b$ is obtained by specifying

```
transform= ( a ** b )
```

If the constant $a$ is not specified, it is assumed to be zero. The specified ARIMA model is then estimated using the transformed series. The resulting forecast values are transformed back to the original scale.

## BY Statement

**BY** *variables* **;**

A BY statement can be used with PROC X11 to obtain separate analyses on observations in groups defined by the BY variables. When a BY statement appears, the procedure expects the input DATA= data set to be sorted in order of the BY variables.

## ID Statement

**ID** *variables* **;**

If you are creating an output data set, use the ID statement to put values of the ID variables, in addition to the table values, into the output data set. The ID statement has no effect when an output data set is not created. If the DATE= variable is specified in the MONTHLY or QUARTERLY statement, this variable is included automatically in the OUTPUT data set. If no DATE= variable is specified, the variable _DATE_ is added.

The date variable (or _DATE_) values outside the range of the actual data (from ARIMA forecasting or backcasting, or from YRAHEADOUT) are extrapolated, while all other ID variables are missing.

## MACURVES Statement

**MACURVES** *month=option . . .* **;**

The MACURVES statement specifies the length of the moving-average curves for estimating the seasonal factors for any month. This statement can be used only with monthly time series data.

The *month=option* specifications consist of the month name (or the first three letters of the month name), an equal sign, and one of the following option values:

| | |
|---|---|
| ’3’ | specifies a three-term moving average for the month |
| ’3X3’ | specifies a three-by-three moving average |
| ’3X5’ | specifies a three-by-five moving average |
| ’3X9’ | specifies a three-by-nine moving average |
| STABLE | specifies a stable seasonal factor (average of all values for the month) |

For example, the statement

```
macurves jan='3' feb='3x3' march='3x5' april='3x9';
```

uses a three-term moving average to estimate seasonal factors for January, a $3 \times 3$ (a three-term moving average of a three-term moving average) for February, a $3 \times 5$ (a three-term moving average of a five-term moving average) for March, and a $3 \times 9$ (a three-term moving average of a nine-term moving average) for April.

The numeric values used for the weights of the various moving averages and a discussion of the derivation of these weights are given in Shiskin, Young, and Musgrave (1967). A general discussion of moving average weights is given in Dagum (1985).

If the specification for a month is omitted, the X11 procedure uses a three-by-three moving average for the first estimate of each iteration and a three-by-five average for the second estimate.

## MONTHLY Statement

**MONTHLY** *options* **;**

The MONTHLY statement must be used when the input data to PROC X11 are a monthly time series. The MONTHLY statement specifies options that determine the computations performed by PROC X11 and what is included in its output. Either the DATE= or START= option must be used.

The following options can appear in the MONTHLY statement:

**ADDITIVE**

performs additive adjustments. If the ADDITIVE option is omitted, PROC X11 performs multiplicative adjustments.

**CHARTS=STANDARD**

**CHARTS=FULL**

**CHARTS=NONE**

specifies the charts produced by the procedure. The default is CHARTS=STANDARD, which specifies 12 monthly seasonal charts and a trend cycle chart. If you specify CHARTS=FULL (or CHARTS=ALL), the procedure prints additional charts of irregular and seasonal factors. To print no charts, specify CHARTS=NONE.

The TABLES statement can also be used to specify particular monthly charts to be printed. If no CHARTS= option is given, and a TABLES statement is given, the TABLES statement overrides the default value of CHARTS=STANDARD; that is, no charts (or tables) are printed except those specified in the TABLES statement. However, if both the CHARTS= option and a TABLES statement are given, the charts corresponding to the CHARTS= option and those requested by the TABLES statement are printed.

For example, suppose you wanted only charts G1, the final seasonally adjusted series and trend cycle, and G4, the final irregular and final modified irregular series. You would specify the following statements:

```
monthly date=date;
tables g1 g4;
```

**DATE=***variable*

specifies a variable that gives the date for each observation. The starting and ending dates are obtained from the first and last values of the DATE= variable, which must contain SAS date values. The procedure checks values of the DATE= variable to ensure that the input observations are sequenced correctly. This variable is automatically added to the OUTPUT= data set if one is requested and extrapolated if necessary. If the DATE= option is not specified, the START= option must be specified.

The DATE= option and the START= and END= options can be used in combination to subset a series for processing. For example, suppose you have 12 years of monthly data (144 observations, no missing values) beginning in January 1970 and ending in December 1981, and you wanted to seasonally adjust only six years beginning in January 1974. Specifying

```
monthly date=date start=jan1974 end=dec1979;
```

would seasonally adjust only this subset of the data. If instead you wanted to adjust the last eight years of data, only the START= option is needed:

```
monthly date=date start=jan1974;
```

**END=***mmmyyyy*
specifies that only the part of the input series ending with the month and year given be adjusted (for example, END=DEC1970). For information about using the START= and END= options to subset a series for processing, see the DATE=*variable* option.

**EXCLUDE=***value*
excludes from the trading-day regression any irregular values that are more than *value* standard deviations from the mean. The EXCLUDE=value must be between 0.1 and 9.9, with the default value being 2.5.

**FULLWEIGHT=***value*
assigns weights to irregular values based on their distance from the mean in standard deviation units. The weights are used for estimating seasonal and trend cycle components. Irregular values less than the FULLWEIGHT= *value* (in standard deviation units) are assigned full weights of 1, values that fall between the ZEROWEIGHT= and FULLWEIGHT= limits are assigned weights linearly graduated between 0 and 1, and values greater than the ZEROWEIGHT= limit are assigned a weight of 0.

For example, if ZEROWEIGHT=2 and FULLWEIGHT=1, a value 1.3 standard deviations from the mean would be assigned a graduated weight. The FULLWEIGHT=value must be between 0.1 and 9.9 but must be less than the ZEROWEIGHT=value. The default is FULLWEIGHT=1.5.

**LENGTH**
includes length-of-month allowance in computing trading-day factors. If this option is omitted, length-of-month allowances are included with the seasonal factors.

**NDEC=***n*
specifies the number of decimal places shown in the printed tables in the listing. This option has no effect on the precision of the variable values in the output data set.

**PMFACTOR=***variable*
specifies a variable containing the prior monthly factors. Use this option if you have previous knowledge of monthly adjustment factors. The PMFACTOR= option can be used to make the following adjustments:

- adjust the level of all or part of a series with discontinuities
- adjust for the influence of holidays that fall on different dates from year to year, such as the effect of Easter on certain retail sales
- adjust for unreasonable weather influence on series, such as housing starts
- adjust for changing starting dates of fiscal years (for budget series) or model years (for automobiles)

- adjust for temporary dislocating events, such as strikes

For more information and examples using the PMFACTOR= option, see the section "Prior Daily Weights and Trading-Day Regression" on page 3276.

**PRINTOUT=STANDARD | LONG | FULL | NONE**

specifies the tables to be printed by the procedure. If the PRINTOUT=STANDARD option is specified, between 17 and 27 tables are printed, depending on the other options that are specified. PRINTOUT=LONG prints between 27 and 39 tables, and PRINTOUT=FULL prints between 44 and 59 tables. Specifying PRINTOUT=NONE results in no tables being printed; however, charts are still printed. The default is PRINTOUT=STANDARD.

The TABLES statement can also be used to specify particular monthly tables to be printed. If no PRINTOUT= option is specified, and a TABLES statement is given, the TABLES statement overrides the default value of PRINTOUT=STANDARD; that is, no tables (or charts) are printed except those given in the TABLES statement. However, if both the PRINTOUT= option and a TABLES statement are specified, the tables corresponding to the PRINTOUT= option and those requested by the TABLES statement are printed.

**START=***mmmyyyy*

adjusts only the part of the input series starting with the specified month and year. When the DATE= option is not used, the START= option gives the year and month of the first input observation—for example, START=JAN1966. START= must be specified if DATE= is not given. If START= is specified (and no DATE= option is given), and an OUT= data set is requested, a variable named _DATE_ is added to the data set, giving the date value for each observation. For information about using the START= and END= options to subset a series, see the DATE= *variable* option.

**SUMMARY**

specifies that the data are already seasonally adjusted and the procedure is to produce summary measures. If the SUMMARY option is omitted, the X11 procedure performs seasonal adjustment of the input data before calculating summary measures.

**TDCOMPUTE=***year*

uses the part of the input series beginning with January of the specified year to derive trading-day weights. If this option is omitted, the entire series is used.

**TDREGR=NONE | PRINT | ADJUST | TEST**

specifies the treatment of trading-day regression. TDREG=NONE omits the computation of the trading-day regression. TDREG=PRINT computes and prints the trading-day regressions but does not adjust the series. TDREG=ADJUST computes and prints the trading-day regression and adjusts the irregular components to obtain preliminary weights. TDREG=TEST adjusts the final series if the trading-day regression estimates explain significant variation on the basis of an $F$ test (or residual trading-day variation if prior weights are used). The default is TDREGR=NONE.

For more information and examples using the TDREGR= option, see the section "Prior Daily Weights and Trading-Day Regression" on page 3276.

If ARIMA processing is requested, any value of TDREGR other than the default TDREGR=NONE will cause PROC X11 to perform an initial pass (see the section "Details: X11 Procedure" on page 3268 and the PRINTFP option).

The significance level reported in Table C15 should be viewed with caution. The dependent variable in the trading-day regression is the irregular component formed by an averaging operation. This induces a correlation in the dependent variable and hence in the residuals from which the *F* test is computed. Hence the distribution of the trading-day regression *F* statistics differs from an exact *F*; for more information, see Cleveland and Devlin (1980).

**TRENDADJ**
modifies extreme irregular values prior to computing the trend cycle estimates in the first iteration. If the TRENDADJ option is omitted, the trend cycle is computed without modifications for extremes.

**TRENDMA=9 | 13 | 23**
specifies the number of terms in the moving average to be used by the procedure in estimating the variable trend cycle component. The value of the TRENDMA= option must be 9, 13, or 23. If the TRENDMA= option is omitted, the procedure selects an appropriate moving average. For information about the number of terms in the moving average, see Shiskin, Young, and Musgrave (1967).

**ZEROWEIGHT=***value*
assigns weights to irregular values based on their distance from the mean in standard deviation units. The weights are used for estimating seasonal and trend cycle components. Irregular values beyond the standard deviation limit specified in the ZEROWEIGHT= option are assigned zero weights. Values that fall between the two limits (ZEROWEIGHT= and FULLWEIGHT=) are assigned weights linearly graduated between 0 and 1. For example, if ZEROWEIGHT=2 and FULLWEIGHT=1, a value 1.3 standard deviations from the mean would be assigned a graduated weight. The ZEROWEIGHT=value must be between 0.1 and 9.9 but must be greater than the FULLWEIGHT=value. The default is ZEROWEIGHT=2.5.

The ZEROWEIGHT option can be used in conjunction with the FULLWEIGHT= option to adjust outliers from a monthly or quarterly series. For an illustration of this use, see Example 44.3 later in this chapter.

## OUTPUT Statement

**OUTPUT OUT=** *SAS-data-set tablename=var1 var2 . . .* **;**

The OUTPUT statement creates an output data set containing specified tables. The data set is named by the OUT= option.

**OUT=***SAS-data-set*
If OUT= is omitted, the SAS System names the new data set by using the DATA*n* convention.

For each table to be included in the output data set, write the X11 table identification keyword, an equal sign, and a list of new variable names:

*tablename* = var1 var2 . . .

The *tablename* keywords that can be used in the OUTPUT statement are listed in the section "Printed Output" on page 3284. The following is an example of a VAR statement and an OUTPUT statement:

```
var z1 z2 z3;
output out=out_x11  b1=s  d11=w x y;
```

The variable s contains the Table B1 values for the variable z1, while the Table D11 values for variables z1, z2, and z3 are contained in variables w, x, and y, respectively. As this example shows, the list of variables following a *tablename*= keyword can be shorter than the VAR variable list.

In addition to the variables named by *tablename* =*var1 var2* . . . , the ID variables, and BY variables, the output data set contains a date identifier variable. If the DATE= option is given in the MONTHLY or QUARTERLY statement, the DATE= variable is the date identifier. If no DATE= option is given, a variable named _DATE_ is the date identifier.

## PDWEIGHTS Statement

**PDWEIGHTS** *day=w . . .* **;**

The PDWEIGHTS statement can be used to specify one to seven daily weights. The statement can only be used with monthly series that are seasonally adjusted using the multiplicative model. These weights are used to compute prior trading-day factors, which are then used to adjust the original series prior to the seasonal adjustment process. Only relative weights are needed; the X11 procedure adjusts the weights so that they sum to 7.0. The weights can also be corrected by the procedure on the basis of estimates of trading-day variation from the input data.

For more information and examples using the PDWEIGHTS statement, see the section "Prior Daily Weights and Trading-Day Regression" on page 3276.

Each *day=w* option specifies a weight (*w*) for the named day. The *day* can be any day, Sunday through Saturday. The *day* keyword can be the full spelling of the day, or the three-letter abbreviation. For example, SATURDAY=1.0 and SAT=1.0 are both valid. The weights *w* must be a numeric value between 0.0 and 10.0.

The following is an example of a PDWEIGHTS statement:

```
pdweights sun=.2 mon=.9 tue=1 wed=1 thu=1 fri=.8 sat=.3;
```

Any number of days can be specified with one PDWEIGHTS statement. The default weight value for any day that is not specified is 0. If you do not use a PDWEIGHTS statement, the program computes daily weights if TDREGR=ADJUST is specified. For more information, see Shiskin, Young, and Musgrave (1967).

## QUARTERLY Statement

**QUARTERLY** *options* **;**

The QUARTERLY statement must be used when the input data are quarterly time series. This statement includes options that determine the computations performed by the procedure and what is in the printed output. The DATE= option or the START= option must be used.

The following options can appear in the QUARTERLY statement:

**ADDITIVE**
performs additive adjustments. If this option is omitted, the procedure performs multiplicative adjustments.

**CHARTS=STANDARD**

**CHARTS=FULL**

**CHARTS=NONE**
specifies the charts to be produced by the procedure. The default value is CHARTS=STANDARD, which specifies four quarterly seasonal charts and a trend cycle chart. If you specify CHARTS=FULL (or CHARTS=ALL), the procedure prints additional charts of irregular and seasonal factors. To print no charts, specify CHARTS=NONE. The TABLES statement can also be used to specify particular charts to be printed. The presence of a TABLES statement overrides the default value of CHARTS=STANDARD; that is, if a TABLES statement is specified, and no CHARTS=option is specified, no charts (nor tables) are printed except those given in the TABLES statement. However, if both the CHARTS= option and a TABLES statement are given, the charts corresponding to the CHARTS= option and those requested by the TABLES statement are printed.

For example, suppose you wanted only charts G1, the final seasonally adjusted series and trend cycle, and G4, the final irregular and final modified irregular series. This is accomplished by specifying the following statements:

```
quarterly date=date;
tables g1 g4;
```

**DATE=***variable*
specifies a variable that gives the date for each observation. The starting and ending dates are obtained from the first and last values of the DATE= variable, which must contain SAS date values. The procedure checks values of the DATE= variable to ensure that the input observations are sequenced correctly. This variable is automatically added to the OUTPUT= data set if one is requested, and extrapolated if necessary. If the DATE= option is not specified, the START= option must be specified.

The DATE= option and the START= and END= options can be used in combination to subset a series for processing. For example, suppose you have a series with 10 years of quarterly data (40 observations, no missing values) beginning in '1970Q1' and ending in '1979Q4', and you want to seasonally adjust only four years beginning in '1974Q1' and ending in '1977Q4'. Specifying

```
quarterly date=variable start='1974q1' end='1977q4';
```

seasonally adjusts only this subset of the data. If instead you wanted to adjust the last six years of data, only the START= option is needed:

```
quarterly date=variable start='1974q1';
```

**END=***'yyyyQq'*
specifies that only the part of the input series ending with the quarter and year given be adjusted (for example, END='1973Q4'). The specification must be enclosed in quotes, and *q* must be 1, 2, 3, or 4. For information about using the START= and END= options to subset a series, see the DATE= *variable* option.

**FULLWEIGHT=***value*
assigns weights to irregular values based on their distance from the mean in standard deviation units. The weights are used for estimating seasonal and trend cycle components. Irregular values less than the FULLWEIGHT= value (in standard deviation units) are assigned full weights of 1, values that fall between the ZEROWEIGHT= and FULLWEIGHT= limits are assigned weights linearly graduated between 0 and 1, and values greater than the ZEROWEIGHT= limit are assigned a weight of 0.

For example, if ZEROWEIGHT=2 and FULLWEIGHT=1, a value 1.3 standard deviations from the mean would be assigned a graduated weight. The default is FULLWEIGHT=1.5.

**NDEC=***n*
specifies the number of decimal places shown on the output tables. This option has no effect on the precision of the variables in the output data set.

**PRINTOUT=STANDARD**
**PRINTOUT=LONG**
**PRINTOUT=FULL**
**PRINTOUT=NONE**
specifies the tables to print. If PRINTOUT=STANDARD is specified, between 17 and 27 tables are printed, depending on the other options that are specified. PRINTOUT=LONG prints between 27 and 39 tables, and PRINTOUT=FULL prints between 44 and 59 tables. Specifying PRINTOUT=NONE results in no tables being printed. The default is PRINTOUT=STANDARD.

The TABLES statement can also specify particular quarterly tables to be printed. If no PRINTOUT= is given, and a TABLES statement is given, the TABLES statement overrides the default value of PRINTOUT=STANDARD; that is, no tables (or charts) are printed except those given in the TABLES statement. However, if both the PRINTOUT= option and a TABLES statement are given, the tables corresponding to the PRINTOUT= option and those requested by the TABLES statement are printed.

**START=***'yyyyQq'*
adjusts only the part of the input series starting with the quarter and year given. When the DATE= option is not used, the START= option gives the year and quarter of the first input observation (for example, START='1967Q1'). The specification must be enclosed in quotes, and *q* must be 1, 2, 3, or 4. START= must be specified if the DATE= option is not given. If START= is specified (and no DATE= is given), and an OUTPUT= data set is requested, a variable named _DATE_ is added to the data set, giving the date value for a given observation. For information about using the START= and END= options to subset a series, see the DATE= option.

**SUMMARY**
specifies that the input is already seasonally adjusted and that the procedure is to produce summary measures. If this option is omitted, the procedure performs seasonal adjustment of the input data before calculating summary measures.

**TRENDADJ**
modifies extreme irregular values prior to computing the trend cycle estimates. If this option is omitted, the trend cycle is computed without modification for extremes.

**ZEROWEIGHT=***value*
assigns weights to irregular values based on their distance from the mean in standard deviation units. The weights are used for estimating seasonal and trend cycle components. Irregular values beyond the standard deviation limit specified in the ZEROWEIGHT= option are assigned zero weights. Values that fall between the two limits (ZEROWEIGHT= and FULLWEIGHT=) are assigned weights linearly graduated between 0 and 1. For example, if ZEROWEIGHT=2 and FULLWEIGHT=1, a value 1.3 standard deviations from the mean would be assigned a graduated weight. The default is ZEROWEIGHT=2.5.

The ZEROWEIGHT option can be used in conjunction with the FULLWEIGHT= option to adjust outliers from a monthly or quarterly series. For an illustration of this use, see Example 44.3 later in this chapter.

## SSPAN Statement

**SSPAN** *options* **;**

The SSPAN statement applies sliding spans analysis to determine the suitability of seasonal adjustment for an economic series.

The following options can appear in the SSPAN statement:

**NDEC=***n*
specifies the number of decimal places shown on selected sliding span reports. This option has no effect on the precision of the variables values in the OUTSPAN output data set.

**CUTOFF=***value*
gives the percentage value for determining an excessive difference within a span for the seasonal factors, the seasonally adjusted series, and month-to-month and year-to-year differences in the seasonally adjusted series. The default value is 3.0. The use of the CUTOFF=value in determining the maximum percent difference (MPD) is described in the section "Computational Details for Sliding Spans Analysis" on page 3273. Caution should be used in changing the default CUTOFF=value. The empirical threshold ranges found by the U.S. Census Bureau no longer apply when value is changed.

**TDCUTOFF=***value*
gives the percentage value for determining an excessive difference within a span for the trading-day factors. The default value is 2.0. The use of the TDCUTOFF=value in determining the maximum percent difference (MPD) is described in the section "Computational Details for Sliding Spans Analysis" on page 3273. Caution should be used in changing the default TDCUTOFF=value. The empirical threshold ranges found by the U.S. Census Bureau no longer apply when the value is changed.

**NOPRINT**
suppresses all sliding span reports. For more information about sliding span reports, see the section "Computational Details for Sliding Spans Analysis" on page 3273.

**PRINT**
prints the summary sliding span reports S 0 through S 6.E.

**PRINTALL**
prints the summary sliding spans report S 0 through S 6.E, along with detail reports S 7.A through S 7.E.

## TABLES Statement

**TABLES** *table names* **;**

The TABLES statement prints the tables specified in addition to the tables that are printed as a result of the PRINTOUT= option in the MONTHLY or QUARTERLY statement. Table names are listed in Table 44.4 later in this chapter.

To print only selected tables, omit the PRINTOUT= option in the MONTHLY or QUARTERLY statement and list the tables to be printed in the TABLES statement. For example, to print only the final seasonal factors and final seasonally adjusted series, use the statement

```
tables d10 d11;
```

## VAR Statement

**VAR** *variables* **;**

The VAR statement is used to specify the variables in the input data set that are to be analyzed by the procedure. Only numeric variables can be specified. If the VAR statement is omitted, all numeric variables are analyzed except those appearing in a BY or ID statement or the variable named in the DATE= option in the MONTHLY or QUARTERLY statement.

# Details: X11 Procedure

## Historical Development of X-11

This section briefly describes the historical development of the standard X-11 seasonal adjustment method and the later development of the X-11-ARIMA method. Most of the following discussion is based on a comprehensive article by Bell and Hillmer (1984), which describes the history of X-11 and the justification of using seasonal adjustment methods, such as X-11, given the current availability of time series software. For further discussions about statistical problems associated with the X-11 method, see Ghysels (1990).

Seasonal adjustment methods began to be developed in the 1920s and 1930s, before there were suitable analytic models available and before electronic computing devices were in existence. The lack of any suitable model led to methods that worked the same for any series—that is, methods that were not model-based and that could be applied to any series. Experience with economic series had shown that a given mathematical form could adequately represent a time series only for a fixed length; as more data were added, the model became inadequate. This suggested an approach that used moving averages. For further analysis of the properties of X-11 moving averages, see Cleveland and Tiao (1976).

The basic method was to break up an economic time series into long-term trend, long-term cyclical movements, seasonal movements, and irregular fluctuations.

Early investigators found that it was not possible to uniquely decompose the trend and cycle components. Thus, these two were grouped together; the resulting component is usually referred to as the "trend cycle component."

It was also found that estimating seasonal components in the presence of trend produced biased estimates of the seasonal components, but, at the same time, estimating trend in the presence of seasonality was difficult. This eventually lead to the iterative approach used in the X-11 method.

Two other problems were encountered by early investigators. First, some economic series appear to have changing or evolving seasonality. Secondly, moving averages were very sensitive to extreme values. The estimation method used in the X-11 method allows for evolving seasonal components. For the second problem, the X-11 method uses repeated adjustment of extreme values.

All of these problems encountered in the early investigation of seasonal adjustment methods suggested the use of moving averages in estimating components. Even with the use of moving averages instead of a model-based method, massive amounts of hand calculations were required. Only a small number of series could be adjusted, and little experimentation could be done to evaluate variations on the method.

With the advent of electronic computing in the 1950s, work on seasonal adjustment methods proceeded rapidly. These methods still used the framework previously described; variants of these basic methods could now be easily tested against a large number of series.

Much of the work was done by Julian Shiskin and others at the U.S. Bureau of the Census beginning in 1954 and culminating after a number of variants into the *X-11 Variant of the Census Method II Seasonal Adjustment Program*, which PROC X11 implements.

References for this work during this period include Shiskin and Eisenpress (1957), Shiskin (1958), and Marris (1961). The authoritative documentation for the X-11 Variant is in Shiskin, Young, and Musgrave (1967). This document is not equivalent to a program specification; however, the FORTRAN code that implements

the X-11 Variant is in the public domain. A less detailed description of the X-11 Variant is given in US Bureau of the Census (1969).

### Development of the X-11-ARIMA Method

The X-11 method uses symmetric moving averages in estimating the various components. At the end of the series, however, these symmetric weights cannot be applied. Either asymmetric weights have to be used, or some method of extending the series must be found.

While various methods of extending a series have been proposed, the most important method to date has been the X-11-ARIMA method developed at Statistics Canada. This method uses Box-Jenkins ARIMA models to extend the series.

The Time Series Research and Analysis Division of Statistics Canada investigated 174 Canadian economic series and found five ARIMA models out of twelve that fit the majority of series well and reduced revisions for the most recent months. References that give details of various aspects of the X-11-ARIMA methodology include Dagum (1980, 1982a, c, 1983, 1988), Laniel (1985), Lothian and Morry (1978a), and Huot et al. (1986).

### Differences between X11ARIMA/88 and PROC X11

The original implementation of the X-11-ARIMA method was by Statistics Canada in 1980 (Dagum 1980), with later changes and enhancements made in 1988 (Dagum 1988). The calculations performed by PROC X11 differ from those in X11ARIMA/88, which will result in differences in the final component estimates provided by these implementations.

There are three areas where Statistics Canada made changes to the original X-11 seasonal adjustment method in developing X11ARIMA/80 (Monsell 1984). These are (a) selection of extreme values, (b) replacement of extreme values, and (c) generation of seasonal and trend cycle weights.

These changes have not been implemented in the current version of PROC X11. Thus the procedure produces results identical to those from previous versions of PROC X11 in the absence of an ARIMA statement.

Additional differences can result from the ARIMA estimation. X11ARIMA/88 uses conditional least squares (CLS), while CLS, unconditional least squares (ULS) and maximum likelihood (ML) are all available in PROC X11 by using the METHOD= option in the ARIMA statement. Generally, parameters estimates will differ for the different methods.

## Implementation of the X-11 Seasonal Adjustment Method

The following steps describe the analysis of a monthly time series using multiplicative seasonal adjustment. Additional steps used by the X-11-ARIMA method are also indicated. Equivalent descriptions apply for an additive model if you replace *divide* with *subtract* where applicable.

In the multiplicative adjustment, the original series $O_t$ is assumed to be of the form

$$O_t = C_t S_t I_t P_t D_t$$

where $C_t$ is the trend cycle component, $S_t$ is the seasonal component, $I_t$ is the irregular component, $P_t$ is the prior monthly factors component, and $D_t$ is the trading-day component.

The trading-day component can be further factored as

$$D_t = D_{r,t} D_{tr,t}$$

where $D_{tr,t}$ are the trading-day factors derived from the prior daily weights, and $D_{r,t}$ are the residual trading-day factors estimated from the trading-day regression. For further information about estimating trading day variation, see Young (1965).

## Additional Steps When Using the X-11-ARIMA Method

The X-11-ARIMA method consists of extending a given series by an ARIMA model and applying the usual X-11 seasonal adjustment method to this extended series. Thus in the simplest case in which there are no prior factors or calendar effects in the series, the ARIMA model selection, estimation, and forecasting are performed first, and the resulting extended series goes through the standard X-11 steps described in the next section.

If prior factor or calendar effects are present, they must be eliminated from the series before the ARIMA estimation is done because these effects are not stochastic.

Prior factors, if present, are removed first. Calendar effects represented by prior daily weights are then removed. If there are no further calendar effects, the adjusted series is extended by the ARIMA model, and this extended series goes through the standard X-11 steps without repeating the removal of prior factors and calendar effects from prior daily weights.

If further calendar effects are present, a trading-day regression must be performed. In this case it is necessary to go through an initial pass of the X-11 steps to obtain a final trading-day adjustment. In this initial pass, the series, adjusted for prior factors and prior daily weights, goes through the standard X-11 steps. At the conclusion of these steps, a final series adjusted for prior factors and all calendar effects is available. This adjusted series is then extended by the ARIMA model, and this extended series goes through the standard X-11 steps again, without repeating the removal of prior factors and calendar effects from prior daily weights and trading-day regression.

## The Standard X-11 Seasonal Adjustment Method

The standard X-11 seasonal adjustment method consists of the following steps. These steps are applied to the original data or the original data extended by an ARIMA model.

1. In step 1, the data are read, ignoring missing values until the first nonmissing value is found. If prior monthly factors are present, the procedure reads prior monthly $P_t$ factors and divides them into the original series to obtain $O_t / P_t = C_t S_t I_t D_{tr,t} D_{r,t}$.

   Seven daily weights can be specified to develop monthly factors to adjust the series for trading-day variation, $D_{tr,t}$; these factors are then divided into the original or prior adjusted series to obtain $C_t S_t I_t D_{r,t}$.

2. In steps 2, 3, and 4, three iterations are performed, each of which provides estimates of the seasonal $S_t$, trading-day $D_{r,t}$, trend cycle $C_t$, and irregular components $I_t$. Each iteration refines estimates of the extreme values in the irregular components. After extreme values are identified and modified, final estimates of the seasonal component, seasonally adjusted series, trend cycle, and irregular components are produced. Step 2 consists of three substeps:

a) During the first iteration, a centered, 12-term moving average is applied to the original series $O_t$ to provide a preliminary estimate $\hat{C}_t$ of the trend cycle curve $C_t$. This moving average combines 13 (a 2-term moving average of a 12-term moving average) consecutive monthly values, removing the $S_t$ and $I_t$. Next, it obtains a preliminary estimate $\widehat{S_t I_t}$ by

$$\widehat{S_t I_t} = \frac{O_t}{\hat{C}_t}$$

b) A moving average is then applied to the $\widehat{S_t I_t}$ to obtain an estimate $\hat{S}_t$ of the seasonal factors. $\widehat{S_t I_t}$ is then divided by this estimate to obtain an estimate $\hat{I}_t$ of the irregular component. Next, a moving standard deviation is calculated from the irregular component and is used in assigning a weight to each monthly value for measuring its degree of extremeness. These weights are used to modify extreme values in $\widehat{S_t I_t}$. New seasonal factors are estimated by applying a moving average to the modified value of $\widehat{S_t I_t}$. A preliminary seasonally adjusted series is obtained by dividing the original series by these new seasonal factors. A second estimate of the trend cycle is obtained by applying a weighted moving average to this seasonally adjusted series.

c) The same process is used to obtain second estimates of the seasonally adjusted series and improved estimates of the irregular component. This irregular component is again modified for extreme values and then used to provide estimates of trading-day factors and refined weights for the identification of extreme values.

3. Using the same computations, a second iteration is performed on the original series that has been adjusted by the trading-day factors and irregular weights developed in the first iteration. The second iteration produces final estimates of the trading-day factors and irregular weights.

4. A third and final iteration is performed using the original series that has been adjusted for trading-day factors and irregular weights computed during the second iteration. During the third iteration, PROC X11 develops final estimates of seasonal factors, the seasonally adjusted series, the trend cycle, and the irregular components. The procedure computes summary measures of variation and produces a moving average of the final adjusted series.

## Sliding Spans Analysis

The motivation for sliding spans analysis is to answer the question, When is a economic series unsuitable for seasonal adjustment? There have been a number of past attempts to answer this question: stable seasonality $F$ test; moving seasonality $F$ test, $Q$ statistics, and others.

Sliding spans analysis attempts to quantify the stability of the seasonal adjustment process, and hence quantify the suitability of seasonal adjustment for a given series.

It is based on a very simple idea: for a stable series, deleting a small number of observations should not result in greatly different component estimates compared with the original, full series. Conversely, if deleting a small number of observations results in drastically different estimates, the series is unstable. For example, a drastic difference in the seasonal factors (Table D10) might result from a dominating irregular component or sudden changes in the seasonally component. When the seasonal component estimates of a series is unstable in this manner, they have little meaning and the series is likely to be unsuitable for seasonal adjustment.

Sliding spans analysis, developed at the Statistical Research Division of the U.S. Census Bureau (Findley et al. 1990; Findley and Monsell 1986), performs a repeated seasonal adjustment on subsets or spans of the

full series. In particular, an initial span of the data, typically eight years in length, is seasonally adjusted, and the Tables C18, the trading-day factors (if trading-day regression performed), D10, the seasonal factors, and D11, the seasonally adjusted series are retained for further processing. Next, one year of data is deleted from the beginning of the initial span and one year of data is added. This new span is seasonally adjusted as before, with the same tables retained. This process continues until the end of the data is reached. The beginning and ending dates of the spans are such that the last observation in the original data is also the last observation in the last span. This is discussed in more detail in the following paragraphs.

The following notation for the components or differences computed in the sliding spans analysis follows Findley et al. (1990). The meaning for the symbol $X_t(k)$ is component $X$ in month (or quarter) $t$, computed from data in the $k$th span. These components are now defined.

- Seasonal Factors (Table D10): $S_t(k)$
- Trading-Day Factors (Table C18): $TD_t(k)$
- Seasonally Adjusted Data (Table D11): $SA_t(k)$
- Month-to-Month Changes in the Seasonally Adjusted Data: $MM_t(k)$
- Year-to-Year Changes in the Seasonally Adjusted Data: $YY_t(k)$

The key measure is the maximum percent difference across spans. For example, consider a series that begins in January 1972, ends in December 1984, and has four spans, each of length 8 years (see Figure 1 in Findley et al. (1990), p. 346). Consider $S_t(k)$ the seasonal factor (Table D10) for month $t$ for span $k$, and let $N_t$ denote the number of spans containing month $t$; that is,

$$N_t = \{k : \textit{span } k \textit{ contains month } t\}$$

In the middle years of the series there is overlap of all four spans, and $N_t$ will be 4. The last year of the series will have only one span, while the beginning can have 1 or 0 spans depending on the original length.

Since we are interested in how much the seasonal factors vary for a given month across the spans, a natural quantity to consider is

$$\max_{k \epsilon N_t} S_t(k) - \min_{k \epsilon N_t} S_t(k)$$

In the case of the multiplicative model, it is useful to compute a percentage difference; define the maximum percentage difference (MPD) at time $t$ as

$$\mathrm{MPD}_t = \frac{\max_{k \epsilon N_t} S_t(k) - \min_{k \epsilon N_t} S_t(k)}{\min_{k \epsilon N_t} S_t(k)}$$

The seasonal factor for month $t$ is then unreliable if $\mathrm{MPD}_t$ is large. While no exact significance level can be computed for this statistic, empirical levels have been established by considering over 500 economic series (Findley et al. 1990; Findley and Monsell 1986). For these series it was found that for four spans, stable series typically had less than 15% of the MPD values exceeding 3.0%, while in marginally stable series, between 15% and 25% of the MPD values exceeded 3.0%. A series in which 25% or more of the MPD values exceeded 3.0% is almost always unstable.

While these empirical values cannot be considered an exact significance level, they provide a useful empirical basis for deciding if a series is suitable for seasonal adjustment. These percentage values are shifted down when fewer than four spans are used.

# Computational Details for Sliding Spans Analysis

## Length and Number of Spans

The algorithm for determining the length and number of spans for a given series was developed at the U.S. Bureau of the Census, Statistical Research Division. A summary of this algorithm is as follows.

First, an initial length based on the MACURVE *month=option* specification is determined, and then the maximum number of spans possible using this length is determined. If this maximum number exceeds four, set the number of spans to four. If this maximum number is one or zero, there are not enough observations to perform the sliding spans analysis. In this case a note is written to the log and the sliding spans analysis is skipped for this variable.

If the maximum number of spans is two or three, the actual number of spans used is set equal to this maximum. Finally, the length is adjusted so that the spans begin in January (or the first quarter) of the beginning year of the span.

The remainder of this section gives the computation formulas for the maximum percentage difference (MPD) calculations along with the threshold regions.

## Seasonal Factors (Table D10)

For the additive model, the MPD is defined as

$$\max_{k \epsilon N_t} S_t(k) - \min_{k \epsilon N_t} S_t(k)$$

For the multiplicative model, the MPD is

$$\text{MPD}_t = \frac{\max_{k \epsilon N_t} S_t(k) - \min_{k \epsilon N_t} S_t(k)}{\min_{k \epsilon N_t} S_t(k)}$$

A series for which less than 15% of the MPD values of D10 exceed 3.0% is stable; between 15% and 25% is marginally stable; and greater than 25% is unstable. Span reports S 2.A through S 2.C give the various breakdowns for the number of times the MPD exceeded these levels.

## Trading Day Factor (Table C18)

For the additive model, the MPD is defined as

$$\max_{k \epsilon N_t} TD_t(k) - \min_{k \epsilon N_t} TD_t(k)$$

For the multiplicative model, the MPD is

$$\text{MPD}_t = \frac{\max_{k \epsilon N_t} TD_t(k) - \min_{k \epsilon N_t} TD_t(k)}{\min_{k \epsilon N_t} TD_t(k)}$$

The U.S. Census Bureau currently gives no recommendation concerning MPD thresholds for the trading-day factors. Span reports S 3.A through S 3.C give the various breakdowns for MPD thresholds. When TDREGR=NONE is specified, no trading-day computations are done, and this table is skipped.

## Seasonally Adjusted Data (Table D11)

For the additive model, the MPD is defined as

$$\max_{k \epsilon N_t} SA_t(k) - \min_{k \epsilon N_t} SA_t(k)$$

For the multiplicative model, the MPD is

$$\text{MPD}_t = \frac{\max_{k \epsilon N_t} SA_t(k) - \min_{k \epsilon N_t} SA_t(k)}{\min_{k \epsilon N_t} SA_t(k)}$$

A series for which less than 15% of the MPD values of D11 exceed 3.0% is stable; between 15% and 25% is marginally stable; and greater than 25% is unstable. Span reports S 4.A through S 4.C give the various breakdowns for the number of times the MPD exceeded these levels.

## Month-to-Month Changes in the Seasonally Adjusted Data

Some additional notation is needed for the month-to-month and year-to-year differences. Define $N1_t$ as

$$N1_t = \{k : \textit{span } k \textit{ contains month } t \textit{ and } t-1\}$$

For the additive model, the month-to-month change for span $k$ is defined as

$$MM_t(k) = SA_t - SA_{t-1}$$

while for the multiplicative model

$$MM_t(k) = \frac{SA_t - SA_{t-1}}{SA_{t-1}}$$

Since this quantity is already in percentage form, the MPD for both the additive and multiplicative model is defined as

$$\text{MPD}_t = \max_{k \epsilon N1_t} MM_t(k) - \min_{k \epsilon N1_t} MM_t(k)$$

The current recommendation of the U.S. Census Bureau is that if 35% or more of the MPD values of the month-to-month differences of D11 exceed 3.0%, then the series is usually not stable; 40% exceeding this level clearly marks an unstable series. Span reports S 5.A.1 through S 5.C give the various breakdowns for the number of times the MPD exceeds these levels.

### Year-to-Year Changes in the Seasonally Adjusted Data

First define $N12_t$ as

$$N12_t = \{k : \textit{span } k \textit{ contains month } t \textit{ and } t-12\}$$

(Appropriate changes in notation for a quarterly series are obvious.)

For the additive model, the month-to-month change for span $k$ is defined as

$$YY_t(k) = SA_t - SA_{t-12}$$

while for the multiplicative model

$$YY_t(k) = \frac{SA_t - SA_{t-12}}{SA_{t-12}}$$

Since this quantity is already in percentage form, the MPD for both the additive and multiplicative model is defined as

$$\mathrm{MPD}_t = \max_{k \epsilon N1_t} YY_t(k) - \min_{k \epsilon N1_t} YY_t(k)$$

The current recommendation of the U.S. Census Bureau is that if 10% or more of the MPD values of the month-to-month differences of D11 exceed 3.0%, then the series is usually not stable. Span reports S 6.A through S 6.C give the various breakdowns for the number of times the MPD exceeds these levels.

## Data Requirements

The input data set must contain either quarterly or monthly time series, and the data must be in chronological order. For the standard X-11 method, there must be at least three years of observations (12 for quarterly time series or 36 for monthly) in the input data sets or in each BY group in the input data set if a BY statement is used.

For the X-11-ARIMA method, there must be at least five years of observations (20 for quarterly time series or 60 for monthly) in the input data sets or in each BY group in the input data set if a BY statement is used.

## Missing Values

Missing values at the beginning of a series to be adjusted are skipped. Processing starts with the first nonmissing value and continues until the end of the series or until another missing value is found.

Missing values are not allowed for the DATE= variable. The procedure terminates if missing values are found for this variable.

Missing values found in the PMFACTOR= variable are replaced by 100 for the multiplicative model (default) and by 0 for the additive model.

Missing values can occur in the output data set. If the time series specified in the OUTPUT statement is not computed by the procedure, the values of the corresponding variable are missing. If the time series specified in the OUTPUT statement is a moving average, the values of the corresponding variable are missing for the first *n* and last *n* observations, where *n* depends on the length of the moving average. Additionally, if the time series specified is an irregular component modified for extremes, only the modified values are given, and the remaining values are missing.

## Prior Daily Weights and Trading-Day Regression

Suppose that a detailed examination of retail sales at ZXY Company indicates that certain days of the week have higher amounts of sales. In particular, Thursday, Friday, and Saturday have approximately twice the amount of sales as Monday, Tuesday, and Wednesday, and no sales occur on Sunday. This means that months with five Saturdays would have higher amounts of sales than months with only four Saturdays.

This phenomenon is called a calendar effect; it can be handled in PROC X11 by using the PDWEIGHTS (prior daily weights) statement or the TDREGR=option (trading-day regression). The PDWEIGHTS statement and the TDREGR=option can be used separately or together.

If the relative weights are known (as in the preceding) it is appropriate to use the PDWEIGHTS statement. If further residual calendar variation is present, TDREGR=ADJUST should also be used. If you know that a calendar effect is present, but know nothing about the relative weights, use TDREGR=ADJUST without a PDWEIGHTS statement.

In this example, it is assumed that the calendar variation is due to both prior daily weights and residual variation. Thus both a PDWEIGHTS statement and TDREGR=ADJUST are specified.

Note that only the relative weights are needed; in the actual computations, PROC X11 normalizes the weights to sum to 7.0. If a day of the week is not present in the PDWEIGHTS statement, it is given a value of zero. Thus "sun=0" is not needed.

```
proc x11 data=sales;
   monthly date=date tdregr=adjust;
   var sales;
   tables a1 a4 b15 b16 C14 C15 c18 d11;
   pdweights mon=1 tue=1 wed=1 thu=2 fri=2 sat=2;
   output out=x11out a1=a1 a4=a4 b1=b1 c14=c14
                     c16=c16 c18=c18 d11=d11;
run;
```

Tables of interest include A1, A4, B15, B16, C14, C15, C18, and D11. Table A4 contains the adjustment factors derived from the prior daily weights; Table C14 contains the extreme irregular values excluded from trading-day regression; Table C15 contains the trading-day-regression results; Table C16 contains the monthly factors derived from the trading-day regression; and Table C18 contains the final trading-day factors derived from the combined daily weights. Finally, Table D11 contains the final seasonally adjusted series.

## Adjustment for Prior Factors

Suppose now that a strike at ZXY Company during July and August of 1988 caused sales to decrease an estimated 50%. Since this is a one-time event with a known cause, it is appropriate to prior adjust the data to reflect the effects of the strike. This is done in PROC X11 through the use of PMFACTOR=*varname* (prior monthly factor) in the MONTHLY statement.

In the following example, the PMFACTOR variable is named PMF. Since the estimate of the decrease in sales is 50%, PMF has a value of 50.0 for the observations corresponding to July and August 1988, and a value of 100.0 for the remaining observations.

This prior adjustment on SALES is performed by replacing SALES with the calculated value (SALES/PMF) * 100.0. A value of 100.0 for PMF leaves SALES unchanged, while a value of 50.0

for PMF doubles SALES. This value is the estimate of what SALES would have been without the strike. The following example shows how this prior adjustment is accomplished:

```
data sales2;
   set sales;
   if '01jul1988'd <= date <= '01aug1988'd then pmf = 50;
   else pmf = 100;
run;

proc x11 data=sales2;
   monthly date=date pmfactor=pmf;
   var sales;
   tables a1 a2 a3 d11;
   output out=x11out a1=a1 a2=a2 a3=a3 d11=d11;
run;
```

Table A2 contains the prior monthly factors (the values of PMF), and Table A3 contains the prior adjusted series.

## The YRAHEADOUT Option

For monthly data, the YRAHEADOUT option affects only Tables C16 (regression trading-day adjustment factors), C18 (trading-day factors from combined daily weights), and D10 (seasonal factors). For quarterly data, only Table D10 is affected. Variables for all other tables have missing values for the forecast observations. The forecast values for a table are included only if that table is specified in the OUTPUT statement.

Tables C16 and C18 are calendar effects that are extrapolated by calendar composition. These factors are independent of the data once trading-day weights have been calculated. Table D10 is extrapolated by a linear combination of past values. If $N$ is the total number of nonmissing observations for the analysis variable, this linear combination is given by

$$D10_t = \frac{1}{2}(3 \times D10_{t-12} - D10_{t-24}), \quad t = N+1, \ldots, N+12$$

If the input data are monthly time series, 12 extra observations are added to the end of the output data set. (If a BY statement is used, 12 extra observations are added to the end of each BY group.) If the input data are a quarterly time series, four extra observations are added to the end of the output data set. (If a BY statement is used, four extra observations are added to each BY group.)

The DATE= variable (or _DATE_) is extrapolated for the extra observations generated by the YRAHEADOUT option, while all other ID variables will have missing values.

If ARIMA processing is requested, and if both the OUTEXTRAP and YRAHEADOUT options are specified in the PROC X11 statement, an additional 12 (or 4) observations are added to the end of output data set for monthly (or quarterly) data after the ARIMA forecasts, using the same linear combination of past values as before.

## Effect of Backcast and Forecast Length

Based on a number of empirical studies (Dagum 1982a, b, c; Dagum and Laniel 1987), one year of forecasts minimize revisions when new data become available. Two and three years of forecasts show only small gains.

Backcasting improves seasonal adjustment but introduces permanent revisions at the beginning of the series and also at the end for series of length 8, 9, or 10 years. For series shorter than 7 years, the advantages of backcasting outweigh the disadvantages (Dagum 1988).

Other studies (Pierce 1980; Bobbitt and Otto 1990; Buszuwski 1987) suggest "full forecasting"—that is, using enough forecasts to allow symmetric weights for the seasonal moving averages for the most current data. For example, if a $3 \times 9$ seasonal moving average was specified for one or more months by using the MACURVES statement, five years of forecasts would be required. This is because the seasonal moving averages are performed on calendar months separately, and the $3 \times 9$ is an 11-term centered moving average, requiring five observations before and after the current observation. Thus

```
macurves dec='3x9';
```

would require five additional December values to compute the seasonal moving average.

## Details of Model Selection

If an ARIMA statement is present but no MODEL= is given, PROC X11 estimates and forecasts five predefined models and selects the best. This section describes the details of the selection criteria and the selection process.

The five predefined models used by PROC X11 are the same as those used by X11ARIMA/88 from Statistics Canada. These particular models, shown in Table 44.2, were chosen on the basis of testing a large number of economics series (Dagum 1988) and should provide reasonable forecasts for most economic series.

**Table 44.2** Five Predefined Models

| Model # | Specification | Multiplicative | Additive |
|---|---|---|---|
| 1 | (0,1,1)(0,1,1)s | Log transform | No transform |
| 2 | (0,1,2)(0,1,1)s | Log transform | No transform |
| 3 | (2,1,0)(0,1,1)s | Log transform | No transform |
| 4 | (0,2,2)(0,1,1)s | Log transform | No transform |
| 5 | (2,1,2)(0,1,1)s | No transform | No transform |

The selection process proceeds as follows. The five models are estimated and one-step-ahead forecasts are produced in the order shown in Table 44.2. As each model is estimated, the following three criteria are checked:

- The mean absolute percent error (MAPE) for the last three years of the series must be less than 15%.
- The significance probability for the Box-Ljung chi-square for up to lag 24 for monthly (8 for quarterly) must greater than 0.05.

- The over-differencing criteria must not exceed 0.9.

The descriptions of these three criteria are given in the section "Criteria Details" on page 3279. The default values for these criteria are those used by X11ARIMA/88 from Statistics Canada; these defaults can be changed by the MAPECR=, CHICR=, and OVDIFCR= options.

A model that fails any one of these three criteria is excluded from further consideration. In addition, if the ARIMA estimation fails for a given model, a warning is issued, and the model is excluded. The final set of all models considered consists of those that pass all three criteria and are estimated successfully. From this set, the model with the smallest MAPE for the last three years is chosen.

If all five models fail, ARIMA processing is skipped for the variable being processed, and the standard X-11 seasonal adjustment is performed. A note is written to the log with this information.

The chosen model is then used to forecast the series one or more years (determined by the FORECAST= option in the ARIMA statement). These forecasts are appended to the original data (or the prior and calendar-adjusted data).

If a BACKCAST= option is specified, the chosen model form is used, but the parameters are reestimated using the reversed series. Using these parameters, the reversed series is forecast for the number of years specified by the BACKCAST= option. These forecasts are then reversed and appended to the beginning of the original series, or the prior and calendar-adjusted series, to produce the backcasts.

Note that the final selection rule (the smallest MAPE using the last three years) emphasizes the quality of the forecasts at the end of the series. This is consistent with the purpose of the X-11-ARIMA methodology, which is to improve the estimates of seasonal factors and thus minimize revisions to recent past data as new data become available.

## Criteria Details

### *Mean Absolute Percent Error (MAPE)*

For the MAPE criteria testing, only the last three years of the original series (or prior and calendar adjusted series) are used in computing the MAPE.

Let $y_t, t = 1, \ldots, n$, be the last three years of the series, and denote its one-step-ahead forecast by $\hat{y}_t$, where $n = 36$ for a monthly series and $n = 12$ for a quarterly series.

With this notation, the MAPE criteria are computed as

$$\text{MAPE} = \frac{100}{n} \sum_{t=1}^{n} \frac{|y_t - \hat{y}_t|}{|y_t|}$$

### *Box-Ljung Chi-Square*

The Box-Ljung chi-square is a lack-of-fit test based on the model residuals. This test statistic is computed using the Ljung-Box formula

$$\chi^2_m = n(n+2) \sum_{k=1}^{m} \frac{r_k^2}{(n-k)}$$

where $n$ is the number of residuals that can be computed for the time series, and

$$r_k = \frac{\sum_{t=1}^{n-k} a_t a_{t+k}}{\sum_{t=1}^{n} a_t^2}$$

where the $a_t$'s are the residual sequence. This formula has been suggested by Ljung and Box (1978) as yielding a better fit to the asymptotic chi-square distribution. Some simulation studies of the finite sample properties of this statistic are given by Davies, Triggs, and Newbold (1977) and by Ljung and Box (1978).

For monthly series, $m = 24$, while for quarterly series, $m = 8$.

#### Over-differencing Test

From Table 44.2 you can see that all models have a single seasonal MA factor and at most two nonseasonal MA factors. Also, all models have seasonal and nonseasonal differencing. Consider model 2 applied to a monthly series $y_t$ with $E(y_t) = \mu$:

$$(1 - B^1)(1 - B^{12})(y_t - \mu) = (1 - \theta_1 B - \theta_2 B^2)(1 - \theta_3 B^{12})a_t$$

If $\theta_3 = 1.0$, then the factors $(1 - \theta_3 B^{12})$ and $(1 - B^{12})$ will cancel, resulting in a lower-order model.

Similarly, if $\theta_1 + \theta_2 = 1.0$,

$$(1 - \theta_1 B - \theta_2 B^2) = (1 - B)(1 - \alpha B)$$

for some $\alpha \neq 0.0$. Again, this results in cancellation and a lower-order model.

Since the parameters are not exact, it is not reasonable to require that

$$\theta_3 < 1.0 \text{ and } \theta_1 + \theta_2 < 1.0$$

Instead, an approximate test is performed by requiring that

$$\theta_3 \leq 0.9 \text{ and } \theta_1 + \theta_2 \leq 0.9$$

The default value of 0.9 can be changed by the OVDIFCR= option. Similar reasoning applies to the other models.

### ARIMA Statement Options for the Five Predefined Models

Table 44.3 lists the five predefined models and gives the equivalent MODEL= parameters in a PROC X11 ARIMA statement.

In all models except the fifth, a log transformation is performed before the ARIMA estimation for the multiplicative case; no transformation is performed for the additive case. For the fifth model, no transformation is done for either case.

The multiplicative case is assumed in Table 44.3. The indicated seasonality $s$ in the specification is either 12 (monthly) or 4 (quarterly). The MODEL statement assumes a monthly series.

**Table 44.3** ARIMA Statements Options for Predefined Models

| Model | ARIMA Statement Options |
|---|---|
| (0,1,1)(0,1,1)s | MODEL=( Q=1 SQ=1 DIF=1 SDIF=1 ) TRANSFORM=LOG |
| (0,1,2)(0,1,1)s | MODEL=( Q=2 SQ=1 DIF=1 SDIF=1 ) TRANSFORM=LOG |
| (2,1,0)(0,1,1)s | MODEL=( P=2 SQ=1 DIF=1 SDIF=1 ) TRANSFORM=LOG |
| (0,2,2)(0,1,1)s | MODEL=( Q=2 SQ=1 DIF=2 SDIF=1 ) TRANSFORM=LOG |
| (2,1,2)(0,1,1)s | MODEL=( P=2 Q=2 SQ=1 DIF=1 SDIF=1 ) |

## OUT= Data Set

The OUT= data set specified in the OUTPUT statement contains the BY variables, if any; the ID variables, if any; and the DATE= variable if the DATE= option is given, or _DATE_ if the DATE= option is not specified.

In addition, the variables specified by the option

*tablename= var1 var2 . . . varn*

are placed in the OUT= data set. A list of tables available for monthly and quarterly series is given later, in Table 44.4.

## The OUTSPAN= Data Set

The OUTSPAN= option is specified in the PROC statement, and writes the sliding spans results to the specified output data set. The OUTSPAN= data set contains the following variables:

- A1, a numeric variable that is a copy of the original series truncated to the current span. Note that overlapping spans will contain identical values for this variable.
- C18, a numeric variable that contains the trading-day factors for the seasonal adjustment for the current span
- D10, a numeric variable that contains the seasonal factors for the seasonal adjustment for the current span
- D11, a numeric variable that contains the seasonally adjusted series for the current span
- DATE, a numeric variable that contains the date within the current span
- SPAN, a numeric variable that contains the current span. The first span is the earliest span—that is, the one with the earliest starting date.
- VARNAME, a character variable containing the name of each variable in the VAR list. A separate sliding spans analysis is performed on each variable in the VAR list.

## OUTSTB= Data Set

The output data set produced by the OUTSTB= option of the PROC X11 statement contains the information in the analysis of variance on Table D8 (Final Unmodified S-I Ratios). This analysis of variance, following Table D8 in the printed output, tests for stable seasonality (Shiskin, Young, and Musgrave 1967, Appendix A). These data contain the following variables:

- VARNAME, a character variable containing the name of each variable in the VAR list
- TABLE, a character variable specifying the table from which the analysis of variance is performed. When ARIMA processing is requested, and two passes of PROC X11 are required (when TDREGR=PRINT, TEST, or ADJUST), Table D8 and the stable seasonality test are computed twice: once in the initial pass, then again in the final pass. Both of these computations are put in the OUTSTB data set and are identified by D18.1 and D18.2, respectively.
- SOURCE, a character variable corresponding to the "source" column in the analysis of variance table following Table D8
- SS, a numeric variable containing the sum of squares associated with the corresponding source term
- DF, a numeric variable containing the degrees of freedom associated with the corresponding source term
- MS, a numeric variable containing the mean square associated with the corresponding source term. MS is missing for the source term "Total."
- F, a numeric variable containing the *F* statistic for the "Between" source term. F is missing for all other source terms.
- PROBF, a numeric variable containing the significance level for the *F* statistic. PROBF is missing for the source terms "Total" and "Error."

## OUTTDR= Data Set

The trading-day regression results (Tables B15 and C15) are written to the OUTTDR= data set, which contains the following variables:

- VARNAME, a character variable containing the name of the VAR variable being processed
- TABLE, a character variable containing the name of the table. It can have only the value B15 (Preliminary Trading-Day Regression) or C15 (Final Trading-Day Regression).
- _TYPE_, a character variable whose value distinguishes the three distinct table format types. These types are (a) the regression, (b) the listing of the standard error associated with length-of-month, and (c) the analysis of variance. The first seven observations in the OUTTDR= data set correspond to the regression on days of the week; thus the _TYPE_ variable is given the value "REGRESS" (day-of-week regression coefficient). The next four observations correspond to 31-, 30-, 29-, and 28-day months and are given the value _TYPE_=LOM_STD (length-of-month standard errors). Finally, the last three observations correspond to the analysis of variance table, and _TYPE_=ANOVA.

- PARM, a character variable, further identifying the nature of the observation. PARM is set to blank for the three _TYPE_=ANOVA observations.
- SOURCE, a character variable containing the source in the regression. This variable is missing for all _TYPE_=REGRESS and LOM_STD.
- CWGT, a numeric variable containing the combined trading-day weight (prior weight + weight found from regression). The variable is missing for all _TYPE_=LOM_STD and _TYPE_=ANOVA.
- PRWGT, a numeric variable containing the prior weight. The prior weight is 1.0 if PDWEIGHTS are not specified. This variable is missing for all _TYPE_=LOM_STD and _TYPE_=ANOVA.
- COEFF, a numeric variable containing the calculated regression coefficient for the given day. This variable is missing for all _TYPE_=LOM_STD and _TYPE_=ANOVA.
- STDERR, a numeric variable containing the standard errors. For observations with _TYPE_=REGRESS, this is the standard error corresponding to the regression coefficient. For observations with _TYPE_=LOM_STD, this is standard error for the corresponding length-of-month. This variable is missing for all _TYPE_=ANOVA.
- T1, a numeric variable containing the *t* statistic corresponding to the test that the combined weight is different from the prior weight. This variable is missing for all _TYPE_=LOM_STD and _TYPE_=ANOVA.
- T2, a numeric variable containing the *t* statistic corresponding to the test that the combined weight is different from 1.0. This variable is missing for all _TYPE_=LOM_STD and _TYPE_=ANOVA.
- PROBT1, a numeric variable containing the significance level for *t* statistic T1. The variable is missing for all _TYPE_=LOM_STD and _TYPE_=ANOVA.
- PROBT2, a numeric variable containing the significance level for *t* statistic T2. The variable is missing for all _TYPE_=LOM_STD and _TYPE_=ANOVA.
- SS, a numeric variable containing the sum of squares associated with the corresponding source term. This variable is missing for all _TYPE_=REGRESS and LOM_STD.
- DF, a numeric variable containing the degrees of freedom associated with the corresponding source term. This variable is missing for all _TYPE_=REGRESS and LOM_STD.
- MS, a numeric variable containing the mean square associated with the corresponding source term. This variable is missing for the source term 'Total' and for all _TYPE_=REGRESS and LOM_STD.
- F, a numeric variable containing the *F* statistic for the 'Regression' source term. The variable is missing for the source terms 'Total' and 'Error' and for all _TYPE_=REGRESS and LOM_STD.
- PROBF, a numeric variable containing the significance level for the *F* statistic. This variable is missing for the source term 'Total' and 'Error' and for all _TYPE_=REGRESS and LOM_STD.

## Printed Output

The output from PROC X11, both printed tables and the series written to the OUT= data set, depends on whether the data are monthly or quarterly. For the printed tables, the output depends further on the value of the PRINTOUT= option and the TABLE statement, along with other options specified.

The printed output is organized into tables identified by a part letter and a sequence number within the part. The seven major parts of the X11 procedure are as follows:

| | |
|---|---|
| A | prior adjustments (optional) |
| B | preliminary estimates of irregular component weights and regression trading-day factors |
| C | final estimates of irregular component weights and regression trading-day factors |
| D | final estimates of seasonal, trend cycle, and irregular components |
| E | analytical tables |
| F | summary measures |
| G | charts |

Table 44.4 describes the individual tables and charts. Most tables apply to both quarterly and monthly series. Those that apply only to a monthly time series are indicated by an "M" in the notes section, while "P" indicates that the table is not a time series, and is only printed, not output to the OUT= data set.

**Table 44.4** Table Names and Descriptions

| Table | Description | Notes |
|---|---|---|
| A1 | Original series | M |
| A2 | Prior monthly adjustment factors | M |
| A3 | Original series adjusted for prior monthly factors | M |
| A4 | Prior trading-day adjustments | M |
| A5 | Prior adjusted or original series | M |
| A13 | ARIMA forecasts | |
| A14 | ARIMA backcasts | |
| A15 | Prior adjusted or original series extended by ARIMA backcasts and forecasts | |
| B1 | Prior adjusted or original series | |
| B2 | Trend cycle | |
| B3 | Unmodified seasonal-irregular (S-I) ratios | |
| B4 | Replacement values for extreme S-I ratios | |
| B5 | Seasonal factors | |
| B6 | Seasonally adjusted series | |
| B7 | Trend cycle | |
| B8 | Unmodified S-I ratios | |
| B9 | Replacement values for extreme S-I ratios | |
| B10 | Seasonal factors | |
| B11 | Seasonally adjusted series | |
| B13 | Irregular series | |

**Table 44.4** *continued*

| Table | Description | Notes |
|---|---|---|
| B14 | Extreme irregular values excluded from trading-day regression | M |
| B15 | Preliminary trading-day regression | M,P |
| B16 | Trading-day adjustment factors | M |
| B17 | Preliminary weights for irregular components | |
| B18 | Trading-day factors derived from combined daily weights | M |
| B19 | Original series adjusted for trading-day and prior variation | M |
| C1 | Original series modified by preliminary weights and adjusted for trading-day and prior variation | |
| C2 | Trend cycle | |
| C4 | Modified S-I ratios | |
| C5 | Seasonal factors | |
| C6 | Seasonally adjusted series | |
| C7 | Rrend cycle | |
| C9 | Modified S-I ratios | |
| C10 | Seasonal factors | |
| C11 | Seasonally adjusted series | |
| C13 | Irregular series | |
| C14 | Extreme irregular values excluded from trading-day regression | M |
| C15 | Final trading-day regression | M,P |
| C16 | Final trading-day adjustment factors derived from regression coefficients | M |
| C17 | Final weight for irregular components | |
| C18 | Final trading-day factors derived from combined daily weights | M |
| C19 | Original series adjusted for trading-day and prior variation | M |
| D1 | Original series modified for final weights and adjusted for trading-day and prior variation | |
| D2 | Trend cycle | |
| D4 | Modified S-I ratios | |
| D5 | Seasonal factors | |
| D6 | Seasonally adjusted series | |
| D7 | Trend cycle | |
| D8 | Final unmodified S-I ratios | |
| D9 | Final replacement values for extreme S-I ratios | |
| D10 | Final seasonal factors | |
| D11 | Final seasonally adjusted series | |
| D12 | Final trend cycle | |
| D13 | Final irregular series | |
| E1 | Original series with outliers replaced | |
| E2 | Modified seasonally adjusted series | |
| E3 | Modified irregular series | |
| E4 | Ratios of annual totals | P |
| E5 | Percent changes in original series | |
| E6 | Percent changes in final seasonally adjusted series | |
| F1 | MCD moving average | |

**Table 44.4** *continued*

| Table | Description | Notes |
|---|---|---|
| F2 | Summary measures | P |
| G1 | Chart of final seasonally adjusted series and trend cycle | P |
| G2 | Chart of S-I ratios with extremes, S-I ratios without extremes, and final seasonal factors | P |
| G3 | Chart of S-I ratios with extremes, S-I ratios without extremes, and final seasonal factors in calendar order | P |

## The PRINTOUT= Option

The PRINTOUT= option controls printing for groups of tables. For information about specifying individual tables, see the section "TABLES Statement" on page 3267. The following list gives the tables printed for each value of the PRINTOUT= option:

| | |
|---|---|
| STANDARD (26 tables) | A1–A4, B1, C13–C19, D8–D13, E1–E6, F1, F2 |
| LONG (40 tables) | A1–A5, A13–A15, B1, B2, B7, B10, B13–B15, C1, C7, C10, C13–C19, D1, D7–D11, D13, E1–E6, F1, F2 |
| FULL (62 tables) | A1–A5, A13–A15, B1–B11, B13–B19, C1–C11, C13–C19, D1, D2, D4–D12, E1–E6, F1, F2 |

The actual number of tables printed depends on the options and statements specified. If a table is not computed, it is not printed. For example, if TDREGR=NONE is specified, none of the tables associated with the trading-day are printed.

## The CHARTS= Option

Of the four charts listed in Table 44.4, G1 and G2 are printed by default (CHARTS=STANDARD). Charts G3 and G4 are printed when CHARTS=FULL is specified. For information about specifying individual charts, see the section "TABLES Statement" on page 3267.

## Stable, Moving, and Combined Seasonality Tests on the Final Unmodified SI Ratios (Table D8)

PROC X11 displays four tests used to identify stable seasonality and moving seasonality and to measure identifiable seasonality. These tests are displayed after Table D8. They are "Stable Seasonality Test," "Moving Seasonality Test," "Nonparametric Test for the Presence of Seasonality Assuming Stability," and "Summary of Results and Combined Test for the Presence of Identifiable Seasonality." The motivation, interpretation, and statistical details of all these tests are now given.

### *Motivation*

The seasonal component of this time series, $S_t$, is defined as the intrayear variation that is repeated constantly (stable) or in an evolving fashion from year to year (moving seasonality). If the increase in the seasonal

factors from year to year is too large, then the seasonal factors will introduce distortion into the model. It is important to determine if seasonality is identifiable without distorting the series.

To determine if stable seasonality is present in a series, PROC X11 computes a one-way analysis of variance by using the seasons (months or quarters) as the factor on the Final Unmodified SI Ratios (Table D8). This is the appropriate table to use because the removal of the trend cycle is equivalent to detrending. PROC X11 prints this test, labeled "Stable Seasonality Test," immediately after the Table D8.

The X11 seasonal adjustment method tests for moving seasonality. Moving seasonality can be a source of distortion when seasonal factors are used in the model. PROC X11 computes and prints a test for moving seasonality. The test is a two-way analysis of variance that uses months (or quarters) and years. As in the "Stable Seasonality Test," this analysis of variance is performed on the Final Unmodified SI Ratios (Table D8). PROC X11 prints this test, labeled "Moving Seasonality Test," after the "Stable Seasonality Test."

PROC X11 next computes a nonparametric Kruskal-Wallis chi-squared test for stable seasonality, "Nonparametric Test for the Presence of Seasonality Assuming Stability." The Kruskal-Wallis test is performed on the ranks of the Final Unmodified SI Ratios (Table D8). For more information about the Kruskal-Wallis test, see Lehmann and D'Abrera (2006, pp. 204–210).

The results of the preceding three tests are combined into a joint test to measure identifiable seasonality, "Summary of Results and Combined Test for the Presence of Identifiable Seasonality." This test combines the two $F$ tests previously described, along with the Kruskal-Wallis chi-squared test for stable seasonality, to determine "identifiable" seasonality. This test is printed after "Nonparametric Test for the Presence of Seasonality Assuming Stability."

### Interpretation and Statistical Details

The "Stable Seasonality Test" is a one-way analysis of variance on the "Final Unmodified SI Ratios" with seasons (months or quarters) as the factor.

To determine whether stable seasonality is present in a series, PROC X11 computes a one-way analysis of variance by using the seasons (months or quarters) as the factor on the Final Unmodified SI Ratios (Table D8). This is the appropriate table to use because the removal of the trend cycle is similar to detrending.

A large $F$ statistic and a small significance level are evidence that a significant amount of variation in the SI-ratios is due to months or quarters, which in turn is evidence of seasonality; the null hypothesis of no month/quarter effect is rejected.

Conversely, a small $F$ statistic and a large significance level (close to 1.0) are evidence that variation due to month or quarter could be due to random error, and the null hypothesis of no month/quarter effect is not rejected. The interpretation and utility of seasonal adjustment are problematic under such conditions.

The $F$ test for moving seasonality is performed by a two-way analysis of variance. The two factors are seasons (months or quarters) and years. The years effect is tested separately; the null hypothesis is no effect due to years after accounting for variation due to months or quarters. For more information about the moving seasonality test, see Lothian (1984a, b, 1978) and Higginson (1975).

The significance level reported in both the moving and stable seasonality tests are only approximate. Table D8, the Final Unmodified SI Ratios, is constructed from an averaging operation that induces a correlation in the residuals from which the $F$ test is computed. Hence the computed $F$ statistic differs from an exact $F$ statistic; for more information, see Cleveland and Devlin (1980).

The test for identifiable seasonality is performed by combining the $F$ tests for stable and moving seasonality, along with a Kruskal-Wallis test for stable seasonality. The following description is based on Lothian and Morry (1978b); for more information, see Dagum (1988, 1983).

Let $F_s$ and $F_m$ denote the $F$ value for the stable and moving seasonality tests, respectively. The combined test is performed as shown in Table 44.5 and as follows:

1. If the null hypothesis of no stable seasonality is not rejected at the 0.10% significance level ($P_S \geq 0.001$), then the series is considered to be nonseasonal. PROC X11 returns the conclusion, "Identifiable Seasonality Not Present."

2. If the null hypothesis in step 1 is rejected, then PROC X11 computes the following quantities:

$$T_1 = \frac{7}{F_s}$$

$$T_2 = \frac{3F_m}{F_s}$$

   Let $T$ denote the simple average of $T_1$ and $T_2$:

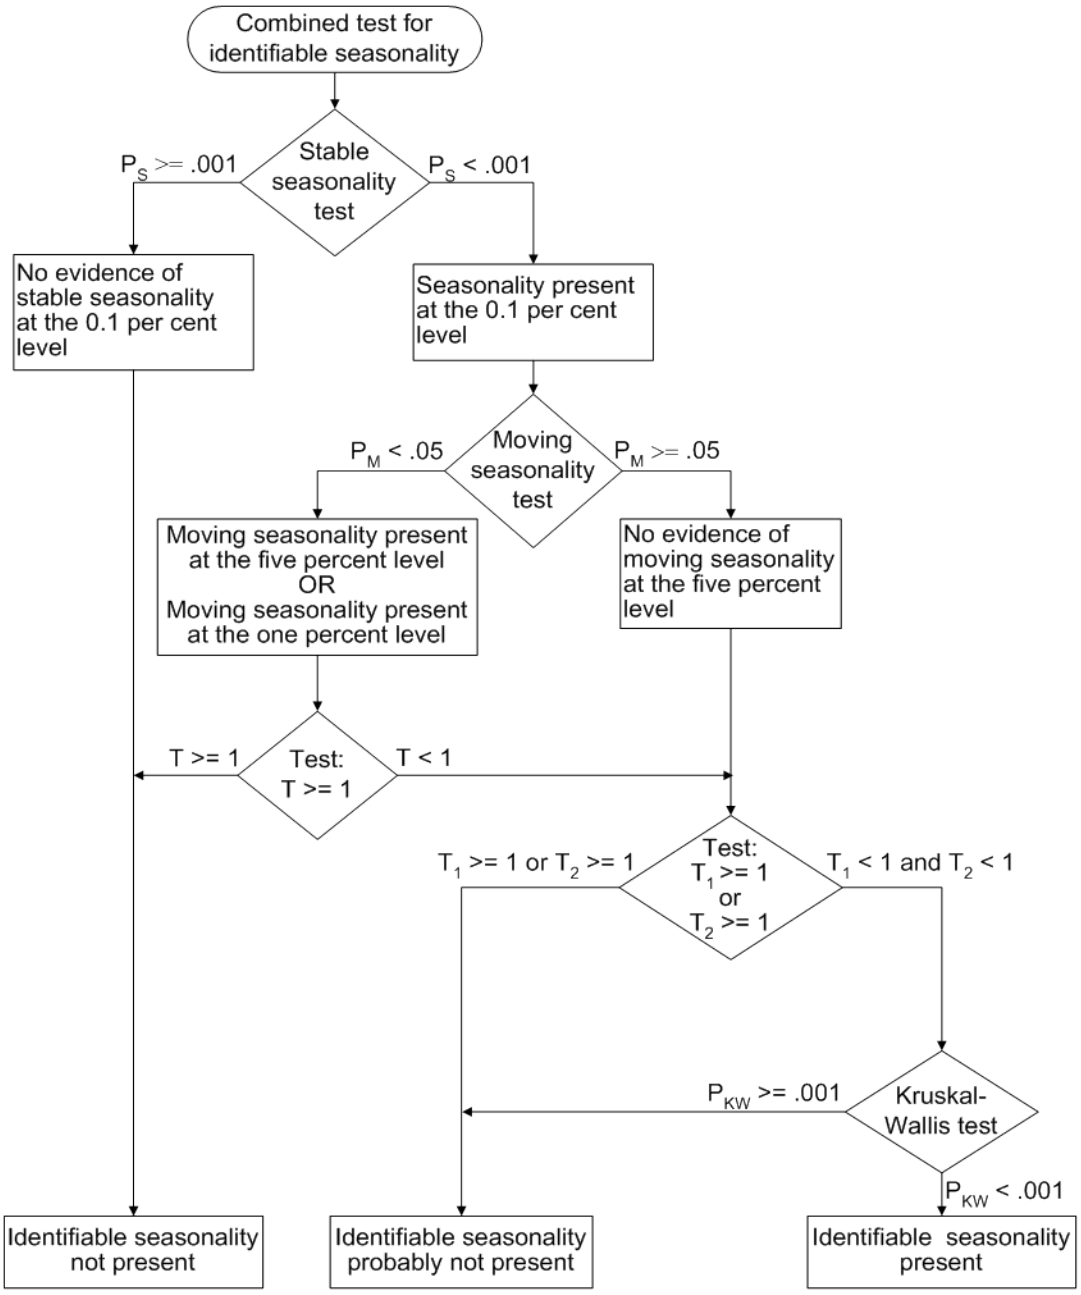
$$T = \frac{(T_1 + T_2)}{2}$$

   If the null hypothesis of no moving seasonality is rejected at the 5.0% significance level ($P_M < 0.05$) and if $T \geq 1.0$, the null hypothesis of identifiable seasonality *not* present is not rejected and PROC X11 returns the conclusion, "Identifiable Seasonality Not Present."

3. If the null hypothesis of identifiable seasonality *not* present has not been accepted, but $T_1 \geq 1.0$, $T_2 \geq 1.0$, or the Kruskal-Wallis chi-squared test fails to reject at the 0.10% significance level ($P_{KW} \geq 0.001$), then PROC X11 returns the conclusion "Identifiable Seasonality Probably Not Present."

4. If the null hypotheses of no stable seasonality associated with the $F_S$ and Kruskal-Wallis chi-squared tests are rejected and if none of the combined measures described in steps 2 and 3 fail, then the null hypothesis of identifiable seasonality *not* present is rejected and PROC X11 returns the conclusion "Identifiable Seasonality Present."

**Figure 44.5** Combined Seasonality Test Flowchart



## Tables Written to the OUT= Data Set

All tables that are time series can be written to the OUT= data set. However, depending on the specified options and statements, not all tables are computed. When a table is not computed, but is requested in the OUTPUT statement, the resulting variable has all missing values.

For example, if the PMFACTOR= option is not specified, Table A2 is not computed, and requesting this table in the OUTPUT statement results in the corresponding variable having all missing values.

The trading-day regression results, Tables B15 and C15, although not written to the OUT= data set, can be written to an output data set; for more information, see the OUTTDR= option.

## Printed Output Generated by Sliding Spans Analysis

### Table S 0.A

Table S 0.A gives the variable name, the length and number of spans, and the beginning and ending dates of each span.

### Table S 0.B

Table S 0.B gives the summary of the two $F$ tests performed during the standard X11 seasonal adjustments for stable and moving seasonality on Table D8, the final SI ratios. These tests are described in the section "Printed Output" on page 3284.

### Table S 1.A

Table S 1.A gives the range analysis of seasonal factors. This includes the means for each month (or quarter) within a span, the maximum percentage difference across spans for each month, and the average. The minimum and maximum within a span are also indicated.

For example, for a monthly series and an analysis with four spans, the January row would contain a column for each span, with the value representing the average seasonal factor (Table D10) over all January calendar months occurring within the span. Beside each span column is a character column with either a MIN, MAX, or blank value, indicating which calendar month had the minimum and maximum value over that span.

Denote the average over the $j$th calendar month in span $k, k = 1, \ldots, 4$, by $\bar{S}_j(k)$; then the maximum percent difference (MPD) for month $j$ is defined by

$$\mathrm{MPD}_j = \frac{\max_{k=1,\ldots,4} \bar{S}_j(k) - \min_{k=1,\ldots,4} \bar{S}_j(k)}{\min_{k=1,\ldots,4} \bar{S}_j(k)}$$

The last numeric column of Table S 1.A is the average value over all spans for each calendar month, with the minimum and maximum row flagged as in the span columns.

### Table S 1.B

Table S 1.B gives a summary of range measures for each span. The first column, Range Means, is calculated by computing the maximum and minimum over all months or quarters in a span, then taking the difference. The next column is the range ratio means, which is simply the ratio of the previously described maximum and minimum. The next two columns are the minimum and maximum seasonal factors over the entire span, while the range sf column is the difference of these. Finally, the last column is the ratio of the Max SF and Min SF columns.

### Breakdown Tables

Table S 2.A.1 begins the breakdown analysis for the various series considered in the sliding spans analysis. The key concept here is the MPD described earlier in the section "Table S 1.A" on page 3290 and in the section "Computational Details for Sliding Spans Analysis" on page 3273. For a month or quarter that appears in two or more spans, the maximum percentage difference is computed and tested against a cutoff level. If it exceeds this cutoff, it is counted as an instance of exceeding the level. It is of interest to see if such instances fall disproportionately in certain months and years. Tables S 2.A.1 through S 6.A.3 display this breakdown for all series considered.

### *Table S 2.A.1*

Table S 2.A.1 gives the monthly (quarterly) breakdown for the seasonal factors (Table D10). The first column identifies the month or quarter. The next column is the number of times the MPD for D10 exceeded 3.0%, followed by the total count. The last is the average maximum percentage difference for the corresponding month or quarter.

### *Table S 2.A.2*

Table S 2.A.2 gives the same information as Table S 2.A.1, but on a yearly basis.

### *Table S 2.A.3*

The description of Table S 2.A.3 requires the definition of "Sign Change" and "Turning Point."

First, some motivation. Recall that for a highly stable series, adding or deleting a small number of observations should not affect the estimation of the various components of a seasonal adjustment procedure.

Consider Table D10, the seasonal factors in a sliding spans analysis that uses four spans. For a given observation $t$, looking across the four spans, we can easily pick out large differences if they occur. More subtle differences can occur when estimates go from above to below (or vice versa) a base level. In the case of multiplicative model, the seasonal factors have a base level of 100.0. So it is useful to enumerate those instances where both a large change occurs (an MPD value exceeding 3.0%) and a change of sign (with respect to the base) occur.

Let $B$ denote the base value (which in general depends on the component being considered and the model type, multiplicative or additive). If, for span 1, $S_t(1)$ is below $B$ (that is, $S_t(1) - B$ is negative) and for some subsequent span $k$, $S_t(k)$ is above $B$ (that is, $S_t(k) - B$ is positive), then a positive "Change in Sign" has occurred at observation $t$. Similarly, if, for span 1, $S_t(1)$ is above $B$, and for some subsequent span $k$, $S_t(k)$ is below $B$, then a negative "Change in Sign" has occurred. Both cases, positive or negative, constitute a "Change in Sign"; the actual direction is indicated in tables S 7.A through S 7.E, which are described below.

Another behavior of interest occurs when component estimates increase then decrease (or vice versa) across spans for a given observation. Using the preceding example, the seasonal factors at observation $t$ could first increase, then decrease across the four spans.

This behavior, combined with an MPD exceeding the level, is of interest in questions of stability.

Again, consider Table D10, the seasonal factors in a sliding spans analysis that uses four spans. For a given observation $t$ (containing at least three spans), note the level of D10 for the first span. Continue across the spans until a difference of 1.0% or greater occurs (or no more spans are left), noting whether the difference is up or down. If the difference is up, continue until a difference of 1.0% or greater occurs downward (or no more spans are left). If such an up-down combination occurs, the observation is counted as an up-down turning point. A similar description occurs for a down-up turning point. Tables S 7.A through S 7.E, described below, show the occurrence of turning points, indicating whether up-down or down-up. Note that it requires at least three spans to test for a turning point. Hence Tables S 2.A.3 through S 6.A.3 show a reduced number in the "Turning Point" row for the "Total Tested" column, and in Tables S 7.A through S 7.E, the turning points symbols can occur only where three or more spans overlap.

With these descriptions of sign change and turning point, we now describe Table S 2.A.3. The first column gives the type or category, the second column gives the total number of observations falling into the category, the third column gives the total number tested, and the last column gives the percentage for the number found in the category.

The first category (row) of the table is for flagged observations—that is, those observations where the MPD exceeded the appropriate cutoff level (3.0% is default for the seasonal factors). The second category is for level changes, while the third category is for turning points. The fourth category is for flagged sign changes—that is, for those observations that are sign changes, how many are also flagged. Note the total tested column for this category equals the number found for sign change, reflecting the definition of the fourth category.

The fifth column is for flagged turning points—that is, for those observations that are turning points, how many are also flagged.

The footnote to Table S 2.A.3 gives the U.S. Census Bureau recommendation for thresholds, as described in the section "Computational Details for Sliding Spans Analysis" on page 3273.

#### *Table S 2.B*

Table S 2.B gives the histogram of flagged for seasonal factors (Table D10) using the appropriate cutoff value (default 3.0%). This table looks at the spread of the number of times the MPD exceeded the corresponding level. The range is divided up into four intervals: 3.0%–4.0%, 4.0%–5.0%, 5.0%–6.0%, and greater than 6.0%. The first column shows the symbol used in Table S 7.A, the second column gives the range in interval notation, and the last column gives the number found in the corresponding interval. Note that the sum of the last column should agree with the "Number Found" column of the "Flagged MPD" row in Table S 2.A.3.

#### *Table S 2.C*

Table S 2.C gives selected percentiles for the MPD for the seasonal factors (Table D10).

#### *Tables S 3.A.1 through S 3.A.3*

These table relate to the trading-day factors (Table C18) and follow the same format as Tables S 2.A.1 through S 2.A.3. The only difference between these tables and Tables S 2.A.1 through S 2.A.3 is the default cutoff value of 2.0% instead of the 3.0% used for the seasonal factors.

#### *Tables S 3.B, S 3.C*

These tables, applied to the trading-day factors (Table C18), are the same format as Tables S 2.B through S 2.C. The default cutoff value is different, with corresponding differences in the intervals in S 3.B.

#### *Tables S 4.A.1 through S 4.A.3*

These tables relate to the seasonally adjusted series (Table D11) and follow the same format as Tables S 2.A.1 through S 2.A.3. The same default cutoff value of 3.0% is used.

#### *Tables S 4.B, S 4.C*

These tables, applied to the seasonally adjusted series (Table D11), are the same format as Tables S 2.B through S 2.C.

#### *Tables S 5.A.1 through S 5.A.3*

These tables relate to the month-to-month (or quarter-to-quarter) differences in the seasonally adjusted series, and follow the same format as Tables S 2.A.1 through S 2.A.3. The same default cutoff value of 3.0% is used.

#### *Tables S 5.B, S 5.C*

These tables, applied to the month-to-month (or quarter-to-quarter) differences in the seasonally adjusted series, are the same format as Tables S 2.B through S 2.C. The same default cutoff value of 3.0% is used.

### *Tables S 6.A.1 through S 6.A.3*

These tables relate to the year-to-year differences in the seasonally adjusted series, and follow the same format as Tables S 2.A.1 through S 2.A.3. The same default cutoff value of 3.0% is used.

### *Tables S 6.B, S 6.C*

These tables, applied to the year-to-year differences in the seasonally adjusted series, are the same format as Tables S 2.B through S 2.C. The same default cutoff value of 3.0% is used.

### *Table S 7.A*

Table S 7.A gives the entire listing of the seasonal factors (Table D10) for each span. The first column gives the date for each observation included in the spans. Note that the dates do not cover the entire original data set. Only those observations included in one or more spans are listed.

The next *N* columns (where *N* is the number of spans) are the individual spans starting at the earliest span. The span columns are labeled by their beginning and ending dates.

Following the last span is the "Sign Change" column. As explained in the description of Table S 2.A.3, a sign change occurs at a given observation when the seasonal factor estimates go from above to below, or below to above, a base level. For the seasonal factors, 100.0 is the base level for the multiplicative model, 0.0 for the additive model. A blank value indicates no sign change, a "U" indicates a movement "upward" from the base level and a "D" indicates a movement "downward" from the base level.

The next column is the "Turning Point" column. As explained in the description of Table S 2.A.3, a turning point occurs when there is an upward then downward movement, or downward then upward movement, of sufficient magnitude. A blank value indicates no turning point, a "U-D" indicates a movement "upward then downward," and a "D-U" indicates a movement "downward then upward."

The next column is the maximum percentage difference (MPD). This quantity, described in the section "Computational Details for Sliding Spans Analysis" on page 3273, is the main computation for sliding spans analysis. A measure of how extreme the MPD value is given in the last column, the "Level of Excess" column. The symbols used and their meaning are described in Table S 2.A.3. If a given observation has exceeded the cutoff, the level of excess column is blank.

### *Table S 7.B*

Table S 7.B gives the entire listing of the trading-day factors (Table C18) for each span. The format of this table is exactly like that of Table S 7.A.

### *Table S 7.C*

Table S 7.C gives the entire listing of the seasonally adjusted data (Table D11) for each span. The format of this table is exactly like that of Table S 7.A except for the "Sign Change" column, which is not printed. The seasonally adjusted data have the same units as the original data; there is no natural base level as in the case of a percentage. Hence the sign change is not appropriate for D11.

### *Table S 7.D*

Table S 7.D gives the entire listing of the month-to-month (or quarter-to-quarter) changes in seasonally adjusted data for each span. The format of this table is exactly like that of Table S 7.A.

#### *Table S 7.E*

Table S 7.E gives the entire listing of the year-to-year changes in seasonally adjusted data for each span. The format of this table is exactly like that of Table S 7.A.

### Printed Output from the ARIMA Statement

The information printed by default for the ARIMA model includes the parameter estimates, their approximate standard errors, *t* ratios, and variances, the standard deviation of the error term, and the AIC and SBC statistics for the model. In addition, a criteria summary for the chosen model is given that shows the values for each of the three test criteria and the corresponding critical values.

If the PRINTALL option is specified, a summary of the nonlinear estimation optimization and a table of Box-Ljung statistics is also produced. If the automatic model selection is used, this information is printed for each of the five predefined models. Finally, a model selection summary is printed, showing the final model chosen.

## ODS Table Names

PROC X11 assigns a name to each table it creates. You can use these names to reference the table when using the Output Delivery System (ODS) to select tables and create output data sets. These names are listed in Table 44.5.

**NOTE:** For monthly and quarterly tables, use the ODS names MonthlyTables and QuarterlyTables; For brevity, only the MonthlyTables are listed here; the QuarterlyTables are simply duplicates. Printing of individual tables can be specified by using the TABLES table_name, which is not listed here. Printing groups of tables is specified in the MONTHLY and QUARTERLY statements by specifying the option PRINTOUT=NONE|STANDARD|LONG|FULL. The default is PRINTOUT=STANDARD.

**Table 44.5** ODS Tables Produced in PROC X11

# Examples: X11 Procedure

## Example 44.1: Component Estimation—Monthly Data

This example computes and plots the final estimates of the individual components for a monthly series. In the first plot (Output 44.1.1), an overlaid plot of the original and seasonally adjusted data is produced. The trend in the data is more evident in the seasonally adjusted data than in the original data. This trend is even more clear in Output 44.1.3, the plot of Table D12, the trend cycle. Note that both the seasonal factors and the irregular factors vary around 100, while the trend cycle and the seasonally adjusted data are in the scale of the original data.

From Output 44.1.2 the seasonal component appears to be slowly increasing, while no apparent pattern exists for the irregular series in Output 44.1.4.

```

X-11 Seasonal Adjustment Program
U. S. Bureau of the Census
Economic Research and Analysis Division
November 1, 1968

The X-11 program is divided into seven major parts.
Part Description
A. Prior adjustments, if any
B. Preliminary estimates of irregular component weights and regression trading day factors
C. Final estimates of above
D. Final estimates of seasonal, trend-cycle and irregular components
E. Analytical tables
F. Summary measures
G. Charts

Series - fy35rr
Period covered - 1st Quarter 1971 to 4th Quarter 1976

**B1 Original Series**

## Example 44.3: Outlier Detection and Removal

PROC X11 can be used to detect and replace outliers in the irregular component of a monthly or quarterly series.

The weighting scheme used in measuring the "extremeness" of the irregulars is developed iteratively; thus the statistical properties of the outlier adjustment method are unknown.

In this example, the data are simulated by generating a trend plus a random error. Two periods in the series were made "extreme" by multiplying one generated value by 2.0 and another by 0.10. The additive model is appropriate based on the way the data were generated. Note that the trend in the generated data was modeled automatically by the trend cycle component estimation.

The detection of outliers is accomplished by considering Table D9, the final replacement values for extreme S-I ratios. This table indicates which observations had irregular component values more than FULLWEIGHT= standard deviation units from 0.0 (1.0 for the multiplicative model). The default value of the FULLWEIGHT= option is 1.5; a larger value would result in fewer observations being declared extreme.

In this example, FULLWEIGHT=3.0 is used to isolate the extreme inflated and deflated values generated in the DATA step. The value of ZEROWEIGHT= must be greater than FULLWEIGHT; it is given a value of 3.5.

A plot of the original and modified series, Output 44.3.2, shows that the deviation from the trend line for the modified series is greatly reduced compared with the original series.

```
data a;
   retain seed 99831;
   do kk = 1 to 48;
      x = kk + 100 + rannor( seed );
      date = intnx( 'month', '01jan1970'd, kk-1 );
      if kk = 20 then x = 2 * x;
      else if kk = 30 then x = x / 10;
      output;
      end;
run;
```

## Overview: X12 Procedure

The X12 procedure is an adaptation of the US Bureau of the Census X-12-ARIMA seasonal adjustment program (US Bureau of the Census 2010). The X-12-ARIMA program was developed by the Time Series Staff of the Statistical Research Division, US Census Bureau. The X-12-ARIMA seasonal adjustment program contains components developed from Statistics Canada's X-11-ARIMA program. The X-12-ARIMA automatic modeling method is based on the work of Gómez and Maravall (1997a, b).

The Time Series Staff of the Statistical Research Division, US Census Bureau, has recently developed a new program, X-13ARIMA-SEATS (US Bureau of the Census 2013). This program incorporates the X-12-ARIMA functionality along with the SEATS functionality that was developed by Gómez and Maravall (1997a, b). The X12 procedure includes improvements on X-12-ARIMA methods that are incorporated into the X-13ARIMA-SEATS program.

Because the US Census Bureau has focused its new development on the X-13ARIMA-SEATS program, a new X13 procedure has been developed to incorporate the X-13ARIMA-SEATS method.

**NOTE:** The functionality previously available in the X12 procedure is included in the new X13 procedure. You can specify either of the following with the same results:

```
proc x12 ...

proc x13 ...
```

For documentation of the PROC X12 syntax and a description of its details, see Chapter 46, "The X13 Procedure."

# Overview: X13 Procedure

The X13 procedure is an adaptation of the US Bureau of the Census X-13ARIMA-SEATS seasonal adjustment program (US Bureau of the Census 2013c). The X-13ARIMA-SEATS program was developed by the Time Series Staff of the Statistical Research Division, US Census Bureau, by incorporating the SEATS method into the X-12-ARIMA seasonal adjustment program. The X-12-ARIMA seasonal adjustment program contains components developed from Statistics Canada's X-11-ARIMA program (US Bureau of the Census 2010). The X-12-ARIMA automatic modeling method and the SEATS method are based on the work of Gómez and Maravall (1997a, b).

The new X-13ARIMA-SEATS program incorporates the X-12-ARIMA functionality. It also incorporates improvements on X-12-ARIMA methods. Because the X-12-ARIMA methods and improvements are available in X-13ARIMA-SEATS, the new X13 procedure and the existing X12 procedure use the same X-13ARIMA-SEATS methodology, and PROC X12 and PROC X13 are aliases for the same procedure.

The version of PROC X13 documented here was produced by converting the US Census Bureau's FORTRAN code to the SAS development language and adding typical SAS procedure syntax. This conversion work was performed by SAS and resulted in the X13 procedure. Although several features were added during the conversion, credit for the statistical aspects and general methodology of the X13 procedure belongs to the US Census Bureau.

The X13 procedure seasonally adjusts monthly or quarterly time series. The procedure makes additive or multiplicative adjustments and creates an output data set that contains the adjusted time series and intermediate calculations.

The X-13ARIMA-SEATS program includes the X-12-ARIMA program, which combines the capabilities of the X-11 program (Shiskin, Young, and Musgrave 1967) and the X-11-ARIMA/88 program (Dagum 1988) and also introduces some new features (Findley et al. 1998). One of the main enhancements in the X-12-ARIMA program involves the use of a regARIMA model, a regression model with ARIMA (autoregressive integrated moving average) errors. Thus, the X-12-ARIMA program contains methods developed by both the US Census Bureau and Statistics Canada. In addition, the X-12-ARIMA automatic modeling routine is based on the TRAMO (time series regression with ARIMA noise, missing values, and outliers) method (Gómez and Maravall 1997a, b). The four major components of the X-12-ARIMA program are regARIMA modeling, model diagnostics, seasonal adjustment that uses enhanced X-11 methodology, and post-adjustment diagnostics. Statistics Canada's X-11 method fits an ARIMA model to the original series, and then uses the model forecasts to extend the original series. This extended series is then seasonally adjusted by the standard X-11 seasonal adjustment method. The extension of the series improves the estimation of the seasonal factors and reduces revisions to the seasonally adjusted series as new data become available.

Seasonal adjustment of a series is based on the assumption that seasonal fluctuations can be measured in the original series, $O_t$, $t = 1, \ldots, n$, and separated from trend cycle, trading day, and irregular fluctuations. The seasonal component of this time series, $S_t$, is defined as the intrayear variation that is repeated consistently or evolves slowly from year to year (Hillmer and Tiao 1982). The trend cycle component, $C_t$, includes variation that is attributed to the long-term trend, the business cycle, and other long-term cyclical factors. The trading day component, $D_t$, is the variation that can be attributed to the composition of the calendar. The irregular component, $I_t$, is the residual variation. Many economic time series are related in a multiplicative fashion ($O_t = S_t C_t D_t I_t$). Other economic series are related in an additive fashion ($O_t = S_t + C_t + D_t + I_t$). A seasonally adjusted time series, $C_t I_t$ or $C_t + I_t$, consists of only the trend cycle and irregular components. For more information about the X-11 seasonal adjustment method, see Ladiray and Quenneville (2001).

Graphics are now available with the X13 procedure. For more information, see the section "ODS Graphics" on page 3381.

## Getting Started: X13 Procedure

The most common use of the X13 procedure is to produce a seasonally adjusted series. Eliminating the seasonal component from an economic series facilitates comparison among consecutive months or quarters. A plot of the seasonally adjusted series is often more informative about trends or location in a business cycle than a plot of the unadjusted series.

The following example shows how to use PROC X13 to produce a seasonally adjusted series, $C_t I_t$, from an original series $O_t = S_t C_t D_t I_t$.

In the multiplicative model, the trend cycle component $C_t$ keeps the same scale as the original series $O_t$, while $S_t$, $D_t$, and $I_t$ vary around 1.0. In all displayed tables, these latter components are expressed as percentages and thus vary around 100.0 (in the additive case, they vary around 0.0). However, in the output data set, the data displayed as percentages in the displayed output are expressed as the decimal equivalent and thus vary around 1.0 in the multiplicative case.

The naming convention used in PROC X13 for the tables follows the convention used in the Census Bureau's X-13ARIMA-SEATS program; see *X-13ARIMA-SEATS Reference Manual* (US Bureau of the Census 2013c), *X-13ARIMA-SEATS Quick Reference for DOS* (US Bureau of the Census 2013b), and *X-13ARIMA-SEATS Quick Reference for UNIX/Linux* (US Bureau of the Census 2013a). Also see the section "Displayed Output, ODS Table Names, and OUTPUT Tablename Keywords" on page 3376. The table names are outlined in Table 46.15.

The tables that correspond to parts A through C are intermediate calculations. The final estimates of the individual components are found in the D tables: Table D10 contains the final seasonal factors, Table D12 contains the final trend cycle, and Table D13 contains the final irregular series. If you are primarily interested in seasonally adjusting a series without consideration of intermediate calculations or diagnostics, you need to look only at Table D11, the final seasonally adjusted series. Tables in part E contain information about extreme values and changes in the original and seasonally adjusted series. The tables in part F are seasonal adjustment quality measures. Spectral analysis is performed in part G. For more information about the tables produced by the X11 statement, see Ladiray and Quenneville (2001).

## Basic Seasonal Adjustment

Suppose that you have monthly retail sales data starting in September 1978 in a SAS data set named SALES. At this point, you do not suspect that any calendar effects are present, and there are no prior adjustments that need to be made to the data.

In this simplest case, you need only specify the DATE= variable in the PROC X13 statement and request seasonal adjustment in the X11 statement as shown in the following statements:

```
data sales;
   set sashelp.air;
   sales = air;
   date = intnx( 'month', '01sep78'd, _n_-1 );
   format date monyy.;
run;

proc x13 data=sales date=date;
   var sales;
   x11;
   ods select d11;
run;
```

The results of the seasonal adjustment are in Table D11 (the final seasonally adjusted series) in the displayed output shown in Figure 46.1.

**Figure 46.1** Basic Seasonal Adjustment

**The X13 Procedure**

**Table D 11: Final Seasonally Adjusted Data**
**For Variable sales**

| Year | JAN | FEB | MAR | APR | MAY | JUN | JUL | AUG | SEP | OCT | NOV | DEC | Total |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **1978** | . | . | . | . | . | . | . | . | 124.560 | 124.649 | 124.920 | 129.002 | 503.131 |
| **1979** | 125.087 | 126.759 | 125.252 | 126.415 | 127.012 | 130.041 | 128.056 | 129.165 | 127.182 | 133.847 | 133.199 | 135.847 | 1547.86 |

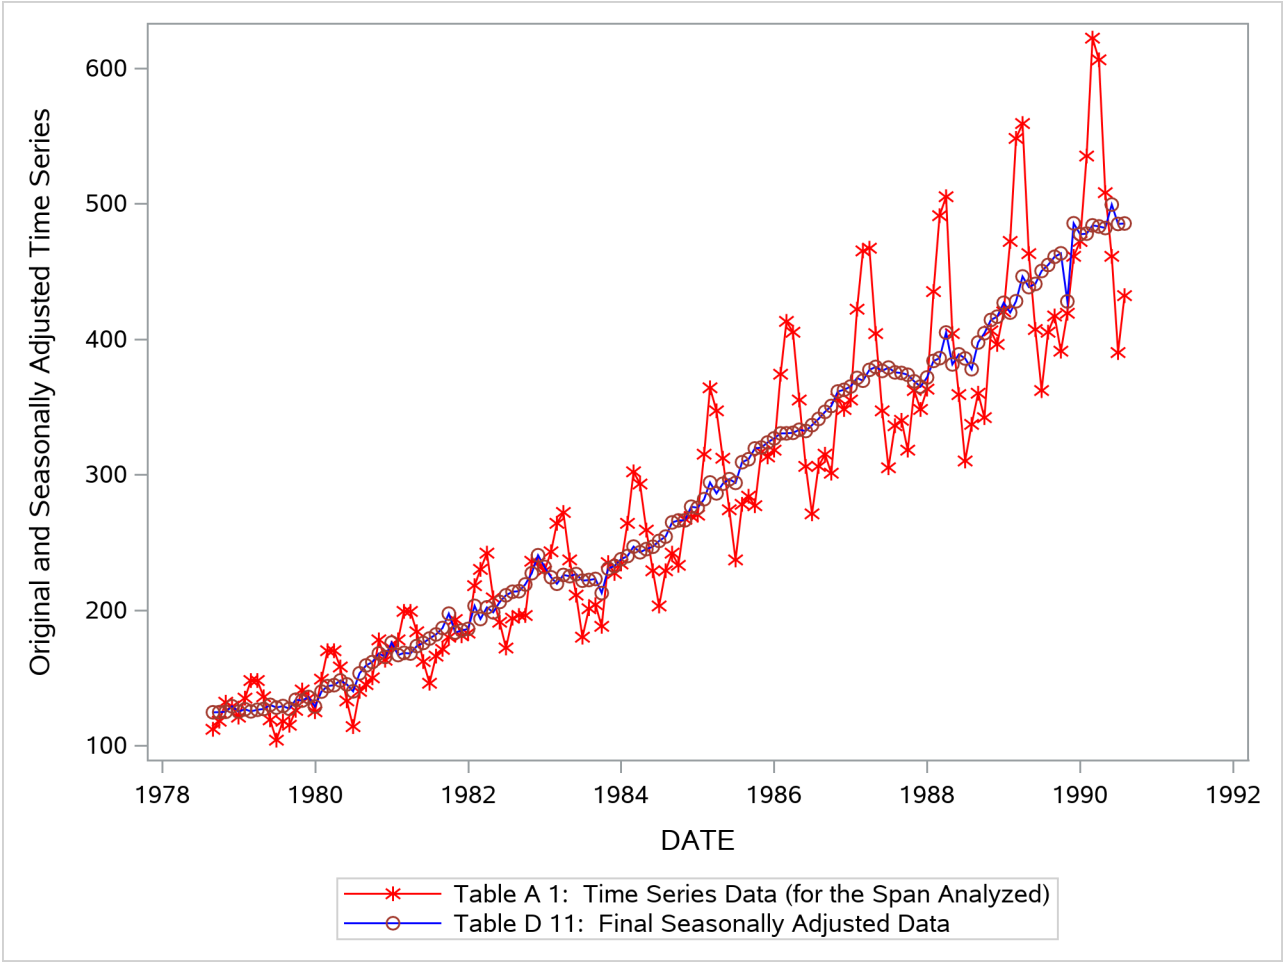
**Total: 40323 Mean: 280.02 S.D.: 111.31**
**Min: 124.56 Max: 499.2**

You can compare the original series (Table A1) and the final seasonally adjusted series (Table D11) by plotting them together as shown in Figure 46.2. These tables are requested in the OUTPUT statement and are written to the OUT= data set. Note that the default variable name used in the output data set is the input variable name followed by an underscore and the corresponding table name.

```
proc x13 data=sales date=date noprint;
   var sales;
   x11;
   output out=out a1 d11;
run;

proc sgplot data=out;
   series x=date y=sales_A1 / name = "A1" markers
                              markerattrs=(color=red symbol='asterisk')
                              lineattrs=(color=red);
   series x=date y=sales_D11 / name= "D11" markers
                               markerattrs=(symbol='circle')
                               lineattrs=(color=blue);
   yaxis label='Original and Seasonally Adjusted Time Series';
run;
```

**Figure 46.2** Plot of Original and Seasonally Adjusted Data



# Syntax: X13 Procedure

The X13 procedure uses the following statements:

**PROC X13** *options* ;
**VAR** *variables* ;
**BY** *variables* ;
**ID** *variables* ;
**EVENT** *variables* < / *options* > ;
**USERDEFINED** *variables* ;
**TRANSFORM** *options* ;
**ADJUST** *option* ;
**IDENTIFY** *options* ;
**PICKMDL** *options* ;
**AUTOMDL** *options* ;
**OUTLIER** *options* ;
**REGRESSION** *options* ;
**INPUT** *variables* < / *options* > ;
**ARIMA** *option* ;
**ESTIMATE** *options* ;
**X11** *options* ;
**FORECAST** *options* ;
**CHECK** *options* ;
**SEATSDECOMP OUT=** *SAS-data-set* < *options* > ;
**OUTPUT OUT=** *SAS-data-set* < **YEARSEAS** > *tablename1 tablename2 . . .* ;
**TABLES** *tablename1 tablename2 . . . options* ;

The statements used by PROC X13 perform basically the same function as the Census Bureau's X-13ARIMA-SEATS specs (specifications). *Specs* are used in X-13ARIMA-SEATS to control the computations and output. The PROC X13 statement performs some of the same functions as the Series spec in the Census Bureau's X-13ARIMA-SEATS software. The ADJUST statement performs some of the same functions as the Transform spec. The ARIMA, AUTOMDL, CHECK, ESTIMATE, FORECAST, IDENTIFY, OUTLIER, PICKMDL, REGRESSION, TRANSFORM, and X11 statements are designed to perform the same functions as the corresponding X-13ARIMA-SEATS specs, although full compatibility is not yet available. The Census Bureau documentation *X-13ARIMA-SEATS Reference Manual* (US Bureau of the Census 2009) provides added insight to the functionality of these statements. The SEATSDECOMP statement provides a SEATS (signal extraction in ARIMA time series) seasonal decomposition for the B1 series that uses the same ARIMA model as is used to model the series. For more information about SEATS, see Gómez and Maravall (1997a, b).

## Functional Summary

Table 46.1 summarizes the statements and options that control the X13 procedure.

**Table 46.1** PROC X13 Functional Summary

| Description | Statement | Option |
|---|---|---|
| **Data Set Options** | | |
| Specifies the auxiliary data set | PROC X13 | AUXDATA= |
| Specifies the input data set | PROC X13 | DATA= |
| Specifies the user-defined event definition data set | PROC X13 | INEVENT= |
| Specifies regression and ARIMA information | PROC X13 | MDLINFOIN= |
| Outputs regression and ARIMA information | PROC X13 | MDLINFOOUT= |
| Writes summary statistics to an output data set | PROC X13 | OUTSTAT= |
| Writes table values to an output data set | OUTPUT | OUT= |
| Appends forecasts to the OUTPUT OUT= data set | X11 or FORECAST | OUTFORECAST |
| Prefixes backcasts to the OUTPUT OUT= data set | FORECAST | OUTBACKCAST |
| **Display Control Options** | | |
| Suppresses all displayed output | PROC X13 | NOPRINT |
| Specifies the plots to be displayed | PROC X13 | PLOTS= |
| Specifies the type of spectral plot to be displayed | PROC X13 | PERIODOGRAM |
| Specifies the series for spectral analysis | PROC X13 | SPECTRUMSERIES= |
| Displays automatic model information | AUTOMDL | PRINT= |
| Specifies the number of lags in regARIMA model residuals ACF and PACF tables and plots | CHECK | MAXLAG= |
| Displays regARIMA model residuals information | CHECK | PRINT= |
| Displays the iterations history | ESTIMATE | ITPRINT |
| Displays information about restarted iterations | ESTIMATE | PRINTERR |
| Specifies the differencing used in the ARIMA model identification ACF and PACF tables and plots | IDENTIFY | DIFF= |
| Specifies the seasonal differencing used in the ARIMA model identification ACF and PACF tables and plots | IDENTIFY | SDIFF= |
| Specifies the number of lags in ARIMA model identification ACF and PACF tables and plots | IDENTIFY | MAXLAG= |
| Displays regression model parameter estimates | IDENTIFY | PRINTREG |
| Requests tables that are not displayed by default | TABLES | |

**Table 46.1** *continued*

| Description | Statement | Option |
|---|---|---|
| Specifies that the summary line not be displayed | TABLES | NOSUM |
| **Date Information Options** | | |
| Specifies the date variable | PROC X13 | DATE= |
| Specifies the date of the first observation | PROC X13 | START= |
| Specifies the beginning or ending date or both of the subset | PROC X13 | SPAN= |
| Specifies the interval of the time series | PROC X13 | INTERVAL= |
| Specifies the interval of the time series | PROC X13 | SEASONS= |
| **Declaring the Role of Variables** | | |
| Specifies BY-group processing | BY | |
| Specifies identifying variables | ID | |
| Specifies the variables to be seasonally adjusted | VAR | |
| Specifies the user-defined variables that are available for regression | USERDEFINED | |
| **Controlling the Table Computations** | | |
| Suppresses trimming of leading and trailing missing values (if they exist) | PROC X13 | NOTRIMMISS |
| Transforms or prior-adjusts the series | TRANSFORM | FUNCTION= |
| Transforms or prior-adjusts the series | TRANSFORM | POWER= |
| Adjusts the series by using a predefined adjustment variable | ADJUST | PREDEFINED= |
| Specifies the likelihood function to be used for estimating AR and MA parameters | ESTIMATE | EXACT= |
| Specifies the maximum number of iterations for estimating AR and MA parameters | ESTIMATE | MAXITER |
| Specifies the convergence tolerance for nonlinear estimation | ESTIMATE | TOL= |
| Specifies size of forecast confidence limits | FORECAST | ALPHA= |
| Specifies the number of backcasts by which to extend the series for seasonal adjustment | FORECAST | NBACKCAST= |
| Specifies the number of forecasts by which to extend the series for seasonal adjustment | FORECAST | LEAD= |
| Specifies that one-step-ahead forecasts be computed | FORECAST | OUT1STEP |
| **Specifying Outlier Detection Options** | | |
| Specifies automatic outlier detection | OUTLIER | |
| Specifies the span for outlier detection | OUTLIER | SPAN= |
| Specifies the outlier types to be detected | OUTLIER | TYPE= |

**Table 46.1** *continued*

| Description | Statement | Option |
|---|---|---|
| Specifies the critical values for outlier detection | OUTLIER | CV= |
| Specifies the critical values for AO outlier detection | OUTLIER | AOCV= |
| Specifies the critical values for LS outlier detection | OUTLIER | LSCV= |
| Specifies the critical values for TC outlier detection | OUTLIER | TCCV= |
| Specifies the alpha value for outlier detection | OUTLIER | ALPHA= |
| Specifies the method for calculating the critical value for outlier detection based on the alpha value | OUTLIER | CVMETHOD= |
| Specifies the number of level-shift outliers to consider for forming a temporary level-shift | OUTLIER | LSRUN= |
| Specifies the rate of decay for temporary change outliers | OUTLIER | TCRATE= |
| Specifies the method of adding outliers at each iteration | OUTLIER | METHOD= |
| Specifies the difference in critical values for almost outliers | OUTLIER | ALMOST= |
| **Specifying the Regression Model** | | |
| Specifies regression variables to be selected using an AIC-based test | REGRESSION | AICTEST= |
| Specifies predefined regression variables | REGRESSION | PREDEFINED= |
| Specifies user-defined regression variables | REGRESSION | USERVAR= |
| Specifies user-defined regression variables | INPUT | |
| Specifies user defined event regression variables | EVENT | |
| Specifies the method used to calculate the means for the Easter regression variable | REGRESSION | EASTERMEANS= |
| Specifies which types of regression effects are not to be removed before seasonal adjustment | REGRESSION | NOAPPLY= |
| **Specifying the ARIMA Model** | | |
| Uses the X-13ARIMA-SEATS TRAMO-based method to choose a model | AUTOMDL | |
| Chooses a regARIMA model from a set that you specify | PICKMDL | |
| Specifies the ARIMA part of the model | ARIMA | MODEL= |
| **Specifying Automatic Model Detection Options** | | |
| Specifies the maximum orders of ARMA polynomials | AUTOMDL | MAXORDER= |
| Specifies the maximum orders of differencing | AUTOMDL | MAXDIFF= |

**Table 46.1** *continued*

| Description | Statement | Option |
|---|---|---|
| Specifies the estimation method for identifying difference orders | AUTOMDL | DIFFID= |
| Specifies the maximum number of iterations for exact likelihood for DIFFID=EXACTFIRST | AUTOMDL | DIFFIDITER= |
| Specifies the fixed orders of differencing | AUTOMDL | DIFFORDER= |
| Suppresses fitting of a constant parameter | AUTOMDL | NOINT |
| Specifies the preference for balanced models | AUTOMDL | BALANCED |
| Specifies Hannan-Rissanen initial estimation | AUTOMDL | HRINITIAL |
| Specifies default model acceptance based on Ljung-Box $Q$ | AUTOMDL | ACCEPTDEFAULT |
| Specifies the acceptance value for Ljung-Box $Q$ | AUTOMDL | LJUNGBOXLIMIT= |
| Specifies the percentage by which to reduce the outlier critical value | AUTOMDL | REDUCECV= |
| Specifies the critical value for ARMA coefficients | AUTOMDL | ARMACV= |
| **Model Diagnostics** | | |
| Examines the regARIMA model residuals | CHECK | |
| **Specifying Seasonal Adjustment Options** | | |
| Specifies seasonal adjustment | X11 | |
| Specifies the mode of seasonal adjustment decomposition | X11 | MODE= |
| Specifies the seasonal filter | X11 | SEASONALMA= |
| Specifies the sigma limits | X11 | SIGMALIM= |
| Specifies the Henderson trend filter | X11 | TRENDMA= |
| Specifies the D11 calculation method | X11 | TYPE= |
| Specifies the adjustment factors to remove from final seasonally adjusted series | X11 | FINAL= |
| Specifies a method for reconciling the seasonally adjusted series to the original series | X11 | FORCE= |
| Specifies that SEATS seasonal decomposition be output to a data set | SEATSDECOMP | OUT= |

## PROC X13 Statement

**PROC X13** *options* **;**

The PROC X13 statement provides information about the time series to be processed by PROC X13. Either the DATE= or the START= option must be specified. If both options are specified, then a syntax error results and the X13 procedure is not executed.

The original series is displayed in Table A1. If there are missing values in the original series and a regARIMA model is specified or automatically selected, then Table MV1 is displayed. Table MV1 contains the original series with missing values replaced by the predicted values from the fitted model. If outliers are identified and Table A19 is added in the TABLES statement, then the outlier adjusted series is displayed in Table A19. Table B1 is displayed when the original data are altered (for example, through an ARIMA model estimation, prior adjustment factor, or regression) or the series is extended with forecasts.

Although the X-13ARIMA-SEATS method handles missing values, there are some restrictions. In order for PROC X13 to process the series, no month or quarter can contain missing values for all years. For instance, if the third quarter contained only missing values for all years, then processing is skipped for that series. In addition, if more than half the values for a month or a quarter are missing, then a warning message is displayed in the log file, and other errors might occur later in processing. If a series contains many missing values, other methods of missing value replacement should be considered prior to seasonally adjusting the series.

You can specify the following *options* in the PROC X13 statement:

**AUXDATA=***SAS-data-set*
specifies an auxiliary input data set that contains user-defined variables, which are specified in the INPUT statement, the USERVAR= option in the REGRESSION statement, or the USERDEFINED statement. The AUXDATA= data set can also contain the date variable, which is specified in the DATE= option in the PROC X13 statement. If the date variable is present, then the date variable is used to align the observations in the auxiliary data set to the observations in the series that is being processed. The date values must be sorted in ascending order with no gaps or duplications, and the interval must match the interval of the series. If the date variable is not present or valid, then observations in the auxiliary data set are matched by observation number to the series that is being processed. The auxiliary data set does not support BY-group processing. The variables in the auxiliary data set are applied to all BY groups, where the dates of the BY group correspond to the dates of the auxiliary data set. Example 46.11 shows the use of the AUXDATA= data set.

**DATA=***SAS-data-set*
specifies the input SAS data set to use. If this option is omitted, the most recently created SAS data set is used.

**DATE=***variable*

**DATEVAR=***variable*
specifies a variable that gives the date for each observation. Unless specified in the SPAN= option, the starting and ending dates are obtained from the first and last values of the BY group for the DATE= variable, which must contain SAS date or datetime values. The procedure checks values of the DATE= variable to ensure that the input observations are sequenced correctly in ascending order. If the INTERVAL= option or the SEASONS= option is specified, the values of the date variable must be consistent with the specified seasonality or interval. If neither the INTERVAL= option nor the

SEASONS= option is specified, then the procedure tries to determine the type of data from the values of the date variable. This variable is automatically added to the OUT= data set if a data set is requested in an OUTPUT statement, and the date values for the variable are extrapolated if necessary. If the DATE= option is not specified, the START= option must be specified.

**INEVENT=***SAS-data-set*

specifies the input data set that defines any user-defined event variables. This option can be omitted if events are not specified or if only SAS predefined events are specified in an EVENT statement. For more information about the format of this data set, see the section "INEVENT= Data Set" on page 3387.

**INTERVAL=***interval*

specifies the frequency of the input time series. If the input data consist of quarterly observations, then INTERVAL=QTR should be used. If the input data consist of monthly observations, then INTERVAL=MONTH should be used. If the INTERVAL= option is not specified and SEASONS=4, then INTERVAL=QTR is assumed; likewise, SEASONS=12 implies INTERVAL=MONTH. If both the INTERVAL= option and the SEASONS= option are specified, the values should not be conflicting. If neither the INTERVAL= option nor the SEASONS= option is specified and the START= option is specified, then the data are assumed to be monthly. If a date variable is specified using the DATE= option, it is not necessary to specify the INTERVAL= option or the SEASONS= option; however, if specified, the values of the INTERVAL= option or the SEASONS= option should not be in conflict with the values of the date variable. For more information about intervals, see Chapter 5, "Date Intervals, Formats, and Functions."

**MDLINFOIN=***SAS-data-set*

specifies an optional input data set that contains model information that overrides information that is contained in one or more of the TRANSFORM, REGRESSION, ARIMA, and AUTOMDL statements. The *SAS-data-set* can contain BY-group, series names, and other information. For more information about this data set, see the section "MDLINFOIN= and MDLINFOOUT= Data Sets" on page 3385.

You can supply the following model information in *SAS-data-set*:

- a single model for each series that is used to forecast the series.
- multiple models for each series. If multiple models are specified for a series, the PICKMDL method is used to select from among the candidate models, and the selected model will be used to generate the forecasts. For more information, see the "PICKMDL Model Selection" on page 3374.

The MDLINFOIN= data set can include a variable that identifies different models. All observations that have the same value for the model identification variable are considered to be relevant to the same model. A single model can be considered to consist of all the observations for a BY group that consists of the BY variables (if any), the _NAME_ variable if it exists, and the model identification variable (whose default is _MODEL_). Even if the PICKMDL statement is not specified, but the MDLINFOIN= data set contains a _MODEL_ variable and more than one model for a series, then the PICKMDL method is automatically invoked to choose a model for that series.

**MDLINFOOUT=***SAS-data-set*

specifies the optional output data set that contains the transformation, regression, and ARIMA information related to each seasonally adjusted series. The data set is sorted by the BY-group variables, if any, and by series names. The MDLINFOOUT= data set can be used as input for the MDLINFOIN= option. For more information, see the section "MDLINFOIN= and MDLINFOOUT= Data Sets" on page 3385.

**NOPRINT**

suppresses any printed output.

**NOTRIMMISS**

suppresses the default, by which leading and trailing missing values are trimmed from each variable listed (or implied) in the VAR statement. If you specify the NOTRIMMISS option, PROC X13 treats leading and trailing missing values in the same manner as it treats embedded missing values. For information about the treatment of embedded missing values, see the section "Missing Values" on page 3366. Missing values are not supported in the regression variables that you specify in the REGRESSION, INPUT, or USERDEFINED statement; therefore, leading and trailing missing values are always trimmed from user-defined regressors even if you specify NOTRIMMISS.

**OUTSTAT=***SAS-data-set*

specifies an optional output data set which contains the summary statistics that related to each seasonally adjusted series. The data set is sorted by the BY-group variables, if any, and by series names. For more information, see the section "OUTSTAT= Data Set" on page 3389.

**PERIODOGRAM**

specifies that the PERIODOGRAM rather than the spectrum of the series be plotted in the G tables and plots. If PERIODOGRAM is not specified, then the spectrum is plotted in the G tables.

**PLOTS<(***global-plot-options***)> <=** *plot-request* **<(***options***)>>**

**PLOTS<(***global-plot-options***)> <=(***plot-request* **<(***options***)> <...** *plot-request* **<(***options***)>>)>**

controls the plots that are produced through ODS Graphics. When you specify only one plot request, you can omit the parentheses around the plot request.

Following are some examples of the PLOTS= option:

```
plots=none
plots=all
plots=residual(none)
plots(only)=(series(acf pacf) residual(hist))
```

ODS Graphics must be enabled before you request plots. For example:

```
ods graphics on;

proc x13 data=sales date=date;
   var sales;
   identify diff=(0,1) sdiff=(0,1);
run;
```

Since no specific plot is requested in this program, the default plots associated with the PROC X13 and IDENTIFY statements are produced.

For general information about ODS Graphics, see Chapter 24, "Statistical Graphics Using ODS" (*SAS/STAT User's Guide*). If you have enabled ODS Graphics but do not specify any specific plot request, then the default plots that are associated with each of the PROC X13 statements used in the program are produced. Line printer plots are suppressed when ODS Graphics is enabled.

If NONE is specified in an option, then no plots are produced for that option. If ALL is specified without NONE in an option, then all plots are produced for that option.

### Global Plot Options

The *global-plot-options* apply to all relevant plots that are generated by the X13 procedure. The following *global-plot-option* is supported:

**ONLY**
suppresses the default plots. Only the plots specifically requested are produced.

### Specific Plot Options

The following list describes the specific plots and their *options*:

**ALL**
produces all plots that are appropriate for the particular analysis.

**NONE**
suppresses all plots.

**ADJUSTED(**< *sa-plot-options* >**)**

**SA(**< *sa-plot-options* >**)**
produces plots of the seasonally adjusted series that results from the decomposition specified in the X11 statement. The SPECTRUM plot is produced by default.

The following *sa-plot-options* are available:

**ALL**
produces all seasonally adjusted plots.

**NONE**
suppresses all seasonally adjusted plots.

**SPECTRUM**
produces the spectral plot of Table G1. Table G1 is calculated based on the modified seasonally adjusted series (Table E2). The data are first-differenced and transformed as specified in the TRANSFORM statement. By default, the type of spectral estimate used to calculate the spectral plot is the spectrum. If the PERIODOGRAM option is specified in the PROC X13 statement, then the periodogram of the series is used to calculate the spectral plot.

**FORECAST(< *forecast-plot-options* >)**
produces the regARIMA model forecast plots if the FORECAST statement is specified. The FORECAST plot is produced by default. The following *forecast-plot-options* are available:

**ALL**
produces all the forecast plots that are appropriate for the particular analysis.

**FORECAST**
plots the actual time series and its one-step-ahead forecast over the historical period, and plots the forecast and its confidence bands over the forecast horizon. The OUT1STEP option must be specified in the FORECAST statement in order for the X13 procedure to calculate the one-step-ahead forecasts.

**FORECASTONLY**
plots the forecast and its confidence bands over the forecast horizon only.

**MODELFORECASTS**
plots the one-step-ahead model forecast and its confidence bands in the historical period; plots the forecast and its confidence bands over the forecast horizon. The OUT1STEP option must be specified in the FORECAST statement in order for the X13 procedure to calculate the one-step-ahead forecasts.

**MODELS**
plots the one-step-ahead model forecast and its confidence bands in the historical period. The OUT1STEP option must be specified in the FORECAST statement in order for the X13 procedure to calculate the one-step-ahead forecasts.

**NONE**
suppresses all the forecast plots.

**TRANSFORECAST**
plots the transformed time series and its one-step-ahead forecast over the historical period; plots the forecast and its confidence bands over the forecast horizon. The OUT1STEP option must be specified in the FORECAST statement in order for the X13 procedure to calculate the one-step-ahead forecasts. The TRANSFORECAST plot is available only if the data have been transformed using the TRANSFORM statement.

**TRANSFORECASTONLY**
plots the forecast of the transformed series and its confidence bands over the forecast horizon only. The TRANSFORECASTONLY plot is available only if the data have been transformed using the TRANSFORM statement.

**TRANSMODELFORECASTS**
plots the one-step-ahead model forecast of the transformed series and its confidence bands in the historical period; plots the forecast and its confidence bands over the forecast horizon. The OUT1STEP option must be specified in the FORECAST statement in order for the X13 procedure to calculate the one-step-ahead forecasts. The TRANSMODELFORECASTS plot is available only if the data have been transformed using the TRANSFORM statement.

**TRANSMODELS**
plots the one-step-ahead model forecast of the transformed series and its confidence bands in the historical period. The OUT1STEP option must be specified in the FORECAST statement in order for the X13 procedure to calculate the one-step-ahead forecasts. The TRANSMODELS plot is available only if the data have been transformed using the TRANSFORM statement.

**IRREGULAR(<** *ic-plot-options* **>)**
**IC(<** *ic-plot-options* **>)**
produces plots of the irregular series that results from the decomposition specified in the X11 statement. The SPECTRUM plot is produced by default.

The following *ic-plot-options* are available:

**ALL**
produces all irregular plots.

**NONE**
suppresses all irregular plots.

**SPECTRUM**
produces the spectral plot of Table G2. Table G2 is calculated based on the modified irregular series (Table E3). The data are first-differenced and transformed as specified in the TRANSFORM statement. By default, the type of spectral estimate used to calculate the spectral plot is the spectrum. If the PERIODOGRAM option is specified in the PROC X13 statement, then the periodogram of the series is used to calculate the spectral plot.

**RESIDUAL(<** *residual-plot-options* **>)**
produces the regARIMA model residual series plots if the CHECK statement is specified. The ACF, PACF, HIST, SQACF, and SPECTRUM plots are produced by default. The following *residual-plot-options* are available:

**ACF**
produces the plot of residual autocorrelations.

**ALL**
produces all the residual diagnostics plots that are appropriate for the particular analysis.

**HIST**
produces the histogram of the residuals and also the residual outliers and residual statistics tables that describe the residual histogram.

**NONE**
suppresses all the residual diagnostics plots.

**PACF**
produces the plot of residual partial-autocorrelations if PRINT=PACF is specified in the CHECK statement.

**SPECTRUM**
produces the spectral plot of Table GRs. Table GRs is calculated based on the regARIMA model residual series. By default, the type of spectral estimate used to calculate the spectral plot is the spectrum. If the PERIODOGRAM option is specified in the PROC X13 statement, then the periodogram of the series is used to calculate the spectral plot.

**SQACF**
produces the plot of squared residual autocorrelations.

**SERIES(<** *series-plot-options* **>)**
produces plots that are associated with the identification stage of the modeling. The ACF, PACF, and SPECTRUM plots are produced by default. The following *series-plot-options* are available:

**ACF**
produces the plot of autocorrelations.

**ALL**
produces all the plots that are associated with the identification stage.

**NONE**
suppresses all plots that are associated with the identification stage.

**PACF**
produces the plot of partial-autocorrelations.

**SPECTRUM**
produces the spectral plot of Table G0. Table G0 is calculated based on either Table A1, A19, B1, or E1, as specified by the SPECTRUMSERIES= option. The original data are first-differenced and transformed as specified in the TRANSFORM statement. By default, the type of spectral estimate that is used to calculate the spectral plot is the spectrum. If the PERIODOGRAM option is specified in the PROC X13 statement, then the periodogram of the series is used to calculate the spectral plot.

**SEASONS=***number*
specifies the number of observations in a seasonal cycle. If the SEASONS= option is not specified and INTERVAL=QTR, then SEASONS=4 is assumed. If the SEASONS= option is not specified and INTERVAL=MONTH, then SEASONS=12 is assumed. If the SEASONS= option is specified, its value should not conflict with the values of the INTERVAL= option or the values of the date variable. For more information, see the descriptions of the START=, DATE=, and INTERVAL= options.

**SPAN=(***mmmyy* **,***mmmyy* **)**
**SPAN=(***'yyQq'* **,***'yyQq'* **)**
specifies the dates of the first and last observations to define a subset for processing. A single date in parentheses is interpreted to be the starting date of the subset. To specify only the ending date, use SPAN=(,*mmmyy*). If the starting or ending date is omitted, then the first or last date, respectively, of the input data set or BY group is assumed. Because the dates are input as strings and the quarterly dates begin with a numeric character, the specification for a quarterly date must be enclosed in quotation marks. A four-digit year can be specified; if a two-digit year is specified, the value specified in the YEARCUTOFF= SAS system option applies.

**SPECTRUMSERIES=***table-name*

specifies the table name of the series that is used in the spectrum of the original series (Table G0). The table names that can be specified are A1, A19, B1, or E1. The default is B1.

**START=***mmmyy*

**START=***'yyQq'*

**STARTDATE=***mmmyy*

**STARTDATE=***'yyQq'*

specifies the date of the first observation. Unless the SPAN= option is used, the starting and ending dates are the dates of the first and last observations, respectively. Either this option or the DATE= option is required. When using this option, use either the INTERVAL= option or the SEASONS= option to specify monthly or quarterly data. If neither the INTERVAL= option nor the SEASONS= option is present, monthly data are assumed. Because the dates are input as strings and the quarterly dates begin with a numeric character, the specification for a quarterly date must be enclosed in quotation marks. A four-digit year can be specified; if a two-digit year is specified, the value specified in the YEARCUTOFF= SAS system option applies. When using the START= option with BY processing, the start date is applied to the first observation in each BY group.

## ADJUST Statement

**ADJUST** *option* **;**

The ADJUST statement adjusts the series for leap year and length-of-period factors prior to estimating a regARIMA model. The "Prior Adjustment Factors" table is associated with the ADJUST statement.

The following *option* can appear in the ADJUST statement:

**PREDEFINED=LOM | LOQ | LPYEAR**

specifies length-of-month adjustment, length-of-quarter adjustment, or leap year adjustment. PREDEFINED=LOM and PREDEFINED=LOQ are equivalent because the actual adjustment is determined by the interval of the time series. Also, because leap year adjustment is a limited form of length-of-period adjustment, only one type of predefined adjustment can be specified. The PREDEFINED= option should not be used in conjunction with PREDEFINED=TD or PREDEFINED=TD1COEF in the REGRESSION statement or MODE=ADD or MODE=PSEUDOADD in the X11 statement. PREDEFINED=LPYEAR cannot be specified unless the series is log transformed.

If the series is to be transformed by using a Box-Cox or logistic transformation, the series is first adjusted according to the ADJUST statement, and then it is transformed.

In the case of a length-of-month adjustment for the series with observations $Y_t$, each observation is first divided by the number of days in that month, $m_t$, and then multiplied by the average length of month (30.4375), resulting in $(30.4375 \times Y_t)/m_t$. Length-of-quarter adjustments are performed in a similar manner, resulting in $(91.3125 \times Y_t)/q_t$, where $q_t$ is the length in days of quarter $t$.

Forecasts of the transformed and adjusted data are transformed and adjusted back to the original scale for output.

## ARIMA Statement

**ARIMA** *option* **;**

The ARIMA statement specifies the ARIMA part of the regARIMA model. This statement defines a pure ARIMA model if no REGRESSION statements, INPUT statements, or EVENT statements are specified. The ARIMA part of the model can include multiplicative seasonal factors.

The following *option* can appear in the ARIMA statement:

**MODEL=((*p d q*) (*P D Q*)*s*)**

specifies the ARIMA model. The format follows standard Box-Jenkins notation (Box, Jenkins, and Reinsel 1994). The nonseasonal AR and MA orders are given by *p* and *q*, respectively, while the seasonal AR and MA orders are given by *P* and *Q*. The number of differences and seasonal differences are given by *d* and *D*, respectively. The notation (*p d q*) and (*P D Q*) can also be specified as (*p*, *d*, *q*) and (*P*, *D*, *Q*). The maximum lag of any AR or MA parameter is 36. The maximum value of a difference order, *d* or *D*, is 144. All values for *p*, *d*, *q*, *P*, *D*, and *Q* should be nonnegative integers. The seasonality parameter, *s*, should be a positive integer. If *s* is omitted, it is set equal to the value that is specified in the SEASONS= option in the PROC X13 statement.

For example, the following statements specify an ARIMA (2,1,1)(1,1,0)12 model:

```
proc x13 data=ICMETI seasons=12 start=jan1968;
   arima model=((2,1,1)(1,1,0));
```

## AUTOMDL Statement

**AUTOMDL** *options* **;**

The AUTOMDL statement invokes the automatic model selection procedure of the X-13ARIMA-SEATS method. This method is based largely on the TRAMO (time series regression with ARIMA noise, missing values, and outliers) method by Gómez and Maravall (1997a, b). If the AUTOMDL statement is used without the OUTLIER statement, then only missing values regressors are included in the regARIMA model. If both the AUTOMDL and the OUTLIER statements are used, then both missing values regressors and regressors for automatically identified outliers are included in the regARIMA model. For more information about missing value regressors, see the section "Missing Values" on page 3366.

If both the AUTOMDL statement and the ARIMA statement are present, the ARIMA statement is ignored. The ARIMA statement specifies the model, but the AUTOMDL statement allows the X13 procedure to select the model. If the AUTOMDL statement is specified and a data set is specified in the MDLINFOIN= option in the PROC X13 statement, then the AUTOMDL statement is ignored if the specified data set contains a model specification for the series. If no model for the series is specified in the MDLINFOIN= data set, the AUTOMDL or ARIMA statement is used to determine the model. Thus, it is possible to give a specific model for some series and automatically identify the model for other series by using both the MDLINFOIN= option and the AUTOMDL statement.

The AUTOMDL statement cannot be specified when the PICKMDL statement is also specified. The AUTOMDL and PICKMDL statements each specify different methods of automatic model selection. So, either one method must be used or the other method must be used to select a model.

When the AUTOMDL statement is specified, the X13 procedure compares a model selected using a TRAMO method to a default model. The TRAMO method is implemented first, and involves two parts: identifying the orders of differencing and identifying the ARIMA model. The table "ARIMA Estimates for Unit Root Identification" provides details about the identification of the orders of differencing, and the table "Results of Unit Root Test for Identifying Orders of Differencing" shows the orders of differencing selected by TRAMO. The table "Models Estimated by Automatic ARIMA Model Selection Procedure" provides details regarding the TRAMO automatic model selection, and the table "Best Five ARIMA Models Chosen by Automatic Modeling" ranks the best five models estimated using the TRAMO method. The "Comparison of Automatically Selected Model and Default Model" table compares the model selected by the TRAMO method to a default model. At this point in the processing, if the default model is selected over the TRAMO model, then PROC X13 displays a note. No note is displayed if the TRAMO model is selected. The Ljung-Box $Q$ statistic is then checked for acceptance, and the results are displayed in the "Check of the Residual Ljung-Box Q Statistic" table. The initial model selected at this point is displayed in the "Initial Automatic Model Selection" table. PROC X13 then performs final checks for unit roots, overdifferencing, and insignificant ARMA coefficients. The results of the final checks are displayed in the "Final Checks for Identified Model" table, which also indicates changes to the model order if the orders are changed. The last table, "Final Automatic Model Selection," shows the results of the automatic model selection; if the orders have been altered during the final checks, the Orders Altered column displays a value of Yes. An example of the automatic modeling selection procedure is shown in Example 46.4.

The following *options* can appear in the AUTOMDL statement:

**ACCEPTDEFAULT**
specifies that the default model be chosen if its Ljung-Box $Q$ is acceptable.

**ARMACV=***value*
specifies the threshold value for the $t$ statistics that are associated with the highest-order ARMA coefficients. As a check of model parsimony, the parameter estimates and $t$ statistics of the highest-order ARMA coefficients are examined to determine whether the coefficient is insignificant. An ARMA coefficient is considered to be insignificant if the $t$ value that is displayed in the table "Exact ARMA Maximum Likelihood Estimation" is below the value specified in the ARMACV= option and the absolute value of the parameter estimate is reliably close to zero. The absolute value is considered to be *reliably close to zero* if it is below 0.15 for 150 or fewer observations or is below 0.1 for more than 150 observations. If the highest-order ARMA coefficient is found to be insignificant, then the order of the ARMA model is reduced. For example, if AUTOMDL identifies a (3 1 1)(0 0 1) model and the parameter estimate of the seasonal MA lag of order 1 is –0.09 and its $t$ value is –0.55, then the ARIMA model is reduced to at least (3 1 1)(0 0 0). After the model is reestimated, the check for insignificant coefficients is performed again. If ARMACV=0.54 is specified in the preceding example, then the coefficient is not found to be insignificant and the model is not reduced.

If a constant is allowed in the model and if the $t$ value associated with the constant parameter estimate is below the ARMACV= critical value, then the constant is considered to be insignificant and is removed from the model. Note that if a constant is added to or removed from the model and then the ARIMA model changes, then the $t$ statistic for the constant parameter estimate also changes. Thus, changing the ARMACV= value does not necessarily add or remove a constant term from the model.

The value specified in the ARMACV= option should be greater than zero. The default value is 1.0.

**BALANCED**
specifies that the automatic modeling procedure prefer balanced models over unbalanced models. A balanced model is one in which the sum of the AR, seasonal AR, differencing, and seasonal differencing orders equals the sum of the MA and seasonal MA orders. Specifying BALANCED gives the same preference as the TRAMO program. If BALANCED is not specified, all models are given equal consideration.

**DIFFID=CONDITIONAL | EXACT | EXACTFIRST**
specifies the estimation to be used in automatic difference identification when Hannen-Rissanen fails. You can specify the following values:

**CONDITIONAL** uses conditional likelihood estimation.

**EXACT** uses exact likelihood estimation.

**EXACTFIRST** attempts to estimate the parameters by using exact likelihood for the first *diffiditer* iterations, where *diffiditer* is specified in the DIFFIDITER= option. If the estimation does not converge within *diffiditer* iterations, then conditional likelihood is used to estimate the parameters.

The effects of this option are displayed in the Estimation Method column in the "ARIMA Estimates for Unit Root Identification" table. By default, DIFFID=EXACTFIRST.

**DIFFIDITER=***diffiditer*
specifies the maximum number of exact likelihood estimation iterations when DIFFID=EXACTFIRST is specified. If the number of iterations exceeds *diffiditer*, then conditional likelihood is used to estimate the remaining iterations. The default value is 500; this default differs from the default value of 200 in the US Census Bureau's implementation of X-13ARIMA-SEATS.

**DIFFORDER=(***nonseasonal-order***, *seasonal-order*)**
specifies the fixed orders of differencing to be used in the automatic ARIMA model identification procedure. When the DIFFORDER= option is used, only the AR and MA orders are automatically identified. Acceptable values for the regular (nonseasonal) differencing orders are 0, 1, and 2; acceptable values for the seasonal differencing orders are 0 and 1. If the MAXDIFF= option is also specified, then the DIFFORDER= option is ignored. There are no default values for DIFFORDER. If neither the DIFFORDER= option nor the MAXDIFF= option is specified, then the default is MAXDIFF=(2,1).

**HRINITIAL**
specifies that Hannan-Rissanen estimation be done before exact maximum likelihood estimation to provide initial values. If the HRINITIAL option is specified, then models for which the Hannan-Rissanen estimation has an unacceptable coefficient are rejected.

**LJUNGBOXLIMIT=***value*
specifies acceptance criteria for the confidence coefficient of the Ljung-Box $Q$ statistic. If the Ljung-Box $Q$ for a final model is greater than this value, the model is rejected, the outlier critical value is reduced, and outlier identification is redone with the reduced value. For more information, see the REDUCECV option. The value specified in the LJUNGBOXLIMIT= option must be greater than 0 and less than 1. The default value is 0.95.

**MAXDIFF=(***nonseasonal-order***, *seasonal-order*)**
specifies the maximum orders of regular and seasonal differencing for the automatic identification of differencing orders. When MAXDIFF is specified, the differencing orders are identified first, and then the AR and MA orders are identified. Acceptable values for the regular differencing orders are 1 and 2. The only acceptable value for the seasonal differencing order is 1. If both the MAXDIFF= option and the DIFFORDER option= are specified, then the DIFFORDER= option is ignored. If neither the DIFFORDER= nor the MAXDIFF= option is specified, the default is MAXDIFF=(2,1).

**MAXORDER=(***nonseasonal-order***, *seasonal-order*)**
specifies the maximum orders of nonseasonal and seasonal ARMA polynomials for the automatic ARIMA model identification procedure. The maximum order for the nonseasonal ARMA parameters is 4, and the maximum order for the seasonal ARMA is 2.

**NOINT**
suppresses the fitting of a constant or intercept parameter in the model.

**PRINT=(***option-list***)**
specifies the tables to be displayed in the output. You can specify one or more of the following *options* (parentheses are optional; use a space between *options*):

**NONE** suppresses all automatic modeling output.

**ALL** includes all automatic modeling tables in the output if NONE is not specified in the *option-list*.

**ONLY** specifies that only the listed tables be output.

**AUTOCHOICE** displays the tables titled "Comparison of Automatically Selected Model and Default Model" and "Final Automatic Model Selection." The "Comparison of Automatically Selected Model and Default Model" table compares a default model to the model chosen by the TRAMO-based automatic modeling method. The "Final Automatic Model Selection" table indicates which model has been chosen automatically. These tables are output by default unless NONE or ONLY is specified in the *option-list*.

**AUTOCHOICEMDL** displays the table "Models Estimated by Automatic ARIMA Model Selection Procedure." This table summarizes the various models that were considered by the TRAMO automatic model selection method and their measures of fit.

**AUTOLJUNGBOX** displays the table "Check of the Residual Ljung-Box Q Statistic." This table is displayed only if the model is not accepted because the Ljung-Box $Q$ statistic is greater than the acceptance limit. The details of the test and the changes made either to the model or to the model selection method are displayed.

**BEST5MODEL** displays the table "Best Five ARIMA Models Chosen by Automatic Modeling." This table ranks the five best models that were considered by the TRAMO automatic modeling method.

**FINALCHECKS** displays the table "Final Checks for Identified Model." This table displays the results of the final checks for model adequacy. The final checks can result in the orders of the initially identified model being altered. Any order changes or changes in the constant term are included in this table. This table is output by default unless NONE or ONLY is specified in the *option-list*.

**INITCHOICEMDL** displays the table "Initial Automatic Model Selection." The "Comparison of Automatically Selected Model and Default Model" table compares a default model to the model chosen by the TRAMO-based automatic modeling method. The chosen model can then be altered if the model fails the Ljung-Box $Q$ statistic test. The "Initial Automatic Model Selection" table indicates which model has been chosen automatically after the Ljung-Box $Q$ statistic test. This table is output by default unless NONE or ONLY is specified in the *option-list*.

**UNITROOTTEST** displays the table titled "Results of Unit Root Test for Identifying Orders of Differencing." This table displays the orders that were automatically selected by the AUTOMDL statement. Unless the nonseasonal and seasonal differences are specified using the DIFFORDER= option, the AUTOMDL statement automatically identifies the orders of differencing. This table is output by default unless NONE or ONLY is specified in the *option-list*.

**UNITROOTTESTMDL** displays the table titled "ARIMA Estimates for Unit Root Identification." This table summarizes the various models that were considered by the TRAMO automatic selection method while it identified the orders of differencing and the statistics associated with those models. The unit root identification method first attempts to obtain the coefficients by using the Hannan-Rissanen method. If Hannan-Rissanen estimation cannot be performed, the algorithm attempts to obtain the coefficients by using conditional likelihood estimation.

By default, PRINT=(UNITROOTTEST AUTOCHOICE INITCHOICEMDL FINALCHECKS).

**REDUCECV=***value*

specifies the percentage by which the outlier critical value be reduced when a final model is found to have an unacceptable confidence coefficient for the Ljung-Box $Q$ statistic. This value should be between 0 and 1. The default value is 0.14286.

## BY Statement

**BY** *variables* **;**

A BY statement can be used with PROC X13 to obtain separate analyses on observations in groups defined by the BY variables. When a BY statement appears, the procedure expects the input DATA= data set to be sorted in order of the BY variables.

## CHECK Statement

**CHECK** *options* **;**

The CHECK statement produces statistics for diagnostic checking of residuals from the estimated regARIMA model.

The following tables that are associated with diagnostic checking are displayed in the output: "Autocorrelation of regARIMA Model Residuals," "Partial Autocorrelation of regARIMA Model Residuals," "Autocorrelation of Squared regARIMA Model Residuals," "Outliers of the Unstandardized Residuals," "Summary Statistics for the Unstandardized Residuals," "Normality Statistics for regARIMA Model Residuals," and "Table G Rs: 10*LOG(SPECTRUM) of the regARIMA Model Residuals." If ODS graphics is enabled, the following plots that are associated with diagnostic checking output are produced: the autocorrelation function (ErrorACF) plot of the residuals, the partial autocorrelation function (ErrorPACF) plot of the residuals, the autocorrelation function (SqErrorACF) plot of the squared residuals, a histogram (ResidualHistogram) of the residuals, and a spectral plot (SpectralPlot) of the residuals. For more information about controlling the display of plots, see the PLOTS=RESIDUAL option in the PROC X13 statement.

The residual histogram displayed by the X13 procedure shows the distribution of the unstandardized, uncentered regARIMA model residuals; the residual histogram displayed by the US Census Bureau's X-13ARIMA-SEATS seasonal adjustment program displays standardized and mean-centered residuals.

The following *options* can appear in the CHECK statement:

**MAXLAG=***value*

specifies the number of lags for the residual sample autocorrelation function (ACF) and partial autocorrelation function (PACF). The default is 36 for monthly series and 12 for quarterly series. The minimum value for MAXLAG= is 1.

For the table "Autocorrelation of Squared regARIMA Model Residuals" and the corresponding SqErrorACF plot, the maximum number of lags calculated is 12 for monthly series and 4 for quarterly series. The MAXLAG= option can only reduce the number of lags for this table and plot.

**PRINT=(***option-list***)**

specifies the diagnostic checking tables to be displayed. You can specify one or more of the following *options* (parentheses are optional; use a space between *options*):

**NONE** suppresses diagnostic checking output. If PRINT=NONE is specified and no other PRINT= option is specified, then none of the tables that are associated with diagnostic checking are displayed. However, PRINT=NONE has no effect if other PRINT= options are specified in the CHECK statement.

**ALL** specifies that all tables related to diagnostic checking be displayed.

**ACF** displays the table titled "Autocorrelation of regARIMA Model Residuals."

**ACFSQUARED** displays the table titled "Autocorrelation of Squared regARIMA Model Residuals."

**NORM** displays the table titled "Normality Statistics for regARIMA Model Residuals." Measures of normality included in this table are skewness, Geary's *a* statistic, and kurtosis.

**PACF** displays the table titled "Partial Autocorrelation of regARIMA Model Residuals."

**RESIDUALOUTLIER** displays the table titled "Outliers of the Unstandardized Residuals" if the residuals contain outliers. You can specify this option either as PRINT=RESIDUALOUTLIER or PRINT=RESOUTLIER.

**RESIDUALSTATISTICS** displays the table titled "Summary Statistics for the Unstandardized Residuals." You can specify this option either as PRINT=RESIDUALSTATISTICS or PRINT=RESSTAT.

**SPECRESIDUAL** displays the table titled "Table G Rs: 10*LOG(SPECTRUM) of the regARIMA Model Residuals."

By default, PRINT=(ACF ACFSQUARED NORM RESIDUALOUTLIER RESIDUALSTATISTICS SPECRESIDUAL).

## ESTIMATE Statement

**ESTIMATE** *options* **;**

The ESTIMATE statement estimates the regARIMA model. The regARIMA model is specified by the REGRESSION, INPUT, EVENT, and ARIMA statements or by the MDLINFOIN= data set in the PROC X13 statement. Estimation output includes point estimates and standard errors for all estimated AR, MA, and regression parameters; the maximum likelihood estimate of the variance $\sigma^2$; $t$ statistics for individual regression parameters; $\chi^2$ statistics for assessing the joint significance of the parameters associated with certain regression effects (if included in the model); and likelihood-based model selection statistics (if the exact likelihood function is used). The regression effects for which $\chi^2$ statistics are produced are fixed seasonal effects.

Tables displayed in the output associated with estimation are "Exact ARMA Likelihood Estimation Iteration Tolerances," "Average Absolute Percentage Error in within-Sample Forecasts," "ARMA Iteration History," "AR/MA Roots," "Exact ARMA Likelihood Estimation Iteration Summary," "Regression Model Parameter Estimates," "Chi-Squared Tests for Groups of Regressors," "Exact ARMA Maximum Likelihood Estimation," and "Estimation Summary."

The following *options* can appear in the ESTIMATE statement:

**EXACT=ARMA | MA | NONE**
specifies the likelihood function for estimation, likelihood evaluation, and forecasting. You can specify the following values:

**ARMA** uses the likelihood function that is exact for both AR and MA parameters.

**MA** uses the likelihood function that is exact for MA parameters, but conditional for AR parameters.

**NONE** uses the likelihood function that is conditional for both AR and MA parameters.

The ARMA estimation iterations are displayed in the "Iteration History" table, which is available when the ITPRINT option is specified. By default, EXACT=ARMA.

**ITPRINT**
displays the "Iteration History" table. This table includes detailed output for estimation iterations, including log-likelihood values, parameters, counts of function evaluations, and iterations. It is useful to examine the "Iteration History" table when errors occur within estimation iterations. By default, only successful iterations are displayed, unless the PRINTERR option is specified. An unsuccessful iteration is an iteration that is restarted due to a problem such as a root inside the unit circle. Successful iterations have a status of 0. If restarted iterations are displayed, a note at the end of the table gives definitions for status codes that indicate a restarted iteration. For restarted iterations, the number of function evaluations and the number of iterations is –1, which is displayed as missing. If regression parameters are included in the model, then both IGLS and ARMA iterations are included in the table. The number of function evaluations is a cumulative total.

**MAXITER=***value*
specifies the maximum number of iterations used in estimating the AR and MA parameters. For models that include regression variables, this limit applies to the total number of ARMA iterations over all iterations of the iterative generalized least squares (IGLS) algorithm. For models without regression variables, *value* is the maximum number of iterations allowed for the set of ARMA iterations. By default, MAXITER=1500.

**PRINTERR**
causes restarted iterations to be included in the "Iteration History" table if ITPRINT is specified; creates the "Restarted Iterations" table if ITPRINT is not specified. Whether or not PRINTERR is specified, a WARNING message is printed to the log file if any iteration is restarted during estimation.

**TOL=***value*
specifies the convergence tolerance for the nonlinear estimation. Absolute changes in the log-likelihood are compared to the TOL= value to check convergence of the estimation iterations. For models with regression variables, the TOL= value is used to check convergence of the IGLS iterations (where the regression parameters are reestimated for each new set of AR and MA parameters). For models without regression variables, there are no IGLS iterations, and the TOL= value is then used to check convergence of the nonlinear iterations that are used to estimate the AR and MA parameters. The default value is TOL=0.00001. The minimum tolerance value is a positive value based on the machine precision and the length of the series. If a tolerance less than the minimum supported value is specified, an error message is displayed and the series is not processed.

## EVENT Statement

**EVENT** *variables* < */ options* > **;**

The EVENT statement specifies events to be included in the regression portion of the regARIMA model. Multiple EVENT statements can be specified. Dummy variable values for EVENT variables are generated by the X13 procedure, however, the EVENT variables are input as user-defined regression effects to the X-13ARIMA-SEATS method. Thus, the EVENT variables are treated in the same manner as it treats variables specified in the USERVAR= option in the REGRESSION statement. If a MDLINFOIN= data set is not specified in the PROC X13 statement, then all variables specified in the EVENT statements are applied to all BY groups and all time series that are processed. If a MDLINFOIN= data set is specified, then the EVENT statements apply only if no regression information for the BY group and series is available in the MDLINFOIN= data set. The events specified in the EVENT statements either must be SAS predefined events

or must be defined in the data set specified in the INEVENT= option in the PROC X13 statement. For a summary of SAS predefined events, see the section "SAS Predefined Events" on page 3367.

The EVENT statement can also be used to include outlier, level-shift, and temporary change regressors that are available as predefined US Census Bureau variables in the X-13ARIMA-SEATS program. For example, the following statements specify an additive outlier in January 1970 and a level-shift that begins in July 1971:

```
proc x13 data=ICMETI seasons=12 start=jan1968;
   event AO01JAN1970D CBLS01JUL1971D;
```

The following statements specify an additive outlier in the second quarter 1970 and a temporary change that begins in the fourth quarter 1971:

```
proc x13 data=ICMETI seasons=4 start='1970q1';
   event AO01APR1970D TC01OCT1971D;
```

The following *options* can appear in the EVENT statement:

**B=(***value* < **F** > . . . **)**
specifies initial or fixed values for the EVENT parameters in the order in which they appear in *variables*. Each B= list applies to the variable list that immediately precedes the slash.

For example, the following statements set an initial value of 1 for the event, x:

```
event y ;
event x / b=1 2 ;
```

In this example, the B= option applies only to the second EVENT statement. The value 2 is discarded because there is only one variable in the variable list.

To assign an initial value of 1 to the y regressor and 2 to the x regressor, use the following statements:

```
event y / b=1;
event x / b=2 ;
```

An **F** immediately following the numerical value indicates that this is not an initial value, but a fixed value. For an example that uses fixed parameters, see Example 46.8. In PROC X13, individual parameters can be fixed while other parameters in the same model are estimated.

**USERTYPE=(***values***)**
enables a user-defined variable to be processed in the same manner as a US Census predefined variable. You can specify the following *values*: AO, CONSTANT, EASTER, HOLIDAY, LABOR, LOM, LOMSTOCK, LOQ, LPYEAR, LS, RP, SCEASTER, SEASONAL, TC, TD, TDSTOCK, THANKS, or USER. For example, the US Census Bureau EASTER(*w*) regression effects are included in the "RegARIMA Holiday Component" table (A7). Specify USERTYPE=EASTER to include an event variable that is processed exactly as the US Census predefined EASTER(*w*) variable, including inclusion in the A7 table. The NOAPPLY= option in the REGRESSION statement also changes the processing of variables based on the USERTYPE= value. Table 46.4 shows the regression types that are associated with each regression effects table.

Each USERTYPE= list applies to the variable list that immediately precedes the slash. The same rules for assigning B= values to regression variables apply for USERTYPE= options. For example, the

following statements specify that the event in the variable MyEaster be processed exactly as the US Census predefined LOM variable:

```
event MyLOM;
event MyEaster / usertype=LOM EASTER;
```

In this example, the USERTYPE= option applies only to the MyEaster variable in the second EVENT statement. The USERTYPE value **EASTER** is discarded because there is only one variable in the variable list.

To assign the USERTYPE value **LOM** to the MyLOM variable and **EASTER** to the MyEaster variable, use the following statements:

```
event MyLOM / usertype=LOM;
event MyEaster / usertype=EASTER;
```

The following USERTYPE= options specify that the regression effect be removed from the seasonally adjusted series: EASTER, HOLIDAY, LABOR, LOM, LOMSTOCK, LOQ, LPYEAR, SCEASTER, SEASONAL, TD, TDSTOCK, THANKS, and USER. When a regression effect is removed from the seasonally adjusted series, the level (mean) of the seasonally adjusted series can be altered. It is often desirable to use a zero-mean (mean-adjusted) regressor for effects that are to be removed from the seasonally adjusted series. For an example showing the effects of specifying a zero-mean regressor, see Example 46.6.

## FORECAST Statement

**FORECAST** *options* **;**

The FORECAST statement uses the estimated model to forecast the time series. The output contains point forecasts and forecast statistics for the transformed and original series. Whenever forecasts or backcasts (or both) are generated and seasonal adjustment is performed, the forecasts and backcasts are appended to the original series, and the seasonal adjustment procedures are applied to the forecast or backcast (or both) extended series. If the FORECAST statement is not specified, but a regARIMA model is specified using either the ARIMA or AUTOMDL statement, then the series is extended one year ahead by default.

Tables that contain forecasts, standard errors, and confidence limits are displayed in association with the FORECAST statement. If the data are transformed, then two tables are displayed: one table for the original data, and one table for the transformed data. Data from these tables can be output to a SAS data set using ODS. The auxiliary variable _SCALE_ is included in forecast data sets that are output using ODS. The value of _SCALE_ is "Original" or "Transformed" to indicate the scale of the data. The auxiliary variable can also be used in ODS SELECT and ODS OUTPUT statements. For example, you can specify the following statements to output the forecasts on the original scale to a data set forecasts and the forecasts on the transformed scale to a data set Tforecasts:

```
ods output Original.ForecastCL=forecasts;
ods output Transformed.ForecastCL=Tforecasts;
```

The following *options* can appear in the FORECAST statement:

**ALPHA=**$\alpha$

specifies the size of the upper and lower confidence limits, which are calculated as $1 - \alpha$, where $\alpha$ must be between 0 and 1. By default, ALPHA=0.05, which produces 95% confidence intervals.

**LEAD=***value*

specifies the number of periods ahead to forecast for regARIMA extension of the series. The default is the number of periods in a year (4 or 12), and the maximum is 120. Setting LEAD=0 specifies that the series not be extended by forecasts for seasonal adjustment. The LEAD= value also controls the number of forecasts that are displayed in Table D10.A. However, if the series is not extended by forecasts (LEAD=0), then the default year of forecasts is displayed in Table D10.A. Forecast values in Table D10.A are calculated using the method shown on page 148 of Ladiray and Quenneville (2001) based on values that are displayed in Table D10. The regARIMA forecasts affect the D10.A forecasts only indirectly through the impact of the regARIMA forecasts on the seasonal factors that are shown in Table D10. If the SEATSDECOMP statement is specified, then *value* is increased to the minimum required for SEATS decomposition. For more information, see the section "SEATS Decomposition" on page 3375.

**NBACKCAST=***value*

**BACKCAST=***value*

**NBACK=***value*

specifies the number of periods to backcast for regARIMA extension of the series. The default is NBACKCAST=0, which specifies that the series not be extended with backcasts. The maximum number of backcasts is 120. When the OUTBACKCAST option is specified, the NBACKCAST= value also controls the number of backcasts that are output to the OUT= data set specified in the OUTPUT statement. If the SEATSDECOMP statement is specified, then *value* is increased to the minimum required for SEATS decomposition. For more information, see the section "SEATS Decomposition" on page 3375.

**OUT1STEP**

specifies that the one-step-ahead forecasts be computed and displayed in addition to the multistep forecasts. The default is to compute and display only the multistep forecasts beginning at the forecast horizon.

**OUTBACKCAST**

**OUTBKCAST**

determines whether backcasts are included in certain tables sent to the output data set. If OUTBACKCAST is specified, then backcast values are included in the output data set for tables A6, A7, A8, A9, A10, B1, D10, D10B, D10D, D16, D16B, and D18. The default is not to include backcasts.

**OUTFCST**

**OUTFORECAST**

determines whether forecasts are included in certain tables sent to the output data set. If OUTFORECAST is specified, then forecast values are included in the output data set for Tables A6, A7, A8, A9, A10, B1, D10, D10B, D10D, D16, D16B, D18, and E18. The default is not to include forecasts. The OUTFORECAST option can be specified in either the X11 statement or the FORECAST statement with identical results.

## ID Statement

**ID** *variables* **;**

If you are creating an output data set, use the ID statement to copy values of the ID variables, in addition to the table values, into the output data set. Or, if the VAR statement is omitted, all numeric variables that are not identified as BY variables, ID variables, the DATE= variable, or user-defined regressors are processed as time series. The ID statement has no effect when a VAR statement is specified and an output data set is not created. If the DATE= variable is specified in the PROC X13 statement, this variable is included automatically in the OUTPUT data set. If no DATE= variable is specified, the variable _DATE_ is added.

The date variable (or _DATE_ ) values outside the range of the actual data (from forecasting) are extrapolated, while all other ID variables are missing in the forecast horizon.

## IDENTIFY Statement

**IDENTIFY** *options* **;**

The IDENTIFY statement produces plots of the sample autocorrelation function (ACF) and partial autocorrelation function (PACF) for identifying the ARIMA part of a regARIMA model. The sample ACF and PACF are produced for all combinations of the nonseasonal and seasonal differences of the data specified by the DIFF= and SDIFF= options.

The original series is first transformed as specified in the TRANSFORM statement.

If the model includes a regression component (specified using the REGRESSION, INPUT, and EVENT statements or the MDLINFOIN= data set in the PROC X13 statement), both the transformed series and the regressors are differenced at the highest order that is specified in the DIFF= and SDIFF= option. The parameter estimates are calculated using the differenced data. Then the undifferenced regression effects (with the exception of a constant term) are removed from the undifferenced data to produce undifferenced regression residuals. The ACFs and PACFs are calculated for the specified differences of the undifferenced regression residuals.

If the model does not include a regression component, then the ACFs and PACFs are calculated for the specified differences of the transformed data.

Tables displayed in association with identification are "Autocorrelation of Model Residuals" and "Partial Autocorrelation of Model Residuals." If the model includes a regression component (specified using the REGRESSION, INPUT, and EVENT statements or the MDLINFOIN= data set in the PROC X13 statement), then the "Regression Model Parameter Estimates" table is also displayed if the PRINTREG option is specified.

The following *options* can appear in the IDENTIFY statement:

**DIFF=(***order***,** *order***,** *order***)**

specifies orders of nonseasonal differencing to use in model identification. The value 0 specifies no differencing, the value 1 specifies one nonseasonal difference $(1 - B)$, the value 2 specifies two nonseasonal differences $(1 - B)^2$, and so forth. The ACFs and PACFs are produced for all orders of nonseasonal differencing specified, in combination with all orders of seasonal differencing that are specified in the SDIFF= option. The default is DIFF=(0). You can specify up to three values for nonseasonal differences.

**MAXLAG=***value*

specifies the number of lags for the sample autocorrelation function (ACF) and partial autocorrelation function (PACF) of the regression residuals for model identification. The default is 36 for monthly series and 12 for quarterly series. MAXLAG applies to both tables and plots. The minimum value for MAXLAG= is 1.

**PRINTREG**

causes the "Regression Model Parameter Estimates" table to be printed if the REGRESSION statement is present. By default, this table is not printed.

**SDIFF=(***order***, *order*, *order*)**

specifies orders of seasonal differencing to use in model identification. The value 0 specifies no seasonal differencing, the value 1 specifies one seasonal difference $(1 - B^s)$, the value 2 specifies two seasonal differences $(1 - B^s)^2$, and so forth. The value for $s$ corresponds to the period specified in the SEASONS= option in the PROC X13 statement. The value of the SEASONS= option is supplied explicitly or is implicitly supplied through the INTERVAL= option or the values of the DATE= variable. The ACFs and PACFs are produced for all orders of seasonal differencing specified, in combination with all orders of nonseasonal differencing specified in the DIFF= option. The default is SDIFF=(0). You can specify up to three values for seasonal differences.

For example, the following statement produces ACFs and PACFs for two levels of differencing: $(1-B)$ and $(1 - B)(1 - B^s)$:

```
identify diff=(1) sdiff=(0, 1);
```

## INPUT Statement

**INPUT** *variables* < / *options* > **;**

The INPUT statement specifies variables in the DATA= or AUXDATA= data set (which are specified in the PROC X13 statement) that are to be used as regressors in the regression portion of the regARIMA model. The variables in the data set should contain the values for each observation that define the regressor. Past values of regression variables should also be included in the DATA= or AUXDATA= data set if the time series listed in the VAR statement is to be extended with regARIMA backcasts. Similarly, future values of regression variables should also be included in the DATA= or AUXDATA= data set if the time series listed in the VAR statement is to be extended with regARIMA forecasts.

You can specify multiple INPUT statements. If you do not specify a MDLINFOIN= data set in the PROC X13 statement, then all variables listed in the INPUT statements are applied to all BY groups and all time series that are processed. If you specify a MDLINFOIN= data set, then the INPUT statements apply only if no regression information for the BY group and series is available in the MDLINFOIN= data set.

The INPUT statement provides the same functionality as the USERVAR= option in the REGRESSION statement. For more information about specifying user-defined regression variables, see the section "User-Defined Regression Variables" on page 3370, Example 46.6, and Example 46.11.

The following *options* can appear in the INPUT statement:

**B=(***value* < **F** > . . . **)**
specifies initial or fixed values for the regression parameters in the order in which they appear in *variables*. Each B= list applies to the variable list that immediately precedes the slash.

For example, the following statements set an initial value of 1 for the user-defined regressor, x:

```
input y ;
input x / b=1 2 ;
```

In this example, the B= option applies only to the second INPUT statement. The value 2 is discarded because there is only one variable in the variable list.

To assign an initial value of 1 to the y regressor and 2 to the x regressor, use the following statements:

```
input y / b=1;
input x / b=2 ;
```

An **F** immediately following the numerical value indicates that this is not an initial value, but a fixed value. For an example that uses fixed parameters, see Example 46.8. In PROC X13, individual parameters can be fixed while other parameters in the same model are estimated.

**USERTYPE=(***values***)**
enables a user-defined variable to be processed in the same manner as a US Census predefined variable. You can specify the following *values*: AO, CONSTANT, EASTER, HOLIDAY, LABOR, LOM, LOMSTOCK, LOQ, LPYEAR, LS, RP, SCEASTER, SEASONAL, TC, TD, TDSTOCK, THANKS, or USER. For example, the US Census Bureau EASTER(*w*) regression effects are included the "RegARIMA Holiday Component" table (A7). Specify USERTYPE=EASTER to include a user-defined variable that is processed exactly as the US Census predefined EASTER(*w*) variable, including inclusion in the A7 table. The NOAPPLY= option in the REGRESSION statement also changes the processing of variables based on the USERTYPE= value. Table 46.4 shows the regression types that are associated with each regression effects table.

Each USERTYPE= list applies to the variable list that immediately precedes the slash. The same rules for assigning B= values to regression variables apply for USERTYPE= options. For example, the following statements specify that the user-defined regressor in the variable MyEaster be processed exactly as the US Census predefined LOM variable:

```
input MyLOM;
input MyEaster / usertype=LOM EASTER;
```

In this example, the USERTYPE= option applies only to the MyEaster variable in the second INPUT statement. The USERTYPE value EASTER is discarded because there is only one variable in the variable list.

To assign the USERTYPE value LOM to the MyLOM variable and EASTER to the MyEaster variable, use the following statements:

```
input MyLOM / usertype=LOM;
input MyEaster / usertype=EASTER;
```

The following USERTYPE= options specify that the regression effect be removed from the seasonally adjusted series: EASTER, HOLIDAY, LABOR, LOM, LOMSTOCK, LOQ, LPYEAR, SCEASTER, SEASONAL, TD, TDSTOCK, THANKS, and USER. When a regression effect is removed from the seasonally adjusted series, the level (mean) of the seasonally adjusted series can be altered. It is often desirable to use a zero-mean (mean-adjusted) regressor for effects that are to be removed from the seasonally adjusted series. For an example that specifies a zero-mean regressor, see Example 46.6.

## OUTLIER Statement

**OUTLIER** *options* **;**

The OUTLIER statement specifies that the X13 procedure perform automatic detection of additive point outliers, temporary change outliers, level-shifts, or any combination of the three when using the specified model. After outliers are identified, the appropriate regression variables are incorporated into the model as "Automatically Identified Outliers," and the model is reestimated. This procedure is repeated until no additional outliers are found.

The OUTLIER statement also identifies potential outliers and lists them in the "Potential Outliers" table in the displayed output. Potential outliers are identified by decreasing the critical value by the value that is specified in the ALMOST= option.

In the output, the initial critical values used for outlier detection in a given analysis are displayed in the table "Critical Values to Use in Outlier Detection." Outliers that are detected and incorporated into the model are displayed in the output in the table "Regression Model Parameter Estimates," where the regression variable is listed as "Automatically Identified."

You can specify the following *options*:

**ALMOST=***value*

specifies the difference between the critical value for an automatically identified outlier and a potential outlier that is "almost" identified. *value* is subtracted from the critical value that is used to identify outliers to form a critical value that more aggressively identifies potential outliers. Potential outliers are not included in the regARIMA model. However, potential outliers are displayed in the "Potential Outliers" table. *value* must be greater than 0. By default, ALMOST=0.5.

**ALPHA=***value*

specifies the significance level to use for outlier identification, where critical values are calculated based on *value*. Any critical value that is specified in the CV=, AOCV=, LSCV=, or TCCV= option overrides the critical values that are calculated based on this option. *value* must be greater than 0 and less than or equal to 0.1. If you do not specify this option or the CV= option, the X-13ARIMA-SEATS method calculates the default initial critical value by assuming ALPHA=0.05.

**AOCV=***value*

specifies a critical value to use for additive point outliers. If you specify this option, it overrides any default initial critical value for AO outliers. For more information, see the CV= option.

**CV=***value*

specifies a default initial critical value to use for detecting all types of outliers. The absolute value of the *t* statistic that is associated with an outlier parameter estimate is compared with *value* to determine the significance of the outlier. If you do not specify this option, then the default initial critical value is computed based on the ALPHA= option, the CVMETHOD= option, and the number of observations for the model span that is used in the analysis. Table 46.2 shows initial critical values for various series lengths, which are based on the default values of the ALPHA= option and CVMETHOD= option. Increasing the critical value decreases the sensitivity of the outlier detection routine and can reduce the number of observations that are treated as outliers. The automatic model identification process might decrease the critical value by a certain percentage if the automatic model identification process fails to identify an acceptable model.

**Table 46.2** Default Critical Values for Outlier Identification

| Number of Observations | Outlier Critical Value |
|---|---|
| 1 | 1.96 |
| 2 | 2.24 |
| 3 | 2.44 |
| 4 | 2.62 |
| 5 | 2.74 |
| 6 | 2.84 |
| 7 | 2.92 |
| 8 | 2.99 |
| 9 | 3.04 |
| 10 | 3.09 |
| 11 | 3.13 |
| 12 | 3.16 |
| 24 | 3.42 |
| 36 | 3.55 |
| 48 | 3.63 |
| 72 | 3.73 |
| 96 | 3.80 |
| 120 | 3.85 |
| 144 | 3.89 |
| 168 | 3.92 |
| 192 | 3.95 |
| 216 | 3.97 |
| 240 | 3.99 |
| 264 | 4.01 |
| 288 | 4.03 |
| 312 | 4.04 |
| 336 | 4.05 |
| 360 | 4.07 |

**CVMETHOD=CORRECTED | LJUNG**

specifies the method to use to calculate the default initial critical value, based on the ALPHA= value and the number of observations for the model span that is used in the analysis. You can specify the following values:

**CORRECTED** uses a method that is a modification of the Ljung method in which critical values are interpolated based on the number of observations in the model span.

**LJUNG** uses a method that is based on the asymptotic formula described in Ljung (1993).

By default, CVMETHOD=CORRECTED.

**LSCV=***value*

specifies a critical value to use for level-shift outliers. If you specify this option, it overrides any default initial critical value for LS outliers. For more information, see the CV= option.

**LSRUN=***value*

specifies the maximum number of successive level-shift outliers to combine to form a temporary level-shift. Valid *values* for this option are 0 to 5, inclusive. If LSRUN=0 or LSRUN=1, no temporary level-shifts are evaluated. The evaluation of the temporary level-shifts is displayed in the "Tests for Cancellation of Level Shifts" table. By default, LSRUN=0.

**METHOD=ADDALL | ADDONE**

specifies whether to add outliers one at a time for each model estimation iteration or to add all outliers at once for each model estimation iteration. You can specify the following values:

**ADDALL** includes all significant outliers as regressors in the model, and then reestimates the model.

**ADDONE** adds the most significant outlier as a regressor in the model, and then reestimates the model.

For both methods, all candidate points for outliers are evaluated at each iteration and model estimation iterations continue until no remaining outliers are identified. By default, METHOD=ADDONE.

**SPAN=(***mmmyy* **,***mmmyy* **)**

**SPAN=(***'yyQq'* **,***'yyQq'* **)**

specifies the dates of the first and last observations to define a subset for searching for outliers. A single date in parentheses is interpreted to be the starting date of the subset. To specify only the ending date, use SPAN=(,*mmmyy*) or SPAN=(,*'yyQq'*). If the starting or ending date is omitted, then the first or last date, respectively, of the input data set or BY group is assumed. Because the dates are input as strings and the quarterly dates begin with a numeric character, the specification for a quarterly date must be enclosed in quotation marks. A four-digit year can be specified. If a two-digit year is specified, the value specified in the YEARCUTOFF= SAS system option applies.

**TCCV=***value*

specifies a critical value to use for temporary change (TC) outliers. If you specify this option, it overrides any default initial critical value for TC outliers. For more information, see the CV= option.

**TCRATE=***value*

specifies the rate of decay for temporary change outliers. *value* must be greater than 0 and less than 1. The default value is $(0.7)^{\frac{12}{period}}$, where *period* is the number of observations in one year.

**TYPE=NONE**

**TYPE=(***outlier types***)**

lists the outlier types to be detected by the automatic outlier identification method. TYPE=NONE turns off outlier detection. The valid outlier types are AO, LS, and TC. The default is TYPE=(AO LS).

## OUTPUT Statement

**OUTPUT OUT=***SAS-data-set* < **YEARSEAS** > *tablename1 tablename2 . . .* **;**

The OUTPUT statement creates an output data set that contains specified tables. The data set is named by the OUT= option.

**OUT=***SAS-data-set*

names the data set to contain the specified tables. If the OUT= option is omitted, the data set is named using the default DATA*n* convention.

**YEARSEAS**

**YRSEAS**

specifies that two additional variables be added to the OUT= data set. The two additional variables are the variables _YEAR_ and _SEASON_. The variable _YEAR_ contains the year of the date identifying the observation. The variable _SEASON_ contains the month for monthly data, or quarter for quarterly data, of the date that identifies the observation. For monthly data, the value of _SEASON_ is between 1 and 12. For quarterly data, the value of _SEASON_ is between 1 and 4. The _YEAR_ and _SEASON_ variables are useful when creating seasonal plots.

*tablename1 tablename2 . . .*

specify X13 *tablenames* that correspond to the title label used by the US Census Bureau X-13ARIMA-SEATS software. Specify one *tablename* for each table to be included in the output data set. Currently available *tablenames* are A1, A2, A6, A7, A8, A8AO, A8LS, A8TC, A9, A10, A19, B1, B7, B13, B17, B20, C1, C17, C20, D1, D7, D8, D8B, D8BX, D8BO, D8BL, D9, D10, D10B, D10D, D11, D11A, D11F, D11R, D12, D13, D16, D16B, D18, E1, E2, E3, E5, E6, E6A, E6R, E7, E8, E18, and MV1. Specifying D8B is equivalent to specifying D8, D8BX, D8BO, and D8BL because Table D 8.B displays the D8 series along with labels for extremes (D8BX), outliers (D8BO), and level shifts (D8BL). If no table is specified in the OUTPUT statement, Table A1 is output to the OUT= data set by default.

The *tablenames* that can be used in the OUTPUT statement are listed in the section "Displayed Output, ODS Table Names, and OUTPUT Tablename Keywords" on page 3376. The following is an example of a VAR statement and an OUTPUT statement:

```
var sales costs;
output out=out_x13  b1 d11;
```

The default variable name used in the output data set is the input variable name followed by an underscore and the corresponding table name. The variable sales_B1 contains the Table B1 values for the variable sales, the variable costs_B1 contains the Table B1 values for the variable costs, the variable sales_D11 contains the Table D11 values for the variable sales, and the variable costs_D11 contains the Table D11 values for the variable costs. If necessary, the variable name is shortened so that the table name can be added. If the DATE= variable is specified in the PROC X13 statement, then that variable is included in the output data set; otherwise, a variable named _DATE_ is written to the OUT= data set as the date identifier.

## PICKMDL Statement

**PICKMDL** *options* **;**

The PICKMDL statement enables you to specify a variety of options for the PICKMDL method. The PICKMDL method uses models that are specified in the MDLINFOIN= data set to choose a regARIMA model. If the MDLINFOIN= option is not specified, then the PICKMDL method chooses a model from the list shown in Table 46.14. Example 46.9 demonstrates the use of the PICKMDL statement.

The PICKMDL statement cannot be specified when the AUTOMDL statement is also specified. The AUTOMDL and PICKMDL statements each specify different methods of automatic model selection. So only one of these methods can be used to select a model.

For more information about using the US Census Bureau's PICKMDL method for model selection, see the section "PICKMDL Model Selection" on page 3374.

You can specify the following *options* in the PICKMDL statement:

**ARIMAMISS= ARIMASTMT | ZEROORDERS**
specifies the method for interpreting missing ARIMA information in a model that is present in the MDLINFOIN= data set. You can specify the following values:

**ARIMASTMT** interprets missing information as the model that is specified in the MODEL= option of the ARIMA statement. This option should not be specified if the MDLINFOOUT= data set from a previous X13 procedure call is being used to replicate previous results. However, the (0 0 0)(0 0 0) model is not always the most appropriate model to use as a default when no model has been specified. This option enables you to specify default model orders.

**ZEROORDERS** interprets missing information as the (0 0 0)(0 0 0) model. This method is compatible with the output from the MDLINFOOUT= option.

By default, ARIMAMISS=ZEROORDERS.

**MDLVAR=***variable*
specifies the variable in the MDLINFOIN= data set that identifies the models. A model identification variable is not required in the data set if fewer than two models are specified for each series. By default, MDLVAR= _MODEL_.

**METHOD= BEST | FIRST**
specifies the method for choosing the regARIMA model. You can specify the following values:

**BEST** chooses the best model.

**FIRST** chooses the first acceptable model.

By default, METHOD=FIRST.

## REGRESSION Statement

**REGRESSION** *regression-group-options* **;**

**REGRESSION PREDEFINED=** *variables* < / **B=(***value* < **F** > **...)** > **;**

**REGRESSION USERVAR=** *variables* < / **B=(***value* < **F** > **...) USERTYPE=(***values***)** > **;**

The REGRESSION statement includes regression variables in a regARIMA model or specifies regression variables whose effects are to be removed by the IDENTIFY statement to aid in ARIMA model identification. Include the PREDEFINED= option to select predefined regression variables. Include the USERVAR= option to specify user-defined regression variables.

Table 46.3 shows the X-13ARIMA-SEATS tables that contain regression factors. Tables A8AO, A8LS, and A8TC are available only when more than one outlier type is present in the model.

**Table 46.3** X-13ARIMA-SEATS Regression Effects Tables

| Table | Regression Effects |
|---|---|
| A6 | Trading day effects |
| A7 | Holiday effects including Easter, Labor Day, and Thanksgiving-Christmas |
| A8 | Combined effects of outliers, level-shifts, ramps, and temporary changes |
| A8AO | Point outlier effects; available only when more than one outlier type is present in the model |
| A8LS | Level-shift and ramp effects; available only when more than one outlier type is present in the model |
| A8TC | Temporary change effects; available only when more than one outlier type is present in the model |
| A9 | User-defined regression effects |
| A10 | User-defined seasonal component effects |

Missing values in the span of an input series automatically create missing value regressors. For more information about missing values, see the NOTRIMMISS option in the PROC X13 statement and the section "Missing Values" on page 3366.

Combining your model with additional predefined regression variables can result in a singularity problem. To successfully perform the regression if a singularity occurs, you might need to alter either the model or the choices of the regressors.

To seasonally adjust a series that uses a regARIMA model, the factors derived from regression are used as multiplicative or additive factors, depending on the mode of seasonal decomposition. Therefore, regressors that are appropriate to the mode of the seasonal decomposition should be defined, so that meaningful combined adjustment factors can be derived and adjustment diagnostics can be generated. For example, if a regARIMA model is applied to a log-transformed series, then the regression factors are expressed as ratios, which match the form of the seasonal factors that are generated by the multiplicative or log-additive adjustment modes. Conversely, if a regARIMA model is fit to the original series, then the regression factors are measured on the same scale as the original series, which matches the scale of the seasonal factors that are generated by the additive adjustment mode. Note that the default transformation (no transformation) and the default seasonal adjustment mode (multiplicative) are in conflict. Thus, when you specify the X11 statement and any of the REGRESSION, INPUT, or EVENT statements, you must also either use the TRANSFORM statement to specify a transformation or use the MODE= option in the X11 statement to specify a different mode to seasonally adjust the data that uses the regARIMA model.

According to Ladiray and Quenneville (2001), "X-12-ARIMA is based on the same principle [as the X-11 method] but proposes, in addition, a complete module, called Reg-ARIMA, that allows for the initial series to be corrected for all sorts of undesirable effects. These effects are estimated using regression models with ARIMA errors (Findley et al. [23])." The REGRESSION, INPUT, and EVENT statements specify these regression effects. Predefined effects that can be corrected in this manner are listed in the PREDEFINED= option. You can create your own definitions to remove other effects by using the USERVAR= option and the EVENT statement.

You can specify either the PREDEFINED= option or the USERVAR= option, but not both, in a single REGRESSION statement. You can use multiple REGRESSION statements.

You can specify the following *regression-group-options* in the REGRESSION statement. The *regression-group-options* apply to all regression variables in a regression group. For predefined regression variables, the regression group is predefined. For user-defined regression variables, you can specify the regression group in the USERTYPE= option.

**AICTEST=(EASTER | TD | TD1COEF | TD1NOLPYEAR | TDNOLPYEAR | TDSTOCK | USER)**

specifies that an AIC-based selection be used to determine whether a given set of regression variables are to be included with the specified regARIMA model. For example, if you specify a trading day model selection, then AIC values (with a correction for the length of the series, henceforth referred to as AICC) are derived for models with and without the specified trading day variable. By default, the model with a smaller AICC is used to generate forecasts, identify outliers, and so on. If you specify more than one type of regressor, the AIC tests are performed sequentially in this order: (a) trading day regressors, (b) Easter regressors, (c) user-defined regressors. If there are several variables of the same type (for example, several trading day regressors), then AIC-based selection is applied to them as a group. That is, either all variables of this type or none are included in the final model. If you do not specify this option, no automatic AIC-based selection is performed.

If you use the AUTOMDL statement to identify the model and you also specify this option, then this option affects the model selection process in the following manner:

- AIC-based selection tests are performed on the default model.
- A new series is created by removing the regression effects that are identified in the default model from the original series. The automatic model identification process attempts to identify a model that is based on the new series.

- After a model is automatically identified, AIC-based selection tests that use the automatically identified model are performed on the original series.
- The default model, including regressors that are identified by using AIC-based selection, is compared to the automatically identified model, which also might include regressors that are identified by using AIC-based selections. The regressors for the two models can differ.

For more information about the X-13ARIMA-SEATS automatic modeling method, see section 7.2 of the *X-13ARIMA-SEATS Reference Manual* (US Bureau of the Census 2009).

**EASTERMEANS=(YR400 | YR500 | SPAN)**

specifies how the monthly means, which are used to remove seasonality from the EASTER predefined regressor, are calculated. When PREDEFINED=EASTER(*w*) is specified in the REGRESSION statement, monthly means are computed internally over the 500-year range from 1600 to 2099 by default. These monthly means are then used to remove seasonality from the Easter effect prior to calculating the Easter regression coefficient. The EASTERMEANS= option is ignored if no predefined EASTER regressor is included in the regression model or if SCEASTER(*w*) is the only predefined Easter regressor specified. You can specify the following values:

**SPAN** computes short-term monthly means rather than long-term monthly means to remove seasonality in the Easter effect. In this case, the monthly means are computed over the same span of data that is used to calculate the coefficient of the EASTER(*w*) regressor.

**YR400** computes monthly means over the 400-year range from 1583 to 1982. This method was used in earlier versions of the X-13ARIMA-SEATS methodology.

**YR500** computes monthly means over the 500-year range from 1600 to 2099.

By default, EASTERMEANS=YR500.

**NOAPPLY=(AO | HOLIDAY | LS | TC | TD | USER | USERSEASONAL)**

specifies a list of the types of regression effects whose model-estimated values are not to be removed from the original series before performing the seasonal adjustment calculations that are specified by the X11 statement. The NOAPPLY= option applies to the regression component values displayed in the X11 seasonal adjustment method regARIMA component tables as shown in Table 46.4.

**Table 46.4** NOAPPLY= Types and Regression Effects

| NOAPPLY= Option | Regression Effects Table | Description |
|---|---|---|
| AO | A8AO | Point outliers |
| HOLIDAY | A7 | Easter, Labor Day, and Thanksgiving-to-Christmas holiday effects |
| LS | A8LS | Level changes and ramps |
| TC | A8TC | Temporary changes |
| TD | A6 | Trading day effects |
| USER | A9 | User-defined regression effects |
| USERSEASONAL | A10 | User-defined seasonal regression effects |

You can specify the following regression variable specification options in the REGRESSION statement.

**PREDEFINED=CONSTANT | EASTER(*value*) | LABOR(*value*) | LOM | LOMSTOCK | LOQ | LPYEAR**
**PREDEFINED=SCEASTER(*value*) | SEASONAL | SINCOS(*value . . .*) | TD | TD1COEF**
**PREDEFINED=TD1NOLPYEAR | TDNOLPYEAR | TDSTOCK(*value*) | THANK(*value*)**

lists the predefined regression variables to be included in the model. Data values for these variables are calculated by the program, mostly as functions of the calendar. Table 46.5 gives definitions for the available predefined variables. The values LOM and LOQ are equivalent: the actual regression is controlled by the SEASONS= option in the PROC X13 statement. You can specify multiple predefined regression variables. The syntax for using both a length-of-month and a seasonal regression can be in one of the following forms:

```
regression predefined=lom seasonal;

regression predefined=(lom seasonal);

regression predefined=lom predefined=seasonal;
```

The following restrictions apply when you use more than one predefined regression variable:

- You can specify only one of TD, TDNOLPYEAR, TD1COEF, or TD1NOLPYEAR.
- You cannot specify LPYEAR with TD, TD1COEF, LOM, LOMSTOCK, or LOQ.
- You cannot specify LOM or LOQ with TD or TD1COEF.
- If you specify the SINCOS predefined regression variable, then you must also specify the INTERVAL= option or the SEASONS= option in the PROC X13 statement because there are restrictions on this regression variable that are based on the frequency of the data.

The predefined regression variables, EASTER, LABOR, SCEASTER, SINCOS, TDSTOCK, and THANK, require extra parameters. Only one TDSTOCK regressor can be implemented in the regression model. If you specify multiple TDSTOCK variables, PROC X13 uses the last TDSTOCK variable specified. For EASTER, LABOR, SCEASTER, SINCOS, and THANK, you can specify the variables with different parameters to implement multiple regressors in the model. For example, the following statement specifies two EASTER regressors with widths 7 and 14:

```
regression predefined=easter(7) easter(14);
```

For SINCOS, specifying a parameter includes both the sine and the cosine regressor except for the highest order allowed (2 for quarterly data and 6 for monthly data.) For quarterly data, the following statement is the most common use of the SINCOS variable; it includes three regressors in the model:

```
regression predefined=sincos(1,2);
```

For monthly data, the following statement is the most common use of the SINCOS variable; it includes 11 regressors in the model:

```
regression predefined=sincos(1,2,3,4,5,6);
```

**Table 46.5** Predefined Regression Variables in X-13ARIMA-SEATS

| Regression Effect | Variable Definitions |
|---|---|
| Trend constant<br>CONSTANT | $(1-B)^{-d}(1-B^s)^{-D}I(t \geq 1)$<br>where $I(t \geq 1) = \begin{cases} 1 & \text{for } t \geq 1 \\ 0 & \text{for } t < 1 \end{cases}$ |
| Easter holiday<br>EASTER($w$) | $E(w,t) = \frac{1}{w} \times n_t$ and<br>$n_t$ is the number of the $w$ days before Easter that fall in month (or quarter) $t$. (Note: This variable is 0 except in February, March, and April (or first and second quarter).<br>It is nonzero in February only for $w > 22$.)<br>Restriction: $1 \leq w \leq 25$. |
| Labor Day<br>LABOR($w$) | $L(w,t) = \frac{1}{w} \times$ [no. of the $w$ days before Labor Day that fall in month $t$]<br>(Note: This variable is 0 except in August and September.)<br>Restriction: $1 \leq w \leq 25$. |
| Length-of-month (monthly flow)<br>LOM | $m_t - \bar{m}$ where $m_t$ = length of month $t$ (in days)<br>and $\bar{m} = 30.4375$ (average length of month) |
| Stock length-of-month<br>LOMSTOCK | $\text{SLOM}_t = \begin{cases} m_t - \bar{m} - \mu(l) & \text{for } t = 1 \\ \text{SLOM}_{t-1} + m_t - \bar{m} & \text{otherwise} \end{cases}$<br>where $\bar{m}$ and $m_t$ are defined in LOM and<br>$\mu(l) = \begin{cases} 0.375 & \text{when first February in series is a leap year} \\ 0.125 & \text{when second February in series is a leap year} \\ -0.125 & \text{when third February in series is a leap year} \\ -0.375 & \text{when fourth February in series is a leap year} \end{cases}$ |
| Length-of-quarter (quarterly flow)<br>LOQ | $q_t - \bar{q}$ where $q_t$ = length of quarter $t$ (in days)<br>and $\bar{q} = 91.3125$ (average length of quarter) |

**Table 46.5** *continued*

| Regression Effect | Variable Definitions |
|---|---|
| Leap year<br>(monthly and quarterly flow)<br>LPYEAR | $LY_t = \begin{cases} 0.75 & \text{in leap year February (first quarter)} \\ -0.25 & \text{in other Februaries (first quarter)} \\ 0 & \text{otherwise} \end{cases}$ |
| Statistics Canada Easter<br>(monthly or quarterly flow)<br>SCEASTER($w$) | If Easter falls before April $w$, let $n_E$ be the number of the $w$ days on or before Easter that fall in March. Then:<br>$E(w,t) = \begin{cases} n_E/w & \text{in March} \\ -n_E/w & \text{in April} \\ 0 & \text{otherwise} \end{cases}$<br>If Easter falls on or after April $w$, then $E(w,t) = 0$.<br>(Note: This variable is 0 except in March and April (or first and second quarter).) Restriction: $1 \leq w \leq 24$. |
| Fixed seasonal<br>SEASONAL | $M_{1,t} = \begin{cases} 1 & \text{in January} \\ -1 & \text{in December} \\ 0 & \text{otherwise} \end{cases}$<br>$, \ldots, M_{11,t} = \begin{cases} 1 & \text{in November} \\ -1 & \text{in December} \\ 0 & \text{otherwise} \end{cases}$ |
| Fixed seasonal<br>SINCOS($j$)<br>SINCOS($j_1, \ldots, j_n$) | $\sin(w_j t), \cos(w_j t)$,<br>where $w_j = 2\pi j/s$, $1 \leq j \leq s/2$, and $s$ is the seasonal period<br>(drop $\sin(w_j t) \equiv 0$ for $j = s/2$)<br>Restrictions: $1 \leq j_i \leq s/2$, $1 \leq n \leq s/2$. |
| Trading day<br>TD, TDNOLPYEAR | $T_{1,t} =$ (number of Mondays) – (number of Sundays)<br>$, \ldots, T_{6,t} =$ (number of Saturdays) – (number of Sundays) |
| One coefficient trading day<br>TD1COEF, TD1NOLPYEAR | (number of weekdays) $- \frac{5}{2}$(number of Saturdays and Sundays) |

**Table 46.5** *continued*

| Regression Effect | Variable Definitions |
|---|---|
| Stock trading day<br>TDSTOCK($w$) | $D_{1,t} = \begin{cases} 1 & \tilde{w}\text{th day of month } t \text{ is a Monday} \\ -1 & \tilde{w}\text{th day of month } t \text{ is a Sunday} \\ 0 & \text{otherwise} \end{cases}$<br>$, \ldots, D_{6,t} = \begin{cases} 1 & \tilde{w}\text{th day of month } t \text{ is a Saturday} \\ -1 & \tilde{w}\text{th day of month } t \text{ is a Sunday} \\ 0 & \text{otherwise} \end{cases}$<br>where $\tilde{w}$ is the smaller of $w$ and the length of month $t$.<br>For end-of-month stock series, set $w$ to 31; that is,<br>specify TDSTOCK(31). Restriction: $1 \leq w \leq 31$. |
| Thanksgiving<br>THANK($w$) | ThC$(w, t)$ = proportion of days from $w$ days before Thanksgiving through December 24 that fall in month $t$ (negative values of $w$ indicate days after Thanksgiving).<br>(Note: This variable is 0 except in November and December.)<br>Restriction: $-8 \leq w \leq 17$. |

**USERVAR=(*variables*)**

specifies variables in the DATA= or AUXDATA= data set (which are specified in the PROC X13 statement) that are to be used as regressors. The variables in the data set should contain the values for each observation that define the regressor. Regression variables should also include future values in the data set for the forecast horizon if the time series is to be extended with regARIMA forecasts. Regression variables should include past values if the time series is to be extended with regARIMA backcasts. Missing values are not permitted within the data span, including backcasts and forecasts, of the user-defined regressors. Example 46.6 shows how to create an input data set that contains both the series to be seasonally adjusted and a user-defined input variable. Example 46.11 shows how to create an auxiliary data set that contains a user-defined input variable. For more information about specifying user-defined regression variables, see the section "User-Defined Regression Variables" on page 3370.

All regression variables in the USERVAR= option apply to all time series to be seasonally adjusted unless the MDLINFOIN= data set specifies different regression information. You cannot specify the PREDEFINED= option and the USERVAR= option in the same REGRESSION statement; however, you can specify multiple REGRESSION statements.

You can specify the following *options* for individual regression variables. Individual regression variable options are specified in the PREDEFINED= and USERVAR= options after the slash. The B= option can be specified in both the PREDEFINED= and USERVAR= options. Because the regression group is predefined for predefined variables, you can specify the USERTYPE= option only in the USERVAR= option.

**B=(***value* < **F** > . . . **)**

specifies initial or fixed values for the regression parameters in the order in which they appear in a PREDEFINED= or USERVAR= option. Each B= list applies to the PREDEFINED= or USERVAR= variable list that immediately precedes the slash.

For example, the following statements set an initial value of 1 for the user-defined regressor, x:

```
regression predefined=LOM ;
regression uservar=x / b=1 2 ;
```

In this example, the B= option applies only to the USERVAR= option. The value 2 is discarded because there is only one variable in the USERVAR= list.

To assign an initial value of 1 to the LOM regressor and 2 to the x regressor, use the following statements:

```
regression predefined=LOM / b=1;
regression uservar=x / b=2 ;
```

An F immediately following the numerical value indicates that this is not an initial value, but a fixed value. For an example that uses fixed parameters, see Example 46.8. In PROC X13, individual parameters can be fixed while other parameters in the same model are estimated.

**USERTYPE=(***values***)**

enables a variable that you define to be processed in the same manner as a US Census predefined variable. You can specify the following *values*: AO, CONSTANT, EASTER, HOLIDAY, LABOR, LOM, LOMSTOCK, LOQ, LPYEAR, LS, RP, SCEASTER, SEASONAL, TC, TD, TDSTOCK, THANKS, or USER. For example, the US Census Bureau EASTER(*w*) regression effects are included the "RegARIMA Holiday Component" table (A7). Specify USERTYPE=EASTER to define a variable that is processed exactly as the US Census predefined EASTER(*w*) variable, including inclusion in the A7 table. Each USERTYPE= list applies to the USERVAR= variable list that immediately precedes the slash. USERTYPE= does not apply to US Census predefined variables.

The same rules for assigning B= values to regression variables apply for USERTYPE= options. For example, the following statements specify that the user-defined regressor in the variable MyEaster be processed exactly as the US Census predefined LOM variable:

```
regression uservar=MyLOM;
regression uservar=MyEaster / usertype=LOM EASTER;
```

In this example, the USERTYPE= option applies only to the MyEaster variable in the second REGRESSION statement. The USERTYPE value EASTER is discarded because there is only one variable in the USERVAR= list.

To assign the USERTYPE value LOM to the MyLOM variable and EASTER to the MyEaster variable, use the following statements:

```
regression uservar=MyLOM / usertype=LOM;
regression uservar=MyEaster / usertype=EASTER;
```

The following USERTYPE= options specify that the regression effect be removed from the seasonally adjusted series: EASTER, HOLIDAY, LABOR, LOM, LOMSTOCK, LOQ, LPYEAR, SCEASTER, SEASONAL, TD, TDSTOCK, THANKS, and USER. When a regression effect is removed from the seasonally adjusted series, the level (mean) of the seasonally adjusted series can be altered. It is often desirable to use a zero-mean (mean-adjusted) regressor for effects that are to be removed from the seasonally adjusted series. For an example that specifies a zero-mean regressor, see Example 46.6.

## SEATSDECOMP Statement (Experimental)

**SEATSDECOMP OUT=** *SAS-data-set* < *options* > **;**

The SEATSDECOMP statement creates an output data set (named by the OUT= option) that contains the SEATS decomposition series.

The following is an example of a VAR statement and a SEATSDECOMP statement:

```
var sales costs;
seatsdecomp out=SEATS_DECOMP;
```

The default variable name used in the output data set is the input variable name followed by an underscore and the corresponding table name. Because the B1 series is used as the original input series for the SEATS decomposition, the output data set SEATS_DECOMP from the example will contain the seasonal decomposition variables in the following order:

| | |
|---|---|
| sales_OS | contains the Table B1 values for the variable sales. |
| sales_SC | contains the SEATS decomposition seasonal component for the variable sales. |
| sales_TC | contains the SEATS trend component values for the variable sales. |
| sales_SA | contains the SEATS seasonally adjusted series for the variable sales. |
| sales_IC | contains the SEATS irregular component for the variable sales. |
| costs_OS | contains the Table B1 values for the variable costs. |
| costs_SC | contains the SEATS decomposition seasonal component for the variable costs. |
| costs_TC | contains the SEATS trend component values for the variable costs. |
| costs_SA | contains the SEATS seasonally adjusted series for the variable costs. |
| costs_IC | contains the SEATS irregular component for the variable costs. |

If necessary, the variable name is shortened so that the component name can be added. If you specify the DATE= variable in the PROC X13 statement, then that variable is included in the output data set; otherwise, a variable named _DATE_ is written to the OUT= data set as the date identifier. For more information about the output data set, see the section "SEATSDECOMP OUT= Data Set" on page 3384.

You can specify the following *options* in the SEATSDECOMP statement:

**LEAD=***value*

specifies the number of periods ahead to forecast for a regARIMA extension of the series. The default is twice the number of periods in a year (8 or 24), and the maximum is 120. In the SEATS computations, the number of backcasts and forecasts are the same, and the minimum number is also dependent on the ARIMA model orders. For more information, see the section "SEATS Decomposition" on page 3375. If you specify a LEAD= value that is less than the default, then the number of forecasts specified in the LEAD= option are displayed in the OUT= data set. If the value of the LEAD= option and NBACKCAST= options in the FORECAST statement are less than the required number for SEATS decomposition, then the values of the LEAD= and NBACKCAST= options in the FORECAST statement are increased.

**NBACKCAST=***value*

**BACKCAST=***value*

**NBACK=***value*

specifies the number of periods to backcast for a regARIMA extension of the series. The default is twice the number of periods in a year (8 or 24), and the maximum is 120. In the SEATS computations, the number of backcasts and forecasts are the same, and the minimum number is also dependent on the ARIMA model orders. For more information, see the section "SEATS Decomposition" on page 3375. If you specify a NBACKCAST= value that is less than the default, then the number of backcasts specified in the NBACKCAST= option are displayed in the OUT= data set. If the value of the LEAD= option and NBACKCAST= option specified in the FORECAST statement are less than the required number for SEATS decomposition when SEATSDECOMP is specified, then the value of LEAD= and NBACKCAST= in the FORECAST statement will be increased.

**OUT=***SAS-data-set*

names the data set to contain the SEATS decomposition series: original series, seasonal component, trend component, seasonally adjusted series, irregular component. If the OUT= option is omitted, the data set is named using the default DATA*n* convention.

**YEARSEAS**

**YRSEAS**

specifies that two additional variables be added to the OUT= data set: _YEAR_ and _SEASON_. The variable _YEAR_ contains the year of the date that identifies the observation. The variable _SEASON_ contains the month for monthly data, or quarter for quarterly data, of the date that identifies the observation. For monthly data, the value of _SEASON_ is between 1 and 12. For quarterly data, the value of _SEASON_ is between 1 and 4. The _YEAR_ and _SEASON_ variables are useful when you create seasonal plots.

## TABLES Statement

**TABLES** *tablename1 tablename2 . . . options* **;**

The TABLES statement enables you to alter the display of the PROC X13 tables. You can specify the display of tables that are not displayed by default by PROC X13, and the NOSUM option enables you to suppress the printing of the period summary line in the time series tables.

*tablename1 tablename2 . . .*
specifies X13 *tablenames* that correspond to the title label used by the US Census Bureau X-13ARIMA-SEATS software. For each table to be included in the displayed output, you must specify the X13 *tablename* keyword. Currently available tables are A19, B7, B13, B17, B20, C1, C20, D1, D7, E1, E2, and E3. Although these tables are not displayed by default, their values are sometimes useful in understanding the X-13ARIMA-SEATS method. For more information about the available tables, see the section "Displayed Output, ODS Table Names, and OUTPUT Tablename Keywords" on page 3376.

**NOSUM**

**NOSUMMARY**

**NOSUMMARYLINE**
applies to the tables available for output in the OUTPUT Statement. By default, these tables include a summary line that gives the average, total, or standard deviation for the historical data by period. The NOSUM option suppresses the display of the summary line in the listing. Also, if the tables are output with ODS, the summary line is not an observation in the data set. Thus, the output to the data set is only the time series, both the historical data and the forecast data, if available.

## TRANSFORM Statement

**TRANSFORM** *options* **;**

The TRANSFORM statement transforms or adjusts the series prior to estimating a regARIMA model. With this statement, the series can be Box-Cox (power) transformed. The "Prior Adjustment Factors" table is associated with the TRANSFORM statement.

Only one of the following *options* can appear in the TRANSFORM statement:

**POWER=***value*
transforms the input series, $Y_t$, by using a Box-Cox power transformation,

$$Y_t \rightarrow y_t = \begin{cases} \log(Y_t) & \lambda = 0 \\ \lambda^2 + (Y_t^{\lambda} - 1)/\lambda & \lambda \neq 0 \end{cases}$$

The power $\lambda$ must be specified (for example, POWER=0.33). The default is no transformation ($\lambda = 1$); that is, POWER=1. The log transformation (POWER=0), square root transformation (POWER=0.5), and the inverse transformation (POWER=–1) are equivalent to the corresponding FUNCTION= option.

**Table 46.6** Power Values Related to the Census Bureau Function Argument

| FUNCTION= | Transformation | Range for $Y_t$ | Equivalent Power Argument |
|---|---|---|---|
| NONE | $Y_t$ | All values | POWER=1 |
| LOG | $\log(Y_t)$ | $Y_t > 0$ for all $t$ | POWER=0 |
| SQRT | $2(\sqrt{Y_t} - 0.875)$ | $Y_t \geq 0$ for all $t$ | POWER=0.5 |
| INVERSE | $2 - \frac{1}{Y_t}$ | $Y_t \neq 0$ for all $t$ | POWER=–1 |
| LOGISTIC | $\log(\frac{Y_t}{1-Y_t})$ | $0 < Y_t < 1$ for all $t$ | No equivalent |

**FUNCTION=NONE | LOG | SQRT | INVERSE | LOGISTIC | AUTO**

specifies the transformation to be applied to the series prior to estimating a regARIMA model. The transformation used by FUNCTION=NONE, LOG, SQRT, INVERSE, or LOGISTIC is related to the POWER= option as shown in Table 46.6. FUNCTION=AUTO uses selection based on Akaike's information criterion (AIC) to decide between a log transformation and no transformation. The default is FUNCTION=NONE.

However, the FUNCTION= and POWER= options are not completely equivalent. In some cases, using the FUNCTION= option causes the program to automatically select other options. For example, FUNCTION=NONE causes the default mode to be MODE=ADD in the X11 statement. Also, the choice of transformation invoked by the FUNCTION=AUTO option can impact the default mode of the X11 statement.

There are restrictions on the value used in the POWER= and FUNCTION= options when preadjustment factors for seasonal adjustment are generated from a regARIMA model. When seasonal adjustment is requested with the X11 statement, any value of the POWER option can be used for the purpose of forecasting the series with a regARIMA model. However, this is not the case when factors generated from the regression coefficients are used to adjust either the original series or the final seasonally adjusted series. In this case, the only accepted transformations are the log transformation, which can be specified as POWER=0 for multiplicative or log-additive seasonal adjustments, and no transformation, which can be specified as POWER=1 for additive seasonal adjustments. If no seasonal adjustment is performed, any POWER transformation can be used. The preceding restrictions also apply when FUNCTION=NONE and FUNCTION=LOG are specified.

## USERDEFINED Statement

**USERDEFINED** *variables* **;**

The USERDEFINED statement is used to identify the variables in the input data set or auxiliary data set that are available for user-defined regression. Only numeric variables can be specified. Specifying variables in the USERDEFINED statement does not include the variables as regressors. If a variable is specified in the INPUT statement or USERVAR= option in the REGRESSION statement, it is not necessary to include that variable in the USERDEFINED statement. However, if a variable is specified in the MDLINFOIN= data set in the PROC X13 statement and is not specified in an INPUT statement or in the USERVAR= option in the REGRESSION statement, then the variable should be specified in the USERDEFINED statement in order to make the variable available for regression.

## VAR Statement

**VAR** *variables* **;**

The VAR statement specifies the variables in the input data set that are to be analyzed by the procedure. Only numeric variables can be specified. If the VAR statement is omitted, all numeric variables are analyzed except those that appear in a BY statement, ID statement, INPUT statement, or USERDEFINED statement; in the USERVAR= option in the REGRESSION statement; or in the DATE= option in the PROC X13 statement.

## X11 Statement

**X11** *options* **;**

The X11 statement is an optional statement for invoking seasonal adjustment by an enhanced version of the methodology of the US Census Bureau X-11 and X-11Q programs. You can control the type of seasonal adjustment decomposition calculated with the MODE= option. The output includes the final tables and diagnostics for the X-11 seasonal adjustment method listed in Table 46.7. Tables B7, B13, B17, B20, C1, E1, E2, E3, C20, D1, and D7 are not displayed by default; however, you can display these tables by requesting them in the TABLES statement.

**Table 46.7** Tables Related to X11 Seasonal Adjustment

| Table Name | Description |
|---|---|
| B1 | Original series, adjusted for prior effects and forecast extended |
| B7 | Preliminary trend-cycle, B iteration |
| B13 | Irregular component, B iteration |
| B17 | Preliminary weights for the irregular component |
| B20 | Extreme values, B iteration |
| C1 | Original series modified for outliers, trading day, and prior factors, C iteration |
| C17 | Final weights for the irregular component |
| C20 | Final extreme value adjustment factors |
| D1 | Modified original data, D iteration |
| D7 | Preliminary trend cycle, D iteration |
| D8 | Final unmodified SI ratios (differences) |
| D8A | *F* tests for stable and moving seasonality, D8 |
| D8B | Final unmodified SI ratios, with labels for outliers and extreme values |
| D9 | Final replacement values for extreme SI ratios (differences), D iteration |
| D9A | Moving seasonality ratios for each period |
| SeasonalFilter | Seasonal filter statistics for Table D10 |
| D10 | Final seasonal factors |
| D10B | Seasonal factors, adjusted for user-defined seasonal |
| D10D | Final seasonal difference |
| D11 | Final seasonally adjusted series |
| D11A | Final seasonally adjusted series with forced yearly totals |
| D11R | Rounded final seasonally adjusted series (with forced yearly totals) |
| TrendFilter | Trend filter statistics for Table D12 |

**Table 46.7** *continued*

| Table Name | Description |
|---|---|
| D12 | Final trend cycle |
| D13 | Final irregular component |
| D16 | Combined seasonal and trading day factors |
| D16B | Final adjustment differences |
| D18 | Combined calendar adjustment factors |
| E1 | Original data modified for extremes |
| E2 | Modified seasonally adjusted series |
| E3 | Modified irregular series |
| E4 | Ratio of yearly totals of original and seasonally adjusted series |
| E5 | Percent changes (differences) in original series |
| E6 | Percent changes (differences) in seasonally adjusted series |
| E6A | Percent changes (differences) in seasonally adjusted series with forced yearly totals (D11.A) |
| E6R | Percent changes (differences) in rounded seasonally adjusted series (D11.R) |
| E7 | Percent changes (differences) in final trend component series |
| E8 | Percent changes (differences) in original series adjusted for calendar factors (A18) |
| E18 | Final adjustment ratios (original series to seasonally adjusted series) |
| F2A–F2I | X11 diagnostic summary |
| F3 | Monitoring and quality assessment statistics |
| F4 | Day of the week trading day component factors |
| G | Spectral plots |

For more information about the X-11 seasonal adjustment diagnostics, see Shiskin, Young, and Musgrave (1967), Lothian and Morry (1978a), and Ladiray and Quenneville (2001).

You can specify the following *options* in the X11 statement:

**FINAL=AO | LS | TC | USER |ALL**

**FINAL=(*options*)**

lists the types of prior adjustment factors, obtained from the EVENT, REGRESSION, and OUTLIER statements, that are to be removed from the final seasonally adjusted series. Additive outliers are removed by specifying FINAL=AO. Level change and ramp outliers are removed by specifying FINAL=LS. Temporary change outliers are removed by specifying FINAL=TC. User-defined regressors or events (USERTYPE=USER) are removed by specifying FINAL=USER. All the preceding are removed by specifying FINAL=ALL or by specifying all the options in parentheses, FINAL=(AO LS TC USER). If this option is not specified, the final seasonally adjusted series contains these effects.

**FORCE=TOTALS | ROUND | BOTH**

specifies that the seasonally adjusted series be modified to: (a) force the yearly totals of the seasonally adjusted series and the original series to be the same (FORCE=TOTALS), (b) adjust the seasonally adjusted values for each calendar year so that the sum of the rounded seasonally adjusted series for any year equals the rounded annual total (FORCE=ROUND), or (c) first force the yearly totals, then round the adjusted series (FORCE=BOTH). When FORCE=TOTALS is specified, the differences between the annual totals is distributed over the seasonally adjusted values in a way that approximately preserves the month-to-month (or quarter-to-quarter) movements of the original series. For more

information, see Huot (1975) and Cholette (1979). This forcing procedure is not recommended if the seasonal pattern is changing or if trading day adjustment is performed. Forcing the seasonally adjusted totals to be the same as the original series annual totals can degrade the quality of the seasonal adjustment, especially when the seasonal pattern is undergoing change. It is not natural if trading day adjustment is performed because the aggregate trading day effect over a year is variable and moderately different from zero.

**MODE=ADD | MULT | LOGADD | PSEUDOADD**

determines the mode of the seasonal adjustment decomposition to be performed. The four option choices correspond to additive, multiplicative, log-additive, and pseudo-additive decomposition, respectively. If this option is omitted, the procedure performs multiplicative adjustments. Table 46.8 shows the values of the MODE= option and the corresponding models for the original (O) and the seasonally adjusted (SA) series.

**Table 46.8** Modes of Seasonal Adjustment and Their Models

| Value of Mode Option | Name | Model for $O$ | Model for $SA$ |
|---|---|---|---|
| MULT | Multiplicative | $O = C \times S \times I$ | $\mathrm{SA} = C \times I$ |
| ADD | Additive | $O = C + S + I$ | $\mathrm{SA} = C + I$ |
| PSEUDOADD | Pseudo-additive | $O = C \times [S + I - 1]$ | $\mathrm{SA} = C \times I$ |
| LOGADD | Log-additive | $\log(O) = C + S + I$ | $\mathrm{SA} = \exp(C + I)$ |

**OUTFORECAST**

**OUTFCST**

determines whether forecasts are included in certain tables sent to the output data set. If OUTFORECAST is specified, then forecast values are included in the output data set for Tables A6, A7, A8, A9, A10, B1, D10, D10B, D10D, D16, D16B, D18, and E18. The default is not to include forecasts. The OUTFORECAST option can be specified in either the X11 statement or the FORECAST statement with identical results.

**SEASONALMA=S3X1 | S3X3 | S3X5 | S3X9 | S3X15 | STABLE | X11DEFAULT | MSR**

**SEASONALMA=***(filter-list-by-period)*

specifies which seasonal moving average (also called "seasonal filter") to use to estimate the seasonal factors. These seasonal moving averages are $n \times m$ *moving averages*, meaning that an $n$-term simple average is taken of a sequence of consecutive $m$-term simple averages. X11DEFAULT is the method used by the US Census Bureau's X-11-ARIMA program.

You can specify either a single filter option or a list. A single option indicates that all periods will use the same filter or the same method of identifying the filter. Alternately, you can specify the seasonal filters for each seasonal period by specifying SEASONALMA=*(filter-list-by-period)*, where *(filter-list-by-period)* lists the moving average filter for each period. For quarterly data, you must specify four filters; for monthly data, you must specify 12 filters. In the *filter-list-by-period*, you can specify S3X1, S3X3, S3X5, S3X9, or S3X15. For example, the following statement assigns a $3 \times 1$ moving average filter to the first quarter of a quarterly series and a $3 \times 3$ moving average to the second, third, and fourth quarters:

```
X11 SEASONALMA=( S3X1 S3X3 S3X3 S3X3 );
```

Table 46.9 describes the seasonal filter options available for the entire series:

**Table 46.9** X-13ARIMA-SEATS Seasonal Filter Options and Descriptions

| Filter Name | Description of Filter |
|---|---|
| S3X1 | A $3 \times 1$ moving average |
| S3X3 | A $3 \times 3$ moving average |
| S3X5 | A $3 \times 5$ moving average |
| S3X9 | A $3 \times 9$ moving average |
| S3X15 | A $3 \times 15$ moving average |
| STABLE | Stable seasonal filter: a single seasonal factor for each calendar month or quarter is generated by calculating the simple average of all the values for each month or quarter (taken after detrending and outlier adjustment) |
| X11DEFAULT | Uses a $3 \times 3$ moving average to calculate the initial seasonal factors in each iteration and a $3 \times 5$ moving average to calculate the final seasonal factors |
| MSR | Filter chosen automatically by using the moving seasonality ratio of X-11-ARIMA/88 (Dagum 1988) |

By default, SEASONALMA=MSR, which is the methodology of Statistic Canada's X-11-ARIMA/88 program.

**SIGMALIM=(***lower limit***,** *upper limit* **)**

**SIGMALIM=(***lower limit* **)**

**SIGMALIM=( ,** *upper limit* **)**

specifies the lower and upper sigma limits in standard deviation units which are used to identify and down-weight extreme irregular values in the internal seasonal adjustment computations. One or both limits can be specified. The lower limit must be greater than 0 and not greater than the upper limit. If the lower sigma limit is not specified, then it defaults to a value of 1.5. The default upper sigma limit is 2.5. The comma must be used if the upper limit is specified.

Table 46.10 shows the effect of the SIGMALIM= option on the weights that are applied to the internal irregular values.

**Table 46.10** Weights for Irregular Values

| Weight | Sigma Limit |
|---|---|
| 0 | If $\frac{\lvert I_t-\mu\rvert}{\sigma_{1,I_t}} \geq$ *upper limit* |
| Partial weight | If *lower limit* $< \frac{\lvert I_t-\mu\rvert}{\sigma_{2,I_t}} <$ *upper limit* |
| 1 | If $\frac{\lvert I_t-\mu\rvert}{\sigma_{2,I_t}} \leq$ *lower limit* |

In Table 46.10, $\mu$ is the theoretical mean of the irregular component, and $\sigma_{1,I_t}$ and $\sigma_{2,I_t}$ are the respective estimates of the standard deviation of the irregular component before and after extreme values are removed. The estimates of the standard deviation $\sigma_{1,I_t}$ and $\sigma_{2,I_t}$ vary with respect to $t$, and they are the same if no extreme values are removed. If they are different ($\sigma_{2,I_t} < \sigma_{1,I_t}$), then the first line in Table 46.10 is reevaluated with $\sigma_{2,I_t}$. In the special case where the lower limit equals the upper limit, the weight is 1 for $\frac{\lvert I_t-\mu\rvert}{\sigma_{2,I_t}} \leq$ *lower limit*, and 0 otherwise. For more information about how extreme irregular values are handled in the X11 computations, see Ladiray and Quenneville 2001, pp. 53–68, 122–125.

**TRENDMA=***value*

specifies which Henderson moving average is used to estimate the final trend cycle. Any odd number greater than one and less than or equal to 101 can be specified (for example, TRENDMA=23). If the TRENDMA= option is not specified, the program selects a trend moving average based on statistical characteristics of the data. For monthly series, a 9-, 13-, or 23-term Henderson moving average is selected. For quarterly series, the program chooses either a 5- or a 7-term Henderson moving average.

**TYPE=SA | SUMMARY | TREND**

specifies the method used to calculate the final seasonally adjusted series (Table D11). The default method is TYPE=SA. This method assumes that the original series has not been seasonally adjusted. For method TYPE=SUMMARY, the trend cycle, irregular, trading day, and holiday factors are calculated, but not removed from the seasonally adjusted series. Thus, for TYPE=SUMMARY, Table D11 is the same as the original series. For TYPE=TREND, trading day, holiday, and prior adjustment factors are removed from the original series to calculate the seasonally adjusted series (Table D11) and also are used in the calculation of the final trend (Table D12).

# Details: X13 Procedure

## Data Requirements

The input data set must contain either quarterly or monthly time series, and the data must be sorted in chronological order within each BY group. For the standard X-13ARIMA-SEATS method, there must be at least three years of observations (12 for quarterly time series or 36 for monthly).

If an ARIMA model is specified in the ARIMA statement, AUTOMDL statement, PICKMDL statement, or the MDLINFOIN= data set, then more than three years of observations might be required in order to fit the ARIMA model and perform the computations associated with the seasonal decomposition and other diagnostics.

The minimum number of observations applies to each series listed in the VAR statement and within each BY group and is determined after any missing values are trimmed from the series.

## Missing Values

PROC X13 can process a series with missing values.

### Types of Missing Values

Missing values in a series are considered to be one of two types:

- A leading or trailing missing value occurs before the first nonmissing value or after the last nonmissing value, respectively, in the span of a series. The span of a series can be determined either explicitly by the SPAN= option or implicitly by the START= or DATE= option in the PROC X13 statement. By default, leading and trailing missing values are ignored. If you specify the NOTRIMMISS option in the PROC X13 statement, PROC X13 processes leading and trailing missing values according to the X-13ARIMA-SEATS missing value method.
- An embedded missing value occurs between the first nonmissing value and the last nonmissing value in the span of the series. PROC X13 processes embedded missing values according to the X-13ARIMA-SEATS missing value method.

### X-13ARIMA-SEATS Missing Value Method

When the X-13ARIMA-SEATS method encounters a missing value, it inserts an additive outlier for the missing observation into the set of regression variables for the model of the series and then replaces the missing observation with a value large enough to be considered an outlier during model estimation. After the regARIMA model is estimated, the X-13ARIMA-SEATS method adjusts the original series by using factors that are generated from these missing value outlier regressors. The adjusted values are estimates of the missing values, and the adjusted series is displayed in Table MV1. The X-13ARIMA-SEATS missing value method requires the use of a regARIMA model to replace the missing values. Thus, either an ARIMA or AUTOMDL statement or the MDLINFOIN= option in the PROC X13 statement must be specified if there are embedded missing values in the time series.

## SAS Predefined Events

SAS predefined events are summarized in this section. For complete details about SAS predefined events, see the section "EVENTKEY Statement" in *SAS Forecast Studio: User's Guide*.

Table 46.11 shows a summary of the SAS predefined event keywords. Table 46.12 lists the holiday date keywords that can be used as SAS predefined events. Table 46.13 lists the seasonal date keywords that can be used as SAS predefined events.

**Table 46.11** Definitions for EVENTKEY Predefined Event Keywords

| Variable Name or Variable Name Format | Description | Qualifier Options |
|---|---|---|
| AO<*obs*>OBS<br>AO<*date*>D<br>AO<*datetime*>DT | Outlier | TYPE=POINT VALUE=1<br>BEFORE=(DURATION=0)<br>AFTER=(DURATION=0) |

**Table 46.12** Holiday Date Keywords and Definitions

| Date Keyword | Definition |
|---|---|
| BOXING | December 26 |
| CANADA | July 1 |
| CANADAOBSERVED | July 1, or July 2 if July 1 is a Sunday |
| CHRISTMAS | December 25 |
| COLUMBUS | Second Monday in October |
| EASTER | Easter Sunday |
| FATHERS | Third Sunday in June |
| HALLOWEEN | October 31 |
| JUNETEENTH | June 19 |
| JUNETEENTHUSG | Juneteenth date observed by US government for Monday–Friday schedule |

**Table 46.12** *continued*

| Date Keyword | Definition |
|---|---|
| JUNETEENTHUSPS | Juneteenth date observed by US government for Monday–Saturday schedule (US Postal Service) |
| LABOR | First Monday in September |
| MLK | Third Monday in January |
| MEMORIAL | Last Monday in May |
| MOTHERS | Second Sunday in May |
| NEWYEAR | January 1 |
| THANKSGIVING | Fourth Thursday in November |
| THANKSGIVINGCANADA | Second Monday in October |
| USINDEPENDENCE | July 4 |
| USPRESIDENTS | Third Monday in February (since 1971) |
| VALENTINES | February 14 |
| VETERANS | November 11 |
| VETERANSUSG | Veterans Day date that is observed by US government for Monday–Friday schedule |
| VETERANSUSPS | Veterans Day date that is observed by US government for Monday–Saturday schedule (US Post Office) |
| VICTORIA | Monday on or preceding May 24 |

**Table 46.13** Seasonal Date Keywords and Definitions

| Date Keyword | Definition |
|---|---|
| SECOND_1, . . . , SECOND_60 | Specified second |
| MINUTE_1, . . . , MINUTE_60 | Beginning of the specified minute |
| HOUR_1, . . . , HOUR_24 | Beginning of the specified hour |
| SUNDAY, . . . , SATURDAY | All Sundays, and so on, in the time series |
| WEEK_1, . . . , WEEK_53 | First day of the $n$th week of the year (PULSE=WEEK.n shifts this date for $n \neq 1$) |
| TENDAY_1, TENDAY_4, . . . , TENDAY_34 | The first day of the month |
| TENDAY_2, TENDAY_5, . . . , TENDAY_35 | The 11th day of the month |
| TENDAY_3, TENDAY_6, . . . , TENDAY_36 | The 21st day of the month |
| SEMIMONTH_1, SEMIMONTH_3, . . . , SEMIMONTH_23 | The first day of the month |
| SEMIMONTH_2, SEMIMONTH_4, . . . , SEMIMONTH_24 | The 16th day of the month |

**Table 46.13** *continued*

| Date Keyword | Definition |
|---|---|
| JANUARY, . . . , DECEMBER | The first day of the specified month |
| QTR_1, QTR_2, QTR_3, QTR_4 | The first date of the quarter indicated after the underscore (PULSE=QTR.n shifts this date for $n \neq 1$) |
| SEMIYEAR_1, SEMIYEAR_2 | The first date of the semiyear (PULSE=SEMIYEAR.n shifts this date for $n \neq 1$) |

## User-Defined Regression Variables

The X-13ARIMA-SEATS method enables you to define regression variables to be included in the regARIMA model. A user-defined regression variable is composed of a value at each time series observation that you provide; the entire variable is implemented as a regressor in the regARIMA model. The regARIMA model is used in the seasonal decomposition process to extend the series prior to X11 decomposition. Because the X-13ARIMA-SEATS method does not impute, forecast, nor backcast user-defined regression variables, you must provide a nonmissing value at each observation in the span of the time series to be modeled and also provide a nonmissing value at each observation to be forecast or backcast.

A user-defined regression variable can be included in either the PROC X13 DATA= or AUXDATA= data set. You can supply the values for the user-defined regression variable by one of the following methods:

- You can include them in an auxiliary data set. The auxiliary data set should have a date variable that corresponds to the date variable in the DATA= data set. The name of the auxiliary data set is specified in the AUXDATA= option in the PROC X13 statement. The name of the date variable that exists in both the DATA= and AUXDATA= data sets is specified in the DATE= option in the PROC X13 statement. The observations in the auxiliary data set must span the entire series plus any forecast and backcast period.
- You can include them in the DATA= data set. Because the number of observations and the date values are exactly the same for both user-defined regressors and time series values, you need to include forecast and backcast values for user-defined regression variables beyond the span of the time series in one of the following ways:
  - You must specify leading missing values in the series to be seasonally adjusted for backcast periods. You must specify trailing missing values in the series to be seasonally adjusted for forecast periods. You must not use the NOTRIMMISS option in this case. The span of the series to be seasonally adjusted that is implied by trimming the leading and trailing missing values will be less than the span of the date values in the DATA= data set. Using this method, forecast error cannot be computed for the forecast and backcast periods.
  - You can use the SPAN= option in the PROC X13 statement to alter the span of the series to be seasonally adjusted to allow for backcast and forecast periods within the span of the date values in the DATA= data set. Using this method, forecast error can be computed for the forecast and backcast periods.

These methods of including user-defined regression variables in the regARMIA model are illustrated in Example 46.6 and Example 46.11.

If missing values for the user-defined regression variable are present within the span of the time series, including backcast and forecast observations, then an error message is displayed and the time series is not processed. If the span of the user-defined regression variable, or the span after leading and trailing missing values are trimmed, is not sufficient to cover the span of the series to be seasonally adjusted, including any backcasts and forecasts, then an error message is also displayed, and the time series is not processed.

## Combined Test for the Presence of Identifiable Seasonality

The seasonal component of a time series, $S_t$, is defined as the intrayear variation that is repeated constantly (stable) or in an evolving fashion from year to year (moving seasonality). If the increase in the seasonal factors from year to year is too large, then the seasonal factors introduce distortion into the model. It is important to determine whether seasonality is identifiable without distorting the series.

For seasonality to be identifiable, the series should be identified as seasonal by using the "Test for the Presence of Seasonality Assuming Stability" and "Nonparametric Test for the Presence of Seasonality Assuming Stability." Also, since the presence of moving seasonality can cause distortion, it is important to evaluate the moving seasonality in conjunction with the stable seasonality to determine whether the seasonality is identifiable. The results of these tests are displayed in "$F$ tests for Seasonality" (Table D8.A) in the X13 procedure.

The test for identifiable seasonality is performed by combining the $F$ tests for stable and moving seasonality, along with a Kruskal-Wallis test for stable seasonality. The following description is based on Lothian and Morry (1978b). Other details can be found in Dagum (1988, 1983).

Let $F_s$ and $F_m$ denote the $F$ value for the stable and moving seasonality tests, respectively. The combined test is performed as follows (see also Figure 46.3):

1. If the null hypothesis of no stable seasonality is not rejected at the 0.10% significance level ($P_S \geq 0.001$), then the series is considered to be nonseasonal. PROC X13 returns the conclusion, "Identifiable Seasonality Not Present."

2. If the null hypothesis in step 1 is rejected, then PROC X13 computes the following quantities:

$$T_1 = \frac{7}{F_s}$$

$$T_2 = \frac{3F_m}{F_s}$$

   Let $T$ denote the simple average of $T_1$ and $T_2$:

$$T = \frac{(T_1 + T_2)}{2}$$

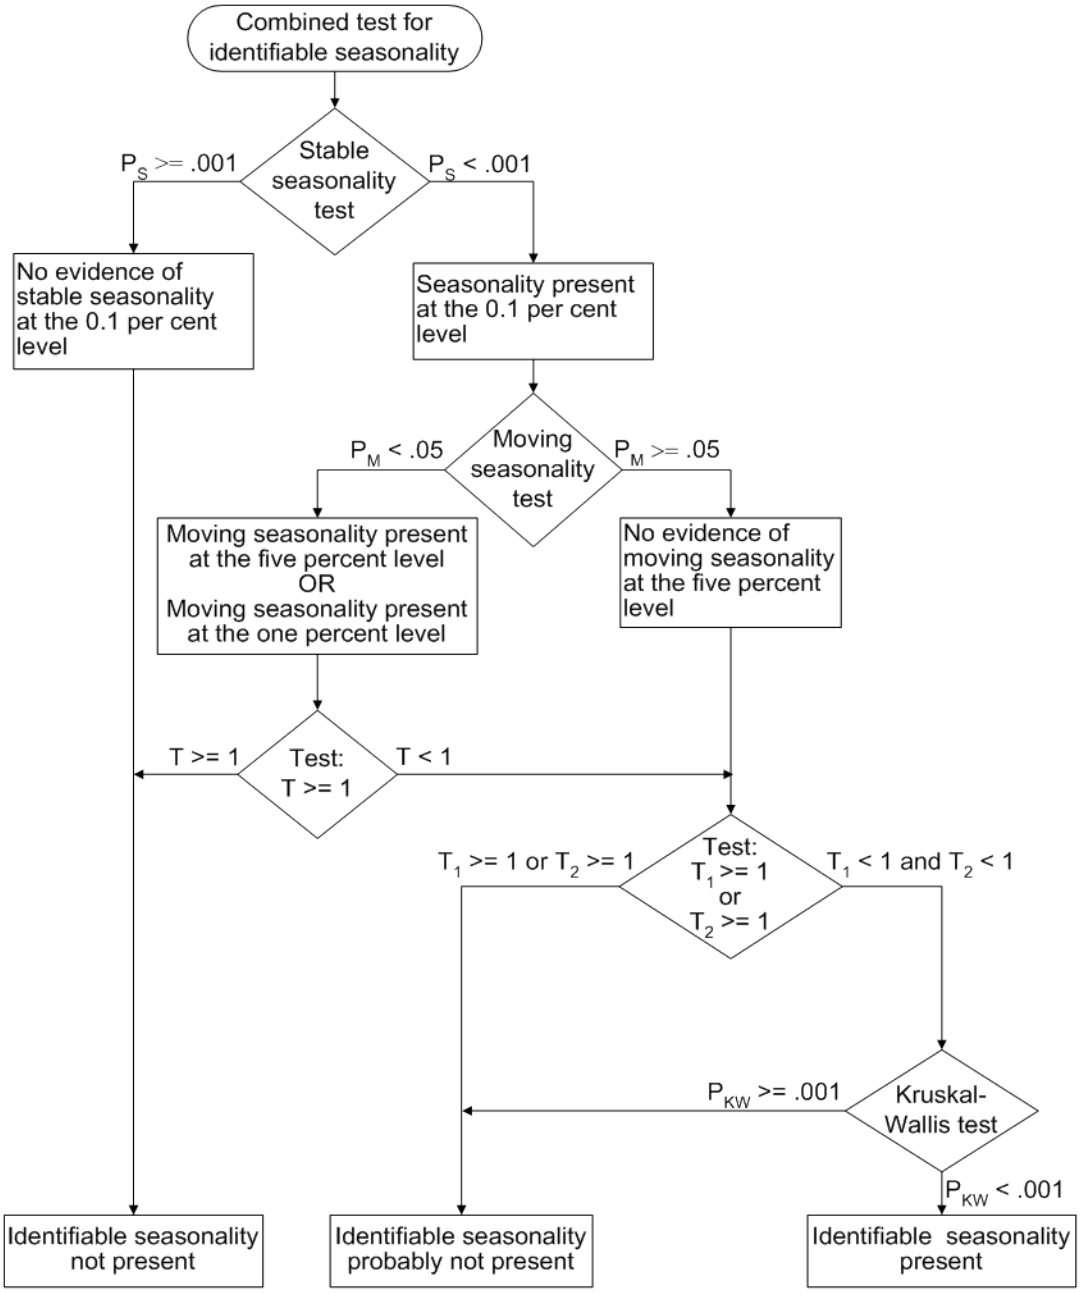
   If the null hypothesis of no moving seasonality is rejected at the 5.0% significance level ($P_M < 0.05$) and if $T \geq 1.0$, the null hypothesis of identifiable seasonality *not* present is not rejected and PROC X13 returns the conclusion, "Identifiable Seasonality Not Present."

3. If the null hypothesis of identifiable seasonality *not* present has not been accepted, but $T_1 \geq 1.0$, $T_2 \geq 1.0$, or the Kruskal-Wallis chi-squared test fails to reject at the 0.10% significance level ($P_{\mathrm{KW}} \geq 0.001$), then PROC X13 returns the conclusion "Identifiable Seasonality Probably Not Present."

4. If the null hypotheses of no stable seasonality associated with the $F_S$ and Kruskal-Wallis chi-squared tests are rejected and if none of the combined measures described in steps 2 and 3 fail, then the null hypothesis of identifiable seasonality *not* present is rejected and PROC X13 returns the conclusion "Identifiable Seasonality Present."

Included in the displayed output of Table D8A is the table "Summary of Results and Combined Test for the Presence of Identifiable Seasonality." This table displays the $T_1$, $T_2$, and $T$ values and the significance levels for the stable seasonality test, the moving seasonality test, and the Kruskal-Wallis test. The last item in the table is the result of the combined test for identifiable seasonality.

**Figure 46.3** Combined Seasonality Test Flowchart



## Computations

For more information about the computations used in PROC X13, see the *X-13ARIMA-SEATS Reference Manual* (US Bureau of the Census 2009).

For more information about the X-11 method of decomposition, see *Seasonal Adjustment with the X-11 Method* (Ladiray and Quenneville 2001).

## PICKMDL Model Selection

You can request that the X-13ARIMA-SEATS method select a model in a manner similar to the method used in X-11-ARIMA (Dagum 1988, 1983). Information about this model selection (PICKMDL) is based on the description in the *X-13ARIMA-SEATS Reference Manual* (US Bureau of the Census 2009). You can request the PICKMDL method in one of the following ways:

- by specifying the PICKMDL statement
- by specifying more than one value for the _MODEL_ variable in the MDLINFOIN= data set (subset by BY group and series)

The default settings for the PICKMDL automatic model selection method classify a model as acceptable if all of the following conditions are true:

- The absolute average percentage error of the extrapolated values within the last three years of data is less than 15%.
- The *p*-value is greater than 5% for the fitted model's Ljung-Box *Q* statistic test of the lack of correlation in the model's residuals.
- There are no signs of overdifferencing. Overdifferencing is indicated if the sum of the nonseasonal MA parameter estimates (for models with at least one nonseasonal difference) is greater than 0.9.

If a data set is specified in the MDLINFOIN= option and the data set contains more than one model for a series to be forecast, then the models described in the data set are candidates for the PICKMDL method of model selection. If the MDLINFOIN= option is not specified, then the candidate models are shown in Table 46.14, along with the order in which the models are considered. The order in which the model is considered is important when METHOD=FIRST is specified in the PICKMDL statement.

**Table 46.14** PICKMDL Method Default ARIMA Models

| Order of Candidate Model | ARIMA Model Orders |
|---|---|
| 1 | (0 1 1)(0 1 1) |
| 2 | (0 1 2)(0 1 1) |
| 3 | (2 1 0)(0 1 1) |
| 4 | (0 2 2)(0 1 1) |
| 5 | (2 1 2)(0 1 1) |

No model is selected when none of the models in the MDLINFOIN= data set are acceptable. For more information about the output when no model is selected, see the section "Final Automatic Model Selection Table" on page 3379.

The regARIMA model consists of a transformation, a regression component, and an ARIMA model component. For each series, the following conditions hold:

- If no regression is specified in the MDLINFOIN= data set model but regressors are specified using the INPUT, EVENT, or REGRESSION statements, then the ARIMA models from the MDLINFOIN= data set are tested in conjunction with the regression variables specified in the INPUT, EVENT, and REGRESSION statements.
- If no ARIMA model is specified in the MDLINFOIN= data set but an ARIMA model is specified using an ARIMA statement or TRANSFORM statement, then the regression information from each model specified in the MDLINFOIN= data set is used in conjunction with the ARIMA model specified by the TRANSFORM and ARIMA statements.
- If no model information is specified in the MDLINFOIN= data set, then any model information specified by the TRANSFORM, INPUT, REGRESSION, EVENT, and ARIMA statements is used, and the PICKMDL statement is not in effect for that series.

## SEATS Decomposition

PROC X13 can decompose the B1 series by using the SEATS decomposition method described in Gómez and Maravall (1997a, b). The SEATS decomposition method is planned for inclusion in the US Census Bureau's X13 program, which is not yet available for release.

The SEATS method requires the series to be extended with the same number of backcast and forecast observations. The number of observations backcast and forecast must meet the following minimum criteria:

- The number of forecast and backcast observations must be at least twice the number of observations in a year, with a minimum of 8.
- The number of forecast and backcast observations must be at least $2 \times (q + Q * s)$, where the ARIMA model used to extend the series is $(pdq)(PDQ)s$ in standard Box-Jenkins notation.
- The number of forecast and backcast observations must be at least $p + d + q + (P + D + Q) * s$, where the ARIMA model used to extend the series is $(pdq)(PDQ)s$ in standard Box-Jenkins notation.

If you specify the SEATSDECOMP statement and the number of forecasts or backcasts (either the default number or the number you specify) is not sufficient for SEATS decomposition, then the number of forecasts or backcasts is increased to the minimum required.

## Displayed Output, ODS Table Names, and OUTPUT Tablename Keywords

The options specified in PROC X13 control both the tables produced by the procedure and the tables available for output to the OUT= data set specified in the OUTPUT statement.

The displayed output is organized into tables identified by a part letter and a sequence number within the part. The seven major parts of the X13 procedure are as follows:

A prior adjustments and regARIMA components (optional)

B preliminary estimates of irregular component weights and trading day regression factors (X-11 method)

C final estimates of irregular component weights and trading day regression factors

D final estimates of seasonal, trend cycle, and irregular components

E analytical tables

F summary measures

G charts

Table 46.15 describes the individual tables and charts. "P" indicates that the table is only displayed and is not available for output to the OUT= data set. Data from displayed tables can be extracted into data sets by using the Output Delivery System (ODS). For more information about the SAS Output Delivery System, see the *SAS Output Delivery System: User's Guide*. For more information about the features of the ODS Graphics system, including the many ways that you can control or customize the plots that are produced by SAS procedures, see Chapter 24, "Statistical Graphics Using ODS" (*SAS/STAT User's Guide*).

When tables available through the OUTPUT statement are output using ODS, the summary line is included in the ODS output by default. The summary line gives the average, standard deviation, or total by each period. The value –1 for YEAR indicates that the summary line is a total; the value –2 for YEAR indicates that the summary line is an average; and the value –3 for YEAR indicates that the line is a standard deviation. The value of YEAR for historical and forecast values is greater than or equal to zero. Thus, a negative value indicates a summary line. You can suppress the summary line altogether by specifying the NOSUM option in the TABLES statement. However, the NOSUM option also suppresses the display of the summary line in the displayed table.

"T" indicates that the table is available using the OUTPUT statement, but is not displayed by default; you must request that these tables be displayed by using the TABLES Statement. If there is no notation in the "Notes" column, then the table is available directly using the OUTPUT statement, without specifying the TABLES statement. If a table is not computed, then it is not displayed; if it is requested in the OUTPUT statement, then the variable in the OUT= data set contains missing values. The actual number of tables displayed depends on the options and statements specified.

**Table 46.15** Table Names and Descriptions

| Table | Description | Notes |
|---|---|---|
| **Tables Associated with Model Order Identification** | | |
| ModelDescription | Regression model used in ARIMA model identification | P |
| ACF | Autocorrelation function | P |
| PACF | Partial autocorrelation function | P |

**Table 46.15** *continued*

| Table | Description | Notes |
|---|---|---|
| **Tables Associated with Automatic Modeling** | | |
| UnitRootTestModel | ARIMA estimates for unit root identification | P |
| UnitRootTest | Results of unit root test for identifying orders of differencing | P |
| AutoChoiceModel | Models estimated by automatic ARIMA model selection procedure | P |
| AutoLjungBox | Check of the residual Ljung-Box $Q$ statistic | P |
| Best5Model | Best five ARIMA models chosen by automatic modeling | P |
| AutomaticModelChoice | Comparison of automatically selected model and default model | P |
| InitialModelChoice | Initial automatic model selection | P |
| FinalModelChecks | Final checks for identified model | P |
| FinalModelChoice | Final automatic model selection | P |
| **Diagnostic Tables** | | |
| ErrorACF | Autocorrelation of regARIMA model residuals | P |
| ErrorPACF | Partial autocorrelation of regARIMA model residuals | P |
| SqErrorACF | Autocorrelation of squared regARIMA model residuals | P |
| ResidualOutliers | Outliers of the unstandardized residuals | P |
| ResidualStatistics | Summary statistics for the unstandardized residuals | P |
| NormalityStatistics | Normality statistics for regARIMA model residuals | P |
| G | Spectral analysis of regARIMA model residuals | P |
| **Modeling Tables** | | |
| MissingExtreme | Extreme or missing values | P |
| ARMAIterationTolerances | Exact ARMA likelihood estimation iteration tolerances | P |
| IterHistory | ARMA iteration history | P |
| OutlierDetection | Critical values to use in outlier detection | P |
| PotentialOutliers | Potential outliers | P |
| TLSTest | Tests for cancellation of level-shifts | P |
| ARMAIterationSummary | Exact ARMA likelihood estimation iteration summary | P |
| ModelDescription | Model description for regARIMA model estimation | P |
| RegParameterEstimates | Regression model parameter estimates | P |
| RegressorGroupChiSq | Chi-squared tests for groups of regressors | P |
| ARMAParameterEstimates | Exact ARMA maximum likelihood estimation | P |
| AvgFcstErr | Average absolute percentage error in within-sample or without-sample forecasts or backcasts | P |
| Roots | Seasonal or nonseasonal AR or MA roots | P |
| MLESummary | Estimation summary | P |
| ForecastCL | Forecasts, standard errors, and confidence limits | P |
| MV1 | Original series adjusted for missing value regressors | |

**Table 46.15** *continued*

| Table | Description | Notes |
|---|---|---|
| **Sequenced Tables** | | |
| A1 | Original series | |
| A2 | Prior-adjustment factors | |
| A6 | RegARIMA trading day component | |
| A7 | RegARIMA holiday component | |
| A8 | RegARIMA combined outlier component | |
| A8AO | RegARIMA AO outlier component | |
| A8LS | RegARIMA level change outlier component | |
| A8TC | RegARIMA temporary change outlier component | |
| A9 | RegARIMA user-defined regression component | |
| A10 | RegARIMA user-defined seasonal component | |
| A19 | RegARIMA outlier adjusted original data | T |
| B1 | Prior-adjusted or original series | |
| B7 | Preliminary trend-cycle, B iteration | T |
| B13 | Irregular component, B iteration | T |
| B17 | Preliminary weights for the irregular component | T |
| B20 | Extreme values, B iteration | T |
| C1 | Original series modified for outliers, trading day, and prior factors, C iteration | T |
| C17 | Final weight for irregular components | |
| C20 | Final extreme value adjustment factors | T |
| D1 | Modified original data, D iteration | T |
| D7 | Preliminary trend cycle, D iteration | T |
| D8 | Final unmodified SI ratios | |
| D8A | Seasonality tests | P |
| D8B | Final unmodified SI ratios, with labels for outliers and extreme values | |
| D9 | Final replacement values for extreme SI ratios | |
| D9A | Moving seasonality ratio | P |
| SeasonalFilter | Seasonal filter statistics for Table D10 | P |
| D10 | Final seasonal factors | |
| D10B | Seasonal factors, adjusted for user-defined seasonal | |
| D10D | Final seasonal difference | |
| D11 | Final seasonally adjusted series | |
| D11A | Final seasonally adjusted series with forced yearly totals | |
| D11F | Factors applied to get adjusted series with forced yearly totals | |
| D11R | Rounded final seasonally adjusted series (with forced yearly totals) | |
| TrendFilter | Trend filter statistics for Table D12 | P |
| D12 | Final trend cycle | |
| D13 | Final irregular series | |
| D16 | Combined adjustment factors | |

**Table 46.15** *continued*

| Table | Description | Notes |
|---|---|---|
| D16B | Final adjustment differences | |
| D18 | Combined calendar adjustment factors | |
| E1 | Original data modified for extremes | |
| E2 | Modified seasonally adjusted series | |
| E3 | Modified irregular series | |
| E4 | Ratios of annual totals | P |
| E5 | Percent changes in original series | |
| E6 | Percent changes in final seasonally adjusted series | |
| E6A | Percent changes (differences) in seasonally adjusted series with forced yearly totals (D11.A) | |
| E6R | Percent changes (differences) in rounded seasonally adjusted series (D11.R) | |
| E7 | Differences in final trend cycle | |
| E8 | Percent changes (differences) in original series adjusted for calendar factors (A18) | |
| E18 | Final adjustment ratios (original series to seasonally adjusted series) | |
| F2A-I | Summary measures | P |
| F3 | Quality assessment statistics | P |
| F4 | Day of the week trading day component factors | P |
| G | Spectral analysis | P |

## Final Automatic Model Selection Table

When the PICKMDL statement is specified and no model is selected, then the model in the "Final Automatic Model Selection" table is displayed as "(*, *, *) (*, *, *)" and an error message is displayed in both the log file and the output. If the "Final Automatic Model Selection" table is output to a data set, the model orders are output as –1, indicating the failure to select a model. For more information about PICKMDL model selection, see the section "PICKMDL Model Selection" on page 3374.

## Table D 8.B

Table D8B displays the same series as Table D8. However, additional information is provided about the D8 series. The following values are displayed as labels for each observation of the series:

- The first label column indicates whether the D8 series value is extreme as determined by the X-11 extreme value method. An extreme observation is marked with an asterisk in the first label column. This data value is 0 or 1. If D8B or D8BX is specified in the OUTPUT statement, this value is output as the D8BX series to the data set that is specified in the OUT= option in the OUTPUT statement.
- The second label column contains the number of AO, TC, or RP outliers, if any, that affect the observation. This data value is 0 if no outliers affect the observation. Only the nonzero values are displayed in the table. If D8B or D8BO is specified in the OUTPUT statement, the number of outliers is output as the D8BO series to the data set that is specified in the OUT= option in the OUTPUT statement.
- The third label column indicates whether the observation is affected by level shift outliers as determined by an X-13ARIMA-SEATS method. This data value contains the number of level shifts that affect the observation. A nonzero value is displayed as "L". If D8B or D8BL is specified in the OUTPUT statement, the data values are output as the D8BL series to the data set that is specified in the OUT= option in the OUTPUT statement.

If any observations in Table D 8.B are affected by extremes, outliers, or level shifts, then notes that indicate the number of observations affected in each category are displayed at the end of the table.

## Using Auxiliary Variables to Subset Output Data Sets

The X13 procedure can produce more than one table with the same name. For example, the following IDENTIFY statement produces ACF and PACF tables for two levels of differencing:

```
identify diff=(1) sdiff=(0, 1);
```

Auxiliary variables in the output data can be used to subset the data. In this example, the auxiliary variables Diff and SDiff specify the levels of regular and seasonal differencing that are used to compute the ACF. The following statements show how to retrieve the ACF results for the first differenced series:

```
ods select acf;
ods output acf=acf;
proc x13 data=sashelp.air date=date;
   identify diff=(1) sdiff=(0,1);
run;
title "Regular Difference=1 Seasonal Difference=0";
data acfd1D0;
   set acf(where=(Diff=1 and Sdiff=0));
run;
```

In addition to any BY variables, the auxiliary variables in the ACF and PACF data sets are _NAME_, _TYPE_, Transform, Adjust, Regressors, Diff, and SDiff. Auxiliary variables can be related to the group as shown

in the Results Viewer (for example, BY variables, _NAME_, and _TYPE_). However, they can also be variables in the template where printing is suppressed by using PRINT=OFF. Auxiliary variables such as Transform, Adjust, and Regressors are not displayed in the ACF and PACF tables because similar information is displayed in the ModelDescription table that immediately precedes the ACF and PACF tables. The variables Diff and SDiff are not displayed because the levels of differencing are included in the title of the ACF and PACF tables.

The BY variables and the _NAME_ variable are available for all ODS OUTPUT data sets that are produced by the X13 procedure. The _TYPE_ variable is available for all ODS OUTPUT data sets that are produced during the model identification and model estimation stages. The _TYPE_ variable enables you to determine whether data in a table, such as the ModelDescription table, originated from the model identification stage or the model estimation stage.

The forecast data sets contain the auxiliary variable _SCALE_. The value of _SCALE_ is "Original" or "Transformed" to indicate the scale of the data. The auxiliary variable _SCALE_ is the same as the group in the Results Viewer. It is not displayed in the forecast tables because the table titles indicate the scale of the data.

## ODS Graphics

Statistical procedures use ODS Graphics to create graphs as part of their output. ODS Graphics is described in detail in Chapter 24, "Statistical Graphics Using ODS" (*SAS/STAT User's Guide*).

Before you create graphs, ODS Graphics must be enabled (for example, with the ODS GRAPHICS ON statement). For more information about enabling and disabling ODS Graphics, see the section "Enabling and Disabling ODS Graphics" in that chapter.

The overall appearance of graphs is controlled by ODS styles. Styles and other aspects of using ODS Graphics are discussed in the section "A Primer on ODS Statistical Graphics" in that chapter.

This section describes the use of ODS for creating graphics with the X13 procedure.

The graphs available through ODS Graphics are ACF plots, PACF plots, a residual histogram, spectral graphs, and forecasting plots. ACF and PACF plots for regARIMA model identification are not available unless the IDENTIFY statement is used. ACF plots, PACF plots, the residual histogram, and the residual spectral graph for diagnosis of the regARIMA model residuals are not available unless the CHECK statement is used. Forecasting plots are not available unless the FORECAST statement is used. A spectral plot of the original series is always available; however, additional spectral plots are provided when the X11 statement and CHECK statement are used. When ODS Graphics is not enabled, the ACF, PACF, and spectral analysis are displayed as columns of a table. The residual histogram is available only when ODS Graphics is enabled. To obtain a table that contains values related to the residual histogram, use the ODS OUTPUT statement.

### ODS Graph Names

PROC X13 assigns a name to each graph it creates by using ODS. You can use these names to selectively reference the graphs. The names are listed in Table 46.16.

**Table 46.16** ODS Graphs Produced by PROC X13

| ODS Graph Name | Plot Description | PROC X13 PLOTS= Option |
|---|---|---|
| ACFPlot | Autocorrelation of regression residuals | SERIES(ACF) |
| ErrorACFPlot | Autocorrelation of regARIMA model residuals | RESIDUAL(ACF) |
| ErrorPACFPlot | Partial autocorrelation of regARIMA model residuals | RESIDUAL(PACF) |
| ForecastsOnlyPlot | Forecasts only of the original series | FORECAST(FORECASTONLY) |
| ForecastsOnlyPlot | Forecasts only of the transformed series | FORECAST(TRANSFORECASTONLY) |
| ForecastsPlot | Forecasts of the original series | FORECAST(FORECAST) |
| ForecastsPlot | Forecasts of the transformed series | FORECAST(TRANSFORECAST) |
| ModelForecastsPlot | Model and forecasts of the original series | FORECAST(MODELFORECASTS) |
| ModelForecastsPlot | Model and forecasts of the transformed series | FORECAST(TRANSMODELFORECASTS) |
| ModelPlot | Model of the original series | FORECAST(MODELS) |
| ModelPlot | Model of the transformed series | FORECAST(TRANSMODELS) |
| PACFPlot | Partial autocorrelation of regression residuals | SERIES(PACF) |
| ResidualHistogram | Distribution of regARIMA residuals | RESIDUAL(HIST) |
| SpectralPlot | Spectral plot of the seasonally adjusted series | ADJUSTED(SPECTRUM) |
| SpectralPlot | Spectral plot of irregular series | IRREGULAR(SPECTRUM) |
| SpectralPlot | Spectral plot of the regARIMA model residuals | RESIDUAL(SPECTRUM) |
| SpectralPlot | Spectral plot of the original series | SERIES(SPECTRUM) |
| SqErrorACFPlot | Autocorrelation of squared regARIMA model residuals | RESIDUAL(SQACF) |

## OUT= Data Set

You can use the OUTPUT statement to output the component series computed in the X-13ARIMA-SEATS decomposition.

The OUT= data set specified in the OUTPUT statement contains the BY variables (if any), the ID variables (if any), and the DATE= variable if the DATE= option is specified or the variable _DATE_ if the DATE= option is not specified. If user-defined regressor variables or EVENT variables are specified, they are included. In addition, the various components specified by the table names in the OUTPUT statement are included in the OUT= data set.

The OUTPUT OUT= data set can contain the following variables:

| | |
|---|---|
| BY variables | are the BY variables used to subset the series by BY groups. The BY variables included in this data set match the BY variables, if any, used to process the series in the DATA= data set. |
| ID variables | enable the series observations to be identified using further information. The ID variables included in this data set match the ID variables, if any, specified in the ID statement and input from the DATA= data set. |
| DATE variable | is the time ID variable used to process the time series. It is either the variable specified in the DATE= option in the PROC X13 statement or the variable _DATE_ generated by the START= option in the PROC X13 statement. |
| _YEAR_ variable | contains a value for the year of the date variable for the observation. This variable is included in the OUT= data set if YEARSEAS is specified in the OUTPUT statement. |
| _SEASON_ variable | contains a value for the month or quarter of the date variable for the observation. This variable is included in the OUT= data set if YEARSEAS is specified in the OUTPUT statement. |
| User-defined variables | are variables specified in the INPUT statement or the USERVAR= option in the REGRESSION statement. The values of these variables are copied from the DATA= data set or from the AUXDATA= data set. |
| EVENT variables | variables specified in the EVENT statement. The values of these variables are computed based on the event definition and the dates of the time series observations. |
| Table variables | contains the data from the X-13ARIMA-SEATS decomposition tables: A1, A2, A6, A7, A8, A8AO, A8LS, A8TC, A9, A10, A19, B1, B7, B13, B17, B20, C1, C17, C20, D1, D7, D8, D8BX, D8BO, D8BL, D9, D10, D10B, D10D, D11, D11A, D11F, D11R, D12, D13, D16, D16B, D18, E1, E2, E3, E5, E6, E6A, E6R, E7, E8, E18, and MV1. The variable name used in the output data set is the input variable name followed by an underscore and the corresponding table name. |

## SEATSDECOMP OUT= Data Set

You can use the SEATSDECOMP statement to output the component series that is computed using the SEATS method of seasonal decomposition.

The OUT= data set specified in the SEATSDECOMP statement contains the BY variables (if any), the ID variables (if any), and either the DATE= variable if the DATE= option is specified or the variable _DATE_ if the DATE= option is not specified. If user-defined regressor variables or EVENT variables are specified, they are included. In addition, the five components computed by the SEATS decomposition method are included in the OUT= data set for each series.

The SEATSDECOMP OUT= data set can contain the following variables:

| | |
|---|---|
| BY variables | are the BY variables used to subset the series by BY groups. The BY variables included in this data set match the BY variables (if any) that are used to process the series in the DATA= data set. |
| ID variables | enable the series observations to be identified using further information. The ID variables included in this data set match the ID variables (if any) that are specified in the ID statement and input from the DATA= data set. |
| DATE variable | is the time ID variable used to process the time series. It is either the variable specified in the DATE= option in the PROC X13 statement or the variable _DATE_ that is generated by the START= option in the PROC X13 statement. |
| _YEAR_ variable | contains a value for the year of the date variable for the observation. This variable is included in the OUT= data set if YEARSEAS is specified in the OUTPUT statement. |
| _SEASON_ variable | contains a value for the month or quarter of the date variable for the observation. This variable is included in the OUT= data set if YEARSEAS is specified in the OUTPUT statement. |
| User-defined variables | are variables specified in the INPUT statement or the USERVAR= option in the REGRESSION statement. The values of these variables are copied from the DATA= data set or from the AUXDATA= data set. |
| EVENT variables | are variables that are specified in the EVENT statement. The values of these are computed based on the event definition and the dates of the time series observations. |
| Component variables | contains the data from the SEATS decomposition tables. The variable name used in the output data set is the input variable name followed by an underscore and the corresponding table name. |
| <variable>_OS | contains the original series for SEATS decomposition. This is the B1 series from the X-13ARIMA-SEATS method. |
| <variable>_SC | contains the seasonal component series that is calculated by SEATS decomposition. |
| <variable>_TC | contains the trend component series that is calculated by SEATS decomposition. |
| <variable>_SA | contains the seasonally adjusted series that is calculated by SEATS decomposition. |
| <variable>_IC | contains the irregular series that is calculated by SEATS decomposition. |

## Special Data Sets

The X13 procedure can read a MDLINFOIN= input data set and output a MDLINFOOUT= data set. The structure of both of these data sets is the same. The difference is that when the MDLINFOIN= data set is read, only information relative to specifying a model is processed, whereas the MDLINFOOUT= data set contains the results of estimating a model. The X13 procedure can also read data sets that contain event definition data. The structure of these data sets is the same as in the SAS High-Performance Forecasting system.

### MDLINFOIN= and MDLINFOOUT= Data Sets

The MDLINFOIN= and MDLINFOOUT= data sets can contain one or more of the following variables:

BY variables — enable the model information to be specified by BY groups. BY variables can be included in this data set that match the BY variables used to process the series. If no BY variables are included, then the models specified by _NAME_ in the MDLINFOIN= data set apply to all BY groups in the DATA= data set.

_NAME_ — contains the variable name of the time series to which a particular model is to be applied. Omit the _NAME_ variable if you are specifying the same model for all series in a BY group.

_MODEL_ — contains a name to identify the model for this observation. You can specify a name other than _MODEL_ in the MDLVAR= option in the PICKMDL statement. The _MODEL_ variable is an ID variable; all observations that have the same value of this variable belong to the same model. This variable is used to identify different model candidates when the PICKMDL method is used to choose a model; it is not needed if only a single model is specified.

_MODELTYPE_ — specifies whether the observation contains regression or ARIMA information. The value of _MODELTYPE_ should be either REG to supply regression information or ARIMA to supply model information. If valid regression information exists in the MDLINFOIN= data set for a BY group and series being processed, then the REGRESSION, INPUT, and EVENT statements are ignored for that BY group and series. Likewise, if valid ARIMA model information exists in the data set, then the AUTOMDL, ARIMA, and TRANSFORM statements are ignored. Valid values for the other variables in the data set depend on the value of the _MODELTYPE_ variable. Although other values of _MODELTYPE_ might be permitted in other SAS procedures, PROC X13 recognizes only REG and ARIMA.

_MODELPART_ — further qualifies the regression information in the observation. For _MODELTYPE_=REG, valid values of _MODELPART_ are INPUT, EVENT, and PREDEFINED. A value of INPUT indicates that this observation refers to the user-defined variable whose name is given in _DSVAR_. Likewise, a value of EVENT indicates that the observation refers to the SAS or user-defined event whose name is given in _DSVAR_. PREDEFINED indicates that the name given in _DSVAR_ is a predefined US Census Bureau variable. If only ARIMA model information is included in the data set (that is, all observations have _MODELTYPE_=ARIMA), then the _MODELPART_ variable can be omitted. For observations where _MODELTYPE_=ARIMA, valid values for _MODELPART_ are FORECAST, ".", or blank.

_COMPONENT_ further qualifies the regression or ARIMA information in the observation. For _MODELTYPE_=REG, the only valid value of _COMPONENT_ is SCALE. For _MODELTYPE_=ARIMA, the valid values of _COMPONENT_ are TRANSFORM, CONSTANT, NONSEASONAL, and SEASONAL. TRANSFORM indicates that the observation contains the information that would be supplied in the TRANSFORM statement. CONSTANT is specified to control the constant term in the model. NONSEASONAL and SEASONAL refer to the AR, MA, and differencing terms in the ARIMA model.

_PARMTYPE_ further qualifies the regression or ARIMA information in the observation. For _MODELTYPE_=REG, the value of _PARMTYPE_ is the same as the value of the USERTYPE= option in the REGRESSION statement. Since the USERTYPE= option applies only to user-defined events and variables, the value of _PARMTYPE_ does not alter processing in observations where _MODELPART_=PREDEFINED. However, it is consistent to use a value for _PARMTYPE_ that matches the US Census Bureau predefined variable. For the constant term in the model information, _PARMTYPE_ should be SCALE. For transformation information, the value of _PARMTYPE_ should be NONE, LOG, LOGIT, SQRT, or BOXCOX. For _MODELTYPE_=ARIMA, valid values of _PARMTYPE_ are AR, MA, and DIF.

_DSVAR_ specifies the variable name associated with the current observation. For _MODELTYPE_=REG, the value of _DSVAR_ is the name of the user-defined variable, the event, or the US Census Bureau predefined variable. For _MODELTYPE_=ARIMA, _DSVAR_ should match the name of the series being processed. If the ARIMA model information applies to more than one series, then _DSVAR_ can be blank or ".", equivalently.

_VALUE_ contains a numerical value that is used as a parameter for certain types of information. For example, the PREDEFINED=EASTER(6) option in the REGESSION statement is implemented in the MDLINFOIN= data set by using _DSVAR_=EASTER and _VALUE_=6. For a BOXCOX transformation, _VALUE_ is set equal to the $\lambda$ parameter value. For _COMPONENT_=SEASONAL, if _VALUE_ is nonmissing, then _VALUE_ is used as the seasonal period. If _VALUE_ is missing for _COMPONENT_=SEASONAL, then the seasonal period is determined by the interval of the series.

_FACTOR_ applies only to the AR and MA portions of the ARIMA model. The value of _FACTOR_ identifies the factor of the given AR or MA term. Therefore, the value of _FACTOR_ is the same for all observations that are related to the same factor.

_LAG_ identifies the degree for differencing and AR and MA lags. If _COMPONENT_=SEASONAL, then the value in _LAG_ is multiplied by the seasonal period indicated by the value of _VALUE_.

_SHIFT_ contains the shift value for transfer functions. This value is not processed by PROC X13, but it might be processed by other procedures in which transfer functions can be specified.

_NOEST_ indicates whether a parameter associated with the observation is to be estimated. For example, the NOINT option is indicated by _COMPONENT_=CONSTANT with _NOEST_=1 and _EST_=0. _NOEST_=1 indicates that the value in _EST_ is a fixed value. _NOEST_ pertains to the constant term, to AR and MA parameters, and to regression parameters.

_EST_ contains an initial or fixed value for a parameter associated with the observation that is to be estimated. _NOEST_=1 indicates the value in _EST_ is a fixed value. _EST_ pertains to the constant term, to AR and MA parameters, and to regression parameters.

_STDERR_ contains output information about estimated parameters. The variable _STDERR_ is not processed by the MDLINFOIN= data set for PROC X13. In the MDLINFOOUT= data set, _STDERR_ contains the standard error that pertains to the estimated parameter in the variable _EST_.

_TVALUE_ contains output information about estimated parameters. The variable _TVALUE_ is not processed by the MDLINFOIN= data set for PROC X13. In the MDLINFOOUT= data set, _TVALUE_ contains the *t* value that pertains to the estimated parameter in the variable _EST_.

_PVALUE_ contains output information about estimated parameters. The variable _PVALUE_ is not processed by the MDLINFOIN= data set for PROC X13. In the MDLINFOOUT= data set, _PVALUE_ contains the *p*-value that pertains to the estimated parameter in the variable _EST_.

_LABEL_ contains a character string. The value of the variable _LABEL_ does not affect the model that is input when the data set is specified in the MDLINFOIN= option. The user can store any string in the variable _LABEL_. If a model is selected from the MDLINFOIN= data set, then the value of the variable _LABEL_ (if any) for the first observation corresponding to that model is output to the MDLINFOOUT= data set (if specified).

### INEVENT= Data Set

The INEVENT= data set can contain the following variables. When a variable is omitted from the data set, that variable is assumed to have the default value for all observations. The default values are specified in the list.

_NAME_ specifies the event variable name. _NAME_ is displayed with the case preserved. Since _NAME_ is a SAS variable name, the event can be referenced by using any case. The _NAME_ variable is required; there is no default.

_CLASS_ specifies the class of event: SIMPLE, COMBINATION, PREDEFINED. The default for _CLASS_ is SIMPLE.

_KEYNAME_ contains either a date keyword (SIMPLE EVENT), a predefined event variable name (PREDEFINED EVENT), or an event name (COMBINATION EVENT). All _KEYNAME_ values are displayed in upper case. However, if the _KEYNAME_ value refers to an event name, then the actual name can be of mixed case. The default for _KEYNAME_ is no keyname, designated by ".".

_STARTDATE_ contains either the date timing value or the first date timing value to use in a do-list. The default for _STARTDATE_ is no date, designated by a missing value.

_ENDDATE_ contains the last date timing value to use in a do-list. The default for _ENDDATE_ is no date, designated by a missing value.

_DATEINTRVL_ contains the interval for the date do-list. The default for _DATEINTRVL_ is no interval, designated by ".".

_STARTDT_ contains either the datetime timing value or the first datetime timing value to use in a do-list. The default for _STARTDT_ is no datetime, designated by a missing value.

_ENDDT_ contains the last datetime timing value to use in a do-list. The default for _ENDDT_ is no datetime, designated by a missing value.

_DTINTRVL_ contains the interval for the datetime do-list. The default for _DTINTRVL_ is no interval, designated by ".".

_STARTOBS_ contains either the observation number timing value or the first observation number timing value to use in a do-list. The default for _STARTOBS_ is no observation number, designated by a missing value.

_ENDOBS_ contains the last observation number timing value to use in a do-list. The default for _ENDOBS_ is no observation number, designated by a missing value.

_OBSINTRVL_ contains the interval length of the observation number do-list. The default for _OBSINTRVL_ is no interval, designated by ".".

_TYPE_ specifies the type of event. The valid values of _TYPE_ are POINT, LS, RAMP, TR, TEMPRAMP, TC, LIN, LINEAR, QUAD, CUBIC, INV, INVERSE, LOG, and LOGARITHMIC. The default for _TYPE_ is POINT.

_VALUE_ specifies the value for nonzero observation. The default for _VALUE_ is 1.0.

_PULSE_ specifies the interval that defines the units for the duration values. The default for _PULSE_ is no interval, designated by ".".

_DUR_BEFORE_ specifies the number of durations before the timing value. The default for _DUR_BEFORE_ is 0.

_DUR_AFTER_ specifies the number of durations after the timing value. The default for _DUR_AFTER_ is 0.

_SLOPE_BEF_ determines whether the curve is GROWTH or DECAY before the timing value for _TYPE_=RAMP, _TYPE_=TEMPRAMP, and _TYPE_=TC. Valid values are GROWTH and DECAY. The default for _SLOPE_BEF_ is GROWTH.

_SLOPE_AFT_ determines whether the curve is GROWTH or DECAY after the timing value for _TYPE_=RAMP, _TYPE_=TEMPRAMP, and _TYPE_=TC. Valid values are GROWTH and DECAY. The default for _SLOPE_AFT_ is GROWTH unless _TYPE_=TC; then the default is DECAY.

_SHIFT_ specifies the number of _PULSE_= intervals to shift the timing value. The shift can be positive (forward in time) or negative (backward in time). If _PULSE_= is not specified, then the shift is in observations. The default for _SHIFT_ is 0.

_TCPARM_ specifies the parameter for EVENT of TYPE=TC. The default for _TCPARM_ is 0.5.

_RULE_ specifies the rule to use when combining events or when timing values of an event overlap. The valid values of _RULE_ are ADD, MAX, MIN, MINNZ, MINMAG, and MULT. The default for _RULE_ is ADD.

_PERIOD_ specifies the frequency interval at which the event should be repeated. If this value is missing, then the event is not periodic. The default for _PERIOD_ is no interval, designated by ".".

_LABEL_ specifies the label or description for the event. If a label is not specified, then the default label value is displayed as ".". For events that produce dummy variables,

either the user-supplied label or the default label is used. For COMPLEX events, the _LABEL_ value is merely a description of the group of events.

## OUTSTAT= Data Set

The OUTSTAT= data set can contain the following variables:

BY variables — sorts the statistics into BY groups. BY variables are included in this data set that match the BY variables used to process the series.

NAME — specifies the variable name of the time series to which the statistics apply.

STAT — describes the statistic that is stored in VALUE or CVALUE. STAT takes the following values:

| | |
|---|---|
| Period | the period of the series, 4 or 12. |
| Mode | the mode of the seasonal adjustment from the X11 statement. Possible values are ADD, MULT, LOGADD, and PSEUDOADD. |
| Start | the beginning of the model span expressed as *monyyyy* for monthly series or *yyyy*Q*q* for quarterly series. |
| End | the end of the model span expressed as *monyyyy* for monthly series or *yyyy*Q*q* for quarterly series. |
| NbFcst | the number of forecast observations. |
| SigmaLimLower | the lower sigma limit in standard deviation units. |
| SigmaLimUpper | the upper sigma limit in standard deviation units. |
| pLBQ_24 | the Ljung-Box *Q* statistic of the residuals at lag 24, for monthly series. Note that lag 12 (pLBQ_12) and lag 16 (pLBQ_16) are included in the data set for quarterly series. |
| D8Fs | the stable seasonality *F* test value from Table D8. |
| D8Fm | the moving seasonality *F* test value from Table D8. |
| ISRatio | the final irregular-to-seasonal ratio from Table F 2.H. |
| SMA_ALL | the final seasonal moving average filter for all periods. |
| RSF | the residual seasonality *F* test value for Table D11 for the entire series. |
| RSF3 | the residual seasonality *F* test value for Table D11 for the last three years. |
| RSFA | the residual seasonality *F* test value for Table D11.A for the entire series. |
| RSF3A | the residual seasonality *F* test value for Table D11.A for the last three years. |
| RSFR | the residual seasonality *F* test value for Table D11.R for the entire series. |
| RSF3R | the residual seasonality *F* test value for Table D11.R for the last three years. |

| | | |
|---|---|---|
| | TMA | the Henderson trend moving average filter selected. |
| | ICRatio | the final irregular-to-trend cycle ratio from Table F 2.H. |
| | E5sd | the standard deviation from Table E5. |
| | E6sd | the standard deviation from Table E6. |
| | E6Asd | the standard deviation from Table E6.A. |
| | MCD | months of cyclical dominance. |
| | Q | the overall level Q from Table F3. |
| | Q2 | Q overall level without M2 from Table F3. |
| FMT | indicates whether the format is numeric or character. FMT="NUM" if the value is numeric and stored in the VALUE variable. FMT="CHAR" if the value is a string and stored in the CVALUE variable. | |
| VALUE | contains the numerical value of the statistic or missing if the statistic is of type character. | |
| CVALUE | contains the character value of the text statistic or blank if the statistic is of type numeric. | |

# Examples: X13 Procedure

## Example 46.1: ARIMA Model Identification

This example shows typical PROC X13 statements that are used for ARIMA model identification. This example invokes the X13 procedure and uses the TRANSFORM and IDENTIFY statements. It specifies the time series data, takes the logarithm of the series (TRANSFORM statement), and generates ACFs and PACFs for the specified levels of differencing (IDENTIFY statement). The ACFs and PACFs for DIFF=1 and SDIFF=1 are shown in Output 46.1.1, Output 46.1.2, Output 46.1.3, and Output 46.1.4. The data set is the same as in the section "Basic Seasonal Adjustment" on page 3314.

The graphical displays are available when ODS Graphics is enabled. For more information about the graphics available in the X13 procedure, see the section "ODS Graphics" on page 3381.

```
proc x13 data=sales date=date;
   var sales;
   transform power=0;
   identify diff=(0,1) sdiff=(0,1);
run;
```

**Output 46.1.1** ACFs (Nonseasonal Order=1 Seasonal Order=1)

## Example 46.2: Model Estimation

After studying the output from Example 46.1 and identifying the ARIMA part of the model as, for example, (0 1 1)(0 1 1) 12, you can replace the IDENTIFY statement with the ARIMA and ESTIMATE statements as follows:

```
proc x13 data=sales date=date;
   var sales;
   transform power=0;
   arima model=( (0,1,1)(0,1,1) );
   estimate;
run ;
```

The parameter estimates and estimation summary statistics are shown in Output 46.2.1.

**Output 46.2.1** Estimation Data

## Example 46.3: Seasonal Adjustment

Assuming that the model in Example 46.2 is satisfactory, a seasonal adjustment that uses forecast extension can be performed by adding the X11 statement to the procedure. By default, the data are forecast one year ahead at the end of the series.

```
ods output D8A#1=SalesD8A_1;
ods output D8A#2=SalesD8A_2;
ods output D8A#3=SalesD8A_3;
ods output D8A#4=SalesD8A_4;
proc x13 data=sales date=date;
   var sales;
   transform power=0;
   arima model=( (0,1,1)(0,1,1) );
   estimate;
   x11;
run;

title 'Stable Seasonality Test';
proc print data=SalesD8A_1 LABEL;
run;

title 'Nonparametric Stable Seasonality Test';
proc print data=SalesD8A_2 LABEL;

## Example 46.4: RegARIMA Automatic Model Selection

This example demonstrates regARIMA modeling and TRAMO-based automatic model selection, which is available with the AUTOMDL statement. ODS SELECT statements are used to limit the displayed output to the model selection and estimation stages. The same data set is used as in the previous examples.

```
title 'TRAMO Automatic Model Identification';
ods select UnitRootTestModel
           UnitRootTest
           AutoChoiceModel
           Best5Model
           AutomaticModelChoice
```

```
            InitialModelChoice
            FinalModelChecks
            FinalModelChoice
            AutomdlNote;
proc x13 data=sales date=date;
   var sales;
   transform function=log;
   regression predefined=td;
   automdl maxorder=(1,1)
           print=all;
   estimate;
   x11;
   output out=out a1 a2 a6 b1 c17 c20 d1 d7 d8 d9 d10
                  d11 d12 d13 d16 d18;
run;

proc print data=out(obs=21);
   title 'Output Variables Related to Trading Day Regression';
run;
```

The automatic model selection output is shown in Output 46.4.1, Output 46.4.2, and Output 46.4.3. The first table, "ARIMA Estimate for Unit Root Identification" in Output 46.4.1, gives details of the method that TRAMO uses to automatically select the orders of differencing. The second table, "Results of Unit Root Test for Identifying Orders of Differencing" in Output 46.4.1, shows that a regular difference order of 1 and a seasonal difference order of 1 has been determined by TRAMO. The third table, "Models Estimated by Automatic ARIMA Model Selection Procedure" in Output 46.4.2, shows all the models examined by the TRAMO-based method. The fourth table, "Best Five ARIMA Models Chosen by Automatic Modeling" in Output 46.4.3, shows the top five models in order of rank and their BIC2 statistic. The fifth table, "Comparison of Automatically Selected Model and Default Model" in Output 46.4.3, compares the model selected by the TRAMO model to the default regARIMA model of the X-13ARIMA-SEATS method. The sixth table, "Initial Automatic Model Selection" in Output 46.4.3, shows which model was selected between the two models that are compared in the table "Comparison of Automatically Selected Model and Default Model." (When available, the table "Check of the Residual Ljung-Box $Q$ Statistic" in Output 46.4.3 contains additional information about the initial model choice.) The seventh table, "Final Checks for Identified Model" in Output 46.4.3, displays the results of the final model checks for model adequacy. The eighth table, "Final Automatic Model Selection" in Output 46.4.3, shows which model was actually selected.

**Output 46.4.1** Output from the AUTOMDL Statement

## TRAMO Automatic Model Identification

### The X13 Procedure

**ARIMA Estimates for Unit Root Identification**

**For Variable sales**

| Model Number | Estimation Method | Estimated Model | ARMA Parameter | Estimate |
|---|---|---|---|---|

**For Variable sales**

| Source of Model | Estimated Model |
|---|---|
| Automatic Model Choice | ( 0, 1, 1) ( 0, 1, 1) |

**Final Checks for Identified Model**
**For Variable sales**

| Test | Result | Model Change |
|---|---|---|
| Check for Unit Roots | No unit root. | No Change |
| Check for Nonseasonal Overdifferencing | Nonseasonal MA not within 0.001 of 1.0 - model passes. | No Change |
| Check for insignificant ARMA coefficients | No insignificant ARMA coefficients found. | No Change |

**Final Automatic Model Selection**
**For Variable sales**

| Source of Model | Orders Altered | Estimated Model |
|---|---|---|
| Automatic Model Choice | No | ( 0, 1, 1) ( 0, 1, 1) |

Table 46.17 and Output 46.4.4 illustrate the regARIMA modeling method. Table 46.17 shows the relationship between the output variables in PROC X13 that results from a regARIMA model. Note that some of these formulas apply only to this example. Output 46.4.4 shows the values of these variables for the first 21 observations in the example.

**Table 46.17** regARIMA Output Variables and Descriptions

| Table | Title | Type | Formula |
|---|---|---|---|
| A1 | Time series data (for the span analyzed) | Data | Input |
| A2 | Prior-adjustment factors leap year (from trading day regression) adjustments | Factor | Calculated from regression |
| A6 | RegARIMA trading day component leap year prior adjustments included from Table A2 | Factor | Calculated from regression |
| B1 | Original series (prior adjusted) (adjusted for regARIMA factors) | Data | B1 = A1/A6*<br>*Because only TD specified |
| C17 | Final weights for irregular component | Factor | Calculated using moving standard deviation |
| C20 | Final extreme value adjustment factors | Factor | Calculated using C16 and C17 |
| D1 | Modified original data, D iteration | Data | D1 = B1/C20**<br>D1 = C19/C20<br>**C19 = B1 in this example |
| D7 | Preliminary trend cycle, D iteration | Data | Calculated using Henderson moving average |
| D8 | Final unmodified SI ratios | Factor | D8 = B1/D7***<br>D8 = C19/D7<br>***TD specified in regression |
| D9 | Final replacement values for SI ratios | Factor | If C17 shows extreme values,<br>D9 = D1/D7;<br>D9 = . otherwise |
| D10 | Final seasonal factors | Factor | Calculated using moving averages |
| D11 | Final seasonally adjusted data (also adjusted for trading day) | Data | D11 = B1/D10****<br>D11 = C19/D10<br>****B1 = C19 for this example |
| D12 | Final trend cycle | Data | Calculated using Henderson moving average |
| D13 | Final irregular component | Factor | D13 = D11/D12 |
| D16 | Combined adjustment factors (includes seasonal, trading day factors) | Factor | D16 = A1/D11 |
| D18 | Combined calendar adjustment factors (includes trading day factors) | Factor | D18 = D16/D10<br>D18 = A6*****<br>*****Regression TD is the only calendar adjustment factor in this example |

## Example 46.5: Automatic Outlier Detection

This example demonstrates the use of the OUTLIER statement to automatically detect and remove outliers from a time series to be seasonally adjusted. The data set is the same as in the section "Basic Seasonal Adjustment" on page 3314 and the previous examples. Adding the OUTLIER statement to Example 46.3 requests that outliers be detected by using the default critical value as described in the section "OUTLIER Statement" on page 3344. The tables associated with outlier detection for this example are shown in Output 46.5.1. The first table shows the critical values; the second table shows that a single potential outlier was identified; the third table shows the estimates for the ARMA parameters. Since no outliers are included in the regression model, the "Regression Model Parameter Estimates" table is not displayed. Because only a potential outlier was identified, and not an actual outlier, in this case the A1 series and the B1 series are identical.

```
title 'Automatic Outlier Identification';
proc x13 data=sales date=date;
   var sales;
   transform function=log;
   arima model=( (0,1,1)(0,1,1) );
   outlier;
   estimate;
   x11;
   output out=nooutlier a1 b1 d10;
run ;
```

**Output 46.5.1** PROC X13 Output When Potential Outliers Are Identified

**Automatic Outlier Identification**

**The X13 Procedure**

| Critical Values to use in Outlier Detection For Variable sales | |
|---|---|
| **Begin** | SEP1978 |
| **End** | AUG1990 |
| **Observations** | 144 |
| **Method** | Add One |
| **AO Critical Value** | 3.889838 |
| **LS Critical Value** | 3.889838 |

**Note:** The following time series values might later be identified as outliers when data are added or revised. They were not identified as outliers in this run either because their test t-statistics were slightly below the critical value or because they were eliminated during the backward deletion step of the identification procedure, when a non-robust t-statistic is used.

**Potential Outliers**

**For Variable sales**

| Type of Outlier | Date | t Value for AO | t Value for LS |
|---|---|---|---|
| **AO** | **NOV1989** | -3.48 | -1.51 |

**Output 46.5.1** *continued*

**Exact ARMA Maximum Likelihood Estimation**

**For Variable sales**

| Parameter | Lag | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|---|
| **Nonseasonal MA** | **1** | 0.40181 | 0.07887 | 5.09 | <.0001 |
| **Seasonal MA** | **12** | 0.55695 | 0.07626 | 7.30 | <.0001 |

In the next example, reducing the critical value to 3.3 causes the outlier identification routine to more aggressively identify outliers as shown in Output 46.5.2. The first table shows the critical values. The second table shows that three additive outliers and a level-shift have been included in the regression model. The third table shows how the inclusion of outliers in the model affects the ARMA parameters.

```
proc x13 data=sales date=date;
   var sales;
   transform function=log;
   arima model=((0,1,1) (0,1,1));
   outlier cv=3.3;
   estimate;
   x11;
   output out=outlier a1 a8  a8ao a8ls b1 d10;
run;

proc print data=outlier(obs=45);
run;
```

**Output 46.5.2** PROC X13 Output When Outliers Are Identified

**Automatic Outlier Identification**

**The X13 Procedure**

**Critical Values to use in Outlier Detection**

**For Variable sales**

| | |

|---|---|---|---|---|---|
| **Nonseasonal MA** | **1** | 0.33205 | 0.08239 | 4.03 | <.0001 |
| **Seasonal MA** | **12** | 0.49647 | 0.07676 | 6.47 | <.0001 |

The first 45 observations of the A1, A8, A8AO, A8LS, B1, and D10 series are displayed in Output 46.5.3. You can confirm the following relationships from the data:

$$A8 = A8AO \times A8LS$$

$$B1 = A1/A8$$

The seasonal factors are stored in the variable sales_D10.

**Output 46.5.3** PROC X13 Output Series Related to Outlier Detection

**Automatic Outlier Identification**

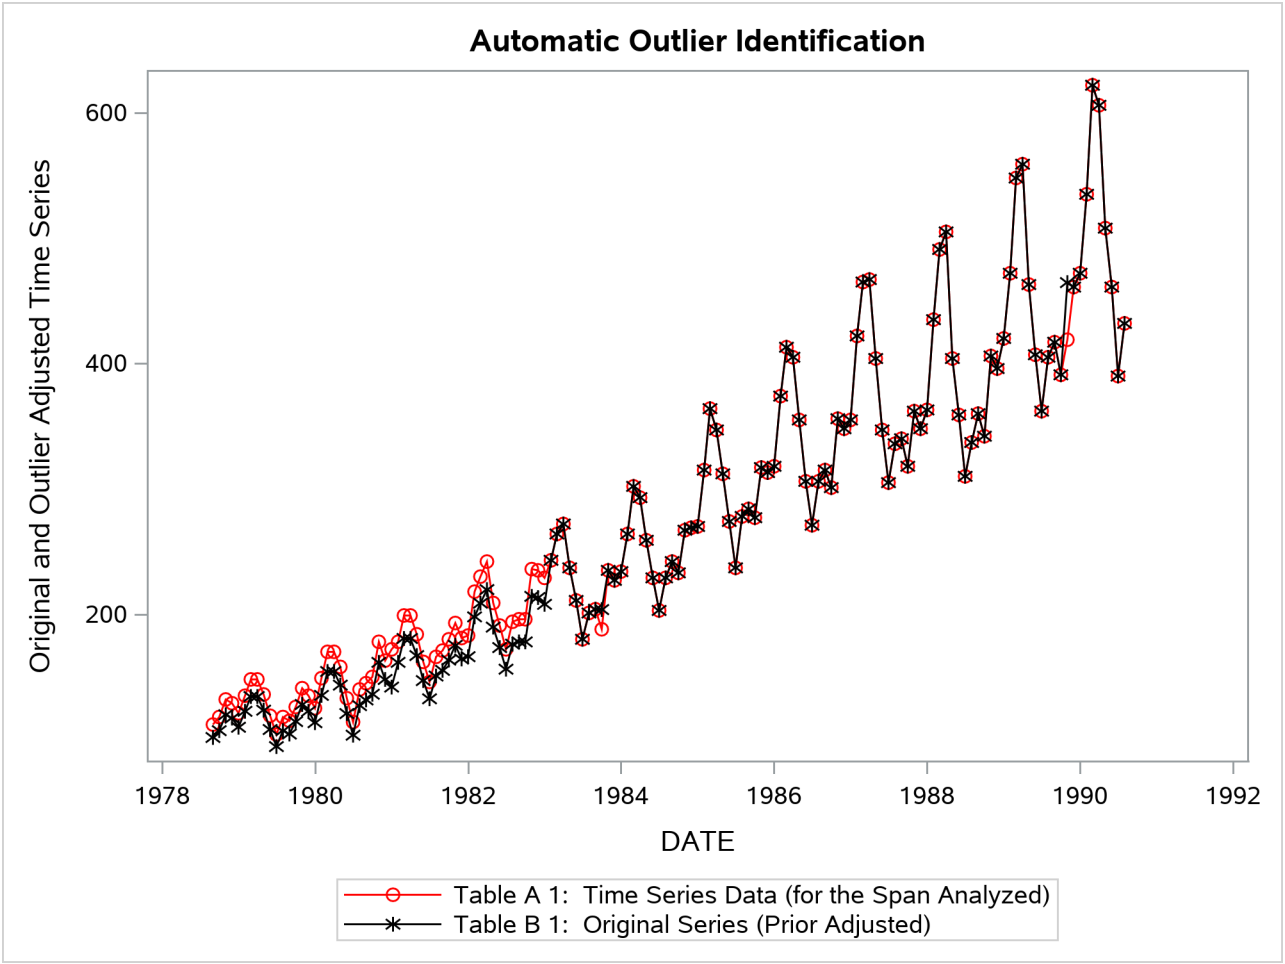
From the two previous examples, you can examine how outlier detection affects the seasonally adjusted series. Output 46.5.4 shows a plot of A1 versus B1 in the series where outliers are detected. B1 has been adjusted for the additive outliers and the level-shift.

```
proc sgplot data=outlier;
   series x=date y=sales_A1 / name='A1' markers
                              markerattrs=(color=red symbol='circle')
                              lineattrs=(color=red);
   series x=date y=sales_B1 / name='B1' markers
                              markerattrs=(color=black symbol='asterisk')
                              lineattrs=(color=black);
   yaxis label='Original and Outlier Adjusted Time Series';
run;
```

**Output 46.5.4** Original Series and Outlier Adjusted Series

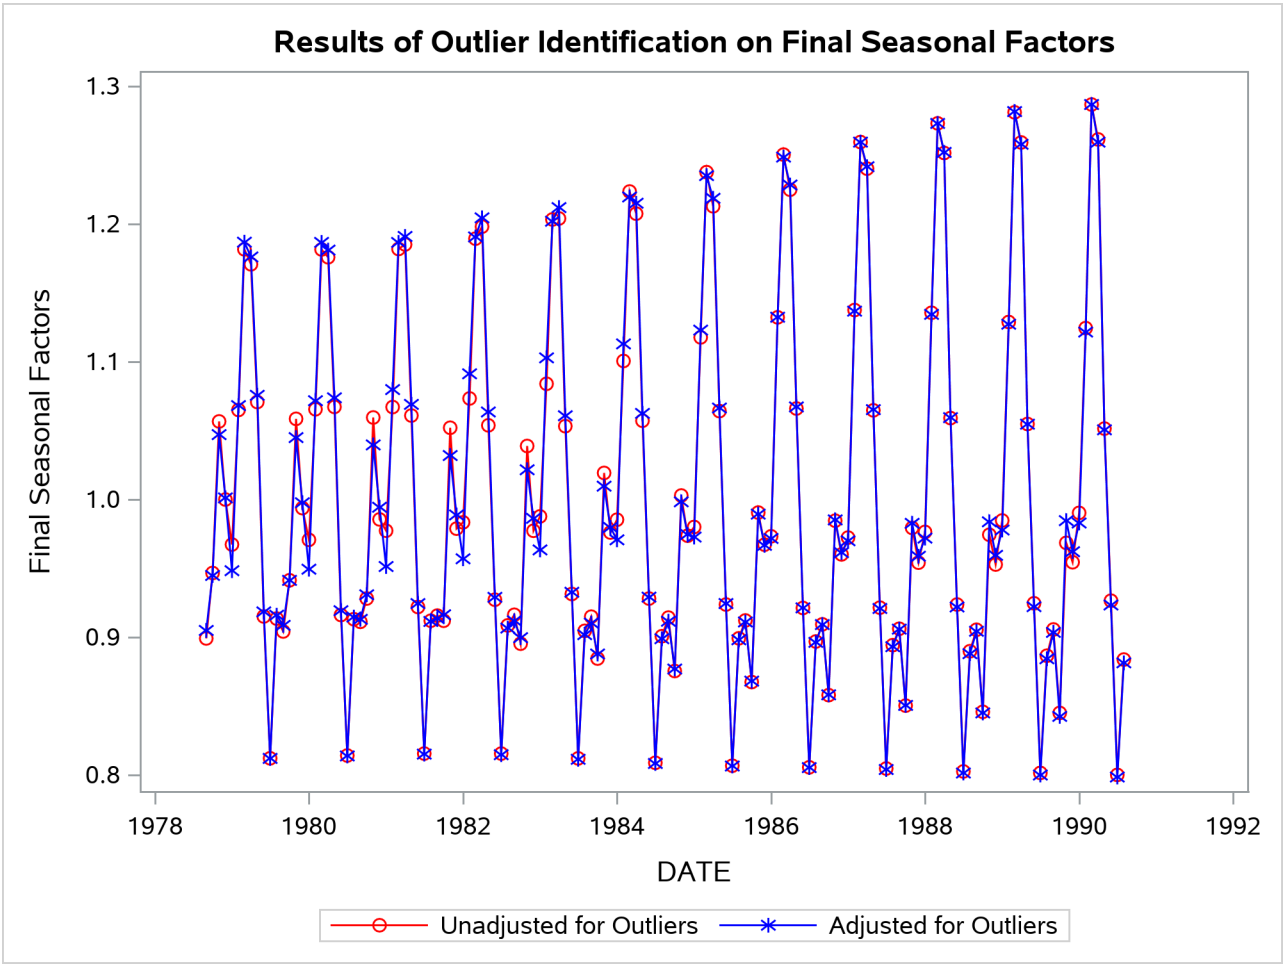


Output 46.5.5 compares the seasonal factors (Table D10) of the series unadjusted for outliers to the series adjusted for outliers. The seasonal factors are based on the B1 series.

```
data both;
   merge nooutlier(rename=(sales_D10=unadj_D10)) outlier;
run;
```

```
title 'Results of Outlier Identification on Final Seasonal Factors';
proc sgplot data=both;
   series x=date y=unadj_D10 / name='unadjusted' markers
                               markerattrs=(color=red symbol='circle')
                               lineattrs=(color=red)
                               legendlabel='Unadjusted for Outliers';
   series x=date y=sales_D10 / name='adjusted' markers
                               markerattrs=(color=blue symbol='asterisk')
                               lineattrs=(color=blue)
                               legendlabel='Adjusted for Outliers';
   yaxis label='Final Seasonal Factors';
run;
```

**Output 46.5.5** Seasonal Factors Based on Original and Outlier Adjusted Series



## Example 46.6: User-Defined Regressors

This example demonstrates the use of the USERVAR= option in the REGRESSION statement to include user-defined regressors in the regARIMA model. The user-defined regressors must be defined as nonmissing values for the span of the series being modeled plus any backcast or forecast values. Suppose you have the data set SALESDATA with 132 monthly observations beginning in January 1949.

```
title 'Data Set to be Seasonally Adjusted';
data salesdata;
   set sashelp.air(obs=132);
run;
```

Because the regARIMA model forecasts one year ahead, you must define the regressor for 144 observations that start in January 1949. You can construct a simple length-of-month regressor by using the following DATA step:

```
title 'User-defined Regressor for Data to be Seasonally Adjusted';
data regressors(keep=date LengthOfMonth);
   set sashelp.air;
   LengthOfMonth = INTNX('MONTH',date,1) - date;
run;
```

In this example, the two data sets are merged to use them as input to PROC X13. You can also use the AUXDATA= data set to input user-defined regressors. For more information, see Example 46.11. The BY statement is used to align the regressors with the time series by the time ID variable DATE.

```
title 'Data Set Containing Series and Regressors';
data datain;
   merge regressors salesdata;
   by date;
run;

proc print data=datain(firstobs=121);
run;
```

The last 24 observations of the input data set are displayed in Output 46.6.1. The regressor variable is defined for one year (12 observations) beyond the span of the time series to be seasonally adjusted.

**Output 46.6.1** PROC X13 Input Data Set with User-Defined Regressor

**Data Set Containing Series and Regressors**

| Obs | DATE | LengthOfMonth | AIR |
|---|---|---|---|
| **121** | JAN59 | 31 | 360 |
| **122** | FEB59 | 28 | 342 |
| **123** | MAR59 | 31 | 406 |
| **124** | APR59 | 30 | 396 |
| **125** | MAY59 | 31 | 420 |
| **126** | JUN59 | 30 | 472 |
| **127** | JUL59 | 31 | 548 |
| **128** | AUG59 | 31 | 559 |
| **129** | SEP59 | 30 | 463 |
| **130** | OCT59 | 31 | 407 |
| **131** | NOV59 | 30 | 362 |
| **132** | DEC59 | 31 | 405 |
| **133** | JAN60 | 31 | . |
| **134** | FEB60 | 29 | . |
| **135** | MAR60 | 31 | . |
| **136** | APR60 | 30 | . |
| **137** | MAY60 | 31 | . |
| **138** | JUN60 | 30 | . |
| **139** | JUL60 | 31 | . |
| **140** | AUG60 | 31 | . |
| **141** | SEP60 | 30 | . |
| **142** | OCT60 | 31 | . |
| **143** | NOV60 | 30 | . |
| **144** | DEC60 | 31 | . |

The DATAIN data set is now ready to be used as input to PROC X13. The DATE= variable and the user-defined regressors are automatically excluded from the variables to be seasonally adjusted.

```
title 'regARIMA Model with User-defined Regressor';
proc x13 data=datain date=DATE interval=MONTH plots=none;
   transform function=log;
   regression uservar=LengthOfMonth / usertype=lom;
   automdl;
   x11;
   output out=out a1 d11;
run;
```

The parameter estimates for the regARIMA model are shown in Output 46.6.2

**Output 46.6.2** PROC X13 Output for User-Defined Regression Parameter

**regARIMA Model with User-defined Regressor**

**The X13 Procedure**

**Regression Model Parameter Estimates**

**For Variable AIR**

| Type | Parameter | NoEst | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|---|---|
| User Defined | LengthOfMonth | Est | 0.04683 | 0.01834 | 2.55 | 0.0119 |

**Exact ARMA Maximum Likelihood Estimation**

**For Variable AIR**

| Parameter | Lag | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|---|
| **Nonseasonal MA** | **1** | 0.33678 | 0.08506 | 3.96 | 0.0001 |
| **Seasonal MA** | **12** | 0.54078 | 0.07726 | 7.00 | <.0001 |

Another way to include user-defined regressors in the regARIMA model is to specify the SPAN= option in the PROC X13 statement. The following user-defined regressor is similar to the one defined previously. However, this length-of-month regressor is mean adjusted. Using a zero-mean regressor prevents the regressor from altering the level of the series. In this instance, the series to be seasonally adjusted, AIR, and the regression variable, LengthOfMonth, have nonmissing observations at all time periods in the data set DATAIN.

```
title 'User-defined Regressor for Data to be Seasonally Adjusted, Mean Adjusted';
data datain(keep=date AIR LengthOfMonth);
   set sashelp.air;
   LengthOfMonth = INTNX('MONTH',date,1) - date - 30.4375;
run;
```

Because the default forecast period is one year ahead, the span of the series must be limited to one year before the end of the regression variable definition to forecast using the regression variable LengthOfMonth,

```
title 'regARIMA Model with Zero-Mean User-defined Regressor';
proc x13 data=datain date=DATE interval=MONTH span=(,DEC1959) plots=none;
   transform function=log;
   regression uservar=LengthOfMonth / usertype=lom;
   automdl;
   x11;
   output out=outzm a1 d11;
run;
```

The parameter estimates for the regARIMA model that are estimated using a zero-mean regressor are shown in Output 46.6.3

**Output 46.6.3** PROC X13 Output for Zero-Mean User-Defined Regression Parameter

**regARIMA Model with Zero-Mean User-defined Regressor**

**The X13 Procedure**

**Regression Model Parameter Estimates**
**For Variable AIR**

| Type | Parameter | NoEst | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|---|---|
| User Defined | LengthOfMonth | Est | 0.04683 | 0.01834 | 2.55 | 0.0119 |

**Exact ARMA Maximum Likelihood Estimation**
**For Variable AIR**

| Parameter | Lag | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|---|
| Nonseasonal MA | 1 | 0.33678 | 0.08506 | 3.96 | 0.0001 |
| Seasonal MA | 12 | 0.54078 | 0.07726 | 7.00 | <.0001 |

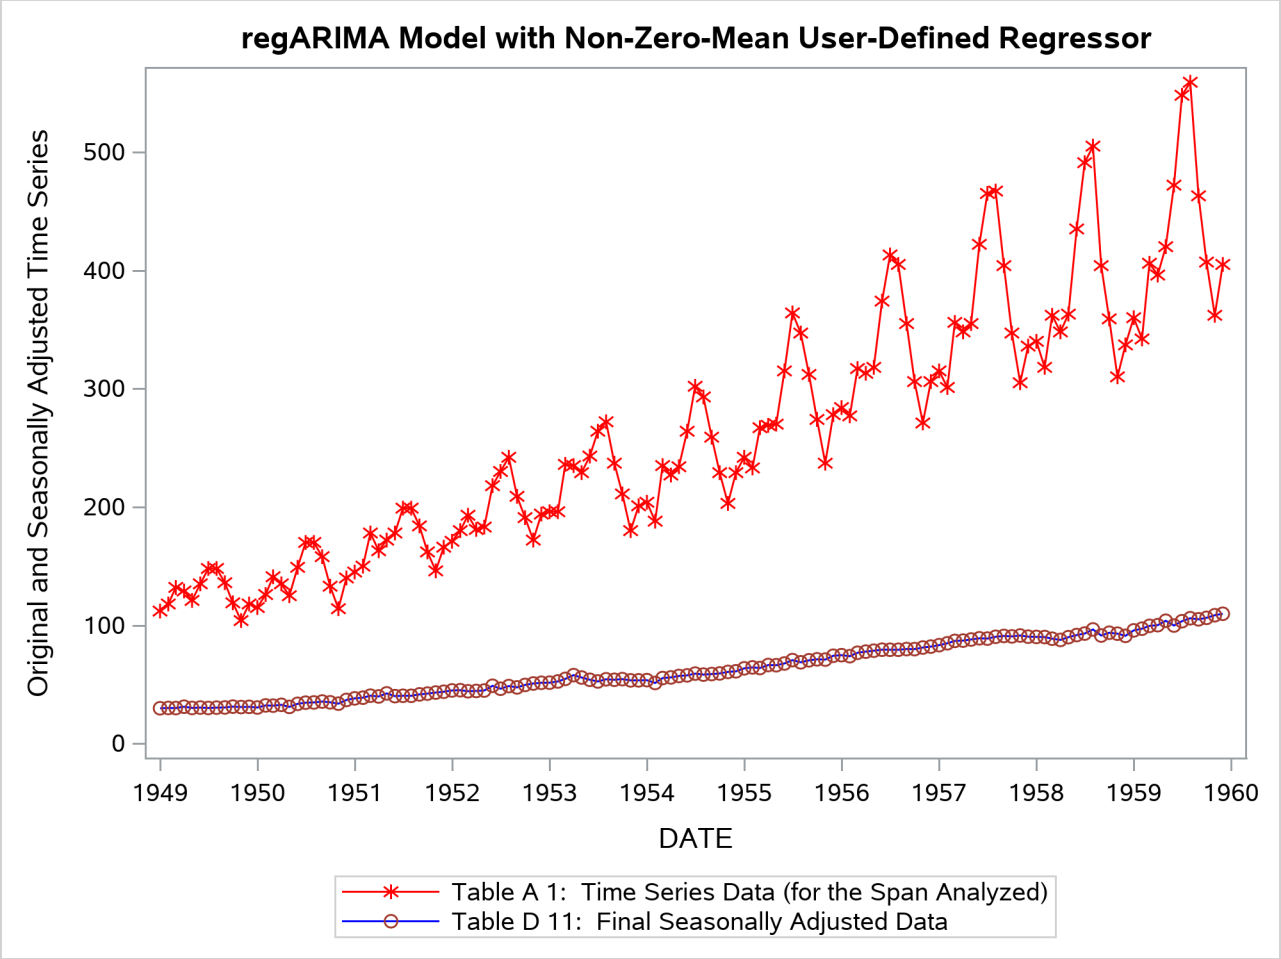
Specifying USERTYPE=LOM causes the regression effect to be removed from the seasonally adjusted series. The effect of the mean of the regression variable on the seasonally adjusted series can be seen by examining the plots of the original series and the seasonally adjusted series.

```
title 'regARIMA Model with Non-Zero-Mean User-Defined Regressor';
proc sgplot data=out;
   series x=date y=air_A1 / name = "A1" markers
                            markerattrs=(color=red symbol='asterisk')
                            lineattrs=(color=red);
   series x=date y=air_D11 / name= "D11" markers
                             markerattrs=(symbol='circle')
                             lineattrs=(color=blue);
   yaxis label='Original and Seasonally Adjusted Time Series';
run;

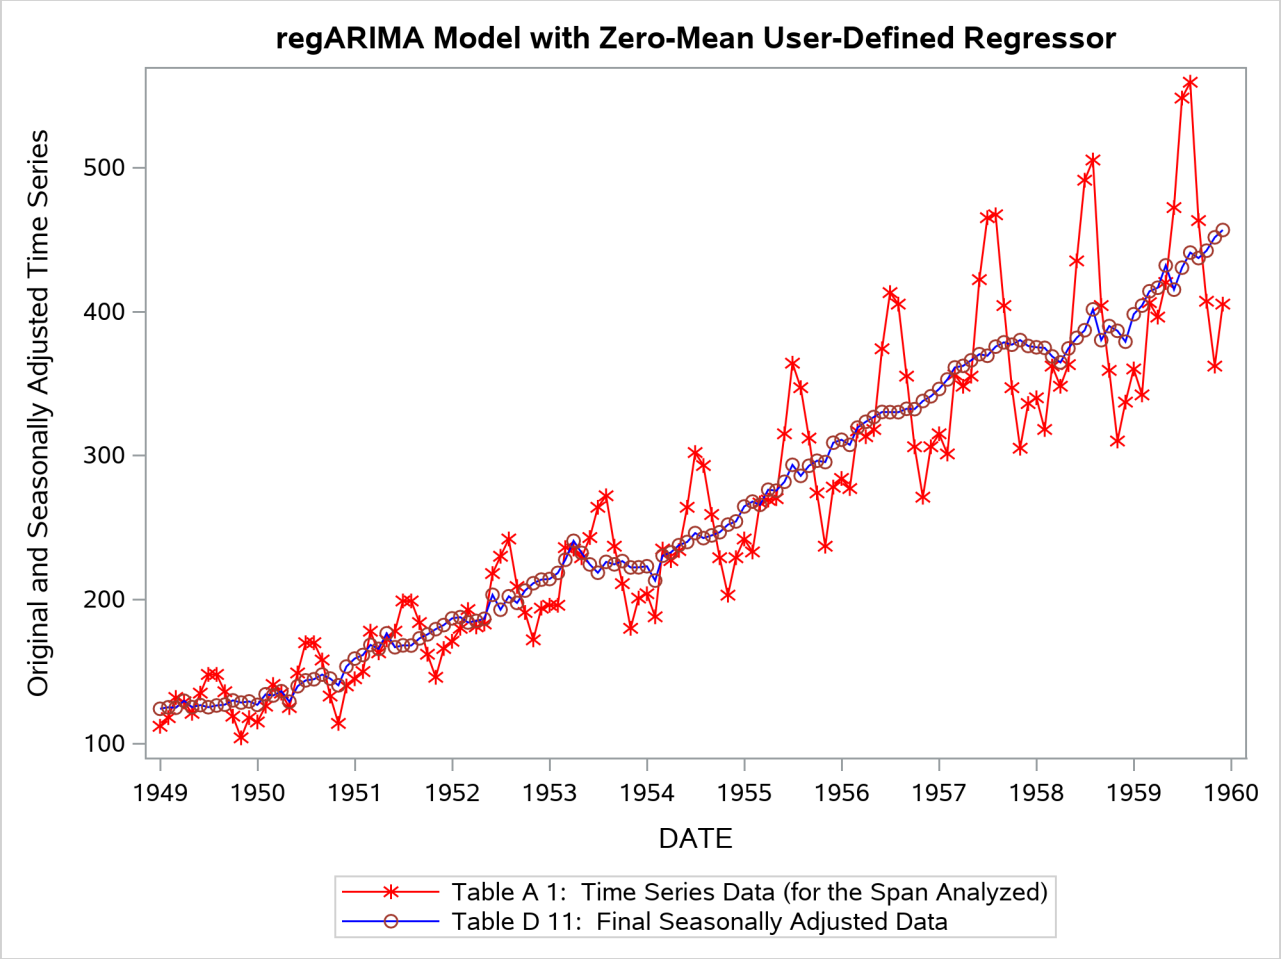
title 'regARIMA Model with Zero-Mean User-Defined Regressor';
proc sgplot data=outzm;
   series x=date y=air_A1 / name = "A1" markers
                            markerattrs=(color=red symbol='asterisk')
                            lineattrs=(color=red);
   series x=date y=air_D11 / name= "D11" markers
                             markerattrs=(symbol='circle')
                             lineattrs=(color=blue);
   yaxis label='Original and Seasonally Adjusted Time Series';
run;
```

The graph of the original and seasonally adjusted series in Output 46.6.4 shows that the level of the seasonally adjusted series has been altered due to the user-defined regressor. The graph of the original and seasonally adjusted series in Output 46.6.5 shows that the level of the seasonally adjusted series is the same as the original series since the user-defined regressor has zero-mean.

**Output 46.6.4** Plot of Original and Seasonally Adjusted Data



**Output 46.6.5** Plot of Original and Seasonally Adjusted Data (Zero-Mean Regressor)



When actual values are available for the forecast periods, information about forecast error is available in the output. Output 46.6.6 shows the table "Forecasts and Standard Errors of the Transformed Data on the Original Scale" for a series with missing values in the forecast period. Output 46.6.7 shows the table "Forecasts and Standard Errors of the Transformed Data on the Original Scale" for a series with actual values in the forecast period. Thus, it is more desirable to use SPAN= option to limit the span of a series if the actual values are available for the forecast period.

**Output 46.6.6** PROC X13 Forecasts for Series Extended with Missing Values

**Forecasts and Standard Errors of the Transformed Data**

**On the Original scale**

**For Variable AIR**

| Date | Forecast | Standard Error | 95% Confidence Limits | |

## Example 46.7: MDLINFOIN= and MDLINFOOUT= Data Sets

This example illustrates the use of MDLINFOIN= and MDLINFOOUT= data sets. Using the data set shown, PROC X13 step identifies the model with outliers as displayed in Output 46.7.1. Output 46.7.2 shows the data set that represents the chosen model.

```
data b1;
   input y @@;
   datalines;
   112 118 132 129
   121 135 148 148
   136 119 104 118
   115 126 141 135
   125 149 270 170
   158 133 114 140
;

title 'Model Identification Output to MDLINFOOUT= Data Set';
proc x13 data=b1 start='1980q1' interval=qtr MdlInfoOut=mdl;
   automdl;
   outlier;
run ;

proc print data=mdl;
run;
```

**Output 46.7.1** Displayed Model Identification with Outliers

**Model Identification Output to MDLINFOOUT= Data Set**

**The X13 Procedure**

Suppose that after examining the output from the preceding example, you decide that an Easter regressor should be added to the model. The following statements create a data set with the model identified above and adds a US Census Bureau Predefined Easter(25) regressor. The new model data set to be used as input in the MDLINFOIN= option is displayed in the data set shown in Output 46.7.3.

```
data pluseaster;
   _NAME_ = 'y';
   _MODELTYPE_ = 'REG';
   _MODELPART_ = 'PREDEFINED';
   _COMPONENT_ = 'SCALE';
   _PARMTYPE_ = 'EASTER';
   _DSVAR_ = 'EASTER';
   _VALUE_ = 25;
run;

data mdlpluseaster;
   set mdl;
run;

title 'Model with Easter(25) Regression Added';
```

```
proc append base=mdlpluseaster data=pluseaster force;
run;

proc print data=mdlpluseaster;
run;
```

**Output 46.7.3** MDLINFOIN= Data Set Model with Easter(25) Regression Added

## Example 46.8: Setting Regression Parameters

This example illustrates the use of fixed regression parameters in PROC X13. Suppose that you have the same data set as in the section "Basic Seasonal Adjustment" on page 3314. You can specify the following statements to use TRAMO to automatically identify a model that includes a US Census Bureau Easter(25) regressor:

```
title 'Estimate Easter(25) Parameter';
proc x13 data=sales date=date MdlInfoOut=mdlout1;
   var sales;
   regression predefined=easter(25);
   automdl;
run ;
```

The displayed results are shown in Output 46.8.1.

**Output 46.8.1** Automatic Model ID with Easter(25) Regression

**Estimate Easter(25) Parameter**

**The X13 Procedure**

**Regression Model Parameter Estimates**

**For Variable sales**

| Type | Parameter | NoEst | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|---|---|
| Easter | Easter[25] | Est | -5.09298 | 3.50786 | -1.45 | 0.1489 |

**Output 46.8.1** *continued*

**Exact ARMA Maximum Likelihood Estimation**

**For Variable sales**

| Parameter | Lag | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|---|
| **Nonseasonal AR** | **1** | 0.62148 | 0.09279 | 6.70 | <.0001 |
| | **2** | 0.23354 | 0.10385 | 2.25 | 0.0262 |
| | **3** | -0.07191 | 0.09055 | -0.79 | 0.4285 |

To fix the Easter(25) parameter while adding a regressor that is weighted according to the number of Saturdays in a month, either use the REGRESSION and EVENT statements or create a MDLINFOIN= data set. The following statements show the method for using the REGRESSION statement to fix the EASTER parameter and the EVENT statement to add the SATURDAY regressor. The output is shown in Output 46.8.3.

```
title 'Use SAS Statements to Alter Model';
proc x13 data=sales date=date MdlInfoOut=mdlout2grm;
   var sales;
   regression predefined=easter(25) / b=-5.029298 F;
   event Saturday;
   automdl;
run ;
```

**Output 46.8.3** Automatic Model ID with Fixed Easter(25) and Saturday Regression

**Use SAS Statements to Alter Model**

**The X13 Procedure**

**Regression Model Parameter Estimates**

**For Variable sales**

| Type | Parameter | NoEst | Estimate | Standard Error | t Value | Pr > \|t\| |

|---|---|---|---|---|---|
| Nonseasonal AR | 1 | -0.32506 | 0.08256 | -3.94 | 0.0001 |

To fix the EASTER regressor and add the new SATURDAY regressor by using a DATA step, you can create the data set mdlin2 as shown. The data set mdlin2 is displayed in Output 46.8.4.

```
title 'Use a SAS DATA Step to Create a MdlInfoIn= Data Set';
data plusSaturday;
   _NAME_ = 'sales';
   _MODELTYPE_ = 'REG';
   _MODELPART_ = 'EVENT';
   _COMPONENT_ = 'SCALE';
   _PARMTYPE_ = 'USER';
   _DSVAR_ = 'SATURDAY';
run;

data mdlin2;
   set mdlout1;
   if ( _DSVAR_ = 'EASTER' ) then do;
       _NOEST_ = 1;
       _EST_ = -5.029298;
       end;
run;

proc append base=mdlin2 data=plusSaturday force;
run;
```

```
proc print data=mdlin2;
run;
```

**Output 46.8.4** MDLINFOIN= Data Set, Fixed Easter(25) and Added Saturday Regression, Previously Identified Model

**Use a SAS DATA Step to Create a MdlInfoIn= Data Set**

The MDLINFOOUT= data set provides a method for comparing the results of the model identification. The data set mdlout3grm that results from using the MODEL= option in the ARIMA statement can be compared to the data set mdlout2DS that results from using the MDLINFOIN= data set with initial values for the AR and MA parameters. The mdlout2DS data set is shown in Output 46.8.7, and the results of the comparison are shown in Output 46.8.8. The slight difference in the estimated parameters can be attributed to the difference in the initial values for the AR and MA parameters.

```
title 'Model Produced by Updating the MdlInfoIn= Data Set';
proc print data=mdlout2DS;
run;
```

**Output 46.8.7** MDLINFOOUT= Data Set, Fixed Easter(25) and Added Saturday Regression, Previously Identified Model

**Model Produced by Updating the MdlInfoIn= Data Set**

## Example 46.9: Creating an MDLINFO= Data Set for Use with the PICKMDL Statement

This example illustrates how you can create a data set for use in the PICKMDL statement that contains five commonly used ARIMA models:

- ARIMA (0 1 1)(0 1 1)s
- ARIMA (0 1 2)(0 1 1)s
- ARIMA (2 1 0)(0 1 1)s
- ARIMA (0 2 2)(0 1 1)s
- ARIMA (2 1 2)(0 1 1)s

The following macro code creates a MDLINFOIN= data set for a general ARIMA model:

```
%macro makemodel(name,p,d,q,sp,sd,sq,model);
   data "&name" (keep= _MODELTYPE_ _MODELPART_ _COMPONENT_
                       _DSVAR_ _PARMTYPE_ _FACTOR_ _LAG_
                         _LABEL_ );
      length _MODELTYPE_ _MODELPART_ _COMPONENT_ _DSVAR_
             _PARMTYPE_ $32;
      length _FACTOR_ _LAG_ 8;
      length _LABEL_ $32;

      _MODELTYPE_="ARIMA";
      _MODELPART_="FORECAST";
      _DSVAR_=".";

      _LABEL_="("||"&p"||" "||"&d"||" "||"&q"||")("||
              "&sp"||" "||"&sd"||" "||"&sq"||")s";

      /* nonseasonal AR factors */
      _COMPONENT_="NONSEASONAL";
      _PARMTYPE_="AR";
      _FACTOR_=1;
      do _LAG_=1 to &p;
         output;
         end;

      /* seasonal AR factors */
      _COMPONENT_="SEASONAL";
      _PARMTYPE_="AR";
      _FACTOR_=2;
      do _LAG_=1 to &sp;
         output;
         end;
```

```
      /* nonseasonal MA factors */
      _COMPONENT_="NONSEASONAL";
      _PARMTYPE_="MA";
      _FACTOR_=1;
      do _LAG_=1 to &q;
         output;
         end;

      /* seasonal MA factors */
      _COMPONENT_="SEASONAL";
      _PARMTYPE_="MA";
      _FACTOR_=2;
      do _LAG_=1 to &sq;
         output;
         end;

      /* nonseasonal DIF */
      _COMPONENT_="NONSEASONAL";
      _PARMTYPE_="DIF";
      _FACTOR_=1;
      _LAG_=1;
      do i_=1 to &d;
         output;
         end;

      /* seasonal DIF */
      _COMPONENT_="SEASONAL";
      _PARMTYPE_="DIF";
      _FACTOR_=2;
      _LAG_=1;
      do i_=1 to &sd;
         output;
         end;

   run;
   data sasuser.&name;
     length _MODEL_ $32;
     set "&name";
     _MODEL_ = "&model";
   run;

%mend makemodel;
```

The following SAS statements use the macro to generate a data set with some commonly used models for use in the PICKMDL statement:

```
%makemodel(x13mdl1,0,1,1,0,1,1,Model1);
%makemodel(x13mdl2,0,1,2,0,1,1,Model2);
%makemodel(x13mdl3,2,1,0,0,1,1,Model3);
%makemodel(x13mdl4,0,2,2,0,1,1,Model4);
%makemodel(x13mdl5,2,1,2,0,1,1,Model5);

data Models;
   length _NAME_ $32;
```

```
   set sasuser.x13mdl1 sasuser.x13mdl2 sasuser.x13mdl3
       sasuser.x13mdl4 sasuser.x13mdl5;
   _NAME_ = 'sales';
run;
```

The Models data set is shown in Output 46.9.1.

```
title '5 Commonly Used Models';
proc print data=Models;
run ;
```

**Output 46.9.1** A Data Set That Contains Models for Use with the PICKMDL Statement

**5 Commonly Used Models**

The following statements reverse the order of the models in the input data set. The default METHOD=FIRST option is used to select the model. The chosen model is shown in the mdlchosen data set in Output 46.9.3.

With METHOD=FIRST, a different model is chosen because the order is changed.

```
data Models;
   length _NAME_ $32;
   set sasuser.x13mdl5 sasuser.x13mdl4 sasuser.x13mdl3
       sasuser.x13mdl2 sasuser.x13mdl1 ;
   _NAME_ = 'sales';
run;

proc x13 data=sales date=date mdlinfoin=Models mdlinfoout=mdlchosen;
   var sales;
   transform function=log;
   pickmdl method=first;
run;

title 'Chosen Model';
proc print data=mdlchosen;
run ;
```

**Output 46.9.3** The Model Chosen from the Five Commonly Used Models, Reversed Order

**Chosen Model**

| Obs | _NAME_ | _MODEL_ | _MODELTYPE_ | _MODELPART_ | _COMPONENT_ | _PARMTYPE_ | _DSVAR_ | _VALUE_ | _FACTOR_ |

The following example shows the use of PICKMDL statement option METHOD=BEST to select the model. The chosen model is shown in the mdlchosen data set in Output 46.9.4. With METHOD=BEST, a different model is chosen than either of the previous models chosen. Because the order in which the models occur in the MDLINFOIN= data set affects model selection when METHOD=FIRST is specified, it is a common practice to list models from the simplest model to the most complex in the MDLINFOIN= data set that is used in conjunction with the PICKMDL statement.

```
proc x13 data=sales date=date mdlinfoin=Models mdlinfoout=mdlchosen;
   var sales;
   transform function=log;
   pickmdl method=best;
run;
```

```
title 'Chosen Model';
proc print data=mdlchosen;
run ;
```

**Output 46.9.4** The Model Chosen from the Five Commonly Used Models, METHOD=BEST

**Chosen Model**

| 6 | 1 | . | 0 | 0.55903 | 0.076446 | 7.31277 | 0.00000 | . | | (0 1 2)(0 1 1)s |

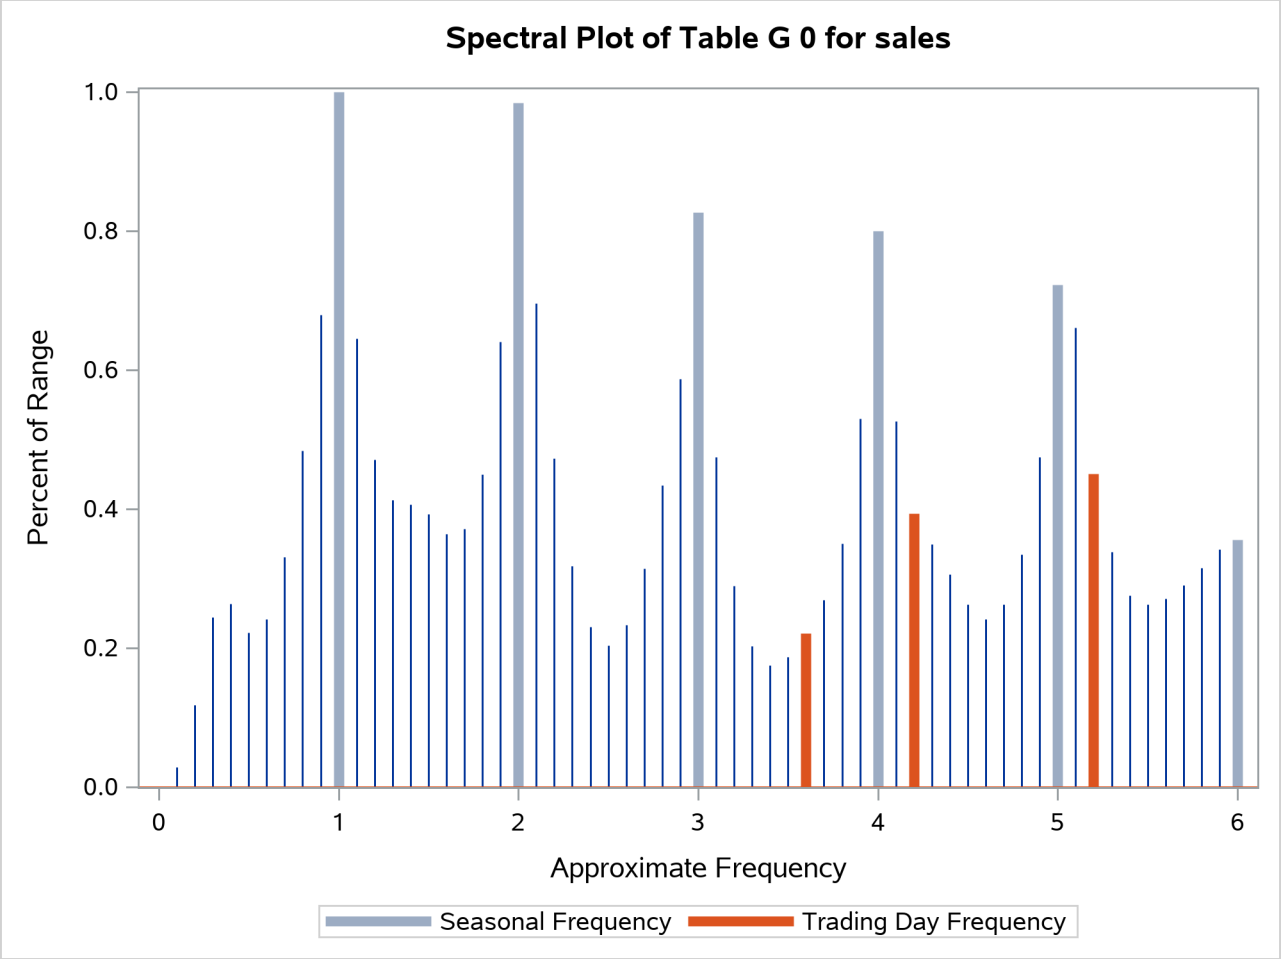
## Example 46.10: Illustration of ODS Graphics

This example illustrates the use of ODS Graphics. Using the same data set as in the section "Basic Seasonal Adjustment" on page 3314 and the previous examples, a spectral plot of the original series is displayed in Output 46.10.1.

The graphical displays are available when ODS Graphics is enabled. For specific information about the graphics available in the X13 procedure, see the section "ODS Graphics" on page 3381.

```
proc x13 data=sales date=date;
   var sales;
run;
```

**Output 46.10.1** Spectral Plot for Original Data



## Example 46.11: AUXDATA= Data Set

This example demonstrates the use of the AUXDATA= data set to input user-defined regressors for use in the regARIMA model. User-defined regressors are often economic indicators, but in this example a user-defined regressor is generated in the following statements:

```
data auxreg(keep=date lengthofmonth);
   set sales;
   lengthofmonth = (INTNX('MONTH',date,1) - date) - (365/12);
   format date monyy.;
run;
```

When you use the AUXDATA= data set, it is not necessary to merge the user-defined regressor data set with the DATA= data set. The following statements input the regressor lengthofmonth in the data set auxreg. The regressor lengthofmonth is specified in the REGRESSION statement, and the data set auxreg is specified in the AUXDATA= option in the PROC X13 statement.

```
title 'Align lengthofmonth Regressor from Auxreg to First Three Years';
ods select regParameterEstimates;
proc x13 data=sales(obs=36) date=date auxdata=auxreg;
   var sales;
   regression uservar=lengthofmonth;
   arima model=((0 1 1) (0 1 1));
   estimate;
run;

title 'Align lengthofmonth Regressor from Auxreg to Second Three Years';
ods select regParameterEstimates;
proc x13 data=sales(firstobs=37 obs=72) date=date auxdata=auxreg;
   var sales;
   regression uservar=lengthofmonth;
   arima model=((0 1 1) (0 1 1));
   estimate;
run;
```

Output 46.11.1 and Output 46.11.2 display the parameter estimates for the two series.

**Output 46.11.1** Using Regressors in the AUXDATA= Data for the First Three Years of Series

**Align lengthofmonth Regressor from Auxreg to First Three Years**

**The X13 Procedure**

**Regression Model Parameter Estimates**

**For Variable sales**

| Type | Parameter | NoEst | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|---|---|
| User Defined | lengthofmonth | Est | 2.98046 | 5.36251 | 0.56 | 0.5840 |

**Output 46.11.2** Using Regressors in the AUXDATA= Data for the Second Three Years of Series

**Align lengthofmonth Regressor from Auxreg to Second Three Years**

**The X13 Procedure**

**Regression Model Parameter Estimates**

**For Variable sales**

| Type | Parameter | NoEst | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|---|---|
| User Defined | lengthofmonth | Est | -0.51216 | 8.43145 | -0.06 | 0.9521 |

The X13 procedure uses the date variable in the sales data set and the auxreg data set to align the user-defined regressors.

In the following example, the DATA= data set salesby contains BY groups. The X13 procedure aligns the regressor in the auxreg data set to each BY group in the salesby data set according to the variable date that is specified by the DATE= option in the PROC X13 statement. The variable date must be present in the auxreg data set to align the values.

```
data salesby;
     set sales(obs=72);
     if ( _n_ < 37 ) then by=1;
     else by=2;
run;
ods select regParameterEstimates;
title 'Align lengthofmonth Regressor from Auxreg to BY Groups';
proc x13 data=salesby date=date auxdata=auxreg;
   var sales;
   by by;
   regression uservar=lengthofmonth;
   arima model=((0 1 1) (0 1 1));
   estimate;
run;
```

The results in Output 46.11.3 match the previous results in Output 46.11.1 and Output 46.11.2.

**Output 46.11.3** Using Regressors in the AUXDATA= Data with BY Groups

**Align lengthofmonth Regressor from Auxreg to BY Groups**

**The X13 Procedure**

**by=1**

**Regression Model Parameter Estimates**

**For Variable sales**

| Type | Parameter | NoEst | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|---|---|
| User Defined | lengthofmonth | Est | 2.98046 | 5.36251 | 0.56 | 0.5840 |

**Align lengthofmonth Regressor from Auxreg to BY Groups**

**The X13 Procedure**

**by=2**

**Regression Model Parameter Estimates**

**For Variable sales**

| Type | Parameter | NoEst | Estimate | Standard Error | t Value | Pr > \|t\| |
|---|---|---|---|---|---|---|
| User Defined | lengthofmonth | Est | -0.51216 | 8.43145 | -0.06 | 0.9521 |

# Overview: SASECRSP Interface Engine

## Introduction

The SASECRSP interface engine in SAS/ETS software enables SAS users to access and process time series, events, portfolios, and group data that reside in Center for Research in Security Prices databases (CRSPAccess data). It also provides a seamless interface between CRSP and SAS data processing. Currently, the SASECRSP engine supports access of CRSP US Stock Databases and CRSP Indices Databases.

## Opening a Database

The SASECRSP interface engine uses the LIBNAME statement to enable you to specify which CRSPAccess database you want to access and how you want to select time series or events from that database.

To specify the database, you supply the combination of a physical path to indicate the location of the CRSPAccess data files and a set identifier (SETID) to identify the selected database from those available at the physical path. Specify one SETID from Table 47.1. Notice that the CRSP environment variable CRSPDB_SASCAL must be defined before the SASECRSP engine can access the CRSPAccess database calendars that provide the time ID variables and enable the libref to be assigned successfully. If your database SETID is 250, use the SASEXCCM interface to access your data. For more information about the SASEXCCM interface engine, see Chapter 56, "The SASEXCCM Interface Engine." Because CRSP no longer supports the CPZ data format, the SASECRSP engine no longer supports the SETID 200 (CRSP/Compustat Merged, CCM) data access.

**Table 47.1** CRSPAccess Databases SETIDs

| SETID | Data Set |
|---|---|
| 10 | CRSP Stock, daily data |
| 20 | CRSP Stock, monthly data |
| 400 | CRSP Indices data, monthly index groups |
| 420 | CRSP Indices data, monthly index series |
| 440 | CRSP Indices data, daily index groups |
| 460 | CRSP Indices data, daily index series |

Usually you do not want to open the entire CRSPAccess database, so for efficiency and ease of use, the SASECRSP engine supports a variety of options for performing data selection on your CRSPAccess database by using the LIBNAME statement. These options enable you to open and retrieve data for only the portion of the database that you want. The availability of some of these options depends on the type of database that you open.

## CRSP US Stock Databases

When accessing the CRSP US Stock Databases, you can select which securities to access by specifying their PERMNOs with the PERMNO= option. A PERMNO is CRSP's unique permanent issue identification number and the primary key for its stock databases. Alternatively, a number of secondary keys can be used to select stock data. For example, you can use the PERMCO= option to read selected securities based on CRSP's unique permanent company identification number, PERMCO. A full list of possible keys for accessing CRSP Stock data is shown in Table 47.2.

**Table 47.2** Keys for Accessing CRSP Stock Data

| Key | Access By |
|---|---|
| PERMNO | CRSP's unique permanent issue identification number. This is the primary key for CRSP Stock Databases. |
| PERMCO | CRSP's unique permanent company identification number |
| CUSIP | CUSIP number |
| HCUSIP | Historical CUSIP |
| SICCD | Standard industrial classification (SIC) code |
| TICKER | Ticker symbol (for active companies only) |

## CRSP/Compustat Merged Databases—No Longer Supported by the SASECRSP Engine

Use the SASEXCCM interface engine instead of the SASECRSP interface engine to access your Xpressfeed CCM data. The SASEXCCM interface engine provides data item handling access methods by using CRSPAccess version 3.23. For a detailed description of this new SAS/ETS interface engine, see Chapter 56, "The SASEXCCM Interface Engine."

Because CRSPAccess version 3.23 does not support CPZ data (legacy Compustat data format for SETID 200), the SASECRSP engine issues the following error messages when you specify the SETID=200 option and/or the CRSPLINKPATH= option:

```
ERROR: Use the SASEXCCM engine instead of the SASECRSP engine for CCM access.
    The CPZ data format needed for SETID=200 and the CRSPLINKPATH= options
    was last shipped in July 2011 and is no longer supported by CRSP.
    Use of the SASECRSP engine for this purpose is not allowed:
    Depreciated calendar configurations can result in fatal errors,
    corrupted memory, tracebacks, exceptions, or incorrect results
    for all libref assignments that follow the deassignment
    of a CCM/CRSPLINKPATH libref.
ERROR: Engine is unable to open crspdb CPZ200606
    with SETID 200. Check that your CRSP database contains the
    crsp_ca_ref_2.bin file.
```

### CRSP Indices Databases

When accessing the CRSP Indices Databases, you can select which indices to access by specifying their INDNOs. INDNO is the primary key for the CRSP Indices Databases. You can specify which INDNO to use by specifying the INDNO= option. No secondary key access is supported for CRSP Indices. A full list of possible keys for accessing CRSP Indices data is shown in Table 47.3.

**Table 47.3** Keys for Accessing CRSP Indices Data

| Key | Access By |
|---|---|
| INDNO | CRSP's unique permanent index identifier number. This is the primary key for CRSP Indices Databases. It enables you to specify which index series or groups you want to select. |

Regardless of which database you access, you can always use the INSET= and RANGE= options for subsetting and selection. The RANGE= option subsets the data by date. The INSET= option enables you to specify which issues or companies to select from the CRSP Indices data by using an input SAS data set.

## Using Your Opened Database

After the libref is assigned, the database is opened. You can retrieve data for any member that you want in the opened database. For a complete description of available data sets and their fields, see the section "Data Elements Reference: SASECRSP Interface Engine" on page 3460. You can also use the SAS DATA step to perform further subsetting and to store the resulting time series in a SAS data set. Because CRSP and SAS use three different date representations, you can use the CRSP date formats, informats, and functions that the SASECRSP engine provides for your data processing needs. For more information about dates in the SASECRSP engine, see the section "Understanding CRSP Date Formats, Informats, and Functions" on page 3456 and Example 47.6 later in this chapter.

The SASECRSP engine supports Linux X64 (64-bit), Solaris Sun Ultra Sparc, Solaris on Intel x86, and Windows. Windows no longer requires you to install the CRSPAccess API, because it is now distributed automatically by your SAS/ETS installation. Prior to running SASECRSP, your Windows setup requires that the environment variable, CRSPDB_SASCAL, be set to the path where your database calendar files reside.

# Getting Started: SASECRSP Interface Engine

## Structure of a SAS Data Set That Contains Time Series Data

SAS requires time series data to be in a specific form that is recognizable by the SAS System. This form is a two-dimensional array, called a SAS data set, whose columns correspond to series variables and whose rows correspond to measurements of these variables at certain points in time. The time at which observations are recorded can be included in the data set as a time ID variable. Because CRSP sets the date at the end of a time period instead of at the beginning, the SASECRSP interface engine follows this convention. For example, the time ID variable for any particular month in a monthly time series is set to the last trading day of that month.

The SASECRSP engine provides several different time ID variables, depending on the data member that is opened. For most members, a time ID variable named CALDT is provided. CALDT provides a day-based calendar date and is in a CRSP date format. The dates are stored as an offset in an array of trading days or a trading-day calendar. Five different CRSP trading-day calendars are available; which calendar is used depends on the frequency of the data member. For example, the CRSP date for a daily time series refers to a daily trading-day calendar.

The five trading-day calendar frequencies are annual, quarterly, monthly, weekly, and daily. For convenience, the format and informat for the frequency field are set so that the CRSP date is automatically converted to an integer date representation when viewed or printed. For data programming, the SASECRSP engine provides 23 different user functions for date conversions between CRSP, SAS, and integer dates.

## Reading CRSP Data Files

The SASECRSP engine supports reading time series, events, portfolios, and group data from CRSPAccess databases. The SETID that you specify determines the database that is read. For a list of possible databases, see Table 47.1. The CRSP environment variable CRSPDB_SASCAL must be defined before the SASECRSP engine can access the CRSPAccess database calendars that provide the time ID variables and enable the libref to be successfully assigned.

## Using the SAS DATA Step

You can store the selected series in a SAS data set by using the SAS DATA step. You can also perform other operations on your data inside the DATA step. After the data are stored in a SAS data set, you can use them as you would use data in any other SAS data set.

## Using SAS Procedures

You can print the output SAS data set by using the PRINT procedure, and you can report information about the contents of your data set by using the CONTENTS procedure.

You can also create a view of the CRSPAccess database by using the SQL procedure in conjunction with a SASECRSP libref.

## Using the SAS Windowing Environment

You can see the available data sets in the SAS LIBNAME window of the SAS windowing environment. To do so, select the SASECRSP engine libref in the LIBNAME window that you have previously defined in your LIBNAME statement. You can view your SAS output observations by double-clicking the desired output data set libref in the LIBNAME window of the SAS windowing environment. Type **Viewtable** on the SAS command line to view any of your SASECRSP engine tables, views, or librefs for both input and output data sets.

Before you use the **Viewtable** command, it is recommended that you store your output data sets in a physical folder or library that is separate from the folder or library used for your input databases. (The default location for output data sets is the SAS Work library.)

## Using CRSP Date Formats, Informats, and Functions

Historically, CRSP has used two different methods to represent dates, and SAS has used a third. The SASECRSP engine provides 23 functions, 15 informats, and 10 formats to enable you to easily translate the dates from one internal representation to another. For more information, see the section "Understanding CRSP Date Formats, Informats, and Functions" on page 3456.

# Syntax: SASECRSP Interface Engine

The SASECRSP engine uses standard engine syntax. The options that the SASECRSP engine uses are summarized in Table 47.4.

**Table 47.4** Summary of SASECRSP Engine Options

| Option | Description |
|---|---|
| SETID= | Specifies which CRSP database subset to open. This option is required. See Table 47.1 for a complete list of supported SETIDs |
| PERMNO= | Specifies a CRSP PERMNO to be selected for access |
| PERMCO= | Specifies a CRSP PERMCO to be selected for access |
| CUSIP= | Specifies a current CUSIP to be selected for access |
| HCUSIP= | Specifies a historic CUSIP to be selected for access |
| TICKER= | Specifies a ticker to be selected for access (for active companies only) |
| SICCD= | Specifies a SIC code to be selected for access |
| INDNO= | Specifies a CRSP INDNO to be selected for access |
| RANGE= | Specifies the range of data to keep in format `'YYYYMMDD-YYYYMMDD'` |
| INSET= | Uses a SAS data set named Setname as input for issues |

## The LIBNAME *libref* SASECRSP Statement

**LIBNAME *libref* SASECRSP '*physical name*' *options* ;**

The physical name that the LIBNAME statement requires should point to the directory of CRSPAccess data files where the CRSP database that you want to open is located. Note that the physical name *must* end in a slash for UNIX environments and a backslash for Windows environments.

The CRSP environment variable CRSPDB_SASCAL must be defined before the SASECRSP engine can access the CRSPAccess database calendars. The CRSP environment variable CRSPDB_SASCAL is necessary for the SASECRSP libref to be assigned successfully. This environment variable should be defined automatically either by the CRSP software installation or, in later versions, by the CRSP data installation. Because occasionally the variable is not set properly, always check to ensure that the CRSPDB_SASCAL environment variable is set to the location where your most recent CRSP data reside. Remember to include the final slash or backslash as required.

After the libref is assigned, you can access any of the available data sets or members within the opened database. For a complete description of available data sets and their fields, see the section "Data Elements Reference: SASECRSP Interface Engine" on page 3460.

You can specify the following options.

**SETID=***crsp_setidnumber*

specifies the CRSP database that you want to read from. SETID= is a required option. Choose one SETID from the six possible values in Table 47.1. The SETID limits the frequency selection of time series that are included in the SAS data set.

For example, to access monthly CRSP US Stock data, you would use the following statements:

```
LIBNAME myLib sasecrsp 'physical-name'
                       SETID=20;
```

**PERMNO=***crsp_permnumber*

enables you to select data from your CRSP database by the PERMNO (or other keys) that you specify. A PERMNO is CRSP's unique permanent issue identification number. There is no limit to the number of *crsp_permnumber* options that you can use. By default, the SASECRSP engine reads all keys for the CRSPAccess database that you specified in your SASECRSP libref.

From a performance standpoint, the PERMNO= option enables efficient random access and reads *only* the data for the PERMNOs specified.

For example, the following LIBNAME statement reads data only for Microsoft Corporation (PERMNO=10107) and International Business Machines Corporation (PERMNO=12490) by using the primary PERMNO key and thus is very efficient:

```
LIBNAME myLib sasecrsp 'physical-name'
   SETID=20
   PERMNO=10107
   PERMNO=12490;
```

The PERMCO=, CUSIP=, HCUSIP=, SICCD=, TICKER=, and INDNO= options behave similarly, and you can use them in conjunction with or in place of the PERMNO= option. For example, you could use the following statement to access monthly data for Microsoft and IBM:

```
LIBNAME myLib sasecrsp 'physical-name'
                       SETID=20
                       TICKER='MSFT'
                       CUSIP=59491810;
```

Details about the use of the other key selection options (PERMCO, CUSIP, HCUSIP, TICKER, SICCD, and INDNO) follow.

PERMNOs that you specify by using this option can select the companies or issues to keep for CRSP US Stock data, but PERMNO is not a supported option for CRSP Indices data. Use the INDNO= option with the CRSP Indices data and use the PERMNO= option with the CRSP US Stock data. Details about the use of key selection options for each type of database follow.

**STK Databases**

PERMNO is the primary key for CRSP Stock data. Every valid PERMNO that you specify with the PERMNO= option keeps exactly one issue.

**IND Databases**

INDNO is the primary key for accessing CRSP Indices data. PERMNO is not available as a key for the IND (CRSP Indices) Databases; use INDNO for efficient access of the IND Databases.

**PERMCO=***crsp_permcompany*
is similar to the PERMNO= option in that it enables you to use the CRSP's unique permanent company identification key (PERMCO) to select the companies or issues to keep. There is no limit to the number of *crsp_permcompany* options that you can use.

**STK Databases**

PERMCO is a secondary key for accessing CRSP US Stock data. One PERMCO can map to multiple PERMNOs. Access by a PERMCO key is equivalent to access by all mapped PERMNOs.

**IND Databases**

Use INDNO for accessing CRSP Indices data. PERMCO is not available as a key for accessing CRSP Indices data; use INDNO instead.

**CUSIP=***crsp_cusip*
is similar to the PERMNO= option in that it enables you to use the CUSIP key to select the companies or issues to keep. There is no limit to the number of *crsp_cusip* options that you can use.

**STK Databases**

CUSIP is a secondary key for accessing CRSP US Stock data. One CUSIP maps to one PERMNO.

**IND Databases**

Use INDNO for accessing CRSP Indices data. CUSIP is not available as a key for accessing CRSP Indices Databases; use INDNO instead.

**HCUSIP=***crsp_hcusip*
is similar to the PERMNO= option in that it enables you to use the historical CUSIP key, HCUSIP, to select the companies or issues to keep. There is no limit to the number of *crsp_hcusip* options that you can use.

**STK Databases**

HCUSIP is a secondary key for accessing CRSP US Stock Databases. One HCUSIP maps to one PERMNO.

**IND Databases**

Use INDNO for accessing CRSP Indices Databases. HCUSIP is not available as a key for accessing CRSP Indices Databases; use INDNO instead.

**TICKER=***crsp_ticker*
is similar to the PERMNO= option in that it enables you to use the TICKER key to select the companies or issues to keep. There is no limit to the number of *crsp_ticker* options that you can use.

**STK Databases**

TICKER is a secondary key for accessing CRSP US Stock Databases. One TICKER maps to one PERMNO. **NOTE:** Some PERMNOs are inaccessible by the TICKER key.

**IND Databases**

Use INDNO for accessing CRSP Indices Databases. TICKER is not available as a key for accessing CRSP Indices Databases; use INDNO instead.

**SICCD=***crsp_siccd*
is similar to the PERMNO= option in that it enables you to use the Standard Industrial Classification (SIC) code (SICCD) to select the companies or issues to keep. There is no limit to the number of *crsp_siccd* options that you can use.

**STK Databases**

SICCD is a secondary key for accessing CRSP US Stock Databases. One SICCD can map to multiple PERMNOs. All PERMNOs that have been classified once under the specified SICCD are mapped and the data for them are retrieved. Access by the SICCD key is equivalent to access by all PERMNOs that have ever been classified under the specified SICCD key.

**IND Databases**

Use INDNO for accessing CRSP Indices Databases. SICCD is not available as a key for accessing CRSP Indices Databases; use INDNO instead.

**INDNO=***crsp_indno*
is similar to the PERMNO= option in that it enables you to use CRSP's permanent index number INDNO to select the companies or issues to keep. There is no limit to the number of *crsp_indno* options that you can use.

**STK Databases**

INDNO is not available as a key for accessing CRSP US Stock Databases, but it can be used in the combined CRSP US Stock and Indices Databases.

**IND Databases**

INDNO is the primary key for accessing CRSP Indices Databases. Every INDNO that you specify keeps exactly one index series or group.

For example, you can use the following statement to access the CRSP NYSE Value-Weighted and Equal-Weighted daily market indices:

```
LIBNAME myLib3 sasecrsp 'physical-name'
                        SETID=460
                        INDNO=1000000   /* Value-Weighted */
                        INDNO=1000001;  /* Equal-Weighted */
```

**RANGE=**'crsp_begdt-crsp_enddt'
limits the time range of data that are read from your CRSPAccess database. Specify this option in your LIBNAME *libref* SASECRSP statement, where *crsp_begdt* is the beginning date of the range in `'YYYYMMDD'` format and *crsp_enddt* is the ending date of the range in `'YYYYMMDD'` format.

For example, to access monthly stock data for Microsoft Corporation and for International Business Machines Corporation for the first quarter of 1999, you can use the following statement:

```
LIBNAME myLib sasecrsp 'physical-name'
                       SETID=20
                       PERMNO=10107
                       PERMNO=12490
                       RANGE='19990101-19990331';
```

The specified beginning and ending dates are interpreted as calendar dates.

You can use the RANGE= option for all members of CRSP US Stock and Indices Databases. CRSP data members are associated with only one date, and all CRSP data members have a date resolution to the day. For example, monthly time series, although they are monthly, resolve to the last trading day of the month.

**INSET=***'setname[,keyfieldname,keyfieldtype,date1field,date2field]'*

specifies a SAS data set named setname as input for issues. The SASECRSP engine assumes that a default PERMNO field that contains selected CRSP PERMNOs is present in the data set. If optional parameters are used, they must all be specified. The only acceptable shorthand for dropping the parameters is to drop those at the very end, assuming they are all being omitted. Dropped parameters use their defaults.

You can specify the following parameters:

*keyfieldname* labels the field that contains the keys to be selected. If unspecified, the default is PERMNO.

*keyfieldtype* specifies the CRSPAccess key type of the provided keys. Possible key types are: PERMNO, PERMCO, CUSIP, HCUSIP, TICKER, SICCD, or INDNO. If unspecified, the default is "PERMNO".

*date1field* specifies the beginning date of the specific date range restriction being applied to this key. If either *date1field* or *date2field* is omitted, then by default there is no date range restriction.

*date2field* specifies the ending date of the specific date range restriction being applied to this key. If either *date1field* or *date2field* is omitted, then by default there is no date range restriction.

Individual date range restrictions that you specify by using the INSET= option can be used in combination with the RANGE= option in the LIBNAME statement. In such a case, only data from the intersection of the individual date restriction and the global RANGE= option date restriction are read.

# Details: SASECRSP Interface Engine

## Using the INSET= Option

The following examples illustrate the use of the INSET= option.

### Basic INSET= Option Use: Providing a List of PERMNOs

This example uses the INSET= option to extract monthly data for a portfolio of three companies. No date range restriction is used.

```
data testin1;
   permno = 10107; output;
   permno = 12490; output;
   permno = 14322; output;
run;

LIBNAME mstk sasecrsp 'physical-name'
                      SETID=20
                      INSET='testin1';

proc print data=mstk.stkhead (keep=permno permco begdt enddt hcomnam htick);
run;
```

### General Use of the INSET= Option to Specify Lists of Keys

This example illustrates the use of the INSET= option to select a few index series from the CRSP Indices data, and securities from the CRSP US Stock data. The libref **ind2** is used for accessing the CRSP Indices data by using the two specified INDNO keys. The libref **sec3** is used to access the CRSP US Stock data by using the three specified TICKER keys. Note the use of shorthand in specifying the INSET= option. The *date1field*, *date2field*, and datetype arguments are all omitted, so the default of no range restriction applies (though the range restriction set by the RANGE= option in the LIBNAME statement still applies). For more information, including sample output, see Example 47.4.

```
data indices;
    indno=1000000; output;  /* NYSE Value-Weighted Market Index */
    indno=1000001; output;  /* NYSE Equal-Weighted Market Index */
run;

libname ind2 sasecrsp "%sysget(CRSP_MSTK)" setid=420
    inset='indices,INDNO,INDNO' range='19990101-19990401';

title2 'Total Returns for NYSE Value- and Equal-Weighted Market Indices';
proc print data=ind2.tret label;
run;

data securities;
    ticker='BAC'; output;  /* Bank of America */
```

```
    ticker='DUK'; output;  /* Duke Energy */
    ticker='GSK'; output;  /* GlaxoSmithKline */
run;

libname sec3 sasecrsp "%sysget(CRSP_MSTK)" setid=20
                      inset='securities,TICKER,TICKER'
                      range='19970820-19970920';

title2 'PERMNOs and General Header Info of Selected TICKERs';
proc print data=sec3.stkhead (keep=permno htick htsymbol) label;
run;

title3 'Average Price for Bank of America, Duke and GlaxoSmithKline';
proc print data=sec3.prc label; run;
```

## Key-Specific Date Range Restriction with the INSET= Option

Suppose you not only want to select keys with your INSET= option, but you also want to specify a date range restriction for each key individually. The following statements show how to do this. Again, shorthand enables you to omit the *date1field* and *date2field* arguments. The dates that are provided default to a calendar interpretation. For more information, including the sample output, see Example 47.5.

```
title2 'INSET=testin2 uses date ranges along with PERMNOs:';
title3 '10107, 12490, 14322, 25788';
title4 'Begin dates and end dates for each permno are used in the INSET';

data testin2;
    permno = 10107; date1 = 19980731; date2 = 19981231; output;
    permno = 12490; date1 = 19970101; date2 = 19971231; output;
    permno = 14322; date1 = 19950731; date2 = 19960131; output;
    permno = 25778; date1 = 19950101; date2 = 19950331; output;
run;

libname mstk2 sasecrsp "%sysget(CRSP_MSTK)" setid=20
                      inset='testin2,PERMNO,PERMNO,DATE1,DATE2';

data b;
    set mstk2.prc;
run;

proc print data=b;
run;
```

## The SAS Output Data Set

You can use the SAS DATA step to write the selected CRSP data to a SAS data set. This enables you to easily analyze the data by using SAS. When you specify the name of the output data set in the DATA statement, the engine supervisor creates a SAS data set by using the specified name in either the SAS Work library or, if specified, the User library.

The contents of the SAS data set include the date of each observation, the series name of each series read from the CRSPAccess database, event variables, and the label or description of each series/event or array.

You can use PROC PRINT and PROC CONTENTS to print your output data set and its contents. Alternatively, you can view your SAS output observations by opening the desired output data set in a SAS Explorer window. You can also use PROC SQL with the SASECRSP engine libref to create a custom view of your data.

In general, CRSP missing values are represented as '.' in the SAS data set. When accessing the CRSP US STOCK data, the SASECRSP engine uses the mapping shown in Table 47.5 for converting CRSP missing values into SAS missing codes.

**Table 47.5** Mapping of CRSP Stock Missing Values to SAS Missing Codes

| CRSP Stock | SAS | Condition |
|---|---|---|
| –99 | . | No valid price |
| –88 | .A | Out of range |
| –77 | .B | Off-exchange |
| –66 | .C | No valid previous price |
| –55 | .D | No delisting information |
| –44 | .E | No valid comparison for an excess return |

## Understanding CRSP Date Formats, Informats, and Functions

CRSP has historically used two different methods to represent dates, whereas SAS has used a third. The three formats are SAS dates, CRSP dates, and integer dates. The SASECRSP engine provides 23 functions, 15 informats, and 10 formats to enable you to easily translate the dates from one internal representation to another. A SASECRSP engine libref must be assigned prior to your use of the CRSP date formats, informats, and functions. See "Example 47.6: Converting Dates by Using the CRSP Date Functions" on page 3488.

SAS dates are stored internally as the number of days since January 1, 1960. The SAS method is an industry standard that provides a great deal of flexibility, including a wide variety of informats, formats, and functions.

CRSP dates are designed to ease time series storage and access. Internally, the dates are stored as an offset in an array of trading days or a trading-day calendar. There are five different CRSP trading-day calendars: Annual, Quarterly, Monthly, Weekly, and Daily. In this sense, there are five different types of CRSP dates, one for each frequency of calendar that it references. The CRSP method provides fewer missing values and makes trading period calculations very easy. However, many valid calendar dates are not available in the CRSP trading calendars, and you must be careful when you use other dates.

Integer dates are a way to represent dates that are platform-independent and maintain the correct sort order. However, the distance between dates is not maintained.

The best way to illustrate the various date formats is to use some sample data. Table 47.6 shows date representations for CRSP daily and monthly data.

**Table 47.6** Date Representations for Daily and Monthly Data

| Date | SAS Date | CRSP Date (Daily) | CRSP Date (Monthly) | Integer Date |
|---|---|---|---|---|
| July 31, 1962 | 942 | 21 | 440 | 19620731 |
| August 31, 1962 | 973 | 44 | 441 | 19620831 |
| Dec. 30, 1998 | 14,243 | 9190 | NA* | 19981230 |
| Dec. 31, 1998 | 14,244 | 9191 | 877 | 19981231 |

*Not available if an exact match is requested.

Having an understanding of the internal differences in representing SAS dates, CRSP dates, and CRSP integer dates helps you use the SASECRSP engine formats, informats, and functions effectively. Always keep in mind the frequency of the CRSP calendar that you are accessing when you specify a CRSP date.

## The CRSP Date Formats

CRSP dates use two types of formats, and five frequencies are available for each type. The two types are exact dates (CRSPDT*) and range dates (CRSPDR*), where the '*' can be A for annual, Q for quarterly, M for monthly, W for weekly, or D for daily. The ten types are CRSPDTA, CRSPDTQ, CRSPDTM, CRSPDTW, CRSPDTD, CRSPDRA, CRSPDRQ, CRSPDRM, CRSPDRW, and CRSPDRD.

Table 47.7 shows some samples that use the monthly and daily calendar as examples. The Annual (CRSPDTA and CRSPDRA), Quarterly (CRSPDTQ and CRSPDRQ), and Weekly (CRSPDTW and CRSPDRW) formats work analogously.

**Table 47.7** Sample CRSPDT Formats for Daily and Monthly Data

| Date | CRSP Date Daily, Monthly | CRSPDTD Daily Date | CRSPDRD Daily Range | CRSPDTM Monthly Date | CRSPDRM Monthly Range |
|---|---|---|---|---|---|
| July 31, 1962 | 21, 440 | 19620731 | 19620731† | 19620731 | 19620630, 19620731 |
| August 31, 1962 | 44, 441 | 19620831 | 19620831† | 19620831 | 19620801, 19620831 |
| Dec. 30, 1998 | 9190, NA* | 19981230 | 19981230† | NA* | NA* |
| Dec. 31, 1998 | 9191, 877 | 19981231 | 19981231† | 19981231 | 19981201, 19981231 |

†Daily ranges look similar to monthly ranges if they are Mondays or immediately follow a trading holiday.
*When you are working with exact matches, no CRSP monthly date exists for December 30, 1998.

## The @CRSP Date Informats

CRSP dates use three types of informats, and five frequencies are available for each type. The three types are exact (@CRSPDT*), range (@CRSPDR*), and backward (@CRSPDB*) dates, where the '*' can be A for annual, Q for quarterly, M for monthly, W for weekly, or D for daily. The 15 formats are @CRSPDTA, @CRSPDTQ, @CRSPDTM, @CRSPDTW, @CRSPDTD, @CRSPDRA, @CRSPDRQ, @CRSPDRM, @CRSPDRW, @CRSPDRD, @CRSPDBA, @CRSPDBQ, @CRSPDBM, @CRSPDBW, and @CRSPDBD.

The five CRSPDT* informats find exact matches only. The five CRSPDR* informats look for an exact match, and if an exact match is not found, they go forward, matching the CRSPDR* formats. The five CRSPDB* informats look for an exact match, and if an exact match is not found, they go backward.

Table 47.8 shows a sample that uses only the CRSP monthly calendar as an example. The daily, weekly, quarterly, and annual frequencies work analogously.

**Table 47.8** Sample @CRSP Date Informats Using Monthly Data

| Input Date (Integer Date) | CRSP Date CRSPDTM | CRSP Date CRSPDRM | CRSP Date CRSPDBM | CRSPDTM Monthly Date | CRSPDRM Monthly Range |
|---|---|---|---|---|---|
| 19620731 | 440 | 440 | 440 | 19620731 | 19620630 to 19620731 |
| 19620815 | .(missing) | 441 | 440 | See below† | See below* |
| 19620831 | 441 | 441 | 441 | 19620831 | 19620801 to 19620831 |

†Missing values are preserved. If 441, then 19620831. If 440, then 19620731.
*Missing values are preserved. If 441, then 19620801 to 19620831. If 440, then 19620630 to 19620731.

## The CRSP Date Functions

Table 47.9 shows the 22 date functions that the SASECRSP engine provides. The engine uses these functions internally, but they are also available to end users. There are seven groups of functions. The first four groups have five functions each, one for each CRSP calendar frequency. The next two functions are for converting between SAS and integer date formats.

**Table 47.9** CRSP Date Functions

| Function Group | Function Name | Argument One | Argument Two | Return Value |
|---|---|---|---|---|
| **CRSP dates to integer dates for December 31, 1998** | | | | |
| Annual | crspdcia | 74 | None | 19981231 |
| Quarterly | crspdciq | 293 | None | 19981231 |
| Monthly | crspdcim | 877 | None | 19981231 |
| Weekly | crspdciw | 1905 | None | 19981231 |
| Daily | crspdcid | 9191 | None | 19981231 |
| **CRSP dates to SAS dates for December 31, 1998** | | | | |
| Annual | crspdcsa | 74 | None | 14,244 |
| Quarterly | crspdcsq | 293 | None | 14,244 |
| Monthly | crspdcsm | 877 | None | 14,244 |
| Weekly | crspdcsw | 1905 | None | 14,244 |
| Daily | crspdcsd | 9191 | None | 14,244 |
| **Integer dates to CRSP dates exact is illustrated, but can be forward or backward** | | | | |
| Annual | crspdica | 19981231 | 0 | 74 |
| Quarterly | crspdicq | 19981231 | 0 | 293 |
| Monthly | crspdicm | 19981231 | 0 | 877 |
| Weekly | crspdicw | 19981231 | 0 | 1905 |
| Daily | crspdicd | 19981231 | 0 | 9191 |
| **SAS dates to CRSP dates exact is illustrated, but can be forward or backward** | | | | |
| Annual | crspdsca | 14,244 | 0 | 74 |
| Quarterly | crspdscq | 14,244 | 0 | 293 |
| Monthly | crspdscm | 14,244 | 0 | 877 |
| Weekly | crspdscw | 14,244 | 0 | 1905 |
| Daily | crspdscd | 14,244 | 0 | 9191 |
| **Integer dates to SAS dates for December 31, 1998** | | | | |
| Integer to SAS | crspdi2s | 19981231 | None | 14,244 |
| **SAS dates to integer dates for December 31, 1998** | | | | |
| SAS to Integer | crspds2i | 14,244 | None | 19981231 |

## Data Elements Reference: SASECRSP Interface Engine

Data sets are made available based on the type of CRSP database that you open. Table 47.10 and Table 47.11 show summary views of the two types of CRSP databases (Stock and Indices) and the data sets that they make available. Tables that contain details about the data sets, including their specific fields, immediately follow the summary tables. You can also see the available data sets for an opened database via the SAS Explorer by opening a SASECRSP engine libref that you previously assigned.

**Table 47.10** Summary of All Available Data Sets by CRSP Database Type: Stock

| CRSP Database | Data Set Name | Reference Table Title | Reference Table |
|---|---|---|---|
| CRSP US Stock Database (STOCK) | STKHEAD | Header Identification and Summary Data | Table 47.12 |

## Available CRSP Stock Data Sets

### STKHEAD Data Set—Header Identification and Summary Data

**Table 47.12** STKHEAD Data Set—Header Identification and Summary Data

| Field | Label | Type |
|---|---|---|
| PERMNO | PERMNO | Numeric |
| PERMCO | PERMCO | Numeric |
| COMPNO | NASDAQ Company Number | Numeric |
| ISSUNO | NASDAQ Issue Number | Numeric |
| HEXCD | Exchange Code Header | Numeric |
| HSHRCD | Share Code Header | Numeric |
| HSICCD | Standard Industrial Classification Code | Numeric |

**Table 47.12** *continued*

| Field | Label | Type |
|---|---|---|
| BEGDT | Begin of Stock data | Numeric |
| ENDDT | End of Stock data | Numeric |
| DLSTCD | Delisting Code Header | Numeric |
| HCUSIP | CUSIP Header | Character |
| HTICK | Ticker Symbol Header | Character |
| HCOMNAM | Company Name Header | Character |
| HTSYMBOL | Trading Symbol Header | Character |
| HNAICS | North American Industry Classification Header | Character |
| HPRIMEXC | Primary Exchange Header | Character |
| HTRDSTAT | Trading Status Header | Character |
| HSECSTAT | Security Status Header | Character |

## NAMES Data Set—Name History Array

**Table 47.13** NAMES Data Set—Name History Array

| Field | Label | Type |
|---|---|---|
| PERMNO | PERMNO | Numeric |
| NAMEDT | Names Date | Numeric |
| NAMEENDT | Names Ending Date | Numeric |
| SHRCD | Share Code | Numeric |
| EXCHCD | Exchange Code | Numeric |
| SICCD | Standard Industrial Classification Code | Numeric |
| NCUSIP | CUSIP | Numeric |
| TICKER | Ticker Symbol | Character |
| COMNAM | Company Name | Character |
| SHRCLS | Share Class | Numeric |
| TSYMBOL | Trading Symbol | Character |
| NAICS | North American Industry Classification System | Character |
| PRIMEXCH | Primary Exchange | Character |
| TRDSTAT | Trading Status | Character |
| SECSTAT | Security Status | Character |

## DISTS Data Set—Distribution Event Array

**Table 47.14** DISTS Data Set—Distribution Event Array

| Field | Label | Type |
|---|---|---|
| PERMNO | PERMNO | Numeric |
| DISTCD | Distribution Code | Numeric |
| DIVAMT | Dividend Cash Amount | Numeric |
| FACPR | Factor to Adjust Price | Numeric |

**Table 47.14** *continued*

| Field | Label | Type |
|---|---|---|
| FACSHR | Factor to Adjust Share | Numeric |
| DCLRDT | Distribution Declaration Date | Numeric |
| EXDT | Ex-Distribution Date | Numeric |
| RCRDDT | Record Date | Numeric |
| PAYDT | Payment Date | Numeric |
| ACPERM | Acquiring PERMNO | Numeric |
| ACCOMP | Acquiring PERMCO | Numeric |

## SHARES Data Set—Shares Outstanding Observation Array

**Table 47.15** SHARES Data Set—Shares Outstanding Observation Array

| Field | Label | Type |
|---|---|---|
| PERMNO | PERMNO | Numeric |
| SHROUT | Shares Outstanding | Numeric |
| SHRSDT | Shares Observation Date | Numeric |
| SHRENDDT | Shares Observation End Date | Numeric |
| SHRFLG | Shares Outstanding Observation Flag | Numeric |

## DELIST Data Set—Delisting History Array

**Table 47.16** DELIST Data Set—Delisting History Array

| Field | Label | Type |
|---|---|---|
| PERMNO | PERMNO | Numeric |
| DLSTDT | Delisting Date | Numeric |
| DLSTCD | Delisting Code | Numeric |
| NWPERM | New PERMNO | Numeric |
| NWCOMP | New PERMCO | Numeric |
| NEXTD | Delisting Next Price Date | Numeric |
| DLAMT | Delisting Amount | Numeric |
| DLRETX | Delisting Return Without Dividends | Numeric |
| DLPRC | Delisting Price | Numeric |
| DLPDT | Delisting Amount Date | Numeric |
| DLRET | Delisting Return | Numeric |

## NASDIN Data Set—NASDAQ Information Array

**Table 47.17** NASDIN Data Set—NASDAQ Information Array

| Field | Label | Type |
|---|---|---|
| PERMNO | PERMNO | Numeric |
| TRTSCD | NASDAQ Traits Code | Numeric |
| TRTSDT | NASDAQ Traits Date | Numeric |
| TRTSENDT | NASDAQ Traits End Date | Numeric |
| NMSIND | NASDAQ National Market Indicator | Numeric |
| MMCNT | Market Maker Count | Numeric |
| NSDINX | NASD Index Code | Numeric |

## STOCK Time Series Data Sets

**Table 47.18** STOCK Time Series Data Sets

| Data Set Name, Long Name | Field | Label | Type |
|---|---|---|---|
| PRC | PERMNO | PERMNO | Numeric |
| Price or Bid/Ask | CALDT | Calendar Trading Date | Numeric |

| | GRPSU | Group Subflag | Numeric |

## Available CRSP Indices Data Sets

### INDHEAD Data Set—CRSP Index Header Data

**Table 47.20** INDHEAD Data Set—CRSP Index Header Data

| Field | Label | Type |
|---|---|---|
| INDNO | Permanent index identification number | Numeric |
| INDCO | Permanent index group identification number | Numeric |
| PRIMFLAG | Index primary link | Numeric |
| PORTNUM | Portfolio number if subset series | Numeric |
| INDNAME | Index Name | Character |
| GROUPNAM | Index Group Name | Character |

## REBAL Data Set—Index Rebalancing History Arrays

**Table 47.21** REBAL Data Set—Index Rebalancing History Arrays

| Field | Label | Type |
|---|---|---|
| INDNO | INDNO | Numeric |
| RBEGDT | Rebalancing beginning date | Numeric |
| RENDDT | Rebalancing ending date | Numeric |
| USDCNT | Count used as of rebalancing | Numeric |
| MAXCNT | Maximum count during period | Numeric |
| TOTCNT | Available count as of rebalancing | Numeric |
| ENDCNT | Count at end of period | Numeric |
| MINID | Identifier at minimum value | Numeric |
| MAXID | Identifier at maximum value | Numeric |
| MINSTA | Smallest statistic in period | Numeric |
| MAXSTA | Largest statistic in period | Numeric |
| MEDSTA | Median statistic in period | Numeric |
| AVGSTA | Average statistic in period | Numeric |

## REBAL Group Data Set—Index Rebalancing History Group Array

**Table 47.22** REBAL Group Data Set—Index Rebalancing History Group Array

| Field | Label | Type |
|---|---|---|
| INDNO | INDNO | Numeric |
| RBEGDT1 | Rebalancing beginning date for port 1 | Numeric |
| RBEGDT2 | Rebalancing beginning date for port 2 | Numeric |
| RBEGDT3 | Rebalancing beginning date for port 3 | Numeric |
| RBEGDT4 | Rebalancing beginning date for port 4 | Numeric |
| RBEGDT5 | Rebalancing beginning date for port 5 | Numeric |
| RBEGDT6 | Rebalancing beginning date for port 6 | Numeric |

# Examples: SASECRSP Interface Engine

## Example 47.1: Specifying PERMNOs and Range in the LIBNAME Statement

The following statements show how to set up a LIBNAME statement to extract data for certain selected PERMNOs during a specific time period. The result is shown in Output 47.1.1.

```
title2 'Define a range inside the data range';
title3 'My range is ( 19950101-19960630 )';

libname _all_ clear;
libname testit1 sasecrsp "/r/tappan/vol/vol1/crsp1/data201212/MIZ201212/"
        setid=20
        permno=81871    /* Desired PERMNOs are selected   */
        permno=82200    /* via the libname PERMNO= option */
        permno=82224
        permno=83435
        permno=83696
        permno=83776
        permno=84788
        range='19950101-19960630';

proc print data=testit1.ask;
run;
```

**Output 47.1.1** ASK Monthly Time Series Data with RANGE= Option

**Define a range inside the data range**
**My range is ( 19950101-19960630 )**

| Obs | PERMNO | CALDT | ASK |
|---|---|---|---|
| 1 | 81871 | 19950731 | 18.25000 |

| 37 | 83696 | 19960628 | 19.12500 |

## Example 47.2: Using the LIBNAME Statement to Access All Keys

To set up the libref to access all keys, no key options such as PERMNO=, TICKER=, or GVKEY= are specified in the LIBNAME statement and no INSET= option is used. Any of these options cause the SASECRSP engine to limit access to specified keys or specified insets. When no such options are specified, the SASECRSP engine correctly defaults to selecting all keys in the database. Other LIBNAME statement options, such as the RANGE= option, can still be used normally to limit the time span of the data—in other words, to define the date range of observations.

This example does not use key-specifying options. This forces the engine to default to all PERMNOs in the monthly STK database. The range that is specified in the LIBNAME statement behaves normally, and data are limited to the first two months of 1995.

```
title2 'Define a range inside the data range ';
title3 'My range is ( 19950101-19950228 )';

libname _all_ clear;
libname testit2 sasecrsp "/r/tappan/vol/vol1/crsp1/data201212/MIZ201212/"
        setid=20
        range='19950101-19950228';
data a;
   set testit2.ask(obs=30);
run;

proc print data=a;
run;
```

The result is shown in Output 47.2.1.

**Output 47.2.1** All PERMNOs of ASK Monthly Time Series Data with RANGE= Option

**Define a range inside the data range**
**My range is ( 19950101-19950228 )**

| Obs | PERMNO | CALDT | ASK |
|---|---|---|---|
| 1 | 10001 | 19950131 | 8.00000 |
| 2 | 10001 | 19950228 | 8.00000 |
| 3 | 10002 | 19950131 | 13.50000 |
| 4 | 10002 | 19950228 | 13.50000 |
| 5 | 10003 | 19950131 | 2.12500 |
| 6 | 10003 | 19950228 | 2.25000 |
| 7 | 10009 | 19950131 | 18.00000 |

| 15 | 10016 | 19950131 | 7.00000 |
| 16 | 10016 | 19950228 | 8.50000 |
| 17 | 10018 | 19950131 | 1.12500 |
| 18 | 10018 | 19950228 | 1.12500 |
| 19 | 10019 | 19950131 | 10.62500 |
| 20 | 10019 | 19950228 | 11.62500 |
| 21 | 10021 | 19950131 | 11.75000 |
| 22 | 10021 | 19950228 | 12.00000 |
| 23 | 10025 | 19950131 | 18.50000 |
| 24 | 10025 | 19950228 | 19.00000 |
| 25 | 10026 | 19950131 | 11.00000 |
| 26 | 10026 | 19950228 | 11.75000 |
| 27 | 10028 | 19950131 | 1.87500 |
| 28 | 10028 | 19950228 | 2.00000 |
| 29 | 10032 | 19950131 | 12.50000 |
| 30 | 10032 | 19950228 | 12.75000 |

## Example 47.3: Accessing One PERMNO without the RANGE= Option

The SASECRSP engine defaults to providing access to the entire range of available data when you do not restrict the range (that is, when you do not use the RANGE= option).

This example shows access of the entire range of available data for one particular PERMNO extracted from the monthly data set.

```
title2 'Select only PERMNO = 81871';
title3 'Valid trading dates (19890131--19981231)';
title4 'No range option, leave wide open';

libname _all_ clear;
libname testit3 sasecrsp "/r/tappan/vol/vol1/crsp1/data201212/MIZ201212/"
        setid=20
        permno=81871;

data c;
   set testit3.ask;
run;

proc print data=c;
run;
```

The result is shown in Output 47.3.1.

**Output 47.3.1** PERMNO=81871 of ASK Monthly Time Series Data without RANGE= Option

**Select only PERMNO = 81871**
**Valid trading dates (19890131--19981231)**
**No range option, leave wide open**

| Obs | PERMNO | CALDT | ASK |
|---|---|---|---|
| 1 | 81871 | 19950731 | 18.25000 |
| 2 | 81871 | 19950831 | 19.25000 |

| 27 | 81871 | 19970930 | 26.81250 |
| 28 | 81871 | 19971031 | 18.37500 |
| 29 | 81871 | 19971128 | 16.50000 |
| 30 | 81871 | 19971231 | 16.25000 |
| 31 | 81871 | 19980130 | 22.75000 |
| 32 | 81871 | 19980227 | 21.00000 |
| 33 | 81871 | 19980331 | 22.50000 |
| 34 | 81871 | 19980430 | 16.12500 |
| 35 | 81871 | 19980529 | 11.12500 |
| 36 | 81871 | 19980630 | 13.43750 |
| 37 | 81871 | 19980731 | 22.87500 |
| 38 | 81871 | 19980831 | 17.75000 |
| 39 | 81871 | 19980930 | 24.25000 |
| 40 | 81871 | 19981030 | 26.00000 |

## Example 47.4: Specifying Keys by Using the INSET= Option

The INSET= option enables you to select any companies or issues for which you want data. This example selects two CRSP Index Series from the CRSP Indices data, and four securities from the CRSP US Stock data for data extraction. Note that because each CRSP database might be in a different location and must be opened separately, a total of two different librefs are used, one for each database.

```
data indices;
   indno=1000000; output;  /* NYSE Value-Weighted Market Index */
   indno=1000001; output;  /* NYSE Equal-Weighted Market Index */
run;

libname _all_ clear;
libname ind2 sasecrsp "/r/tappan/vol/vol1/crsp1/data201212/MIZ201212/"
        setid=420
        inset='indices,INDNO,INDNO'
        range='19990101-19990401';

title2 'Total Returns for NYSE Value- and Equal-Weighted Market Indices';
proc print data=ind2.tret label;
run;
```

Output 47.4.1 shows the result of selecting two CRSP Index Series from the CRSP Indices data.

**Output 47.4.1** IND Data Extracted Using INSET= Option

**Total Returns for NYSE Value- and Equal-Weighted Market Indices**

| Obs | INDNO | Calendar Trading Date | Total Returns |
|---|---|---|---|
| 1 | 1000000 | 19990129 | 0.012583 |
| 2 | 1000000 | 19990226 | -0.024169 |
| 3 | 1000000 | 19990331 | 0.028691 |
| 4 | 1000001 | 19990129 | -0.007700 |
| 5 | 1000001 | 19990226 | -0.041183 |
| 6 | 1000001 | 19990331 | 0.015101 |

The following statements select three securities from the CRSP US Stock data by using TICKER keys in the INSET= option for data extraction:

```
data securities;
   ticker='BAC'; output;  /* Bank of America */
   ticker='DUK'; output;  /* Duke Energy */
   ticker='GSK'; output;  /* GlaxoSmithKline */
run;

libname sec3 sasecrsp "/r/tappan/vol/vol1/crsp1/data201212/MIZ201212/"
        setid=20
        inset='securities,TICKER,TICKER'
        range='19970820-19970920';
```

```
title2 'PERMNOs and General Header Info of Selected TICKERs';
proc print data=sec3.stkhead(keep=permno htick htsymbol) label;
run;
title3 'Average Price for Bank of America, Duke and GlaxoSmithKline';
proc print data=sec3.prc label;
run;
```

Output 47.4.2 shows the STK header data for the TICKER keys that are specified by using the INSET= option.

**Output 47.4.2** STK Header Data Extracted Using INSET= Option

**PERMNOs and General Header Info of Selected TICKERs**

| Obs | PERMNO | Ticker Symbol Header | Trading Symbol Header |
|---|---|---|---|
| 1 | 59408 | BAC | BAC |
| 2 | 27959 | DUK | DUK |
| 3 | 75064 | GSK | GSK |

Output 47.4.3 shows the STK price data for the TICKER keys that are specified by using the INSET= option.

**Output 47.4.3** STK Price Data Extracted Using INSET= Option

**PERMNOs and General Header Info of Selected TICKERs**
**Average Price for Bank of America, Duke and GlaxoSmithKline**

| Obs | PERMNO | Calendar Trading Date | Price or Bid/Ask Average |
|---|---|---|---|
| 1 | 59408 | 19970829 | 59.75000 |
| 2 | 27959 | 19970829 | 48.43750 |
| 3 | 75064 | 19970829 | 39.93750 |

## Example 47.5: Specifying Ranges for Individual Keys with the INSET= Option

Insets enable you to define options that are specific to each individual key. This example uses an inset to select four PERMNOs and specifies a different date restriction for each PERMNO.

```
title2 'INSET=testin2 uses date ranges along with PERMNOs:';
title3 '10107, 12490, 14322, 25788';
title4 'Begin dates and end dates for each permno are used in the INSET';

data testin2;
   permno = 10107; date1 = 19980731; date2 = 19981231; output;
   permno = 12490; date1 = 19970101; date2 = 19971231; output;
   permno = 14322; date1 = 19950731; date2 = 19960131; output;
   permno = 25778; date1 = 19950101; date2 = 19950331; output;
run;
```

```
libname _all_ clear;
libname mstk2 sasecrsp "/r/tappan/vol/vol1/crsp1/data201212/MIZ201212/"
        setid=20
        inset='testin2,PERMNO,PERMNO,DATE1,DATE2';

data b;
   set mstk2.prc;
run;

proc print data=b;
run;
```

Output 47.5.1 shows CRSP US Stock price time series data selected by PERMNO in the INSET= option, where each PERMNO has its own time span specified in the INSET= option.

**Output 47.5.1** PRC Monthly Time Series Using the INSET= Option

**INSET=testin2 uses date ranges along with PERMNOs:**
**10107, 12490, 14322, 25788**
**Begin dates and end dates for each permno are used in the INSET**

| Obs | PERMNO | CALDT | PRC |
|---|---|---|---|
| 1 | 10107 | 19980731 | 109.93750 |
| 2 | 10107 | 19980831 | 95.93750 |
| 3 | 10107 | 19980930 | 110.06250 |
| 4 | 10107 | 19981030 | 105.87500 |
| 5 | 10107 | 19981130 | 122.00000 |
| 6 | 10107 | 19981231 | 138.68750 |
| 7 | 12490 | 19970131 | 156.87500 |
| 8 | 12490 | 19970228 | 143.75000 |
| 9 | 12490 | 19970331 | 137.25000 |
| 10 | 12490 | 19970430 | 160.50000 |
| 11 | 12490 | 19970530 | 86.50000 |
| 12 | 12490 | 19970630 | 90.25000 |
| 13 | 12490 | 19970731 | 105.75000 |
| 14 | 12490 | 19970829 | 101.37500 |
| 15 | 12490 | 19970930 | 106.00000 |
| 16 | 12490 | 19971031 | 98.50000 |
| 17 | 12490 | 19971128 | 109.50000 |
| 18 | 12490 | 19971231 | 104.62500 |
| 19 | 14322 | 19950731 | 32.62500 |
| 20 | 14322 | 19950831 | 32.37500 |
| 21 | 14322 | 19950929 | 36.87500 |
| 22 | 14322 | 19951031 | 34.00000 |
| 23 | 14322 | 19951130 | 39.37500 |
| 24 | 14322 | 19951229 | 39.00000 |
| 25 | 14322 | 19960131 | 41.50000 |
| 26 | 25778 | 19950131 | 49.87500 |
| 27 | 25778 | 19950228 | 57.25000 |
| 28 | 25778 | 19950331 | 59.37500 |

## Example 47.6: Converting Dates by Using the CRSP Date Functions

This example shows how to use the CRSP date functions and formats. The CRSPDTD formats are used for all the crspdt variables, and the `'YYMMDD'` format is used for the sasdt variables.

```
title2 'OUT= Data Set';
title3 'CRSP Functions for sasecrsp';

libname _all_ clear;

/* Always assign the LIBNAME sasecrsp first */
libname mstk sasecrsp "/r/tappan/vol/vol1/crsp1/data201212/MIZ201212/"
        setid=20;

data a (keep = crspdt crspdt2 crspdt3
               sasdt sasdt2 sasdt3
               intdt intdt2 intdt3);
   format crspdt crspdt2 crspdt3 crspdtd8.;
   format sasdt sasdt2 sasdt3 yymmdd6.;
   format intdt intdt2 intdt3 8.;
   format exact 2.;
   crspdt = 1;
   sasdt = '2jul1962'd;
   intdt = 19620702;
   exact = 0;

/* Call the CRSP date to Integer function*/
   intdt2 = crspdcid(crspdt);

/* Call the SAS date to Integer function*/
   intdt3 = crspds2i(sasdt);

/* Call the Integer to CRSP date function*/
   crspdt2 = crspdicd(intdt,exact);

/* Call the SAS date to CRSP date conversion function*/
   crspdt3 = crspdscd(sasdt,exact);

/* Call the CRSP date to SAS date conversion function*/
   sasdt2 = crspdcsd(crspdt);

/* Call the Integer to SAS date conversion function*/
   sasdt3 = crspdi2s(intdt);
run;

title3 'PROC PRINT showing data for sasecrsp';
proc print data=a;
run;

title3 'PROC CONTENTS showing formats for sasecrsp';
proc contents data=a;
run;
```

Output 47.6.1 shows the OUT= data set that is created by the DATA step.

**Output 47.6.1** Date Conversions by Using the CRSP Date Functions

**OUT= Data Set**
**PROC PRINT showing data for sasecrsp**

| Obs | crspdt | crspdt2 | crspdt3 | sasdt | sasdt2 | sasdt3 | intdt | intdt2 | intdt3 |

# Overview: SASEFAME Interface Engine

The SASEFAME interface engine provides a seamless interface between Fame and SAS data to enable SAS users to access and process time series, case series, and formulas that reside in a Fame database.

Fame is an integrated, front-to-back market data and historical database solution for storing and managing real-time and high-volume time series data that are used by leading institutions in the financial, energy, and public sectors, as well as by third-party content aggregators, software vendors, and individual investors. Fame provides real-time market data feeds and end-of-day data, a web-based desktop solution, application hosting, data delivery components, and tools for performing analytic modeling.

The SASEFAME engine uses the LIBNAME statement to enable you to specify the time series that you want to read from the Fame database and how you want to convert the selected time series to the same time scale. You can then use the SAS DATA step to perform further subsetting and to store the resulting time series in a SAS data set. You can perform more analysis (if desired) either in the same SAS session or in a later session.

The SASEFAME interface engine supports Windows and Linux Opteron hosts that use Fame 11.5. Although SASEFAME is no longer available on the AIX and Solaris hosts, you can still get remote access to Fame data on those hosts by using SASEFAME from a Windows or Linux Opteron host to connect to the MCADBS or master server on the AIX and Solaris hosts. For more information about MarketMap (formerly Fame) servers, see *Guide to MarketMap Database Servers*, formerly known as *Guide to Fame Database Servers*.

# Getting Started: SASEFAME Interface Engine

## Setup for SAS and FAME

If not already defined by your system administrator, define a system environment variable named FAME to point to the folder where FAME is installed. On Windows 64-bit install of FAME, this will usually be a location named:

```
C:\Program Files (x86)\FAME
```

It is the same folder where the FAME license files reside (fameid.txt and nameid.txt). Edit your system PATH environment variable to include the location of the FAME executable. On the 64-bit WINDOWS install of FAME CHLI you will add this to your system PATH environment variable:

```
%FAME%\64
```

On Unix, the location of the FAME folder can vary, but may look like this:

```
/usr/local/famelib11
```

and you could define your FAME environment variable like this:

```
export FAME=/usr/local/famelib11
```

On Unix, it is also necessary to define the load library path for the FAME CHLI executable. This definition may look something like this:

```
export LD_LIBRARY_PATH="$LD_LIBRARY_PATH:$FAME/hli/64"
```

## Structure of a SAS Data Set That Contains Time Series Data

The SAS System represents time series data in a two-dimensional array, called a SAS data set, whose columns correspond to series variables and whose rows correspond to measurements of these variables at certain time periods. The time periods at which observations are recorded can be included in the data set as a time ID variable. The SASEFAME engine provides a time ID variable named DATE. The DATE variable can be represented by any of the time intervals shown in the section "Mapping Fame Frequencies to SAS Time Intervals" on page 3506.

## Reading and Converting Fame Database Time Series

The SASEFAME engine supports reading and converting time series that reside in Fame databases. The SASEFAME engine uses Fame's Work database to temporarily store the converted time series. All series that are specified by the Fame wildcard are written to the Fame Work database. For conversion of very large databases, you might want to define the FAME_TEMP environment variable to point to a location where there is ample space for the Fame Work database.

The SASEFAME engine provides seamless access to Fame databases via Fame's C host language interface (CHLI). Fame expressions that contain formulas and Fame functions can be input to the engine via the INSET= option.

The SASEFAME engine finishes the CHLI whenever a fatal error occurs. To restart the engine after a fatal error, terminate the current SAS session and open a new SAS session.

## Using the SAS DATA Step

You can store the converted series in a SAS data set by using the SAS DATA step. You can also perform other operations on your data inside the DATA step. After your data are stored in a SAS data set, you can use this data set as you would any other SAS data set.

## Using SAS Procedures

You can print the output SAS data set by using the PRINT procedure and report information about the contents of your data set by using the CONTENTS procedure, as in Example 48.1. You can create a view of the Fame database by using the SQL procedure's USING clause to reference the SASEFAME engine in your libref. See Example 48.5.

## Using the SAS Windowing Environment

You can see the available data sets in the SAS LIBNAME window of the SAS windowing environment. To do so, select the SASEFAME engine libref in the LIBNAME window that you have previously defined in your LIBNAME statement. You can view your SAS output observations by double-clicking the desired output data set libref in the LIBNAME window of the SAS windowing environment. Type **Viewtable** on the SAS command line to view any of your SASEFAME engine tables, views, or librefs both for input and output data sets. Before you use the **Viewtable** command, it is recommended that you store your output data sets in a physical folder or library that is separate from the folder or library used for your input databases. (The default location for output data sets is the SAS Work library.)

## Remote Fame Data Access

The remote access feature of the SASEFAME engine uses the MarketMap (Fame) CHLI to communicate with your remote server (master or MCADBS). It is available to licensed MarketMap customers who have the CHLI on both their remote and client machines.

For an example that uses the master server, see Example 48.7, where you simply provide the frdb_m port number and node name of your Fame master server in your SASEFAME engine libref. For more information, see the section "Start the Master Server" in *Guide to MarketMap Database Servers*.

For an example that uses the MCADBS remote server, see Example 48.18, where you specify an explicit connection with the CONNECT=YES option, and you specify the service, host, and name of the connection by using the TO_SERVICE= option, ON_HOST= option, and AS_NAME= options, respectively. In addition, you specify the USER= and PASS= options for the connection. For more information, see the section "Start the MCADBS Server" in *Guide to MarketMap Database Servers*.

## Creating Views of Time Series by Using SASEFAME LIBNAME Options

You can perform selection based on names of your time series simply by using Fame wildcard specifications in the SASEFAME engine WILDCARD= option.

You can limit the time span of time series data by specifying a beginning and ending date range in the SASEFAME engine RANGE= option.

It is also easy to use the SAS input data set INSET= option to create a specific view of your Fame data. You can create multiple views by using multiple LIBNAME statements with customized options that are tailored to the unique views that you want to create.

You can list the INSET variables that you want to keep in your SAS data set by using the KEEP= clause. When you use INSET variables in conjunction with the input data set that you specify in the INSET= option, the SASEFAME engine can show any or all of your expression groups in the same view or in multiple views. The INSET= option defines the valid set of expression groups that you can reference in the KEEP= clause, as shown in Example 48.16.

The INSET variables define the BY variables that enable you to view cross sections (slices) of your data. When you use INSET variables in conjunction with the WHERE clause and the CROSSLIST= option, the SASEFAME engine can show any or all of your BY groups in the same view or in multiple views. When you use the INSET= option along with a WHERE clause that specifies the BY variables that you want to use in your view, you must also use the CROSSLIST= option, as shown in Example 48.10. You can use the CROSSLIST= option without using the INSET= option, as shown in Example 48.8 and Example 48.9.

## Syntax: SASEFAME Interface Engine

The SASEFAME interface engine uses standard engine syntax. Table 48.1 summarizes the options used by the SASEFAME engine.

**Table 48.1** Summary of LIBNAME *libref* SASEFAME Statement Options

| Option | Description |
|---|---|
| AS_DB= | Specifies the channel name to use for a local database; used when Fame expressions or formulas need to resolve in a Fame child process. |
| AS_NAME= | Specifies the name to use for an explicit connection for remote access; used with the CONNECT=YES option. |
| CONNECT= | Specifies whether or not you want to use an explicit named connection for remote access, which you name in the AS_NAME= option |
| CONVERT= | Specifies the Fame frequency and the Fame technique |
| CROSSLIST= | Specifies a Fame crosslist *fame_namelist* to perform selection based on the crossproduct of two Fame namelists |
| DBVERSION= | Echoes the present version number of the Fame Work database in the SAS log |
| DEBUG= | Specifies whether or not you need diagnostic message logging in the SAS log window |
| FAMEOUT= | Specifies the Fame data object class/type that you want output to the SAS data set |
| INSET= | Uses a SAS data set named setname and KEEP= *fame_expression_group* as selection input variables or WHERE= *fame_bygroup* as selection input for BY variables |
| ON_HOST= | Specifies the remote Fame MCADBS server node name to connect to; used with the CONNECT=YES option. |
| PASS= | Specifies the password for the connection, which should match the password that you use as the **adduser** parameter in your **Fame FRDB facsq** command; used with the USER= option (for remote access). |
| RANGE= | Specifies the range of data to keep in `'ddmmmyyy'` – `'ddmmmyyyy'` format |
| TO_SERVICE= | Specifies the port number that you started the MCADBS service on, which is the same port that you specified in the **-p** argument in the **mcadbs.exe** command on your MCADBS server; used with the CONNECT=YES option (for remote access). |
| TUNEFAME= | Tunes the Fame database engine's use of memory to reduce I/O in favor of a bigger virtual memory for caching database objects |
| TUNECHLI= | Tunes the CHLI database engine's use of memory to reduce I/O in favor of a bigger virtual memory for caching database objects |
| USER= | Specifies the user name for the connection, which should match the user name you use as the **adduser** parameter in your **Fame FRDB facsq** command; used with the PASS= option (for remote access). |
| WILDCARD= | Specifies a Fame wildcard to match data object series names within the Fame database |

## LIBNAME *libref* SASEFAME Statement

**LIBNAME** *libref* **SASEFAME** '*physical name*' *options* **;**

Because '*physical name*' specifies the location of the folder where your Fame database resides, it should end in a backslash if you are in a Windows environment or a forward slash if you are in a UNIX environment.

If you are accessing a remote Fame database using an implicit connection in the Fame CHLI, you can use the following syntax for '*physical name*':

'`#port_number @hostname physical_path_name`'

You can specify the following *options*.

**AS_DB=***fame_db_name*

**OPEN_AS=** *fame_db_name*

specifies the Fame database ID to use in the **Fame OPEN** command, which is often the same as the name of the database (without the *.db* extension). In Fame, you can retrieve a list of open database ID names by using the Fame command **TYPE @OPEN.DB**. Use this option when you get this error:

```
ERROR: From cfmfame: Error from a FAME-like server, error from
       cfmferr is: \Variable{XXXX} not found
```

For a more complete discussion of opening a local Fame database, see the section "Opening a Local Fame Database" on page 3502.

**AS_NAME=**"*fame_channel_name*"

**NAME=** "*fame_channel_name*"

specifies the Fame channel name to use in the **Fame CONNECT** command for remote database access. In Fame, you can retrieve a list of open channel names by using the Fame command **TYPE @OPEN.CONNECTIONS**. For a more complete discussion of opening a remote Fame database on an MCADBS server, see Example 48.18.

**CONNECT=YES | IMPLICIT | NO**

**CONNECTION=YES | IMPLICIT | NO**

specifies whether or not the connection is an explicit connection.

| | |
|---|---|
| **YES** | specifies that the connection is explicit. |
| **IMPLICIT** | specifies that the connection is implicit. |
| **NO** | specifies that the connection is implicit. |

An explicit connection also requires the TO_SERVICE= , ON_HOST=, AS_NAME=, USER=, and PASS= options. When an implicit connection is specified, these additional options are not used; instead the details of the connection are given inside the physical path name in the SASEFAME LIBNAME statement with the special syntax described in the section "LIBNAME *libref* SASEFAME Statement" on page 3498. For more information about implicit Fame connections, see the section "Opening Databases on Implicit Connections" in *MarketMap Fame 11.5 Online Help* at the following URL:

```
https://fame.sungard.com/support_secure/fame/online_help_115/commands_and_options/
          opening_databases_implicit_connections.htm
```

For more information about explicit Fame connections, see the section "Opening Databases on Explicit Connections" in the *MarketMap Fame 11.5 Online Help* at the following URL:

```
https://fame.sungard.com/support_secure/fame/online_help_115/commands_and_options/
          opening_databases_explicit_connections.htm
```

**CONVERT=( FREQ=***fame_frequency* **TECH=***fame_technique***)**

**CONV=( FREQ=***fame_frequency* **TECH=***fame_technique***)**

specifies the Fame frequency and the Fame technique, just as you would in the Fame CONVERT function. There are four possible values for *fame_technique*: *Constant* (default), *Cubic*, *Discrete*, and *Linear*. Table 48.2 shows the Fame frequencies that are supported by the SASEFAME engine.

For a more complete discussion of Fame frequencies and SAS time intervals, see the section "Mapping Fame Frequencies to SAS Time Intervals" on page 3506. For all possible *fame_frequency* values, see the section "Understanding Frequencies" in the *User's Guide to Fame*. For example:

```
LIBNAME libref sasefame 'physical-name'
        CONVERT=(TECH=CONSTANT FREQ=TWICEMONTHLY);
```

**CROSSLIST=( <** *fame_namelist1***, >** *fame_namelist2* **)**

**CROSS=( <** *fame_namelist1***, >** *fame_namelist2* **)**

performs a crossproduct of the members of the first namelist with the members of the second namelist, using a glue symbol "." to join the two. If one of the time series that are listed in *fame_namelist2* does not exist, the SASEFAME engine stops processing the remainder of the namelist. For more information, see the section "Performing the Crosslist Selection Function" on page 3510.

**DBVERSION=ON | OFF**

specifies whether or not to display the version number of the Fame Work database. DBVERSION=ON specifies that the SAS log show the version number (3 or 4) of the Fame Work database. By default, DBVERSION=OFF.

**DEBUG= ON | OFF (default)**

specifies that additional diagnostic information in the SAS log be reported. When you specify DEBUG=ON, the information about Fame commands that are outlined in the SAS log by debug tracing can be valuable for diagnosing and identifying the issues that cause errors when you are using the SASEFAME engine. By default, DEBUG=OFF. See Example 48.18 for a detailed SAS log that is created when you specify DEBUG=ON.

**FAMEOUT=***fame_data_object_class_type*

specifies the class and type of the Fame data series objects to include in your SAS output data set. The possible values for *fame_data_object_class_type* are FORMULA, TIME, BOOLEAN, CASE, DATE, and STRING. Case series can be numeric, boolean, string, and date, or they can be generated using formulas that resolve to series. The SASEFAME engine resolves all formulas that belong to the type of series data object that you specify in the FAMEOUT= option. If the FAMEOUT= option is not specified, numeric time series are output to the SAS data set. FAMEOUT=CASE defaults to case series of numeric type. If you want another type of case series in your output, then you must specify it. Scalar data objects are not supported.

**INSET=(***setname* **KEEP=***fame_expression_group* **)**

**INSET=(***setname* **KEEPLIST=***fame_expression_group* **)**

specifies the name of a SAS data set (setname) and selects series that are generated by the expressions defined in *fame_expression_group*. You can define *fame_expression_group* by using Fame functions and Fame expressions. It is important to specify the length of the longest expression, or expressions might be truncated because the default length is the first defined variable in the DATA step. The INSET (input data set) must output each expression statement as a character string ending with a semicolon, enclosed in single quotation marks, and followed by another semicolon and an output statement. For more about using the INSET= option to define a group of selected series that are generated by Fame expressions, see the section "Performing the Keeplist Expression Function" on page 3508.

**INSET=(***setname* **WHERE=***fame_bygroup* **)**

specifies a SAS data set (setname) as input for a BY group such as a ticker, and uses the *fame_bygroup* to select time series that are named using the following convention. Selected variable names are glued together by the BY-group name (such as a ticker symbol) concatenated with the glue character (such as DOT) to the series name that is specified in the CROSSLIST= option or in the *fame_bygroup*.

For more information, see the section "Performing the Crosslist Selection Function" on page 3510.

**ON_HOST="***fame_hostname***"**

**HOST= "***fame_hostname***"**

specifies the Fame host name to use in the **Fame CONNECT** command, which is the name of the host or node that is running as the MCADBS server. You can see the host name when you use the **MCADBS** command with the **show** option. For a more complete discussion of using the **MCADBS** command with the **show** option, see the section "Using the MCADBS Show Function" on page 3504.

**PASS="***fame_password***"**

**PASSWORD= "***fame_password***"**

specifies the Fame password to use in the **Fame CONNECT** command, which is the password for the user name designated in the **adduser** function in the **facsq access control** command. For a more complete discussion about managing and monitoring your Fame server processes, see the section "Managing Fame Server Processes for Remote Access" on page 3503.

**RANGE='***fame_begdt***'d-'***fame_enddt***'d**

**DATERANGE='***fame_begdt***'d-'***fame_enddt***'d**

**DATE='***fame_begdt***'d-'***fame_enddt***'d**

**DATECASE='***fame_begdt***'d-'***fame_enddt***'d**

limits the time range of data that are read from your Fame database. The string *fame_begdt* is the beginning date in `'ddmmmyyyy'` format, and the string *fame_enddt* is the ending date of the range in `'ddmmmyyyy'` format; both strings must be enclosed in single quotation marks and followed by the letter `'d'`.

For example, to read a series with a date range that spans the first quarter of 1999, you could use the following statement:

```
LIBNAME test sasefame 'physical name of test database'
        RANGE='01jan1999'd - '31mar1999'd;
```

**TO_SERVICE=**"*fame_service_portnumber*"

**SERVICE=** "*fame_service_portnumber*"

specifies the Fame service port number to use in the **Fame CONNECT** command, which is the same port number that you use in your **MCADBS** command for the name port (**-n** option). For a more complete discussion about managing and monitoring your Fame server processes, see the section "Managing Fame Server Processes for Remote Access" on page 3503.

**TUNEFAME=NODES** *fameengine_size_virtual_memory_MB*

specifies the number of megabytes to use for the cache size for the Fame API (CHLI). The *fameengine_size_virtual_memory_MB* can range from a minimum of 0.1 MB (100 KB) to a maximum of 17,592,186,000,000 MB. For more information, see Example 48.17.

**TUNECHLI=NODES** *famechliengine_size_virtual_memory_MB*

specifies the number of megabytes to use for the cache size for the Fame API (CHLI). The *famechliengine_size_virtual_memory_MB* can range from a minimum of 0.1 MB (100 KB) to a maximum of 17,592,186,000,000 MB. For more information, see Example 48.17.

**USER=**"*fame_username*"

**USERNAME=** "*fame_username*"

specifies the Fame user name to use in the **Fame CONNECT** command, which corresponds to the password and user name designated in the **adduser** function in the **facsq access control** command. For a more complete discussion about managing and monitoring your Fame server processes, see the section "Managing Fame Server Processes for Remote Access" on page 3503.

**WILDCARD="***fame_wildcard***"**

**WILD="***fame_wildcard***"**

limits the time series read from the Fame database. By default, the SASEFAME engine reads all time series in the Fame database that you name in your SASEFAME libref. The *fame_wildcard* is a quoted string that contains the Fame wildcard you want to use. The wildcard is used for matching against the data object names of series that you want to select from the Fame database that resides in the library you are assigning.

For more information about using wildcards, see the section "Specifying Wildcards" in the *User's Guide to Fame*.

For example, to read all time series in the TEST library that is being accessed by the SASEFAME engine, you would specify the following statement:

```
LIBNAME test sasefame 'physical name of test database'
        WILDCARD="?";
```

To read series that have names such as A_DATA, B_DATA, and C_DATA, you could specify the following statement:

```
LIBNAME test sasefame 'physical name of test database'
        WILDCARD="^_DATA";
```

When you use the WILDCARD= option, you limit the number of series that are read and converted to the desired frequency. This option can help you save resources when processing large databases or when processing a large number of observations, such as daily or hourly frequencies. Because the SASEFAME engine uses the Fame Work database to store the converted time series, using wildcards is recommended to prevent your workspace from getting too large. When the FAMEOUT= option is also specified, the wildcard is applied to the type of data object series that you specify in the FAMEOUT= option.

# Details: SASEFAME Interface Engine

## Opening a Local Fame Database

Fame databases often contain expressions and formulas that resolve to a series. In order for Fame to resolve the expressions and formulas a channel is opened to the local database to a Fame-like server that is invoked by the SASEFAME interface engine so that the selected series are complete.

For example, the following SAS code generates the SAS log after it, which shows the **OPEN** command that is used to open the local training database on the Fame channel named TR, enabling the Fame **Crosslist** to resolve all the time series values for all the tickers included in the inset's BY group (TICK) :

```
libname lib5 sasefame "\\tappan\crsp1\fame10"
   as_db="TR"
   debug=ON
   convert=(frequency=business technique=constant)
   inset=( inseta where=tick )
   crosslist=
     ({adjust, close, high, low, open, volume, uclose, uhigh, ulow, uopen, uvolume})

data trout;
   set lib5.training;
run;
```

Here is an excerpt of the information shown in the SAS log (on Windows), which is created by using the DEBUG=ON option:

```
NOTE: The SASEFAME engine is using Version 11.43000 of the HLI.

len4=2
SIMPLE FAMECMD for local open is: \\tappan\crsp1\fame10/training
len4= 2
FAME COMMAND line 1004 is:
OPEN <ACCESS READ> """\\tappan\crsp1\fame10/training""" AS TR
```

It is important to note that the SAS **SET** command for local access uses the database name, training (without the *.db* extension), in the DATA step. This is in contrast to the SET statement for remote MCADBS server

access, which uses the channel name in the SAS SET statement, as shown in Example 48.18. For more information about opening and closing local Fame databases, see the section "Opening and Closing Local Databases" in *Online Help for MarketMap Analytic Studio* at the following URL:

```
https://fame.sungard.com/support_secure/fame/online_help/commands_and_options/
          opening_local_databases.htm
```

## Managing Fame Server Processes for Remote Access

Whether you use a master server or an MCADBS server, the appropriate configuration file is necessary. For the master server, on UNIX, your configuration file might look like this:

```
cat master1.config
security access all
dbback $FAME/frdb/dbback
```

Your **master** command could look like this:

```
$FAME/frdb/master -p \#5555 -s master1.config > master1.log &
```

For more information about the **master** server command, visit the following URL:

```
https://fame.sungard.com/support_secure/fame/online_help_115/
   servers/master_server_command.htm
```

To manage your MCADBS Fame server processes, you can start the FACS daemon on your Fame server. On Windows, enter the **facsd** command in the command window (if that is your Fame server):

```
%FAME%\frdb\64\facsd -d U:\fame940\doc\ -p 2990 -o U:\fame940\test\facs
    -s U:\fame940\doc\facsd.config
```

After you start the FACS daemon this way, you can use it for user authentication, access control, and accounting and logging facilities of Fame access control and accounting. To set up authentication, you can use the **facsq** command as follows:

```
%FAME%\frdb\64\facsq -p 2990 adduser <fame_username> <fame_password>
```

The user name and password in the **adduser** function are the same as those that are specified in the SASEFAME LIBNAME statement's USER= and PASS= options.

For a more complete discussion of the FACS daemon and configuration file, visit the following URLs:

```
https://fame.sungard.com/support_secure/fame/online_help_115/
    servers/facs_server_command.htm

https://fame.sungard.com/support_secure/fame/online_help_115/
    facs/facsd_access_control_command.htm

https://fame.sungard.com/support_secure/fame/online_help_115/
    facs/facsq_access_control_command.htm
```

Next you start your Fame server. The **MCADBS** server command, on Windows, looks like this:

```
C:\PROGRA~2\FAME\frdb\64\mcadbs.exe -n 2960 -p 2961 -s U:\fame940\doc\mcadbs.config
    -o U:\fame940\doc\mcadbs.log
```

For a more complete discussion, see the section "Start the MCADBS Server" in *Guide to MarketMap Database Servers*.

After starting the server, you can ask for information about the MACDBS server, as shown in the following section, "Using the MCADBS Show Function" on page 3504.

## Using the MCADBS Show Function

When you have the MCADBS server running, you can get detailed information about the server by using the MCADBS **show** function as follows:

```
C:\Users\saskff>%FAME%\frdb\64\mcadbs -n 2960 show
```

This results in the following report:

```
MCADBS Release 11.4 64-bit  Copyright (C) 2014 by SunGard.  All rights reserved.

The host name, d79286, is listed in the first few lines of the report, after the operating system details.

## SAS Output Data Set

You can use the SAS DATA step to write the selected time series from your Fame database to a SAS data set. This enables you to easily analyze the data by using the SAS System. You can specify the name of the output data set in the DATA statement. This causes the engine supervisor to create a SAS data set by using the specified name in either the SAS Work library or, if specified, the Sasuser library. For more information about naming your SAS data set, see the section "SAS Data Sets: Data Set Names" in *SAS Programmers Guide: Essentials*.

The contents of the SAS data set that contains time series include the date of each observation, the name of each series read from the Fame database as specified by the WILDCARD= option, and the label or Fame description of each series. Missing values are represented as '.' in the SAS data set. You can see the available data sets in the SAS LIBNAME window of the SAS windowing environment by selecting the SASEFAME libref in the LIBNAME window that you have previously used in your LIBNAME statement. You can use PROC PRINT and PROC CONTENTS to print your output data set and its contents. You can use PROC SQL and the SASEFAME engine to create a view of your SAS data set. You can view your SAS output observations by double-clicking the desired output data set libref in the LIBNAME window of the SAS windowing environment.

The DATE variable in the SAS data set contains the date of the observation. For Fame weekly intervals that end on a Friday, Fame reports the date on the Friday that ends the week, whereas the SAS System reports the date on the Saturday that begins the week.

A more detailed discussion of how to map Fame frequencies to SAS time intervals follows. For other types of data, such as Boolean case series, numeric case series, date case series, string case series, and extracting source for formulas, see Example 48.11, Example 48.12, Example 48.13, Example 48.14, and Example 48.15, respectively.

## Mapping Fame Frequencies to SAS Time Intervals

Table 48.2 summarizes the mapping of Fame frequencies to SAS time intervals. Fame frequencies often have a sample unit in parentheses after the keyword frequency. This sample unit is an end-of-interval unit. SAS dates are represented by beginning-of-interval notation.

For more information about SAS time intervals, see Chapter 5, "Date Intervals, Formats, and Functions."

For more information about Fame frequencies, see the section "Understanding Frequencies" in the *User's Guide to Fame*.

**Table 48.2** Mapping Fame Frequencies

| Fame Frequency | SAS Time Interval |

## Performing the Keeplist Expression Function

This section shows how to use the INSET= option to define a group of selected series that are generated by Fame expressions. It is important to use the LENGTH statement to avoid truncating the longest expression in the group defined by the BY variable EXPRESS. **NOTE:** The EXPRESS variable is assigned the character string expression and is shown in Table 48.3. The following statements create an input data set, INSETA, and print it:

```
data inseta; /* Use this for training database */
  length express $52;
  express='{ibm.high,ibm.low,ibm.close};'; output;
  express='crosslist({gm,f,c},{volume});'; output;
  express='cvx.close;'; output;
  express='mave(ibm.close,30);'; output;
  express='cvx.close+ibm.close;'; output;
  express='ibm.close;'; output;
  express='close * shares/sum(close * shares);'; output;
  express='sum(pep.volume);'; output;
  express='mave(pep.close,20);'; output;
run;

proc print
   data=inseta;
run;
```

Next you can name the input data set that you want to use in the INSET= option, followed by the KEEP= variable that specifies the expression group you want to keep. Only series variables that are defined in the selected expression group are output to the output data set. You can define up to eight different expression groups in an INSET= option.

```
libname lib5 sasefame "C:\PROGRA~1\FAME10\util"
   wildcard="?"
   convert=(frequency=business technique=constant)
   range='23jul1997'd - '25jul1997'd
   inset=( inseta KEEP=express)
   ;

data trout;
   set lib5.trainten;
run;

title1 'TRAINING DB, Pricing Time Series for Expressions in INSET=';
title2 'OUT=TROUT from the PRINT Procedure';
proc print data=trout;
run;
```

Table 48.3 shows the eight expressions that are defined in INSETA.

**Table 48.3** SAS Input Data Set, INSETA, Defined for Use in the INSET= Option

| Observation | EXPRESS |
|---|---|
| 1 | cvx.close; |
| 2 | ibm.high,ibm.low,ibm.close; |
| 3 | mave(ibm.close,30); |
| 4 | crosslist(gm,f,c,volume); |
| 5 | cvx.close+ibm.close; |
| 6 | ibm.close; |
| 7 | sum(pep.volume); |
| 8 | mave(pep.close,20); |

Table 48.4 shows the output data set, TROUT. The output data set names each derived variable SASTEMPn by appending the number, n, to match the observation number of the input data set's expression for that variable. For example, SASTEMP1 names the series derived by 'cvx.close' in observation 1, and SASTEMP3 names the series derived by the expression 'mave(ibm.close,30);' in observation 3. Because SASTEMP2 is a simple name list of three series, the original series names are used.

**Table 48.4** TRAINING DB, Pricing Timeseries for Expressions in INSETA for OUT=TROUT from the PRINT Procedure

| DATE | C.VOLUME | VOLUME | GM.VOLUME | IBM.CLOSE | IBM.HIGH |
|---|---|---|---|---|---|
| 23JUL1997 | 33791.88 | 45864.05 | 37392 | 52.5625 | 53.5000 |
| 24JUL1997 | 41828.85 | 29651.34 | 27771 | 53.9063 | 54.2188 |
| 25JUL1997 | 46979.83 | 36716.77 | 24969 | 53.5000 | 54.2188 |

| IBM.LOW | SASTEMP1 | SASTEMP3 | SASTEMP5 | SASTEMP6 | SASTEMP8 |
|---|---|---|---|---|---|
| 51.5938 | 38.4063 | . | 90.9688 | 52.5625 | . |
| 52.2500 | 38.4375 | . | 92.3438 | 53.9063 | . |
| 52.8125 | 39.0000 | . | 92.5000 | 53.5000 | . |

Note that SASTEMP3 and SASTEMP8 have no observations in the date range July 23, 1997, to July 25, 1997, so the missing value symbol '.' appears for those observations.

## Performing the Crosslist Selection Function

There are two methods of performing the crosslist selection function. The first method uses two Fame namelists, and the second method uses one namelist and one BY group specified in the WHERE= clause of the INSET= option.

For example, suppose that your Fame database has a string case series named TICKER, so that when the Fame NL function is used on TICKER, it returns the following namelist:

```
Ticker = {AOL, C, CVX, F, GM, HPQ, IBM, INDUA, INTC, SPX, SUNW, XOM}
```

Also suppose your time series are named in *fame_namelist2* as

```
{adjust, close, high, low, open, volume, uclose, uhigh, ulow, uopen, uvolume}
```

When you specify the following statements, the 132 variables shown in Table 48.5 are selected by the CROSSLIST= option:

```
LIBNAME test sasefame 'physical name of test database'
        RANGE='01jan1999'd - '31mar1999'd
        CROSSLIST=(nl(ticker),
                   {adjust, close, high, low, open, volume,
                    uclose, uhigh, ulow, uopen, uvolume})
        ;
```

**Table 48.5** SAS Variables Selected by CROSSLIST= Option

| | | | |
|---|---|---|---|
| AOL.ADJUST | C.ADJUST | CVX.ADJUST | F.ADJUST |
| AOL.CLOSE | C.CLOSE | CVX.CLOSE | F.CLOSE |
| AOL.HIGH | C.HIGH | CVX.HIGH | F.HIGH |
| AOL.LOW | C.LOW | CVX.LOW | F.LOW |
| AOL.OPEN | C.OPEN | CVX.OPEN | F.OPEN |
| AOL.UCLOSE | C.UCLOSE | CVX.UCLOSE | F.UCLOSE |
| AOL.UHIGH | C.UHIGH | CVX.UHIGH | F.UHIGH |
| AOL.ULOW | C.ULOW | CVX.ULOW | F.ULOW |
| AOL.UOPEN | C.UOPEN | CVX.UOPEN | F.UOPEN |
| AOL.UVOLUME | C.UVOLUME | CVX.UVOLUME | F.UVOLUME |
| AOL.VOLUME | C.VOLUME | CVX.VOLUME | F.VOLUME |
| GM.ADJUST | HPQ.ADJUST | IBM.ADJUST | INDUA.ADJUST |
| GM.CLOSE | HPQ.CLOSE | IBM.CLOSE | INDUA.CLOSE |
| GM.HIGH | HPQ.HIGH | IBM.HIGH | INDUA.HIGH |
| GM.LOW | HPQ.LOW | IBM.LOW | INDUA.LOW |
| GM.OPEN | HPQ.OPEN | IBM.OPEN | INDUA.OPEN |
| GM.UCLOSE | HPQ.UCLOSE | IBM.UCLOSE | INDUA.UCLOSE |
| GM.UHIGH | HPQ.UHIGH | IBM.UHIGH | INDUA.UHIGH |
| GM.ULOW | HPQ.ULOW | IBM.ULOW | INDUA.ULOW |
| GM.UOPEN | HPQ.UOPEN | IBM.UOPEN | INDUA.UOPEN |

**Table 48.5** *continued*

| | | | |
|---|---|---|---|
| GM.UVOLUME | HPQ.UVOLUME | IBM.UVOLUME | INDUA.UVOLUME |
| GM.VOLUME | HPQ.VOLUME | IBM.VOLUME | INDUA.VOLUME |
| INTC.ADJUST | SPX.ADJUST | SUNW.ADJUST | XOM.ADJUST |
| INTC.CLOSE | SPX.CLOSE | SUNW.CLOSE | XOM.CLOSE |
| INTC.HIGH | SPX.HIGH | SUNW.HIGH | XOM.HIGH |
| INTC.LOW | SPX.LOW | SUNW.LOW | XOM.LOW |
| INTC.OPEN | SPX.OPEN | SUNW.OPEN | XOM.OPEN |
| INTC.UCLOSE | SPX.UCLOSE | SUNW.UCLOSE | XOM.UCLOSE |
| INTC.UHIGH | SPX.UHIGH | SUNW.UHIGH | XOM.UHIGH |
| INTC.ULOW | SPX.ULOW | SUNW.ULOW | XOM.ULOW |
| INTC.UOPEN | SPX.UOPEN | SUNW.UOPEN | XOM.UOPEN |
| INTC.UVOLUME | SPX.UVOLUME | SUNW.UVOLUME | XOM.UVOLUME |
| INTC.VOLUME | SPX.VOLUME | SUNW.VOLUME | XOM.VOLUME |

Instead of using two namelists, you can use the WHERE= clause in an INSET= option to perform the crossproduct of the BY variables specified in your input data set via the WHERE= clause and the members named in your namelist. The following statements define a SAS input data set named INSETA to use as input for the CROSSLIST= option instead of using the Fame namelist:

```
DATA INSETA;
   LENGTH tick $5;
/* AOL, C, CVX, F, GM, HPQ, IBM, INDUA, INTC, SPX, SUNW, XOM */
   tick='AOL'; output;
   tick='C'; output;
   tick='CVX'; output;
   tick='F'; output;
   tick='GM'; output;
   tick='HPQ'; output;
   tick='IBM'; output;
   tick='INDUA'; output;
   tick='INTC'; output;
   tick='SPX'; output;
   tick='SUNW'; output;
   tick='XOM'; output;
RUN;

LIBNAME test sasefame 'physical name of test database'
        RANGE='01jan1999'd - '31mar1999'd
        INSET=(inseta, where=tick)
        CROSSLIST=(
              {adjust, close, high, low, open, volume,
               uclose, uhigh, ulow, uopen, uvolume})
        ;
```

Using a SAS INSET statement with a WHERE clause and using a Fame namelist in the CROSSLIST= statement are equivalent ways of performing the same selection function. In the preceding example, the Fame ticker namelist corresponds to the SAS input data set's BY variable named TICK.

Note that the *fame_bygroup* that you specify in the WHERE= clause must match the BY-variable name used

in your input data set in order for the CROSSLIST= option to perform the desired selection. If one of the time series listed in *fame_namelist2* does not exist, the SASEFAME engine stops processing the remainder of the namelist. For complete results, make sure that your *fame_namelist2* is accurate and does not name unknown variables. The same holds true for *fame_namelist1* and the BY-variable values named in the input data set and used in the WHERE= clause.

# Examples: SASEFAME Interface Engine

In this section, the examples were run on Windows, so the physical names used in the LIBNAME *libref* SASEFAME statement reflect the syntax necessary for that platform. In general, Windows environments use backslashes in their path name, and the UNIX environments use forward slashes.

## Example 48.1: Converting an Entire Fame Database

To enable conversion of all time series, no wildcard is specified, so the default "?" wildcard is used. Always consider both the number of time series and the number of observations generated by the conversion process. The converted series reside in the Fame Work database during the SAS DATA step. You can further limit your resulting SAS data set by using KEEP, DROP, or WHERE statements inside your DATA step.

The following statements convert a Fame database and print out its contents:

```
options pagesize=60 linesize=80 validvarname=any ;
%let FAME=%sysget(FAME);
%put(&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put(&FAMETEMP);

libname famedir sasefame "%sysget(FAME_DATA)"
        convert=(freq=annual technique=constant);

libname mydir "%sysget(FAME_TEMP)";

data mydir.a;  /* add data set to mydir */
   set famedir.oecd1;
   /* Read in oecd1.db data from the Organization */
   /*  For Economic Cooperation and Development    */
   where date between '01jan88'd and '31dec93'd;
run;

proc print data=mydir.a;
run;
```

In the preceding example, the Fame database is called OECD1.DB, and it resides in the **famedir** directory. The DATA statement names the SAS output data set a that will reside in **mydir**. All time series in the Fame OECD1.DB database will be converted to an annual frequency and reside in the mydir.a SAS data set. Because the time series variable names contain the special glue symbol '.', the SAS option statement specifies VALIDVARNAME=ANY. For more information about this option, see *SAS System Options: Reference*. The

Fame environment variable is the location of the Fame installation. In the Windows environment, the log would look like this:

```
1              options validvarname=any;

2              %let FAME=%sysget(FAME);
3              %put(&FAME);
(C:\PROGRA~1\FAME)
4              %let FAMETEMP=%sysget(FAME_TEMP);
5              %put(&FAMETEMP);
(\\ge\U11\saskff\fametemp\)
6
7              libname famedir sasefame "&FAME\util"
8                       convert=(freq=annual technique=constant);
NOTE: Libref FAMEDIR was successfully assigned as follows:
      Engine:        FAMECHLI
      Physical Name: C:\PROGRA~1\FAME\util
9
10             libname mydir '\\dntsrc\usrtmp\saskff';
NOTE: Libref MYDIR was successfully assigned as follows:
      Engine:        V9
      Physical Name: \\dntsrc\usrtmp\saskff
11
12             data mydir.a;  /* add data set to mydir */
13                set famedir.oecd1;
AUS.DIRDES -- SERIES (NUMERIC by ANNUAL)
AUS.DIRDES copied to work data base as AUS.DIRDES.
```

For more about the glue DOT character, see the section "Gluing Names Together" in the *User's Guide to Fame*. In the preceding log, the variable name AUS.DIRDES uses the glue DOT between AUS and DIRDES.

The PROC PRINT statement produces the results shown in Output 48.1.1, which displays all observations in the mydir.a SAS data set.

**Output 48.1.1** Listing of OUT=MYDIR.A of the OECD1 Fame Data

## Example 48.2: Reading Time Series from the Fame Database

This example uses the Fame WILDCARD= option to limit the number of series converted. The following statements show how to read only series whose names begin with WSPCA:

```
options validvarname=any;

%let FAME=%sysget(FAME);
%put(&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put(&FAMETEMP);

libname lib1 sasefame "%sysget(FAME_DATA)"
        wildcard="wspca?"
        convert=(technique=constant freq=twicemonthly );

libname lib2 "%sysget(FAME_TEMP)";

data lib2.twild(label='Annual Series from the FAMEECON.db');
   set lib1.subecon;
   where date between '01jan93'd and '31dec93'd;
   /* keep only  */
   keep date wspca;
run;

proc contents data=lib2.twild;
run;

proc print data=lib2.twild;
run;
```

Output 48.2.1 and Output 48.2.2 show the results of using WILDCARD="WSPCA?".

**Output 48.2.1** Contents of OUT=LIB2.TWILD of the SUBECON Fame Data

**The CONTENTS Procedure**

**Alphabetic List of Variables and Attributes**

| # | Variable | Type | Len | Format | Informat | Label |
|---|---|---|---|---|---|---|
| 1 | DATE | Num | 8 | DATE9. | 9. | Date of Observation |
| 2 | WSPCA | Num | 8 | | | STANDARD & POOR'S WEEKLY BOND YIELD: COMPOSITE, A |

The WILDCARD="WSPCA?" option limits reading to only those series whose names begin with WSPCA. The KEEP statement further restricts the SAS data set to include only the series named WSPCA and the DATE variable. The time interval that is used for the conversion is TWICEMONTHLY.

**Output 48.2.2** Listing of OUT=LIB2.TWILD of the SUBECON Fame Data

| Obs | DATE | WSPCA |
|---|---|---|
| 1 | 01JAN1993 | 8.59400 |
| 2 | 16JAN1993 | 8.50562 |
| 3 | 01FEB1993 | 8.47000 |
| 4 | 16FEB1993 | 8.31000 |
| 5 | 01MAR1993 | 8.27000 |
| 6 | 16MAR1993 | 8.29250 |
| 7 | 01APR1993 | 8.32400 |
| 8 | 16APR1993 | 8.56333 |
| 9 | 01MAY1993 | 8.37867 |
| 10 | 16MAY1993 | 8.26313 |
| 11 | 01JUN1993 | 8.21333 |
| 12 | 16JUN1993 | 8.14400 |
| 13 | 01JUL1993 | 8.09067 |
| 14 | 16JUL1993 | 8.09937 |
| 15 | 01AUG1993 | 7.98533 |
| 16 | 16AUG1993 | 7.91600 |

## Example 48.3: Writing Time Series to the SAS Data Set

The following statements use the DROP statement to exclude certain time series from the SAS data set. (You can also use the KEEP statement to include certain series in the SAS data set.)

```
options validvarname=any;

%let FAME=%sysget(FAME);
%put(&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put(&FAMETEMP);

libname famedir sasefame "%sysget(FAME_DATA)"
        convert=(freq=annual technique=constant);

libname mydir "%sysget(FAME_TEMP)";

data mydir.a;  /* add data set to mydir */
   set famedir.oecd1;
   drop 'ita.dirdes'n--'jpn.herd'n 'tur.dirdes'n--'usa.herd'n;
   where date between '01jan88'd and '31dec93'd;
run;

title1 "OECD1: TECH=Constant, FREQ=Annual";
title2 "Drop Using N-literals";

proc print data=mydir.a;
run;
```

Output 48.3.1 shows the results.

**Output 48.3.1** Listing of OUT=MYDIR.A of the OECD1 Fame Data

**OECD1: TECH=Constant, FREQ=Annual**
**Drop Using N-literals**

Note that the SAS option VALIDVARNAME=ANY was used at the beginning of this example because special characters are present in the time series names. SAS variables that contain certain special characters are called *n*-literals and are referenced in SAS code, as shown in this example.

You can rename your SAS variables by using the RENAME statement. The following statements show how to use *n*-literals when selecting variables that you want to keep and how to rename some of your kept variables:

```
options validvarname=any;

%let FAME=%sysget(FAME);
%put(&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put(&FAMETEMP);

libname famedir sasefame "%sysget(FAME_DATA)"
        convert=(freq=annual technique=constant);
```

```
libname mydir "%sysget(FAME_TEMP)";

data mydir.a;  /* add data set to mydir */
   set famedir.oecd1;
   /* keep and rename  */
   keep date 'ita.dirdes'n--'jpn.herd'n 'tur.dirdes'n--'usa.herd'n;
   rename 'ita.dirdes'n='italy.dirdes'n
          'jpn.dirdes'n='japan.dirdes'n
          'tur.dirdes'n='turkey.dirdes'n
          'usa.dirdes'n='united.states.of.america.dirdes'n ;
run;

title1 "OECD1: TECH=Constant, FREQ=Annual";
title2 "keep statement using n-literals";
title3 "rename statement using n-literals";

proc print data=mydir.a;
run;
```

Output 48.3.2 shows the results.

**Output 48.3.2** Listing of OUT=MYDIR.A of the OECD1 Fame Data

## Example 48.4: Limiting the Time Range of Data

You can also limit the time range of the data in the SAS data set by using the RANGE= option in the LIBNAME statement or the WHERE statement in the DATA step to process the time ID variable DATE only when it falls in the range you are interested in.

All data for 1988, 1989, and 1990 are included in the SAS data set that is generated by using the RANGE='01JAN1988'D - '31DEC1990'D option or the WHERE DATE BETWEEN '01JAN88'D AND '31DEC90'D statement. The difference is that the RANGE= option uses less space in the Fame Work database. If you have a very large database and you want to use less space in your Fame Work database while you are processing the OECD1 database, you should use the RANGE= option as shown in the following statements:

```
options validvarname=any;

%let FAME=%sysget(FAME);
%put(&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put(&FAMETEMP);

libname famedir SASEFAME "%sysget(FAME_DATA)"
        convert=(freq=annual technique=constant)
        range='01jan1988'd - '31dec1990'd;

libname mydir "%sysget(FAME_TEMP)";

data mydir.a;  /* add data set to mydir */
   set famedir.oecd1;
   /* range on the libref restricts the dates *
    * read from famedir's oecd1 database      */
run;

title1 "OECD1: TECH=Constant, FREQ=Annual";
proc print data=mydir.a;
run;
```

Output 48.4.1 shows the results.

**Output 48.4.1** OECD1 Fame Data Using the RANGE= Option

**OECD1: TECH=Constant, FREQ=Annual**

| 2 | 2202 | 308.900 | 2771.40 | 78.7000 | 143.800 | . | . | 1076 |
| 3 | . | . | . | . | . | . | . | . |

| Obs | SWE.HERD | TUR.DIRDES | TUR.HERD | USA.DIRDES | USA.HERD | YUG.DIRDES | YUG.HERD |
|---|---|---|---|---|---|---|---|
| 1 | . | 174.400 | 74474 | 20246.20 | 20246.20 | 233.000 | 29.81 |
| 2 | 11104 | 212.300 | 143951 | 22159.50 | 22159.50 | 205.100 | 375.22 |
| 3 | . | . | . | 23556.10 | 23556.10 | . | 2588.50 |

The following statements show how you can use the WHERE statement in the DATA step to process the time ID variable DATE only when it falls in the range you are interested in:

```
options validvarname=any;

%let FAME=%sysget(FAME);
%put(&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put(&FAMETEMP);

libname famedir SASEFAME "%sysget(FAME_DATA)"
        convert=(freq=annual technique=constant);

libname mydir "%sysget(FAME_TEMP)";

data mydir.a;  /* add data set to mydir */
   set famedir.oecd1;
   /* where only  */
```

```
   where date between '01jan88'd and '31dec90'd;
run;

title1 "OECD1: TECH=Constant, FREQ=Annual";
proc print data=mydir.a;
run;
```

In Output 48.4.2, you can see that the result from the WHERE statement is the same as the result in Output 48.4.1 from using the RANGE= option.

**Output 48.4.2** OECD1 Fame Data Using the WHERE Statement

**OECD1: TECH=Constant, FREQ=Annual**

For more information about the KEEP, DROP, RENAME, and WHERE statements, see *SAS Programmers Guide: Essentials*.

## Example 48.5: Creating a View Using the SQL Procedure and the SASEFAME Engine

The following statements create a view of OECD data by using the SQL procedure's FROM and USING clauses. For more information about SQL views, see the *SAS SQL Procedure User's Guide*.

```
title1 'famesql5: PROC SQL Dual Embedded Libraries w/ FAME option';
options validvarname=any;

%let FAME=%sysget(FAME);
%put(&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put(&FAMETEMP);

title2 'OECD1: Dual Embedded Library Allocations with FAME Option';
proc sql;
   create view fameview as
      select date, 'fin.herd'n
         from lib1.oecd1
      using libname lib1 sasefame "%sysget(FAME_DATA)"
               convert=(tech=constant freq=annual),
            libname temp "%sysget(FAME_TEMP)";
quit;

title2 'OECD1: Print of View from Embedded Library with FAME Option';
proc print data=fameview;
run;
```

Output 48.5.1 shows the results.

**Output 48.5.1** Printout of the Fame View of OECD Data

**famesql5: PROC SQL Dual Embedded Libraries w/ FAME option**
**OECD1: Print of View from Embedded Library with FAME Option**

The following statements create a view of the DRI Basic Economic data by using the SQL procedure's FROM and USING clauses:

```
title2 'SUBECON: Dual Embedded Library Allocations with FAME Option';
options validvarname=any;

%let FAME=%sysget(FAME);
%put(&FAME);
```

```
%let FAMETEMP=%sysget(FAME_TEMP);
%put(&FAMETEMP);

proc sql;
   create view fameview as
   select date, gaa
      from lib1.subecon
      using libname lib1 sasefame "%sysget(FAME_DATA)"
                         convert=(tech=constant freq=annual),
            libname temp "%sysget(FAME_TEMP)";
quit;

title2 'SUBECON: Print of View from Embedded Library with FAME Option';
proc print data=fameview;
run;
```

Output 48.5.2 shows the results.

**Output 48.5.2** Printout of the Fame View of DRI Basic Economic Data

**famesql5: PROC SQL Dual Embedded Libraries w/ FAME option**

The following statements create a view of the Data Resources Incorporated (DRI) Basic Economic data by using the SQL procedure's FROM and USING clauses:

```
title2 'DRIECON: Dual Embedded Library Allocations with FAME Option';
options validvarname=any;

%let FAME=%sysget(FAME);
%put(&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put(&FAMETEMP);

proc sql;
   create view fameview as
```

```
      select date, husts
      from lib1.driecon
      using libname lib1 sasefame "%sysget(FAME_DATA)"
                         convert=(tech=constant freq=annual)
                         range='01jan1980'd - '01jan2006'd ,
            libname temp "%sysget(FAME_TEMP)";
quit;

title2 'DRIECON: Print of View from Embedded Library with FAME Option';
proc print data=fameview;
run;
```

The SAS option VALIDVARNAME=ANY is used at the beginning of this example because special characters are present in the time series names. The output from this example shows how each Fame view is the output of the SASEFAME engine's processing. Different engine options could have been used in the USING LIBNAME clause if desired. Output 48.5.4 shows the results.

**Output 48.5.4** Printout of the Fame View of DRI Basic Economic Data

**famesql5: PROC SQL Dual Embedded Libraries w/ FAME option**
**DRIECON: Print of View from Embedded Library with FAME Option**

## Example 48.6: Reading Other Fame Data Objects with the FAMEOUT= Option

This example shows how you can designate the data objects that are output to your SAS data set by using the FAMEOUT= option. In this example, the FAMEOUT=FORMULA option selects the formulas and their source definitions to be output. The RANGE= option is ignored because no time series are selected when FAMEOUT=FORMULA is specified.

```
options validvarname=any ls=90;

%let FAME=%sysget(FAME);
%put(&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put(&FAMETEMP);

libname lib6 sasefame "%sysget(FAME_DATA)"
   fameout=formula
   convert=(frequency=business technique=constant)
   range='02jan1995'd - '25jul1997'd
   wildcard="?YIELD?" ;

data crout;
   set lib6.training;
   keep 'S.GM.YIELD.A'n -- 'S.XON.YIELD.A'n ;
run;

title1 'Formulas from the TRAINING DB, FAMEOUT=FORMULA Option';
title2 'Using WILDCARD="?YIELD?"';
proc contents
   data=crout;
run;
```

Output 48.6.1shows the results.

**Output 48.6.1** Contents of OUT=CROUT from the FAMEOUT=FORMULA Option of the Fame TRAINING Data

**Formulas from the TRAINING DB, FAMEOUT=FORMULA Option Using WILDCARD="?YIELD?"**

**The CONTENTS Procedure**

**Alphabetic List of Variables and Attributes**

| # | Variable | Type | Len |
|---|---|---|---|
| 1 | S.GM.YIELD.A | Char | 82 |
| 2 | S.GM__PP.YIELD.A | Char | 82 |
| 3 | S.HWP.YIELD.A | Char | 82 |
| 4 | S.IBM.YIELD.A | Char | 82 |
| 5 | S.INDUT.YIELD.A | Char | 82 |
| 6 | S.SPAL.YIELD.A | Char | 82 |
| 7 | S.SPALN.YIELD.A | Char | 82 |
| 8 | S.SUNW.YIELD.A | Char | 82 |
| 9 | S.XOM.YIELD.A | Char | 82 |
| 10 | S.XON.YIELD.A | Char | 82 |

The FAMEOUT=FORMULA option restricts the SAS data set to include only formulas. The WILDCARD="?YIELD?" option further limits the selection of formulas to those whose names contain "YIELD".

```
options validvarname=any linesize=79;

title1 'Formulas from the TRAINING DB, FAMEOUT=FORMULA Option';
title2 'Using WILDCARD="?YIELD?"';
proc print
   data=crout noobs;
run;
```

Output 48.6.2 shows the results.

Additional examples of the FAMEOUT= option are shown in Example 48.11, Example 48.12, Example 48.13, Example 48.14, and Example 48.15.

## Example 48.7: Remote Fame Access by Using Fame CHLI

When you run Fame in a client/server environment and also have Fame CHLI capability to enable access to the server, you can access Fame remote data. Access the remote data by specifying the port number of the TCP/IP service that is defined for the frdb_m and the node name of the Fame master server in the physical path. In this example, the Fame server node name is STONES, and the port number is 5555, as was designated in the Fame master command. For more information about starting your Fame master server, see the section "Starting the Master Server" in *Guide to Fame Database Servers*.

```
options ls=78;
title1 "DRIECON Database, Using FAME with Remote Access via CHLI";
options validvarname=any;
libname test1 sasefame '#5555@stones $FAME/util';

data a;
   set test1.driecon;
   keep YP ZA ZB;
   where date between '01jan98'd and '31dec03'd;
run;

proc means data=a n;
run;
```

Output 48.7.1 shows the results.

**Output 48.7.1** Summary Statistics for the Remote FAME Data

**DRIECON Database, Using FAME with Remote Access via CHLI**

**The MEANS Procedure**

| Variable | Label | N |
|---|---|---|
| YP | PERSONAL INCOME | 5 |
| ZA | CORPORATE PROFITS AFTER TAX EXCLUDING IVA | 4 |
| ZB | CORPORATE PROFITS BEFORE TAX EXCLUDING IVA | 4 |

## Example 48.8: Selecting Time Series by Using the CROSSLIST= Option and KEEP Statement

This example shows how to use two Fame namelists to perform selection. Note that *fame_namelist1* could be easily generated using the Fame WILDLIST function. For more about the WILDLIST function, see the section "The WILDLIST Function" in the *Fame Command Reference, Volume 2, Functions*. In the following statements, four tickers are selected in *fame_namelist1*, but when you use the KEEP statement, the resulting data set contains only the desired IBM ticker:

```
options validvarname=any;

libname lib8 sasefame "%sysget(FAME_DATA)"
        convert=(frequency=business technique=constant)
        crosslist=(
           { IBM,SPALN,SUNW,XOM },
           { adjust, close, high, low, open, volume,
             uclose, uhigh, ulow,uopen,uvolume }
                 );

data trout;
   /* eleven companies, keep only the IBM ticker this time */
   set lib8.training;
   where date between '01mar02'd and '20mar02'd;
   keep IBM: ;
run;

title1 'TRAINING DB, Pricing Timeseries for IBM Ticker in CROSSLIST=';
proc contents
   data=trout;
run;

proc print
   data=trout;
run;
```

Output 48.8.1 and Output 48.8.2 show the results.

**Output 48.8.1** Contents of the IBM Time Series in the Fame TRAINING Data

**TRAINING DB, Pricing Timeseries for IBM Ticker in CROSSLIST=**

## Example 48.9: Selecting Time Series by Using the CROSSLIST= Option and Fame Namelist

This example demonstrates selection by using the CROSSLIST= option. Only the ticker "IBM" is specified in the KEEP statement from the 11 companies in the Fame ticker namelist.

```
options validvarname=any;

libname lib9 sasefame "%sysget(FAME_DATA)"
        convert=(frequency=business technique=constant)
        range='07jul1997'd - '25jul1997'd
        crosslist=( nl(ticker),
                    { adjust, close, high, low, open, volume,
```

```
                    uclose, uhigh, ulow, uopen, uvolume }
                );

data crout;
   /* eleven companies in the FAME ticker namelist */
   set lib9.training;
   keep IBM: ;
run;

title1 'TRAINING DB, Pricing Timeseries for Eleven Tickers in CROSSLIST=';
title2 'Using TICKER Namelist';
proc print data=crout;
run;

proc contents data=crout;
run;
```

Output 48.9.1 and Output 48.9.2 show the results.

## Example 48.10: Selecting Time Series by Using the CROSSLIST= Option and WHERE=TICK

Instead of having a Fame namelist with the ticker symbols for companies whose data you are interested in, you can designate an input SAS data set (INSETA) that specifies the tickers to select. Specify your selection by using the WHERE clause in the INSET= option as follows:

```
options validvarname=any;

data inseta;
   length tick $5;
   /* need $5 so SPALN is not truncated */

   tick='AOL';   output;
   tick='C';     output;
   tick='CPQ';   output;
   tick='CVX';   output;
   tick='F';     output;
   tick='GM';    output;
   tick='HWP';   output;
   tick='IBM';   output;
   tick='SPALN'; output;
   tick='SUNW';  output;
   tick='XOM';   output;
run;

libname lib10 sasefame "%sysget(FAME_DATA)"
        convert=(frequency=business technique=constant)
        range='07jul1997'd - '25jul1997'd
        inset=( inseta where=tick )
        crosslist=
            ( {adjust, close, high, low, open, volume,
               uclose, uhigh, ulow,uopen,uvolume} );
```

```
data trout;
   /* eleven companies with unique TICKs specified in INSETA */
   set lib10.training;
   keep IBM: ;
run;

title1 'TRAINING DB, Pricing Timeseries for Eleven Tickers in CROSSLIST=';
title2 'Using INSET with WHERE=TICK';
proc print data=trout;
run;

proc contents data=trout;
run;
```

Output 48.10.1 and Output 48.10.2 show the results.

**Output 48.10.1** Listing of OUT=TROUT Using CROSSLIST= and INSET= Options in the Fame TRAINING Data

**TRAINING DB, Pricing Timeseries for Eleven Tickers in CROSSLIST= Using INSET with WHERE=TICK**

## Example 48.11: Selecting Boolean Case Series with the FAMEOUT= Option

This example shows how to extract all Boolean case series from the Fame ALLTYPES database. The following statements write all Boolean case series to the SAS data set BOOOUT:

```
title1 '***famallt: FAMEOUT Option, Different Type Values***';
options validvarname=any;

%let FAME=%sysget(FAME);
%put(&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put(&FAMETEMP);

libname lib4 sasefame "%sysget(FAME_DATA)"
   fameout=boolcase wildcard="?" ;

data booout;
   set lib4.alltypes;
run;

title1 'ALLTYPES FAMEOUT=BOOLCASE for Boolean Case Series';
title2 'Using FAMEOUT=CASE BOOLEAN Option without Range';
proc contents
   data=booout;
run;

proc print
   data=booout;
run;
```

Output 48.11.1 and Output 48.11.2 show the results for the Boolean case.

**Output 48.11.1** Contents of OUT=BOOOUT Using FAMEOUT=BOOLCASE for Boolean Case Series

## Example 48.12: Selecting Numeric Case Series with the FAMEOUT= Option

This example extracts numeric case series. In addition to the already existing numeric case series in the Fame database, you can also have formulas that expand to numeric case series. The SASEFAME engine resolves all formulas that belong to the class and type of series data object that you specify in the FAMEOUT= option. The following statements write all numeric case series to the SAS data set CSOUT:

```
libname lib5 sasefame "%sysget(FAME_DATA)"
   fameout=case wildcard="?" ;

data csout;
   set lib5.alltypes;
run;

title1 'Using FAMEOUT=CASE Option without Range';
title2 'ALLTYPES, FAMEOUT=CASE and Open Wildcard for Numeric Case Series';
proc contents
   data=csout;
run;

proc print
   data=csout;
run;
```

Output 48.12.1 and Output 48.12.2 show the results.

**Output 48.12.1** Contents of OUT=CSOUT Using FAMEOUT=CASE and Open Wildcard for Numeric Case Series

## Example 48.15: Extracting Source for Formulas

This example shows how to extract the source for all the formulas in the Fame database by using the FAMEOUT=FORMULA and WILDCARD="?" options. The following statements show the source of all formulas written to the SAS data set CFOROUT. Another example of the FAMEOUT=FORMULA option is shown in Example 48.6.

```
libname lib8 sasefame "%sysget(FAME_DATA)"
   fameout=formula wildcard="?" ;

data cforout;
   set lib8.alltypes;
run;

title1 'Using FAMEOUT=FORMULA Option without Range';
proc contents
   data=cforout;
run;
```

Output 48.15.1 and Output 48.15.2 show the results.

**Output 48.15.1** Contents of OUT=CFOROUT Using FAMEOUT=FORMULA and Open Wildcard

**Using FAMEOUT=FORMULA Option without Range**

**The CONTENTS Procedure**

**Alphabetic List of Variables and Attributes**

| # | Variable | Type | Len |
|---|---|---|---|
| 1 | S.DFRM | Char | 27 |
| 2 | S.FRM1 | Char | 27 |
| 3 | S.FRM2 | Char | 27 |

```
title3 'ALLTYPES, FAMEOUT=FORMULA, and Open Wildcard for FORMULA Series';
proc print
   data=cforout noobs;
run;
```

**Output 48.15.2** Listing of OUT=CFOROUT Using FAMEOUT=FORMULA and Open Wildcard

**Using FAMEOUT=FORMULA Option without Range**

**ALLTYPES, FAMEOUT=FORMULA, and Open Wildcard for FORMULA Series**

| S.DFRM | S.FRM1 | S.FRM2 |
|---|---|---|
| IF DBOO THEN DPRC ELSE DNUM | IF BOO1 THEN NUM1 ELSE NUM2 | IF BOO0 THEN DAT1 ELSE DAT2 |

If you want all series of every type, you can merge the resulting data sets. For more information about merging SAS data sets, see *SAS Programmers Guide: Essentials*.

## Example 48.16: Reading Time Series by Defining Fame Expression Groups in the INSET= Option with the KEEP= Clause

To keep all the numeric time series that are listed in the expressions given in the input data set, INSETA, use the INSET=( *setname* KEEPLIST=*fame_expression_group* ) and WILDCARD="?" options. The following statements show how to select time series that are specified in a KEEP expression group and are written to the SAS output data set:

```
data inseta; /* Use this for d8690 training database */
   length express $52;
   express='cvx.close;'; output;
   express='{ibm.high,ibm.low,ibm.close};'; output;
   express='mave(ibm.close,30);'; output;
   express='crosslist({gm,f,c},{volume});'; output;
   express='cvx.close+ibm.close;'; output;
   express='ibm.close;'; output;
   express='sum(pep.volume);'; output;
   express='mave(pep.close,20);'; output;
run;
```

```
title1 'TRAINING DB, Pricing Timeseries for Expressions in INSET=';
proc print
   data=inseta;
run;
```

Output 48.16.1 shows the expressions that are stored as observations in the input data set, INSETA.

**Output 48.16.1** Listing of INSETA Defining Fame Expression Group

**TRAINING DB, Pricing Timeseries for Expressions in INSET=**

| Obs | express |
|---|---|
| 1 | cvx.close; |
| 2 | {ibm.high,ibm.low,ibm.close}; |
| 3 | mave(ibm.close,30); |
| 4 | crosslist({gm,f,c},{volume}); |
| 5 | cvx.close+ibm.close; |
| 6 | ibm.close; |
| 7 | sum(pep.volume); |
| 8 | mave(pep.close,20); |

The following statements show how to use the INSET= option to keep all time series that are represented in the input data set, INSETA, as the group variable EXPRESS:

```
libname libX sasefame "%sysget(FAME_DATA)"
   wildcard="?"
   convert=(frequency=business technique=constant)
   range='23jul1997'd - '25jul1997'd
   inset=( inseta KEEP=express)
   ;

data trout;
   set libX.trainten;
run;

title1 'TRAINING DB, Pricing Timeseries for Expressions in INSET=';
proc print data=trout;
run;

proc contents data=trout;
run;
```

Output 48.16.2 and Output 48.16.3 show the results.

**Output 48.16.2** Listing of TROUT Using INSETA with KEEP=EXPRESS

**TRAINING DB, Pricing Timeseries for Expressions in INSET=**

## Example 48.17: Optimizing Cache Sizes with the TUNEFAME= and TUNECHLI= Options

This example shows how to use the TUNEFAME= option, the TUNECHLI= option, and a RANGE= option to select pricing time series in the TRAINTEN database. The selected time series are written to the SAS output data set. The Fame database engine's virtual memory is given in megabytes (MB), so this example sets the cache size to 100 MB. The Fame CHLI engine's virtual memory is also given in megabytes (MB), so this example sets the CHLI cache size to 100 MB. These two settings correspond to the default settings. Both the Fame 4GL engine and the Fame CHLI engine can use a cache size that ranges from 0.1 MB to 17,592,186,000,000 MB.

```
libname lib5 sasefame "%sysget(FAME_DATA)"
  wildcard="?UHIGH"
  tunefame=nodes 100
  tunechli=nodes 100
  convert=(frequency=business technique=constant)
```

```
  range='23jul1997'd - '25jul1997'd
  ;

data trout(drop=C:);
   set lib5.trainten;
run;
title1 'TRAINTEN DB, Pricing Time Series, TUNEFAME=NODES and TUNECHLI=NODES Options';
proc print data=trout;
run;

proc contents data=trout;
run;
```

Output 48.17.1 and Output 48.17.2 show the results.

**Output 48.17.1** Listing of TRAINING DB, Pricing Time Series, TUNEFAME=NODES, and TUNECHLI=NODES Options

**TRAINTEN DB, Pricing Time Series, TUNEFAME=NODES and TUNECHLI=NODES Options**

For more information about tuning the use of virtual memory, read about TUNE CACHE nodes in the section "TUNE CACHE Option" in the online document *Fame 10 Online Help*.

## Example 48.18: Remote Access Using the MCADBS Server

Instead of accessing the local Fame training database, as shown in Example 48.10, this example shows how to access the remote Fame training database that is located on a remote Fame MCADBS server whose host name is "txa006". First, specify an explicit connection by using the CONNECT=YES option. Then name the connection in the AS_NAME= option, specify the host name of the remote MCADBS server in the ON_HOST= option, and specify the service to use in the TO_SERVICE= option. In addition, specify the user name and password for the connection by using the USER= and PASS= options. Designate an input SAS data set (INSETZ) that specifies the tickers to select, and specify your selection by using the WHERE clause in the INSET= option as follows:

```
option validvarname=any;

data insetz;
   length tick $6;
   /* need $6 so DJ30IN is not truncated */

   tick='C'; output;
   tick='CVX'; output;
   tick='DJ30IN'; output;
   tick='F'; output;
   tick='HPQ'; output;
   tick='IBM'; output;
   tick='INTC'; output;
   tick='KO'; output;
   tick='ORCL'; output;
   tick='PEP'; output;
   tick='SPX'; output;
   tick='XOM'; output;
   tick='YUM'; output;
run;

libname lib10 sasefame "C:\PROGRA~1\FAME\util"
        debug=on
        connect=yes to_service="2961" on_host="txa006" as_name="C"
        user="famekff" pass="XXXXXXXXX"
        convert=(frequency=business technique=constant)
        range='07jul1997'd - '25jul1997'd
        inset=( insetz where=tick )
        crosslist=
            ( {adjust, close, high, low, open, volume,
               uclose, uhigh, ulow, uopen, uvolume} );

data trout;
   /* thirteen companies with unique TICKs specified in INSETZ */
   /* Use tr since this is the MCADBS dbid for the training.db */
   set lib10.tr;
   keep DATE IBM: ;     /* only keep IBM for brevity of output results */
run;

title1 'TRAINING DB, Pricing Timeseries for IBM';
title2 'Using INSET with WHERE=TICK.';
proc print data=trout;
run;

proc contents data=trout;
run;
```

Output 48.18.1 and Output 48.18.2 show the results.

**Output 48.18.1** Listing of OUT=TROUT Using CROSSLIST= and INSET= Options in the Fame MCADBS Remote TRAINING Data

**TRAINING DB, Pricing Timeseries for IBM**
**Using INSET with WHERE=TICK.**

IBM.UOPEN -- SERIES (NUMERIC by BUSINESS)
IBM.UVOLUME -- SERIES (NUMERIC by BUSINESS)
IBM.VOLUME -- SERIES (NUMERIC by BUSINESS)
.
.
.
YUM.UOPEN -- SERIES (NUMERIC by BUSINESS)
YUM.UVOLUME -- SERIES (NUMERIC by BUSINESS)
YUM.VOLUME -- SERIES (NUMERIC by BUSINESS)
entering fmoinfo, nobs=-1
entering fmoinfo, nobs=8637
158        run;

entering fmoinfo, nobs=8637
inside fmoinfo, nobs=8637
NOTE: There were 8637 observations read from the data set LIB10.TR.
NOTE: The data set WORK.TROUT has 8637 observations and 144 variables.
```

Because you specify the DEBUG=ON option, the SAS log includes the Fame commands and reports the status of the Fame CHLI commands that are issued during the execution of the SAS DATA step. The first Fame command shown is **OPEN**; it is important to note that instead of using training in the SAS SET statement, it is necessary to use the database ID, tr. For the MCADBS server, a list of databases is given in the *mcadbs.config* file, which for the host txa006 contains the following information:

```
# The databases to open
OPEN %OL% %FAME%\util\training.db TR
                              # Clients refer to this as TR.
```

The first **OPEN** command listed in the SAS log (inside the **FAME** command) refers to the named connection, C:

```
OPEN <ACCESS READ> tr ON C;
```

So the connection is named C, which is specified in the AS_NAME= option in the SASEFAME LIBNAME statement.

# Overview: SASEFRED Interface Engine

The SASEFRED interface engine enables SAS users to retrieve economic data from the FRED website, which is hosted by the Economic Research Division of the Federal Reserve Bank of St. Louis. FRED stands for Federal Reserve Economic Data. The FRED databases contain more than 61,000 economic data time series from 48 national and international sources, both public and private. These time series are updated at annual, quarterly, monthly, weekly, and daily intervals. The economic time series on the FRED website contain observation or measurement periods that are associated with data values.

The SASEFRED interface engine uses the LIBNAME statement to enable you to specify how to subset your FRED data and how to aggregate the selected time series at the same update frequency. You can then use the SAS DATA step to perform further subsetting and to store the resulting time series in a SAS data set. You can perform more analysis (if desired) either in the same SAS session or in a later session.

The SASEFRED interface engine supports 64-bit Windows and Linux X64 (LAX) platforms.

Note that the SASEFRED engine uses the FRED API, but it is not endorsed or certified by the Federal Reserve Bank of St. Louis, and that by using the SASEFRED interface, you are agreeing to comply with the FRED terms of use, which are described on the web page at the following URL: **https://api.stlouisfed.org/terms_of_use.html**.

# Getting Started: SASEFRED Interface Engine

You can query the Federal Reserve Economic Data (FRED) databases to retrieve the observations or data values for a list of economic time series by specifying the series ID of each time series that you want to read into SAS and by specifying your unique FRED API key. To obtain your own unique API key, visit the FRED website at the following URL:

**https://api.stlouisfed.org/api_key.html**

The FRED API key is a 32-character alphanumeric lowercase string, such as 'abcdefghijklmnopqrstuvwxyz123456', and is represented by 'XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX' in the APIKEY= option in the following example. In addition, the example URLs in this section and in the section "Details: SASEFRED Interface Engine" on page 3569 use the same FRED API key as the argument *your_fred_apikey*.

After you have your assigned FRED API key and you have agreed to the terms of use, before downloading any copyright-protected data series, be aware that you are solely responsible for obtaining copyright permissions for any copyright-protected time series that you download (other than for personal use). To obtain a list of the copyright-protected data series, visit the web page at the following URL:

**https://api.stlouisfed.org/fred/series/search?search_text=copyright&api_key=your_fred_apikey**

Now that your are informed about the terms of use of the FRED data, you can use your FRED API key to access the FRED data, as shown in the following example.

The following statements enable you to access the exports of goods and services time series data from January 1, 1960, to January 1, 2012, on an annual basis. The observations are sorted by the time ID variable DATE.

```
options validvarname=any;

title 'Retrieve Data for the Exports of Goods and Services';
libname _all_ clear;
libname fred sasefred "%sysget(FRED)"
   OUTXML=exportgs
   XMLMAP="%sysget(FRED)exportgs.map"
   APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   IDLIST='bopxgsa';

data export_gsa;
   set fred.exportgs ;
run;

proc contents data=export_gsa; run;
proc print data=export_gsa(obs=15); run;
```

**Figure 49.1** Getting Started with Exports of Goods and Services: export_gsa(obs=15)

**Retrieve Data for the Exports of Goods and Services**

| Obs | date | realtime_start | realtime_end | BOPXGSA |
|---|---|---|---|---|
| 1 | 1960-01-01 | 2018-09-04 | 2018-09-04 | 25.940 |
| 2 | 1961-01-01 | 2018-09-04 | 2018-09-04 | 26.403 |

| 5 | 1964-01-01 | 2018-09-04 | 2018-09-04 | 33.341 |
| 6 | 1965-01-01 | 2018-09-04 | 2018-09-04 | 35.285 |
| 7 | 1966-01-01 | 2018-09-04 | 2018-09-04 | 38.926 |
| 8 | 1967-01-01 | 2018-09-04 | 2018-09-04 | 41.333 |
| 9 | 1968-01-01 | 2018-09-04 | 2018-09-04 | 45.543 |
| 10 | 1969-01-01 | 2018-09-04 | 2018-09-04 | 49.220 |
| 11 | 1970-01-01 | 2018-09-04 | 2018-09-04 | 56.640 |
| 12 | 1971-01-01 | 2018-09-04 | 2018-09-04 | 59.677 |
| 13 | 1972-01-01 | 2018-09-04 | 2018-09-04 | 67.222 |
| 14 | 1973-01-01 | 2018-09-04 | 2018-09-04 | 91.242 |
| 15 | 1974-01-01 | 2018-09-04 | 2018-09-04 | 120.897 |

The XML data that the FRED website returns are placed in a file named by the OUTXML= option, in this case, *EXPORTGS.xml*. Note that the XML file extension is excluded from the file name given in the OUTXML= option. When the SET statement is executed, the XML data is read into a SAS data set named Exportgs.sas7bdat, which resides in the location given inside the string enclosed in double quotation marks in the SASEFRED LIBNAME statement. So, in the preceding example, if the FRED environment variable is set to

```
/sasusr/fred/test/
```

then the SAS data set created from reading the downloaded XML file is placed into

```
/sasusr/fred/test/exportgs.sas7bdat
```

An equivalent LIBNAME statement that does not use any environment variables could be as follows:

```
Libname fred sasefred "/sasusr/fred/test/"
   OUTXML=exportgs
   XMLMAP="/sasusr/fred/test/exportgs.map"
   APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   IDLIST='bopxgsa';
```

You could also use either a SAS macro variable or a system environment variable to store the value of your FRED API key so that the key does not appear explicitly in your SAS code. The XML map that is created is assigned the full path name specified by the XMLMAP= option. The IDLIST= option specifies the list of time series that you want to retrieve. This option accepts a string, enclosed in single quotation marks, that denotes a list of one or more time series that you select (keep) in the resulting SAS data set. The result, Export_gsa, is named in the DATA step and is shown in Figure 49.1. It is more efficient to use the DATA step to store your FRED data in a SAS data set and then refer to the SAS data set directly in your PROC PRINT or PROC SGPLOT statement, but you can also refer to the SASEFRED libref directly, as in the following statement:

```
proc print data=fred.exportgs; run;
```

This statement uses the member name, exportgs, in the PROC PRINT statement; this usage corresponds to specifying the OUTXML=EXPORTGS option. Although using this statement might seem easier, it is not as efficient, because every time you use the SASEFRED libref, the FRED interface reads the entire XML file again into SAS. It is best to refer to the SAS data set repeatedly rather than invoking the interface engine repeatedly. For another example that uses more SASEFRED LIBNAME statement options, see the section "Reading Price Data by Using Indices" on page 3572.

## Syntax: SASEFRED Interface Engine

The SASEFRED interface engine uses standard engine syntax to read the observations or data values for one or more economic time series. Table 49.1 summarizes the options that the SASEFRED engine uses. There are two required options: APIKEY='*fred_apikey*' and ID_LIST='*fred_idlist*'.

**Table 49.1** Summary of LIBNAME *libref* SASEFRED Options

| Option | Description |
|---|---|
| AGG= | Specifies the aggregation method used for frequency aggregation. The valid aggregation arguments are 'avg', 'sum', and 'eop'; the default is 'avg'. |
| APIKEY= | Specifies the required FRED access key that enables you to access the data that the FRED website provides |
| AUTOMAP= | Specifies whether or not to overwrite the existing XML map file |
| CONNECT= | Specifies whether or not you need the connect method for a secure connection via a proxy server. You must specify the PROXY= option when you use the CONNECT=ON option. See the PROXY= option. |

**Table 49.1** *continued*

| Option | Description |
|---|---|
| DEBUG= | Specifies whether or not you need diagnostic message logging in the SAS log window |
| END= | Specifies the end date for the observation period (`'YYYY-MM-DD'` formatted string, optional; the default is 1776-07-04 (earliest available)) |
| FORMAT= | Specifies a file extension that indicates the type of file to retrieve. Only XML is supported. |
| FREQ= | Specifies the reporting frequency of the selected data (lower frequency to aggregate values to): 'm' for monthly, 'd' for daily. The FRED frequency aggregation feature converts higher-frequency data series to lower-frequency time series (such as converting a monthly time series to an annual time series). For the complete list of frequencies, see Table 49.2. |
| IDLIST= | Specifies a list of time series IDs for accessing FRED data. To select more than one time series, list the unique time series IDs, separated by commas. |
| LIMIT= | Specifies the maximum number of observations (rows) to return (integer between 1 and 100,000, optional; the default is 100,000) |
| MAPREF= | Specifies the fileref used for the map file assignment |
| OFFSET= | Specifies the number of rows (observations) to skip in the returned data set |
| OUTPUT= | Specifies an output type. The valid output arguments are '1' for Observations by Real-Time Period; '2' for Observations by Vintage Date, All Observations; '3' for Observations by Vintage Date, New and Revised Observations Only; and '4' for Observations, Initial Release Only (integer, optional; the default is '1'). |
| OUTXML= | Specifies the name of the output SAS data set and the XML file(s) requested by the IDLIST= option. When more than one time series ID is listed in the IDLIST= option, then the SASEFRED engine appends the positional integer ('1' for the first time series ID, '2' for the second time series ID, and so on) to the name specified by the OUTXML= option. |
| PROXY= | Specifies the proxy server that you want to use (if you have trouble connecting without specifying a proxy). If you also need the connect method for a secure connection, use the CONNECT=ON option in addition to the PROXY= option. See the CONNECT= option. |
| RTSTART= | Specifies the real-time start date for the observation period (`'YYYY-MM-DD'` formatted string, optional; the default is today) |
| RTEND= | Specifies the real-time end date for the observation period (`'YYYY-MM-DD'` formatted string, optional; the default is today) |
| SORT= | Specifies the order of the results in ascending or descending observation_date order. The valid sort arguments are 'asc' and 'desc'; the default is 'asc'. |
| START= | Specifies the start date for the observation period (`'YYYY-MM-DD'` formatted string, optional; the default is 9999-12-31 (latest available)) |
| UNITS= | Specifies a data value transformation. The valid units arguments are 'lin', 'chg', 'ch1', 'pch', 'pc1', 'pca', 'cch', 'cca', and 'log'; the default is 'lin'. For more information about units, see Table 49.3. |

**Table 49.1** *continued*

| Option | Description |
|---|---|
| URL= | Specifies a URL from which to request useful information about available releases, vintage dates, tags, categories, sources, and series. The information is downloaded from the specified URL and stored in the XFREDTPU data set (a temporary utility data set), which can then be saved or renamed to a permanent SAS data set. |
| USER= | Specifies the location of the writable folder where you permanently store data sets that have one-level names |
| VINTAGE= | Specifies one or more dates in history. Vintage dates are used to download data as they existed on that specific date in history (`'YYYY-MM-DD'` formatted string, optional; by default no vintage dates are set). You can request one or many vintage dates at a time; dates are in `'YYYY-MM-DD'` format and are separated by commas (no blanks allowed). For multiple vintage dates, specify OUTPUT=2 for all observations or OUTPUT=3 for only new or revised observations. |
| XMLMAP= | specifies the fully qualified name of the location where the XMLmap file is automatically stored. By default, XMLMAP=Fred.map. |

## The LIBNAME *libref* SASEFRED Statement

**LIBNAME** *libref* **SASEFRED** '*physical-name*' *options* **;**

The LIBNAME statement assigns a SAS library reference (libref) to the physical path of the directory of FRED data files in which the downloaded FRED XML data are stored.

You must specify the following arguments:

"*physical name*"
specifies the location of the folder where your FRED XML data reside. Enclose the *physical name* in double quotation marks, and end it with a backslash if the folder is in a Windows environment or a forward slash if it is in a UNIX environment.

**APIKEY='***fred_apikey***'**
specifies the FRED access key that enables you to access the data provided by the FRED website. The FRED access key is a 32-character alphanumeric lowercase string. You can request your *fred_apikey* by visiting the website at the following URL:

**`https://api.stlouisfed.org/api_key.html`**

**IDLIST='***fred_idlist***'**
specifies the list of time series to be included in the output SAS data set. This list is comma-delimited and must be enclosed in single quotation marks.

You can also specify the following *options*.

**AGG='AVG' | 'EOP' | 'SUM'**
specifies the aggregation method used for frequency aggregation. You can specify the following values:

**'AVG'** aggregates by averaging the frequencies.

**'EOP'** aggregates by using the end of the period.

**'SUM'** aggregates by summing the frequencies.

By default, AGG='AVG'. This option has no effect if the frequency option (FREQ=) is not specified.

**AUTOMAP=REPLACE | REUSE**
specifies which XMLmap file to use. You can specify the following values:

**REPLACE** overwrites the existing XMLmap file and uses the most current XMLmap that is generated by the SASEFRED engine and named in the XMLMAP= option.

**REUSE** uses a preexisting XMLmap file that is named in the XMLMAP= option.

**CONNECT=ON | OFF**
specifies whether or not to use the connect method along with the PROXY= option.**NOTE:** You must use the PROXY= option and specify your proxy server in addition to the CONNECT=ON option when you want to use the connect method. For more information about a secure connection, see the PROXY= option.

**DEBUG=ON | OFF**
specifies whether or not to include diagnostic message logging in the SAS log window. This information can be very useful for troubleshooting a problem. DEBUG=OFF redirects the SAS debug logging to a temporary file in the current working folder. You can specify a different folder to store the resulting log information (in the USER folder) when you specify the USER=option. DEBUG= OFF is the default. Use DEBUG=ON to see all the log messages (including debug information) in the SAS log. For more information about the USER folder, see the USER= option.

**END=**'*fred_enddate*'
specifies the end date for the time series in the format `'YYYY-MM-DD'`. The default is 9999-12-31 (latest available).

**FORMAT=***fred_xmlformat*
specifies the format of the file to be received from the FRED website. Although FRED can report data in many formats, the SASEFRED engine for 9.4 supports the XML format (default).

**FREQ=**'*fred_frequency*'
specifies a lower frequency to aggregate values to. The FRED frequency aggregation feature converts higher-frequency time series to lower-frequency time series (such as converting a daily time series to a monthly time series). In FRED, the highest frequency is daily, and the lowest frequency is annual. There is no default value for no frequency aggregation. The valid frequency arguments are presented in Table 49.2.

**NOTE:** An error is returned if you specify a frequency that is higher than the native frequency of the series. For example, if a series has the native frequency 'Annually', it is not possible to aggregate the series to the higher 'Monthly' frequency by using the frequency parameter value 'm'. To find the

native frequency of an economic time series, enter the following URL in your web browser. The output includes the 'Frequency' field, which shows native frequency of that time series.

```
https://api.stlouisfed.org/fred/series?series_id=DJCA&api_key=your_fred_apikey
```

**NOTE:** When a single time series is specified in the IDLIST= option and the FREQ= option is not specified or is an empty string, then the native frequency of that time series is used as the reporting frequency. When multiple time series are specified in the IDLIST= option, then the 'Annual' frequency is used as the reporting frequency unless the reporting frequency is specified in the FREQ= option. If any time series in the IDLIST= option list have a lower native frequency than the requested frequency, then those time series are dropped from the list and excluded from the output.

**Table 49.2** FRED Frequency Codes

| Frequency Code | Description |
|---|---|
| d | Displays data on a daily basis |
| w | Displays data on a weekly basis |
| bw | Displays data on a biweekly basis |
| m | Displays data on a monthly basis |
| q | Displays data on a quarterly basis |
| sa | Displays data on a semiannual basis |
| a | Displays data on an annual basis |
| wef | Displays data on a weekly (ending Friday) basis |
| weth | Displays data on a weekly (ending Thursday) basis |
| wew | Displays data on a weekly (ending Wednesday) basis |
| wetu | Displays data on a weekly (ending Tuesday) basis |
| wem | Displays data on a weekly (ending Monday) basis |
| wesu | Displays data on a weekly (ending Sunday) basis |
| wesa | Displays data on a weekly (ending Saturday) basis |
| bwew | Displays data on a biweekly (ending Wednesday) basis |
| bwem | Displays data on a biweekly (ending Monday) basis |

**LIMIT=***fred_limit*

specifies the maximum number of rows (time series observations) to return, where *fred_limit* is an integer between 1 and 100,000. LIMIT= is optional, and the default is LIMIT=100000.

**MAPREF=***fred_xmlmapref*

specifies the fileref used for the map assignment. For an example of the SASEFRED engine that uses the MAPREF= and the XMLMAP= options in the FILENAME statement to assign a file name, as in the following, see the section "Reading Price Data by Using Indices" on page 3572:

```
FILENAME MyMap "/sasusr/fred/test/gstart.map";
```

You can use the MAPREF= and XMLMAP= options to control where the map resides, what you name the map, and how you refer to it with a fileref. You can use the OUTXML= option to name your XML data file, and to name your SAS data set created from reading the XML data into SAS. The resulting

SAS data set is placed in the folder designated by 'physical-name', and you can reference it by using the myLib libref in your SASEFRED LIBNAME statement. This is shown in the section "Getting Started: SASEFRED Interface Engine" on page 3558, inside the DATA step in the SET statement. The SET statement reads observations from the input data set myLib.gstart and stores them in a SAS data set named Company_pvol.

**OFFSET=***fred_offset*

specifies the number of rows (time series observations) to skip before reading the time series observations from the FRED database, where *fred_offset* is an optional nonnegative integer. If you specify both the OFFSET= and LIMIT= options, the number of rows specified in the OFFSET= option is skipped before the count begins of the number of rows (specified in the LIMIT= option) that are returned. By default, OFFSET=0.

**OUTPUT=1 | 2 | 3 | 4**

specifies the type of the file to be received from the FRED website. You can specify the following values:

**1** specifies the type Observations by Real-Time Period.

**2** specifies the type Observations by Vintage Date, All Observations.

**3** specifies the type Observations by Vintage Date, New and Revised Observations Only.

**4** specifies the type Observations, Initial Release Only.

If OUTPUT=1 and UNITS='lin', then you must specify a START= date that is later than the series observation start date, Obs_Start. If OUTPUT=3 or OUTPUT=4, then you must specify UNITS='lin'.

**OUTXML=***fred_xmlfile*

specifies the name of both the XML file (downloaded) and the SAS data set created when the XML data are read into SAS. Each FRED time series that is listed in the IDS= option is given a positional numeral: 1 for the first time series ID in the ID= option, 2 for the second time series ID, and so on. The SASEFRED engine appends this numeral to the file name of the XML of each data set that the website returns. When all the XML files are retrieved, the data are merged into a SAS data set. When only one FRED time series ID is specified in the ID= option, the file name has the numeral 1 appended to the OUTXML file name. By default, OUTXML=FRED, which creates a file named FRED1.xml in the current working directory. The SAS data set created when the XML data are read into SAS is placed in the folder specified by the physical path in the LIBNAME libref SASEFRED statement.

**PROXY="***fred_proxyserver***"**

specifies which proxy server to use. This option is not required. The specified proxy server is used only when a connection-refused error or a connection-timed-out error occurs. For *fred_proxyserver*, specify the server's HTTP address followed by a colon and the port number, and enclose that string in double quotation marks; for example, PROXY="http://inetgw.unx.sas.com:8118". See also the CONNECT= option.

**RTEND='***fred_rtenddate***'**

specifies the real-time end date for the time series in the format `'YYYY-MM-DD'`. When you use the OUTPUT=4 option, it is important to specify RTSTART='1776-07-04' and RTEND='9999-12-31'to get the available observations for the initial release of the data. Failure to do so can result in no observations being returned for the requested series. The default is today.

**RTSTART='***fred_rtstartdate***'**
specifies the real-time start date for the time series in the format 'YYYY-MM-DD'. When you use the OUTPUT=4 option, it is important to specify RTSTART='1776-07-04' and RTEND='9999-12-31'to get the available observations for the initial release of the data. Failure to do so can result in no observations being returned for the requested series. The default is today.

**SORT='ASC' | 'DSC'**
specifies the order of the time series observations. You can specify the following values:

**'ASC'** specifies that the time series observations are in ascending order.

**'DSC'** specifies that the time series observations are in descending order.

By default, SORT='ASC'.

**START='***fred_startdate***'**
specifies the start date for the time series in the format 'YYYY-MM-DD'. The default is 1776-07-04 (earliest available). When you use the OUTPUT=1 option (observation by real-time period) and the UNITS='chg' option, it is important to specify a date in the START= option that is later than the series observation start date, Obs_Start. Failure to do so forces the SASEFRED interface engine to change UNITS='chg' to UNITS='lin'.

**UNITS='***fred_units***'**
specifies the data value transformation. The valid units arguments are 'lin', 'chg', 'ch1', 'pch', 'pc1', 'pca', 'cch', 'cca', and 'log'. the default is UNITS='lin' (for no transformation). The details of the arguments and the corresponding formulas are presented in Table 49.3. When you specify UNITS='chg' and OUTPUT=1 (observation by real-time period), it is important to specify a date in the START= option that is later than the series observation start date, Obs_Start. Failure to do so forces the SASEFRED interface engine to change UNITS='chg' to UNITS='lin'.

**Table 49.3** FRED Transformation UNITS Codes

| Units Code | Description | Formula |
|---|---|---|
| chg | Change | $x_t - x_{t-1}$ |
| ch1 | Change from one year ago | $x_t - x_{t-N}$ |
| pch | Percentage change | $(\frac{x_t}{x_{t-1}} - 1) \times 100$ |
| pc1 | Percentage change from one year ago | $(\frac{x_t}{x_{t-N}} - 1) \times 100$ |
| pca | Compounded annual rate of change | $(\frac{x_t}{x_{t-1}})^N - 1) \times 100$ |
| cch | Continuously compounded rate of change | $(\ln(x_t) - \ln(x_{t-1})) \times 100$ |
| cca | Continuously compounded annual rate of change | $((\ln(x_t) - \ln(x_{t-1}))100) \times N$ |
| log | Natural log | $\ln(x_t)$ |

$x_t$ is the value of series $x$ at time period $t$. $N$ is the number of observations per year that differs by frequency: daily ($N$=260), annual ($N$=1), monthly ($N$=12), quarterly ($N$=4), biweekly ($N$=26), and weekly ($N$=52).

**URL=***"fred_url_link/*<*query_type*?<*query_option=value*>><**LIMIT=***limit*>*"*
queries for useful information (such as categories, tags, groups, and releases) and stores the information in a temporary utility data set named XFREDTPU. Specify the following fields within double quotation marks:

*fred_url_link/*
specifies the base FRED URL that you want to use. The *fred_url_link* in the following example is 'https://api.stlouisfed.org/fred/'. The required APIKEY= option completes the FRED URL request. An example follows:

```
URL="https://api.stlouisfed.org/fred/series/
     vintagedates?series_id=N500C1A027NBEA"
APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
```

*query_type*?*query_option*
specifies the type of information that you want to query. You can specify the following *query_types* and *query_options*:

**series/vintagedates?series_id=***series_id*
requests the vintage dates for the specified *series_id*, which you must also specify in the IDLIST= option. For an example of this type of query, see Example 49.7.

**release/series?release_id=***release*
requests a list of the available series for the specified *release*. For an example of this type of query, see Example 49.8.

**source/releases?**

**source/releases?source_id=***source_id*
requests a list of the releases available today or available for a specified *source_id*. For an example of this type of query, see Example 49.14.

You can also narrow this type of query by specifying the *source_id*; then only the releases that are available for the specified source are stored in the XFREDTPU data set. For an example of this type of query, see Example 49.11.

**tags/series?tags_names=***value-list*
requests a list of the series that are available and whose tag names match the specified *value-list*. For an example of this type of query, see Example 49.9.

**category/series?category_id=***category_id*
requests a list of the series that are available and whose category ID matches the specified *category_id*. For an example of this type of query, see Example 49.12.

**sources?**
requests a list of the sources available for today's date. For an example of this type of query, see Example 49.13.

**series/categories?series_id=***series_ID*
requests a list of the categories available for a specified *series_ID*. For an example of this type of query, see Example 49.10.

**LIMIT=***limit*
limits the number of query results that are returned, where *limit* must be an integer between 1 and 100,000, inclusive. By default, LIMIT=1000 for releases and release date requests and LIMIT=100,000 for time series requests.

**USER=**"*user-folder-location*"
specifies the location of the writable folder where you permanently store SAS data sets that have one-level names. Enclose the *user-folder-location* in double quotation marks, and end it with a backslash if the folder is in a Windows environment or a forward slash if it is in a UNIX environment. Use the USER= option to redirect the current working folder when you see this error: Insufficient authorization to access. This error can occur if your SAS environment does not allow you to have write access in the current working folder.

**VINTAGE=**'*fred_vintage_date1,fred_vintage_date2,. . . ,fred_vintage_dateN*'
specifies one or more vintage dates in history. The *fred_vintage_dates* are represented in `'YYYY-MM-DD'` format and are used to download the data for a time series as it existed on that specific date in history. The dates in the list are separated by commas (no blanks are allowed). When requesting multiple vintage dates, specify OUTPUT=2 to retrieve all observations or OUTPUT=3 to retrieve only new or revised observations. The default setting is no vintage dates.

Archival Federal Reserve economic data (ALFRED) enable you to retrieve vintage versions of economic data that were available on specific dates in history. To retrieve vintage versions of various time series, enter the following URL in your web browser:

**https://alfred.stlouisfed.org/**

To see a list of available vintage dates for each series, refer to the FRED documentation at the web page with the following URL:

**https://api.stlouisfed.org/docs/fred/series_vintagedates.html**

**XMLMAP=***fred_xmlmapfile*
specifies the fully qualified name of the location where the XMLmap file is automatically stored. By default, XMLMAP=Fred.map.

# Details: SASEFRED Interface Engine

The SASEFRED interface engine enables SAS users to access both ArchivaL Federal Reserve Economic Data (ALFRED) and FRED data that are provided by the FRED website. Normal use is called *FRED mode*, for which the real-time period is the current day (today). In FRED mode, you are using the current facts: the information about the past that is available today. Economic data sources, releases, series, and observations can change their names or their observation data values over time. The real-time period marks when information was true or when information was known until it changed. Economic data sources, releases, series, and observations are all assigned a real-time period. For most URL requests, the default real-time period is today. This can be thought of as FRED mode. ALFRED users can change the real-time period to retrieve information that was known as of a point in history. ALFRED uses vintage dates, which are release dates for a series, excluding the release dates when the data values did not change.

## Available Sources That Provide FRED Time Series Data

To obtain a list of the available sources of economic data, enter the following URL in your web browser. Table 49.4 shows some of the sources available.

```
https://api.stlouisfed.org/fred/sources?api_key=your_fred_apikey
```

**Table 49.4** Some Available Sources of Economic Data

| ID | Name |
|---|---|
| 1 | Board of Governors of the Federal Reserve System |
| 3 | Federal Reserve Bank of Philadelphia |
| 4 | Federal Reserve Bank of St. Louis |
| 6 | Federal Financial Institutions Examination Council |
| 11 | Dow Jones & Company |
| 13 | Institute for Supply Management |
| 15 | The White House: Council of Economic Advisers |
| 16 | The White House: Office of Management and Budget |
| 17 | US Congress: Congressional Budget Office |
| 18 | US Department of Commerce: Bureau of Economic Analysis |
| 19 | US Department of Commerce: Census Bureau |
| 21 | US Department of Housing and Urban Development |

You can use the URL= option to store today's available sources (and associated information about the sources) in a SAS data set. For more information, see the sources query option. For an example see Example 49.13.

You can also use the URL= option to store today's available releases (and associated information about the releases) in a SAS data set. For more information, see the releases query option. For an example see Example 49.14.

## FRED API Key

The API key that is used in these examples,'abcdefghijklmnopqrstuvwxyz123456', is for demonstration purposes only. To successfully download data from the FRED website, use your own FRED API key, which is a 32-character alphanumeric lowercase string. You can request your own API key by visiting the website at the following URL:

**https://api.stlouisfed.org/api_key.html**

## Available Releases for Each Source That Provides FRED Time Series Data

Each of the FRED sources might have several releases. To get a list of the releases for a specific source, enter the following URL in your web browser and specify the ID that corresponds to that source. For example, the response to this request retrieves a list of all releases for Dow Jones & Company (source_ID=11).

**https://api.stlouisfed.org/fred/source/releases?source_id=11&api_key=your_fred_apikey**

Table 49.5 shows the list of releases for Dow Jones & Company.

**Table 49.5** Releases for Dow Jones & Company

| Release ID | Name | URL |
|---|---|---|
| 72 | Daily Treasury Inflation-Indexed Securities | -- |
| 102 | Wall Street Journal | http://online.wsj.com/public/us |
| 197 | Dow Jones Averages | http://www.djaverages.com |

## Available Time Series for Each Release ID

Each release of economic sources contains several time series. To get the list of time series for a specific release, enter the following URL in your web browser and specify the ID that corresponds to that release. For example, the following URL retrieves a list of all time series for the Dow Jones Averages release (release_ID=197):

**https://api.stlouisfed.org/fred/release/series?release_id=197&api_key=your_fred_apikey**

Table 49.6 shows all the time series that are included in the Dow Jones Averages release.

**Table 49.6** Time Series for the Release of Dow Jones Averages

| Series ID | Title | Start | End | Frequency |
|---|---|---|---|---|
| DJCA | Dow Jones Composite Average | 1934-01-02 | 2012-11-23 | Daily |
| DJIA | Dow Jones Industrial Average | 1896-05-26 | 2012-11-23 | Daily |
| DJTA | Dow Jones Transportation Average | 1896-10-26 | 2012-11-23 | Daily |
| DJUA | Dow Jones Utility Average | 1929-01-02 | 2012-11-23 | Daily |

You can use the URL= option to store the list of available time series for a particular release in a SAS data set. For more information, see the release/series query option.

## Available Native Frequency for Each Series ID

To find the native frequency of an economic time series, enter the following URL in your web browser. The output includes the "Frequency" field, which shows the native frequency of that time series.

```
https://api.stlouisfed.org/fred/series?series_id=DJCA&api_key=your_fred_apikey
```

The response to the preceding request follows. As the response shows, the native frequency of the Dow Jones Composite Average (DJCA) time series is Daily (frequency=Daily).

*<series id="DJCA" realtime_start="2012–11–26" realtime_end="2012–11–26" title="Dow Jones Composite Average" observation_start="1934–01–02" observation_end="2012–11–23"* ***frequency="Daily, Close"*** *frequency_short="D" units="Index" units_short="Index" seasonal_adjustment="Not Seasonally Adjusted" seasonal_adjustment_short="NSA" last_updated="2012–11–26 09:05:12–06" popularity="48">*

## Vintage Dates for Each Series ID

Vintage dates are the release dates for a time series, excluding those releases in which the data did not change. To obtain a list of vintage dates for a particular series, you can enter the following URL in your web browser and specify the series ID of the series that you are interested in. For example, the following URL retrieves a list of all vintage dates for the MICH series, showing the median expected price change (the next 12 months from the Survey of Consumers):

```
https://api.stlouisfed.org/fred/series/vintagedates?series_id=MICH&api_key=your_fred_apikey
```

The resulting list of observations is too long to show here—172 vintage dates, ranging from 1999-02-26 to 2013-05-31. You can get only the vintage dates that you want by specifying the VINTAGE= option.

You can use the URL= option to store the list of available vintage dates for a particular time series in a SAS data set. For more information, see the series/vintagedates query option.

## SAS Output Data Set

You can use the SAS DATA step to write the selected FRED data to a SAS data set. This enables you to use SAS software to easily analyze the data. If you specify the name of the output data set in the DATA statement, the engine supervisor creates a SAS data set that has the specified name in either the SAS Work library or, if specified, the User library.

The contents of the SAS data set include the date of each observation and the series name of each series that is read from the FRED data source.

The SASEFRED interface engine maintains the sort order, so the time series are sorted in the resulting SAS data set by the order specified in the SORT= option, by date (time ID), and by variable (time series item name).

You can use the PRINT and CONTENTS procedures to print your output data set and its contents. Alternatively, you can view your SAS output observations by opening the desired output data set in a SAS Explorer window. You can also use the SQL procedure with your SASEFRED libref to create a custom view of your data.

## SAS OUTXML File

The SAS XML (XML format) data that are returned from the FRED website are placed in a file named by the OUTXML= option. The SAS XML data file is placed in the current working directory, but the SAS data set created by reading the XML data into SAS is placed in the location that is specified by the *physical-name* in the LIBNAME *libref* SASEFRED statement, which is described in the section "The LIBNAME *libref* SASEFRED Statement" on page 3562.

## SAS XML Map File

The XML map that (by default) is automatically created is assigned the full path name given by the XMLMAP= option in your LIBNAME *libref* SASEFRED statement. The map file is either reused (not overwritten) if you specify AUTOMAP=REUSE or overwritten by a new map if you specify AUTOMAP=REPLACE (the default). The SASEFRED engine invokes the XMLV2 engine to create the map and to read the data into SAS.

## XFREDTPU SAS Data Set

You can use the URL= option to query for useful information such as categories, tags, groups, and releases and store the information in a temporary utility data set named XFREDTPU. After you have this information, you can use it for selecting the data you want to include in a subsequent SASEFRED *libref* statement. For more information about the seven possible types of XFREDTPU contents, see the URL= option.

## Reading Price Data by Using Indices

The following statements enable you to access the S&P 500 Stock Price Index (IDLIST=SP500) and the Wilshire 5000 Price Index (IDLIST=WILL5000PR) on a monthly basis:

```
options validvarname=any;
title 'FRED Data: SP500 Stock Index and Wilshire 5000 Price Index';
LIBNAME myLib sasefred "%sysget(FRED)"
   OUTXML=gstart
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="%sysget(FRED)gstart.map"
   APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   IDLIST='sp500,will5000pr'
   START='2011-01-01'
```

```
   END='2012-01-01'
   FREQ='m'
   FORMAT=xml
   ;

data stock_price;
   set myLib.gstart ;
run;

proc contents data=stock_price; run;
proc print data=stock_price; run;
```

**Figure 49.2** FRED Data: stock_price

**FRED Data: SP500 Stock Index and Wilshire 5000 Price Index**

| Obs | date | realtime_start | realtime_end | SP500 | WILL5000PR |
|---|---|---|---|---|---|
| 1 | 2011-01-01 | 2018-09-04 | 2018-09-04 | 1282.62 | 13368.14 |
| 2 | 2011-02-01 | 2018-09-04 | 2018-09-04 | 1321.12 | 13772.27 |
| 3 | 2011-03-01 | 2018-09-04 | 2018-09-04 | 1304.49 | 13610.85 |
| 4 | 2011-04-01 | 2018-09-04 | 2018-09-04 | 1331.51 | 13920.50 |
| 5 | 2011-05-01 | 2018-09-04 | 2018-09-04 | 1338.31 | 13967.83 |
| 6 | 2011-06-01 | 2018-09-04 | 2018-09-04 | 1287.29 | 13434.50 |
| 7 | 2011-07-01 | 2018-09-04 | 2018-09-04 | 1325.18 | 13848.15 |
| 8 | 2011-08-01 | 2018-09-04 | 2018-09-04 | 1185.31 | 12296.04 |
| 9 | 2011-09-01 | 2018-09-04 | 2018-09-04 | 1173.88 | 12144.13 |
| 10 | 2011-10-01 | 2018-09-04 | 2018-09-04 | 1207.22 | 12459.48 |
| 11 | 2011-11-01 | 2018-09-04 | 2018-09-04 | 1226.41 | 12684.75 |
| 12 | 2011-12-01 | 2018-09-04 | 2018-09-04 | 1243.32 | 12850.31 |
| 13 | 2012-01-01 | 2018-09-04 | 2018-09-04 | 1300.58 | 13465.23 |

The SASEFRED interface engine supports the XML format. The XML data that the FRED website returns are placed in a file named by the OUTXML= option. The XML map that is automatically created is assigned the full path name specified by the XMLMAP= option, and the fileref that is used for the map assignment is specified by the MAPREF= option. In the preceding example, the SASEFRED engine uses the MAPREF= and XMLMAP= options in the FILENAME statement to assign a file name:

```
FILENAME MyMap "%sysget(FRED)gstart.map";
```

You can use the MAPREF= and XMLMAP= options to control where the map resides, what you name the map, and how you refer to it with a fileref. You can use the OUTXML= option to name your XML data file and to name your SAS data set created when reading the XML data into SAS; it is described in the section "SAS OUTXML File" on page 3572. The SAS data set is placed in the folder designated by 'physical-name', which is described in the section "The LIBNAME *libref* SASEFRED Statement" on page 3562. You can refer to your data by using the myLib libref in your SASEFRED LIBNAME statement. The myLib libref is shown inside the DATA step in the SET statement. The SET statement reads observations from the input data set myLib.gstart and stores them in a SAS data set named stock_price, as shown in Figure 49.2. You can also use the SAS DATA step to perform further processing and to store the resulting time series in a SAS data set; this process is described in the section "SAS Output Data Set" on page 3571.

To specify the list of time series that you want to retrieve, use the IDLIST= option. This option accepts a

string enclosed in single quotation marks that denotes a list of time series that you select for the resulting SAS data set. The series IDs are separated by commas, so valid time series IDs cannot contain embedded commas or quotes. The stock_price data set contains two time series variables, sp500 and will5000pr, as specified in the IDLIST= option, and the observation range is controlled by the START= and END= options. The stock_price data set contains observations that range from January 1, 2011, to January 1, 2012, as specified by the START= and END= options. The frequency of the data is monthly, as indicated by the 'm' in the FREQ= option.

**NOTE:** The '%20' is a special character for URL encoding of blanks. If the time series ID that you name in the IDLIST= option contains a blank, you must use the '%20' wherever the blank appears in the time series name. If the time series ID contains an underscore, then you must use an underscore in the time series name. The underscore and the blank are not equivalent in the FRED databases, so make sure that you use the '%20' (URL encoded space) to designate blank characters.

# Examples: SASEFRED Interface Engine

## Example 49.1: Retrieving Data for Multiple Time Series

This example shows how to use multiple time series IDs to retrieve the average balance of payment basis data for the exports (BOPXGS) and imports (BOPMGS) of goods and services for the last 15 years, starting 1997-01-01 and ending 2011-01-01, with an annual frequency.

```
options validvarname=any;

title 'Retrieve Balance of Payment Data for the Exports and Imports';
libname _all_ clear;
libname fred sasefred "%sysget(FRED)"
   OUTXML=fredex01
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="%sysget(FRED)fredex01.map"
   APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   IDLIST='bopxgs,bopmgs'
   START='1997-01-01'
   END='2011-01-01'
   FREQ='a'
   OUTPUT=1
   AGG='avg'
   FORMAT=xml;

data export_import;
   set fred.fredex01 ;
run;
```

```
proc contents data=export_import; run;
proc print data=export_import; run;
```

**Output 49.1.1** Retrieve Balance of Payment Data for the Exports and Imports

**Retrieve Balance of Payment Data for the Exports and Imports**

| Obs | date | realtime_start | realtime_end | BOPXGS | BOPMGS |
|---|---|---|---|---|---|
| 1 | 1997-01-01 | 2018-09-04 | 2018-09-04 | 233.614 | -260.682 |
| 2 | 1998-01-01 | 2018-09-04 | 2018-09-04 | 233.293 | -274.829 |

| 15 | 2011-01-01 | 2018-09-04 | 2018-09-04 | 530.359 | -667.515 |

## Example 49.2: Retrieving Data by Using the Vintage Date

This example shows how to use the vintage date to retrieve data for exports of goods and services as they existed on that specific date in history. OUTPUT=3 retrieves the new and revised observations only, by the vintage date (VINTAGE=2012-06-14). If OUTPUT=3, then you must specify UNITS='lin'. In this example, the UNITS= option is not specified, so it assumes its default value, which is 'lin'. Specifying a different argument for the UNITS= option (such as 'chg') is invalid for OUTPUT= 3, so 'chg' is replaced by the default value ('lin').

```
options validvarname=any;

title 'Retrieve Data for the Exports of Goods and Service by Using Vintage Date';
libname _all_ clear;
libname fred sasefred "%sysget(FRED)"
   OUTXML=fredex02
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="%sysget(FRED)fredex02.map"
   APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   IDLIST='bopxgsa'
   VINTAGE='2012-06-14'
   OUTPUT=3
   FORMAT=xml;
```

```
data export_vin;
   set fred.fredex02 ;
run;

proc contents data=export_vin; run;
proc print data=export_vin; run;
```

**Output 49.2.1** Retrieve Data for the Exports of Goods and Services by Using the Vintage Date

**Retrieve Data for the Exports of Goods and Service by Using Vintage Date**

| Obs | date | BOPXGSA_20120614 |
|---|---|---|
| 1 | 2009-01-01 | 1578.95 |
| 2 | 2010-01-01 | 1842.49 |
| 3 | 2011-01-01 | 2103.37 |

## Example 49.3: Selecting Time Series When Native Frequency Is Less Than Requested Frequency

This example shows how to retrieve data for multiple time series that have different default frequencies. The time series are Domestic Financial Commercial Paper Outstanding (DFINCP), Domestic Nonfinancial Commercial Paper Outstanding (DNFINCP), Foreign Financial Commercial Paper Outstanding (FFINCP), Foreign Nonfinancial Commercial Paper Outstanding (FNFINCP), and Total Credit Market Assets Held by Domestic Financial Sectors (ABSITCMAHDFS). The native frequency of the first four time series is 'Weekly', and the native frequency of the last time series (ABSITCMAHDFS) is 'Quarterly'. Note that the requested frequency as it is specified by the FREQ= option is 'Weekly' (FREQ=w). The native frequency of the last time series (ABSITCMAHDFS) is lower than the requested frequency. Therefore, this time series is excluded from the list, and only the observations that correspond to the first four time series are presented. If you want to retrieve the observations for all five time series, then the value of the FREQ= option needs to be less than or equal to all the native frequencies (here, weekly and quarterly). In this case, the valid frequency parameters would be 'q', 'sa', and 'a'. See Example 49.4.

```
options validvarname=any;

title 'Selecting Time Series When Native Frequency Is Less Than Requested Frequency';
libname _all_ clear;
libname fred sasefred "%sysget(FRED)"
   OUTXML=fredex03
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="%sysget(FRED)fredex03.map"
   APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   IDLIST='dfincp,dnfincp,ffincp,fnfincp,absitcmahdfs'
   START='2010-01-01'
   END='2010-05-20'
   FREQ='w'
   OUTPUT=1
   FORMAT=xml;
```

```

## Example 49.4: Selecting Time Series When Native Frequency Is Greater Than Requested Frequency

This example shows how to retrieve data for multiple time series that have different default frequencies. The time series are Domestic Financial Commercial Paper Outstanding (DFINCP), Domestic Nonfinancial Commercial Paper Outstanding (DNFINCP), Foreign Financial Commercial Paper Outstanding (FFINCP), Foreign Nonfinancial Commercial Paper Outstanding (FNFINCP), and Total Credit Market Assets Held by Domestic Financial Sectors (ABSITCMAHDFS). The native frequency of the first four time series is 'Weekly', and the native frequency of the last time series (ABSITCMAHDFS) is 'Quarterly'. The requested frequency as it is specified by the FREQ= option is 'Quarterly' (FREQ=q). The native frequency of all five time series is either greater than or equal to the requested frequency. Hence, the output includes the data for all time series.

```
options validvarname=any;

title 'Selecting Time Series When Native Frequency Is Greater Than Requested Frequency';
libname _all_ clear;
libname fred sasefred "%sysget(FRED)"
   OUTXML=fredex04
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="%sysget(FRED)fredex04.map"
   APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   IDLIST='dfincp,dnfincp,ffincp,fnfincp,absitcmahdfs'
   START='2010-01-01'
   END='2010-05-20'
   FREQ='q'
   OUTPUT=1
   FORMAT=xml;

data diffNative_freqq;
   set fred.fredex04;
run;

proc contents data=diffNative_freqq; run;
proc print data=diffNative_freqq; run;
```

**Output 49.4.1** Selecting Time Series When Native Frequency Is Greater Than Requested Frequency

**Selecting Time Series When Native Frequency Is Greater Than Requested Frequency**

## Example 49.5: Specifying One Series ID with Multiple Vintage Dates for the OUTPUT=2 Option

This example demonstrates how to request the CBI time series, which show the change in private industries for three different vintage dates: 1947-08-17, 1966-08-11, and 1994-08-26. Using the early range of START=’1942-01-01’and END=’1947-04-01’, you can get an idea of how the changes show up for each vintage date. If you specify OUTPUT=2, each time series is named by concatenating the series ID to the vintage date with an underscore.

```
options validvarname=any;

title 'Specifying One Series ID with Multiple Vintage Dates for OUTPUT=2 Option';
libname _all_ clear;
libname fred sasefred "%sysget(FRED)"
   OUTXML=fredex05
   AUTOMAP=replace
```

```
   MAPREF=MyMap

## Example 49.6: Specifying Two Series IDs with Multiple Vintage Dates and Descending Sort Order

This example demonstrates how to request the ADJRES and ADJRESN time series, which show the St. Louis adjusted reserves, the first of which is seasonally adjusted and the second of which is not seasonally adjusted. The request is made for three different vintage dates, but only 2006-08-31 and 2013-06-13 yield data when you use the range of START='2004-01-01'and END='2012-12-01'. If you specify OUTPUT=2, each time series is named by concatenating the series ID to the vintage date with an underscore. For brevity, Output 49.6.1 shows only the first 10 and last 10 observations. The sort order is descending; that is why the dates start with the most recent observation and continue in biweekly (ending Wednesday) periods to the least recent.

```
options validvarname=any;

title 'Specifying Two Series IDs with Multiple Vintage Dates and Descending Sort Order';
libname _all_ clear;
libname fred sasefred "%sysget(FRED)"
   OUTXML=fredex06

## Example 49.7: Vintage Dates for a Specific Series with the URL= Option

The following statements demonstrate how to use the URL= option to obtain the VINTAGE_DATE and VINTAGE_DATES data sets for a specified series and how to create a permanent data set named VINDAT1 in the MyLib SAS library.[1] You must specify the series in both the URL= option and the IDLIST= option.

[1]Disclaimer: SAS may reference other websites or content or resources for use at Customer's sole discretion. SAS has no control over any websites or resources that are provided by companies or persons other than SAS. Customer acknowledges and agrees that SAS is not responsible for the availability or use of any such external sites or resources, and does not endorse any advertising, products, or other materials on or available from such websites or resources. ```
options validvarname=any;

title 'Specifying the URL= Option to Create the VINTAGE_DATES Data Set';
libname _all_ clear;
libname mylib "< path to your folder for data >";
libname fred1 sasefred "%sysget(FRED)"
   URL="https://api.stlouisfed.org/fred/series/vintagedates?series_id=N5005C1A027NBEA"
   APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   IDLIST= 'N5005C1A027NBEA'
   ;

data mylib.vindat1;
   set fred1.XFREDtpu;
run;

proc print
   data=mylib.vindat1;
run;

proc contents
   data=mylib.vindat1;
run;
```

The list of available vintage dates for the N5005C1A027NBEA series is read from the *XFREDtpu.xml* file that is downloaded by the SASEFRED engine. The contents are shown in Output 49.7.1. The engine automatically maps the data in the XML file and reads the data into the XFREDTPU data set when the SET statement is executed. When the DATA step runs, the data in the temporary utility data set are read and stored in the permanent data set named vindat1.sas7bdat in the MyLib library. A side effect of the DATA step is the automatic creation of two SAS data sets, named vintage_date.sas7bdat and vintage_dates.sas7bdat, in the FRED1 library's location.

**Output 49.7.1** Specifying the URL= Option to Create the VINTAGE_DATES Data Set

**Specifying the URL= Option to Create the VINTAGE_DATES Data Set**

## Example 49.8: Series for a Specific Release with the URL= Option

The following statements demonstrate how to use the URL= option to obtain the SERIES and SERIESS data sets for a specified release and how to create a permanent data set named SERIES2 in the MyLib SAS library:[2]

```
options validvarname=any;

title 'Specifying the URL= Option to Create the SERIES Data Set';
libname _all_ clear;
libname fred2 sasefred "%sysget(FRED)"
   URL="https://api.stlouisfed.org/fred/release/series?release_id=51"
   APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   ;
```

[2]Disclaimer: SAS may reference other websites or content or resources for use at Customer's sole discretion. SAS has no control over any websites or resources that are provided by companies or persons other than SAS. Customer acknowledges and agrees that SAS is not responsible for the availability or use of any such external sites or resources, and does not endorse any advertising, products, or other materials on or available from such websites or resources. Customer acknowledges and agrees that SAS is not liable for any loss or damage that may be incurred by Customer or its end users as a result of the availability or use of those external sites or resources, or as a result of any reliance placed by Customer or its end users on the completeness, accuracy, or existence of any advertising, products, or other materials on, or available from, such websites or resources.

```
data series2;
   set fred2.XFREDtpu;
run;

proc contents
   data=series2;
run;

%macro pri10nom(datname);
data lastob;
   set &datname nobs=last;
   last5=last-4;
   if last>10 then
      call symput('print5',last5);
   else
      call symput('print5',9);
run;
data getall10;
   set &datname(obs=5) &datname(firstobs=&print5);
run;
proc print data=getall10; run;
%mend pri10nom;

title3 "First 5/Last 5 Obs, SERIES2 Data Set";
%pri10nom(series2);
```

The returned data are stored in the XFREDTPU data set and are copied to the permanent data set named series2.sas7bdat in the MyLib library. A side effect of the DATA step is the automatic creation of two SAS data sets, named series.sas7bdat and seriess.sas7bdat, in the FRED2 library's location. Many series are returned for release_id=51; Output 49.8.1 shows only the first and last five observations of the SERIES data set.

**Output 49.8.1** Specifying the URL= Option to Create the SERIES Data Set—First 5 and Last 5 Observations

**Specifying the URL= Option to Create the SERIES Data Set**

**First 5/Last 5 Obs, SERIES2 Data Set**

## Example 49.9: Series for Specific Tags with the URL= Option

The following statements demonstrate how to use the URL= option to obtain the SERIES and SERIESS data sets for specified tag names and how to create a permanent data set named TAGS_SERIES4 in the MyLib SAS library:[3]

```
options validvarname=any;

title 'Specifying the URL= Option to Create the TAGS_SERIES4 Data Set.';
libname _all_ clear;
libname mylib "< path to your folder for data >";
libname fred4 sasefred "%sysget(FRED)"
   debug=on
   URL="https://api.stlouisfed.org/fred/tags/series?tag_names=slovenia;food;oecd"
   APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   ;

data mylib.tags_series4;
   set fred4.XFREDtpu;
run;

proc print
   data=mylib.tags_series4(obs=2);
run;

proc contents
   data=mylib.tags_series4;
run;
```

The returned data are stored in the XFREDTPU data set and are copied to the permanent data set named tags_series4.sas7bdat in the MyLib library. A side effect of the DATA step is the automatic creation of two SAS data sets, named series.sas7bdat and seriess.sas7bdat, in the FRED4 library's location. Many series are returned for the specified tag names; the OBS=2 option in the DATA statement in the PROC PRINT step prints only two of them. Output 49.9.1 shows the first two observations of the TAGS_SERIES4 data set.

## Example 49.13: Sources for Today's Date with the URL= Option

The following statements demonstrate how to use the URL= option to obtain the first 10 sources (LIMIT=10) for the SOURCES6 data set for today's date and how to create a permanent data set named SOURCES6 in the MyLib SAS library:[7]

```
options validvarname=any;

title 'Specifying the URL= Option to Create the SOURCES6 Data Set';
libname _all_ clear;
libname mylib "< path to your folder for data >";

libname fred6 sasefred "%sysget(FRED)"
   debug=on
   URL="https://api.stlouisfed.org/fred/sources?limit=10"
   APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   ;

data mylib.sources6;
   set fred6.XFREDtpu;
run;

proc print
   data=mylib.sources6;
run;

proc contents
   data=mylib.sources6;
run;
```

The returned data are stored in the XFREDTPU data set and are copied to the permanent data set named sources6.sas7bdat in the MyLib library. A side effect of the DATA step is the automatic creation of two SAS data sets, named source.sas7bdat and sources.sas7bdat, in the FRED6 library's location. Many sources could be returned for today's date, but the LIMIT=10 option obtains only the first 10 sources, as shown in Output 49.13.1.

## Example 49.14: Releases Available for Today's Date with the URL= Option

The following statements demonstrate how to use the URL= option to obtain the first 10 observations (LIMIT=10) of the REL3 data set for today's date and how to create a permanent data set named REL3 in the MyLib SAS library:[8]

```
options validvarname=any;

title 'Specifying the URL= Option to Create the REL3 Data Set';
libname _all_ clear;
libname mylib "< path to your folder for data >";
libname fred3 sasefred "%sysget(FRED)"
   debug=on
```

[8]Disclaimer: SAS may reference other websites or content or resources for use at Customer's sole discretion. ```
   URL="https://api.stlouisfed.org/fred/releases?limit=10"
   APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   ;

data mylib.rel3;
   set fred3.XFREDtpu;
run;

proc print
   data=mylib.rel3;
run;

proc contents
   data=mylib.rel3;
run;
```

The returned data are stored in the XFREDTPU data set and are copied to the permanent data set named rel3.sas7bdat in the MyLib library. A side effect of the DATA step is the automatic creation of two SAS data sets, named release.sas7bdat and releases.sas7bdat, in the FRED3 library's location. Hundreds of available releases could be returned for today, but the LIMIT=10 option obtains only the first 10 releases, as shown in Output 49.14.1.

| Obs | release_press_release | release_link | release_notes |
|---|---|---|---|
| 1 | true | http://www.census.gov/retail/ | The U.S. Census Bureau conducts the Advance Monthly Retail Trade and Food Services Survey to provide an early estimate of monthly sales by kind of business for retail and food service firms located in the United States. Each month, questionnaires are mailed to a probability sample of approximately 4,700 employer firms selected from the larger Monthly Retail Trade Survey. Advance sales estimates are computed using a link relative estimator. For each detailed industry, we compute a ratio of current-to previous month weighted sales using data from units for which we have obtained usable responses for both the current and previous month. For each detailed industry, the advance total sales estimates for the current month is computed by multiplying this ratio by the preliminary sales estimate for the previous month (derived from the larger MRTS) at the appropriate industry level. Total estimates for broader industries are computed as the sum of the detailed industry estimates. The link relative estimate is used because imputation is not performed for most nonrespondents in MARTS. For a limited number of nonresponding companies that have influential effects on the estimates, sales may be estimated based on historical performance of that company. The monthly estimates are benchmarked to the annual survey estimates from the Annual Retail Trade Survey once available. The estimates are adjusted for seasonal variation and holiday and trading day differences. Additional information on MARTS and MRTS can be found on the Census Bureau website at: www.census.gov/retail. Description of the survey as provided by the Census, https://census.gov/retail/marts/www/marts_current.pdf |

# Overview: SASEHAVR Interface Engine

The SASEHAVR interface engine is a seamless interface between Haver Analytics and SAS data processing that enables SAS users to read economic and financial time series data that reside in a Haver Analytics DLX (Data Link Express) database. The Haver Analytics DLX economic and financial database offerings include U.S. economic indicators, specialized databases, and financial indicators; data about industry, industrial countries, emerging markets, and international organizations; forecasts and as-reported data; and data about U.S. regional services. For more information, see the section "Data Elements Reference: Haver Analytics DLX Database Profile" on page 3630.

The SASEHAVR engine uses the LIBNAME statement to enable you to specify how to subset your Haver data and how to aggregate the selected time series at the same frequency. You can then use the SAS DATA step to perform further subsetting and to store the resulting time series in a SAS data set. You can perform more analysis (if desired) either in the same SAS session or in a later session.

The SASEHAVR engine supports both 32-bit and 64-bit Windows hosts. Haver Analytics supplies two versions of the DLX application programming interface (API), one for 32-bit applications (dlxapi32.dll) and one for 64-bit applications (dlxapi64.dll). Choose the appropriate application, either 32-bit or 64-bit, for your platform. You can follow the instructions for setting up your installation of the Haver API in the section "Setting Up the Haver Analytics DLX Application Programming Interface" on page 3618.

# Getting Started: SASEHAVR Interface Engine

## Setting Up the Haver Analytics DLX Application Programming Interface

If this is your first time using the SASEHAVR interface engine on your Windows machine, then it is necessary to follow these setup instructions. If you have already used the SASEHAVR interface, then just check the file version number of your already installed *dlxapi32.dll* (or *dlxapi64.dll*). For 32-bit installations, the file version is 1.1.9.0, and for 64-bit installations, the file version is 2.0.0.1. The Haver API version number appears in the SAS log the first time you assign a SASEHAVR libref. In Windows Explorer, you can see a file's properties, including its version number, by hovering the mouse pointer over the file icon. Alternatively, you can right-click on the file icon to bring up the properties and click the **Details** tab to see the version number.

To set up the Haver Analytics API on your machine, visit the SAS Technical Support download site at the following URL:

```
http://ftp.sas.com/techsup/download/base/
```

First, create a folder on your system drive (usually designated as C:), and name the folder HAVER. Create an environment variable named HAVER as follows:

```
HAVER=C:\HAVER\
```

If your SAS system is 32-bit, then download the files *dlxapi32.h*, *dlxapi32.dll*, and *dlxapi32.lib* to your HAVER folder. If your SAS system is 64-bit, then download the files *dlxapi64.h*, *dlxapi64.dll*, and *dlxapi64.lib* to your HAVER folder. Second, prepend the location of your HAVER folder to the system environment variable (%PATH%) as follows, so that the SASEHAVR engine can find your downloaded Haver API files:

```
PATH=C:\HAVER\;%PATH%
```

Reboot your system to complete the Haver API setup.

## Structure of a SAS Data Set That Contains Time Series Data

SAS represents time series data in a two-dimensional array called a SAS data set whose columns correspond to series variables and whose rows correspond to measurements of these variables at certain time periods. The time periods at which observations are recorded can be included in the data set as time ID variables. The SASEHAVR engine provides a time ID variable called DATE. The DATE variable can be represented in any of the time intervals shown in the section "Mapping Haver Frequencies to SAS Time Intervals" on page 3626.

## Reading and Converting Haver DLX Time Series

The SASEHAVR engine supports reading and converting all selected time series that reside in Haver DLX databases. The SASEHAVR engine enables you to limit the range of data by specifying the START= and END= options in the LIBNAME statement. Start dates and end dates are recommended to help save resources when you are processing large databases or a large number of observations.

The SASEHAVR engine enables you to convert or aggregate all selected time series to a desired frequency. By default, the SASEHAVR engine selects the time series variables that match the frequency of the first selected variable. To select variables of one specific frequency, use the FREQ= option. If no selection criteria are specified, the first selected variable is the first physical DLX record read from the Haver database. To force aggregation of all selected variables to the frequency specified by the FREQ= option, use the FORCE=FREQ option. The AGGMODE= option enables you to specify a strict or relaxed aggregation method; by default, AGGMODE=RELAXED. Aggregation is supported only from a more frequent time interval to a less frequent time interval, such as from weekly to monthly. If a conversion to a more frequent frequency is attempted, all missing values are returned by the Haver DLX API. For more information, see the section "Aggregating to Quarterly Frequency Using the FORCE=FREQ Option" on page 3629. The FORCE= option is ignored if the FREQ= option is not specified.

## Using the SAS DATA Step

If desired, you can store your selected time series in a SAS data set by using the SAS DATA step. You can further subset your data by using the WHERE, KEEP, or DROP statement in your DATA step.

For more efficient subsetting of time series by Haver variables, Haver groups, Haver sources, Haver short sources, Haver long sources, or Haver geographic codes, you can use the corresponding KEEP=, GROUP=, SOURCE=, SHORTSOURCE=, LONGSOURCE=, GEOGCODE1=, or GEOGCODE2= option in the LIBNAME *libref* SASEHAVR statement. To see the available Haver selection key values, including geographic codes, short sources, and long sources for your database, specify the OUTSELECT=ON option. From the OUTSELECT= option output, you can use convenient wildcard symbols to create the selection list for your next LIBNAME *libref* SASEHAVR statement.

There are three wildcard symbols: '*', '?', and '#'. The '*' wildcard corresponds to any character string and includes any string pattern that corresponds to that position in the matching variable name. The '?' stands for any single alphanumeric character. Lastly, the '#' wildcard corresponds to a single numeric character.

You can also deselect time series by Haver variables, by Haver groups, by Haver sources, by Haver short sources, by Haver long sources, or by Haver geographic codes, by using the corresponding DROP=, DROPGROUP=, DROPSOURCE=, DROPSHORT=, DROPLONG=, DROPGEOG1=, or DROPGEOG2= option. These options also support wildcards.

After your selected data are stored in a SAS data set, you can use these data as you would any other SAS data set.

## Using the SAS Windowing Environment

You can see the available data sets in the SAS LIBNAME window of the SAS windowing environment by selecting the SASEHAVR *libref* in the LIBNAME window that you have previously defined in your LIBNAME statement. You can view your SAS output observations by double-clicking on the desired output data set *libref* in the LIBNAME window of the SAS windowing environment. You can type **Viewtable** on the SAS command line to view your SASEHAVR tables, views, or librefs.

Before you use **Viewtable**, it is recommended that you store your output data sets in a physical folder or library that is separate from the folder or library used for your input databases. (The default location for output data sets is the SAS Work library.) If you do not follow this guideline, you will receive the following error message for each input database that does not have the selected options in the SASEHAVR *libref* that you double-clicked:

```
ERROR: No variable selected with current options.
```

# Syntax: SASEHAVR Interface Engine

The SASEHAVR engine uses standard engine syntax. Table 50.1 summarizes the options used in the LIBNAME *libref* SASEHAVR statement.

**Table 50.1** Summary of LIBNAME *libref* SASEHAVR Statement Options

| Option | Description |
|---|---|
| FREQUENCY= | Specifies the Haver frequency |
| START= | Specifies a Haver start date to limit the selection of time series to those that begin with the specified date |
| END= | Specifies a Haver end date to limit the selection of time series to those that end with the specified date |
| KEEP= | Specifies a list of comma-delimited Haver variables to keep in the output SAS data set |
| DROP= | Specifies a list of comma-delimited Haver variables to drop from the output SAS data set |

**Table 50.1** *continued*

| Option | Description |
|---|---|
| GROUP= | Specifies a list of comma-delimited Haver groups to keep in the output SAS data set |
| DROPGROUP= | Specifies a list of comma-delimited Haver groups to drop from the output SAS data set |
| SOURCE= | Specifies a list of comma-delimited Haver sources to keep in the output SAS data set |
| DROPSOURCE= | Specifies a list of comma-delimited Haver sources to drop from the output SAS data set |
| SHORT= | Specifies a list of comma-delimited Haver short sources to keep in the output SAS data set |
| DROPSHORT= | Specifies a list of comma-delimited Haver short sources to drop from the output SAS data set |
| LONG= | Specifies a list of comma-delimited Haver long sources to keep in the output SAS data set |
| DROPLONG= | Specifies a list of comma-delimited Haver long sources to drop from the output SAS data set |
| GEOG1= | Specifies a list of comma-delimited Haver geography1 codes to keep in the output SAS data set |
| DROPGEOG1= | Specifies a list of comma-delimited Haver geography1 codes to drop from the output SAS data set |
| GEOG2= | Specifies a list of comma-delimited Haver geography2 codes to keep in the output SAS data set |
| DROPGEOG2= | Specifies a list of comma-delimited Haver geography2 codes to drop from the output SAS data set |
| OUTSELECT= | Specifies what values the output data are to contain |
| FORCE=FREQ | Specifies that all selected time series variables be aggregated to the frequency specified in the FREQ= option |
| AGGMODE= | Specifies the aggregation method used for aggregating time series (STRICT or RELAXED) |

## LIBNAME *libref* SASEHAVR Statement

**LIBNAME** *libref* **sasehavr** '*physical name*' *options* **;**

The '*physical name*' specifies the location of the folder where your Haver DLX database resides.

You can use the following options in the LIBNAME *libref* SASEHAVR statement:

**FREQ=***haver_frequency*

**FREQUENCY=***haver_frequency*

**INTERVAL=***haver_frequency*

specifies the Haver frequency. All Haver frequencies are supported by the SASEHAVR engine. Accepted frequency values are annual, year, yearly, quarter, quarterly, qtr, monthly, month, mon, week.1, week.2, week.3, week.4, week.5, week.6, week.7, weekly, week, daily, and day.

**START=***start_date*

**STARTDATE=***start_date*

**STDATE=***start_date*

**BEGIN=***start_date*

specifies the start date for the time series in the form YYYYMMDD.

**END=***end_date*

**ENDDATE=***end_date*

**ENDATE=***end_date*

specifies the end date for the time series in the form YYYYMMDD.

**KEEP=**"*haver_variable_list*"

specifies the list of Haver variables to be included in the output SAS data set. This list is comma-delimited and must be surrounded by double quotation marks.

**DROP=**"*haver_variable_list*"

specifies the list of Haver variables to be excluded from the output SAS data set. This list is comma-delimited and must be surrounded by double quotation marks.

**GROUP=**"*haver_group_list*"

**KEEPGROUP=**"*haver_group_list*"

specifies the list of Haver groups to be included in the output SAS data set. This list is comma-delimited and must be surrounded by double quotation marks.

**DROPGROUP=**"*haver_group_list*"

specifies the list of Haver groups to be excluded from the output SAS data set. This list is comma-delimited and must be surrounded by double quotation marks.

**SOURCE=**"*haver_source_list*"

**KEEPSOURCE=**"*haver_source_list*"

specifies the list of Haver sources to be included in the output SAS data set. This list is comma-delimited and must be surrounded by double quotation marks.

**DROPSOURCE=**"*haver_source_list*"

specifies the list of Haver sources to be excluded from the output SAS data set. This list is comma-delimited and must be surrounded by double quotation marks.

**SHORT=**"*haver_shortsource_list*"

**KEEPSHORT=**"*haver_shortsource_list*"

**SHORTSOURCE=**"*haver_shortsource_list*"

specifies the list of Haver short sources to be included in the output SAS data set. This list is comma-delimited and must be surrounded by double quotation marks.

**DROPSHORT=**"*haver_shortsource_list*"

**DROPSHORTSOURCE=**"*haver_shortsource_list*"

specifies the list of Haver short sources to be excluded from the output SAS data set. This list is comma-delimited and must be surrounded by double quotation marks.

**LONG=**"*haver_longsource_list*"

**KEEPLONG=**"*haver_longsource_list*"

**LONGSOURCE=**"*haver_longsource_list*"

specifies the list of Haver long sources to be included in the output SAS data set. This list is comma-delimited and must be surrounded by double quotation marks.

**DROPLONG=**"*haver_longsource_list*"

**DROPLONGSOURCE=**"*haver_longsource_list*"

specifies the list of Haver long sources to be excluded from the output SAS data set. This list is comma-delimited and must be surrounded by double quotation marks.

**GEOG1=**"*haver_geographycode1_list*"

**KEEPGEOG1=**"*haver_geographycode1_list*"

**GEOGCODE1=**"*haver_geographycode1_list*"

specifies the list of Haver geography1 codes to be included in the output SAS data set. This list is comma-delimited and must be surrounded by double quotation marks.

**DROPGEOG1=**"*haver_geographycode1_list*"

**DROPGEOGCODE1=**"*haver_geographycode1_list*"

specifies the list of Haver geography1 codes to be excluded from the output SAS data set. This list is comma-delimited and must be surrounded by double quotation marks.

**GEOG2=**"*haver_geographycode2_list*"

**KEEPGEOG2=**"*haver_geographycode2_list*"

**GEOGCODE2=**"*haver_geographycode2_list*"

specifies the list of Haver geography2 codes to be included in the output SAS data set. This list is comma-delimited and must be surrounded by double quotation marks.

**DROPGEOG2=**"*haver_geographycode2_list*"

**DROPGEOGCODE2=**"*haver_geographycode2_list*"

specifies the list of Haver geography2 codes to be excluded from the output SAS data set. This list is comma-delimited and must be surrounded by double quotation marks.

**OUTSELECT=ON | OFF**

specifies what the output data set shows. OUTSELECT=ON specifies that the output data set show values of selection keys (such as geography codes, groups, sources, short sources, and long sources) for each selected variable name (time series) in the database. OUTSELECT=OFF specifies that the output data set show the observations in the range for all selected time series. The default is OUTSELECT=OFF.

**AGGMODE=STRICT | RELAXED**

specifies whether the SASEHAVR engine uses a strict or relaxed aggregation method when converting time series from a higher to lower frequency.

A strict aggregation method returns a missing value whenever there is a missing observation in a time period. For instance, if a monthly time series has a missing value for the month of February 2005, then attempting to aggregate to a quarterly frequency results in a missing value for the first quarter of 2005. The SAS log reports the status of this option.

When a relaxed aggregation method is used, some observations can be missing, but the relaxed method returns an aggregated value calculated from the nonmissing data points according to the series aggregation type (average, sum, or end of period). Average type only needs one valid (nonmissing) data point to calculate the average. Sum type needs all the data points to be available in order to sum the values. End of period type calculates the end of period value if there is at least one valid (nonmissing) data point in the aggregated span. It returns the last available valid data point in the aggregated span. The default is AGGMODE=RELAXED.

**FORCE=FREQ**

specifies that the selected variables be aggregated to the frequency in the FREQ= option. Aggregation is supported only from a more frequent time interval to a less frequent time interval, such as from weekly to monthly. For sample output and suggested error recovery from attempting a conversion that yields missing values when a higher frequency conversion is specified, see the section "Aggregating to Quarterly Frequency Using the FORCE=FREQ Option" on page 3629. This option is ignored if the FREQ= option is not set. For a more complete discussion of Haver frequencies and SAS time intervals, see the section "Mapping Haver Frequencies to SAS Time Intervals" on page 3626.

Following is an example of the LIBNAME *libref* SASEHAVR statement:

```
LIBNAME libref sasehavr 'physical-name'
        FREQ=MONTHLY;
```

By default, the SASEHAVR engine reads all time series in the Haver database that you reference by *libref*. The *start_date* is specified in the form YYYYMMDD. The start date is used to delimit the data to a specified start date.

For example, to read the time series in the TEST library starting on July 4, 1996, specify the following statement:

```
LIBNAME test sasehavr 'physical-name'
        STARTDATE=19960704;
```

When you use the START= option, you limit the range of observations that are read from the time series and that are converted to the desired frequency. Start dates can help save resources when processing large databases or when processing a large number of observations. It is also possible to select specific variables to be included or excluded from the SAS data set by using the KEEP= or DROP= option, respectively.

```
LIBNAME test sasehavr 'physical-name'
        KEEP="ABC*, XYZ??";

LIBNAME test sasehavr 'physical-name'
        DROP="*SC*, #T#";
```

When the KEEP= or DROP= option is used, the resulting SAS data set keeps or drops the variables that you select in that option. Three wildcards are available: '*', '?', and '#'. The '*' wildcard corresponds to any character string and includes any string pattern that corresponds to that position in the matching variable name. The '?' means that any single alphanumeric character is valid. The '#' wildcard corresponds to a single numeric character. You can also select time series in your data by using the GROUP=, SOURCE=, SHORT=, LONG=, GEOG1=, or GEOG2= option to select on the group name, source name, short source name, long source name, geography1 code, or geography2 code, respectively. Alternatively, you can deselect time series by using the DROPGROUP=, DROPSOURCE=, DROPSHORT=, DROPLONG=, DROPGEOG1=, or DROPGEOG2= option, respectively.

Following are examples that perform variable selection (or deselection) based on groups or sources:

```
LIBNAME test sasehavr 'physical-name'
        GROUP="CBA, *ZYX";

LIBNAME test sasehavr 'physical-name'
        DROPGROUP="TKN*, XCZ?";

LIBNAME test sasehavr 'physical-name'
        SOURCE="FRB";

LIBNAME test sasehavr 'physical-name'
        DROPSOURCE="NYSE";
```

The SASEHAVR engine selects only the variables that are of the specified frequency in the FREQ= option. If this option is not specified, the SASEHAVR engine selects the variables that match the frequency of the first selected variable. If no other selection criteria are specified, by default the first selected variable is the first physical DLX record read from the Haver database. You can specify the FORCE=FREQ option to force the aggregation of all variables selected to be of the frequency specified in the FREQ= option. Aggregation is supported only from a more frequent time interval to a less frequent time interval, such as from weekly to monthly. For suggested recovery from using a frequency that does not aggregate the data appropriately, see the section "Aggregating to Quarterly Frequency Using the FORCE=FREQ Option" on page 3629. The FORCE= option is ignored if the FREQ= option is not specified. The AGGMODE= STRICT option is used when a strict aggregation method is desired. The default value for AGGMODE is RELAXED, the same method that was used in prior releases of the SASEHAVR engine.

# Details: SASEHAVR Interface Engine

## SAS Output Data Set

You can use the SAS DATA step to write the Haver converted series to a SAS data set so that you can easily analyze the data using the SAS System. You can specify the name of the output data set in the DATA statement. This causes the engine supervisor to create a SAS data set with the specified name in either the SAS Work library or, if specified, the Sasuser library.

When OUTSELECT=OFF (the default), the contents of the SAS data set include the date of each observation, the name of each series read from the Haver database, and the label or Haver description of each series. Missing values are represented as '.' in the SAS data set. You can use the PRINT procedure and the CONTENTS procedure to print your output data set and its contents. You can use the SQL procedure along with the SASEHAVR engine to create a view of your SAS data set.

The DATE variable in the SAS data set contains the date of the observation. The SASEHAVR engine automatically maps the Haver intervals to the appropriate corresponding SAS intervals.

When OUTSELECT=ON, the OUT= data set does not contain the observations of all time series. Instead, each observation contains the name of the time series, the source of the time series, the geography1 code, the geography2 code, the short source, and the long source for that time series. In addition, the contents of the OUT= data set shows every selected time series name and label. For more information about the OUTSELECT=ON option, see Output 50.11.1 and Output 50.11.2.

A more detailed discussion of how to map Haver frequencies to SAS time intervals follows.

## Mapping Haver Frequencies to SAS Time Intervals

Table 50.2 summarizes the mapping of Haver frequencies to SAS time intervals. For more information, see Chapter 5, "Date Intervals, Formats, and Functions."

**Table 50.2** Mapping Haver Frequencies to SAS Time Intervals

| Haver Frequency | SAS Time Interval | FREQ= |
|---|---|---|
| ANNUAL | YEAR | YEARLY |
| QUARTERLY | QTR | QTRLY |
| MONTHLY | MONTH | MON |
| WEEKLY (SUNDAY) | WEEK.1 | WEEK.1 |
| WEEKLY (MONDAY) | WEEK.2 | WEEK.2 |
| WEEKLY (TUESDAY) | WEEK.3 | WEEK.3 |
| WEEKLY (WEDNESDAY) | WEEK.4 | WEEK.4 |
| WEEKLY (THURSDAY) | WEEK.5 | WEEK.5 |
| WEEKLY (FRIDAY) | WEEK.6 | WEEK.6 |
| WEEKLY (SATURDAY) | WEEK.7 | WEEK.7 |
| WEEKLY WEEK.1-WEEK.7 | WEEKLY | WEEKLY |
| DAILY | WEEKDAY17W | DAY |

## Error Recovery for the SASEHAVR Interface Engine

Common errors are easy to avoid by noting the valid dates that are specified in the warning messages in your SAS log. Often you can get rid of errors by removing the date restriction (START= and END= options), by removing the FORCE=FREQ option, or by deleting the FREQ= option so that the frequency defaults to the original frequency rather than attempting a conversion.

Following are some common error scenarios and how to handle them.

### Using the Optimum Range for Best Output Results

Suppose you see the following warnings in your SAS log:

```
libname kgs2 sasehavr "%sysget(HAVER_DATA)"
        start= 19550101 end=19600105
        keep="FCSEED, FCSEEI, FCSEEM, BGSX, BGSM, FXDUSBC"
        group="I01, F56, M02, R30"
        source="JPM,CEN,OMB" ;

NOTE: Libref KGS2 was successfully assigned as follows:
      Engine:        SASEHAVR
      Physical Name: C:\haver

data kgse9;
   set kgs2.haver;
NOTE: Defaulting to MONTHLY frequency.
WARNING: Start date (19550101) is not a valid date.
         Engine is ignoring your start date and using
         default. Setting the default Haver start date to 7001.
WARNING: End date (19600105) is not a valid date.
         Engine is ignoring your end date and using
         default. Setting the default Haver end date to 10103.
run;

NOTE: There were 375 observations read from the data set KGS2.HAVER.
NOTE: The data set WORK.KGSE9 has 375 observations and 4 variables.
```

The important diagnostic to note here is the warning message that tells you that the data start in January 1970 (Haver date 7001) and end in March 2001 (Haver date 10103). Since the specified range falls outside the range of data, no observations are in range. So the engine uses the default range stated in the warning messages. Change the START= and END= options to overlap the results in data that span from JAN1970 to MAR2001. To view the entire range of selected data, remove the START= and END= options from the LIBNAME statement:

```
libname kgs sasehavr "%sysget(HAVER_DATA)"
        keep="FCSEED, FCSEEI, FCSEEM, BGSX, BGSM, FXDUSBC"
        group="I01, F56, M02, R30"
        source="JPM,CEN,OMB" ;

NOTE: Libref KGS was successfully assigned as follows:
      Engine:        SASEHAVR
      Physical Name: C:\haver
```

```
data kgse5;
   set kgs.haver;
NOTE: Defaulting to MONTHLY frequency.
   run;

NOTE: There were 375 observations read from the data set KGS.HAVER.
NOTE: The data set WORK.KGSE5 has 375 observations and 4 variables.
```

## Using a Valid Range of Data with START= and END= Options

In this example, an error about an invalid range is issued:

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"  freq=Weekly
   start=20060301 end=20060531;
NOTE: Libref LIB1 was successfully assigned as follows:
      Engine:        SASEHAVR
      Physical Name: C:\haver
libname lib2 "\\dntsrc\usrtmp\saskff" ;
NOTE: Libref LIB2 was successfully assigned as follows:
      Engine:        V9
      Physical Name: \\dntsrc\usrtmp\saskff
data lib2.wweek;
   set lib1.intwkly;
ERROR: No observations found inside RANGE.
       The valid range for HAVER dates is (610104-1050318).
ERROR: No observations found in specified range.
            keep date m11: ;
         run;

WARNING: The variable date in the DROP, KEEP, or RENAME list
         has never been referenced.
WARNING: The variable m11: in the DROP, KEEP, or RENAME list
         has never been referenced.
NOTE: The SAS System stopped processing this step because of errors.
WARNING: The data set LIB2.WWEEK may be incomplete.
         When this step was stopped there were 0
         observations and 0 variables.
WARNING: Data set LIB2.WWEEK was not replaced because this step was stopped.
```

The important diagnostic message is the first error statement, which tells you that the range of Haver dates is not valid for the specified frequency. A valid range is one that overlaps the dates (610104–1050318). Removing the range altogether causes the engine to output the entire range of data.

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"  freq=Weekly;

NOTE: Libref LIB1 was successfully assigned as follows:
      Engine:        SASEHAVR
      Physical Name: C:\haver

libname lib2 "\\dntsrc\usrtmp\saskff" ;
NOTE: Libref LIB2 was successfully assigned as follows:
      Engine:        V9
      Physical Name: \\dntsrc\usrtmp\saskff
```

```
data lib2.wweek;
   set lib1.intwkly;
   keep date m11: ;
run;

NOTE: There were 2307 observations read from the data set LIB1.INTWKLY.
NOTE: The data set LIB2.WWEEK has 2307 observations and 35 variables.
```

Since the START= and END= options give day-based dates, it is important to use dates that correspond to the FREQ= option when giving a range of dates, especially with weekly frequencies such as WEEK.1–WEEK.7. Since FREQ=WEEK.4 selects weeks that begin on Wednesday, the start and end dates need to be specified as Wednesday dates.

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"  freq=Week.4
   start=20050302 end=20050309;
NOTE: Libref LIB1 was successfully assigned as follows:
      Engine:        SASEHAVR
      Physical Name: \\tappan\crsp1\haver
title2 'Weekly dataset with freq=week.4 range is small';
libname lib2 "\\dntsrc\usrtmp\saskff" ;
NOTE: Libref LIB2 was successfully assigned as follows:
      Engine:        V9
      Physical Name: \\dntsrc\usrtmp\saskff

data lib2.wweek;
   set lib1.intwkly;
   keep date m11: ;
run;

NOTE: There were 2 observations read from the data set LIB1.INTWKLY.
NOTE: The data set LIB2.WWEEK has 2 observations and 25 variables.
```

Giving bad dates (for example, Tuesday dates) for a Wednesday FREQ=WEEK.4 results in the following error:

```
ERROR: Fatal error in GetDate routine.
       Remove the range statement or change the START= date to
       be consistent with the freq=option.
ERROR: No observations found in specified range.
```

## Aggregating to Quarterly Frequency Using the FORCE=FREQ Option

In the next example, six time series are selected by the KEEP= option. Their frequencies are annual, monthly, and quarterly, so when the FREQ=WEEKLY and FORCE=FREQ options are used, a diagnostic appears in the log stating that the engine is forcing the frequency to QUARTERLY for better date alignment of observations. The first selected variable is BALO, which is a quarterly time series and causes the default choice of FREQ to be quarterly.

```
title1 '***HAVKWC.SAS: KEEP= option tests with wildcards***';

%setup( ets );

 /*----------------*/
```

```
 /* Wildcard: *    */
 /*----------------*/

title2 "keep=B*, G*, I*";
title3 "6 valid variables are: BALO BGSM BGSX BPBCA G IUM";
libname lib1 sasehavr 'C:\haver\' keep="B*, G*, I*"
   freq=weekly force=freq;
NOTE: Libref LIB1 was successfully assigned as follows:
      Engine:        SASEHAVR
      Physical Name: C:\haver\

data wc;
   set lib1.haver;
WARNING: Earliest Start Date in DLX Database matches QUARTERLY frequency
         better than the specified WEEKLY frequency.
         Engine is forcing the frequency to QUARTERLY for better date
         alignment of observations.
run;

NOTE: There were 221 observations read from the data set LIB1.HAVER.
NOTE: The data set WORK.WC has 221 observations and 7 variables.
```

Note that the time series IUM is an annual frequency. The attempt to convert to a quarterly frequency produces all missing values in the output range because aggregation produces only missing values when forced to go from a lower frequency to a higher frequency.

## Data Elements Reference: Haver Analytics DLX Database Profile

The Haver DLX economic and financial database offerings include U.S. economic indicators, specialized databases, financial indicators, industry, industrial countries, emerging markets, international organizations, forecasts and as-reported data, and U.S. regional service. Table 50.3 is a list of available databases and their descriptions, in the order in which they appear on the Haver Analytics website.

**Table 50.3** Available Data Offerings

| Database Name | Offering Type | Description |
|---|---|---|
| USECON | U.S. economic indicators | U.S. economic, financial data |
| USNA | U.S. economic indicators | Complete U.S. NIPA accounts from the Bureau of Economic Analysis (BEA) |
| SURVEYS | U.S. economic indicators | Business and consumer expectations, surveys |
| SURVEYW | U.S. economic indicators | Business and consumer expectations, weekly surveys |
| CPIDATA | U.S. economic indicators | Consumer price indexes (CPI), monthly, in CPI detailed report |

**Table 50.3** *continued*

| Database Name | Offering Type | Description |
|---|---|---|
| PPI | U.S. economic indicators | Producer price indexes (PPI), by the Bureau of Labor Statistics (BLS) |
| PPIR | U.S. economic indicators | Producer price indexes by the Bureau of Labor Statistics (BLS) |
| LABOR | U.S. economic indicators | Employment and earnings by the Bureau of Labor Statistics (BLS) |
| EMPL | U.S. economic indicators | Household employment survey, monthly, by the Bureau of Labor Statistics (BLS) |
| CEW | U.S. economic indicators | Covered employment and wages, monthly, quarterly |
| OES | U.S. economic indicators | Occupational employment statistics |
| IP | U.S. economic indicators | Industrial production and capacity utilization by the Federal Reserve Board (FRB) |
| FFUNDS | U.S. economic indicators | Flow of funds data by the Federal Reserve Board (FRB) |
| CAPSTOCK | U.S. economic indicators | Capital stock by the Bureau of Economic Analysis (BEA) |
| USINT | U.S. economic indicators | U.S. international trade (TIC) data by country and product |
| HWOL | Specialized databases | Help wanted online, monthly |
| CBDB | Specialized databases | Conference Board database, monthly, by The Conference Board (TCB) |
| BCI | Specialized databases | U.S. business cycle indicators, by The Conference Board (TCB) |
| UMSCA | Specialized databases | Consumer Sentiment Survey from the University of Michigan |
| FIBERUS | Specialized databases | U.S. FIBER business cycle indicators from the Foundation of International Business and Economic Research (FIBER) |
| FIBER | Specialized databases | FIBER business cycle indicators from the Foundation of International Business and Economic Research (FIBER) |
| DAILY | Financial indicators | U.S. daily statistics data |
| INTDAILY | Financial indicators | Country daily statistics |
| WEEKLY | Financial indicators | U.S. weekly statistics |
| INTWKLY | Financial indicators | Country weekly statistics |

**Table 50.3** *continued*

| Database Name | Offering Type | Description |
|---|---|---|

# Examples: SASEHAVR Interface Engine

Before running the following sample code, set your HAVER_DATA environment variable to point to the SAS/ETS SASMISC folder that contains sample Haver databases. The provided sample data files are HAVERD.DAT, HAVERD.IDX, HAVERW.IDX, and HAVERW.DAT. In the following example, the Haver database is called haverw, and it resides in the directory lib1. The DATA statement names the SAS output data set hwouty, which will reside in the Work library.

## Example 50.1: Examining the Contents of a Haver Database

To see which time series are in your Haver database, use the CONTENTS procedure with the SASEHAVR LIBNAME statement to read the contents.

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"
        freq=yearly start=19920101
        end=20041231
        force=freq;

data hwouty;
   set lib1.haverw;
run;

title1 'Haver Analytics Database, HAVERW.DAT';
title2 'PROC CONTENTS for Time Series converted to yearly frequency';
proc contents data=hwouty;
run;
```

All time series in the Haver haverw database are listed alphabetically in Output 50.1.1.

**Output 50.1.1** Examining the Contents of Haver Analytics Database, haverw.dat

**Haver Analytics Database, HAVERW.DAT**
**PROC CONTENTS for Time Series converted to yearly frequency**

**The CONTENTS Procedure**

**Alphabetic List of Variables and Attributes**

| # | Variable | Type | Len | Format | Label |
|---|---|---|---|---|---|
| 1 | DATE | Num | 8 | YEAR4. | Date of Observation |
| 2 | FA | Num | 8 | | Total Assets: All Commercial Banks (SA, Bil.$) |
| 3 | FCM1M | Num | 8 | | 1-Month Treasury Bill Market Bid Yield at Constant Maturity (%) |
| 4 | FM1 | Num | 8 | | Money Stock: M1 (SA, Bil.$) |
| 5 | FTA1MA | Num | 8 | | Treasury 4-Week Bill: Total Amount Accepted (Bil$) |
| 6 | FTB3 | Num | 8 | | 3-Month Treasury Bills, Auction (% p.a.) |
| 7 | LICN | Num | 8 | | Unemployment Insurance: Initial Claims, State Programs (NSA, Thous) |

You could also use the following SAS statements to create a SAS data set named hwouty and to print its contents:

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"
       freq=yearly
       start=19920101
       end=20041231
       force=freq;

data hwouty;
   set lib1.haverw;
run;

title1 'Haver Analytics Database, Frequency=yearly, infile=haverw.dat';
title2 'Define a range inside the data range for OUT= dataset,';
title3 'Using the START=19920101 END=20041231 LIBNAME options.';

proc print data=hwouty;
run;
```

The preceding LIBNAME LIB1 statement specifies that all time series in the haverw database be converted to a yearly frequency but to select only the range of data from January 1, 1992, to December 31, 2004. The resulting SAS data set, hwouty, is shown in Output 50.1.2.

**Output 50.1.2** Defining a Range inside the Data Range for Yearly Time Series

**Haver Analytics Database, Frequency=yearly, infile=haverw.dat**
**Define a range inside the data range for OUT= dataset,**
**Using the START=19920101 END=20041231 LIBNAME options.**

| Obs | DATE | FA | FCM1M | FM1 | FTA1MA | FTB3 | LICN |

| 13 | 2004 | 7950.5 | 1.26642 | 1337.89 | 13.019 | 1.37557 | 341.338 |

## Example 50.2: Viewing Quarterly Time Series from a Haver Database

The following statements specify a quarterly frequency conversion of all time series for the period spanning April 1, 2001, to December 31, 2004:

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"
        freq=quarterly
        start=20010401
        end=20041231
        force=freq;

data hwoutq;
   set lib1.haverw;
run;

title1 'Haver Analytics Database, Frequency=quarterly, infile=haverw.dat';
title2 '  Define a range inside the data range for OUT= dataset';
title3 '  Using the START=20010401 END=20041231 LIBNAME options.';

proc print data=hwoutq;
run;
```

The resulting SAS data set hwoutq is shown in Output 50.2.1.

**Output 50.2.1** Defining a Range inside the Data Range for Quarterly Time Series

**Haver Analytics Database, Frequency=quarterly, infile=haverw.dat**
**Define a range inside the data range for OUT= dataset**
**Using the START=20010401 END=20041231 LIBNAME options.**

## Example 50.3: Viewing Monthly Time Series from a Haver Database

The following statements convert weekly time series to a monthly frequency:

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"
        freq=monthly
        start=20040401
        end=20041231
        force=freq;

data hwoutm;
   set lib1.haverw;
run;

title1 'Haver Analytics Database, Frequency=monthly, infile=haverw.dat';
title2 '  Define a range inside the data range for OUT= dataset';
title3 '  Using the START=20040401 END=20041231 LIBNAME options.';

proc print data=hwoutm;
run;
```

The result from using the range of April 1, 2004, to December 31, 2004, is shown in Output 50.3.1.

**Output 50.3.1** Defining a Range inside the Data Range for Monthly Time Series

**Haver Analytics Database, Frequency=monthly, infile=haverw.dat**
**Define a range inside the data range for OUT= dataset**
**Using the START=20040401 END=20041231 LIBNAME options.**

| Obs | DATE | FA | FCM1M | FM1 | FTA1MA | FTB3 | LICN |

## Example 50.4: Viewing Weekly Time Series from a Haver Database

The following statements show weekly data that span from September 1, 2004, to December 31, 2004:

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"
        freq=weekly
        start=20040901
        end=20041231;

data hwoutw;
   set lib1.haverw;
run;

title1 'Haver Analytics Database, Frequency=weekly, infile=haverw.dat';
title2 '  Define a range inside the data range for OUT= dataset';
title3 '  Using the START=20040901 END=20041231 LIBNAME options.';

proc print data=hwoutw;
run;
```

Output 50.4.1 shows the output.

**Output 50.4.1** Defining a Range inside the Data Range for Weekly Time Series

**Haver Analytics Database, Frequency=weekly, infile=haverw.dat**
**Define a range inside the data range for OUT= dataset**
**Using the START=20040901 END=20041231 LIBNAME options.**

## Example 50.5: Viewing Daily Time Series from a Haver Database

Consider viewing the Haver Analytics daily database named haverd. The contents of this database can be seen by submitting the following DATA step:

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"
        freq=daily
        start=20041201
        end=20041231;

data hwoutd;
   set lib1.haverd;
run;

title1 'Haver Analytics Database, HAVERD.DAT';
title2 'PROC CONTENTS for Time Series converted to daily frequency';
proc contents data=hwoutd;
run;
```

Output 50.5.1 shows the output of PROC CONTENTS with the time ID variable DATE followed by the time series variables FCM10, FCM1M, FFED, FFP1D, FXAUS, and TCC with their corresponding attributes such as type, length, format, and label.

**Output 50.5.1** Examining the Contents of a Daily Haver Analytics Database, haverd.dat

**Haver Analytics Database, HAVERD.DAT**
**PROC CONTENTS for Time Series converted to daily frequency**

**The CONTENTS Procedure**

**Alphabetic List of Variables and Attributes**

| # | Variable | Type | Len | Format | Label |
|---|---|---|---|---|---|
| 1 | DATE | Num | 8 | DATE9. | Date of Observation |
| 2 | FCM10 | Num | 8 | | 10-Year Treasury Note Yield at Constant Maturity (Avg, % p.a.) |
| 3 | FCM1M | Num | 8 | | 1-Month Treasury Bill Market Bid Yield at Constant Maturity (%) |
| 4 | FFED | Num | 8 | | Federal Funds [Effective] Rate (% p.a.) |
| 5 | FFP1D | Num | 8 | | 1-Day AA Financial Commercial Paper (% per annum) |
| 6 | FXAUS | Num | 8 | | Foreign Exchange Rate: Australia (US$/Australian$) |
| 7 | TCC | Num | 8 | | Treasury: Closing Operating Cash Balance (Today, Mil.$) |

## Example 50.6: Limiting the Range of Time Series from a Haver Database

The following statements limit the range of data to the month of December:

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"
        freq=daily
        start=20041201
        end=20041231;

data hwoutd;
   set lib1.haverd;
run;

title1 'Haver Analytics Database, Frequency=daily, infile=haverd.dat';
title2 '   Define a range inside the data range for OUT= dataset';
title3 '   Using the START=20041201 END=20041231 LIBNAME options.';

proc print data=hwoutd;
run;
```

Note that Output 50.6.1 for daily conversion shows the frequency as the SAS time interval for WEEKDAY.

**Output 50.6.1** Defining a Range inside the Data Range for Daily Time Series

**Haver Analytics Database, Frequency=daily, infile=haverd.dat**
**Define a range inside the data range for OUT= dataset**
**Using the START=20041201 END=20041231 LIBNAME options.**

| Obs | DATE | FCM10 | FCM1M | FFED | FFP1D | FXAUS | TCC |
|---|---|---|---|---|---|---|---|

## Example 50.7: Using the WHERE Statement to Subset Time Series from a Haver Database

Using a WHERE statement in the DATA step can be useful for further subsetting.

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"
        freq=daily start=20041101 end=20041231;

data hwoutd;
   set lib1.haverd;
   where date  between '01nov2004'd and '01dec2004'd;
run;

title1 'Haver Analytics Database, Frequency=daily, infile=haverd.dat';
title2 '   Define a range inside the data range for OUT= dataset';
title3 '   Using the START=20041101 END=20041231 LIBNAME options.';
title4 'Subset further: where date between 01nov2004 and 31dec2004.';
proc print data=hwoutd;
run;
```

Output 50.7.1 shows that the time slice of November 1, 2004, to December 31, 2004, is narrowed further by the DATE test in the WHERE statement to stop at December 1, 2004.

**Output 50.7.1** Defining a Range Using the WHERE Statement, START=20041101, and END=20041231

**Haver Analytics Database, Frequency=daily, infile=haverd.dat**
**Define a range inside the data range for OUT= dataset**
**Using the START=20041101 END=20041231 LIBNAME options.**
**Subset further: where date between 01nov2004 and 31dec2004.**

## Example 50.8: Using the KEEP Option to Subset Time Series from a Haver Database

To select specific time series, you can use the KEEP= or DROP= option as follows:

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"
        freq=daily
        start=20041101
        end=20041231
        keep="FCM*";

data hwoutd;
   set lib1.haverd;
run;

title1 'Haver Analytics Database, Frequency=daily, infile=haverd.dat';
title2 '   Define a range inside the data range for OUT= dataset';
```

```
title3 '   Using the START=20041101 END=20041231 LIBNAME options.';
title4 '   Subset further: Using keep="FCM*" LIBNAME option ';
proc print data=hwoutd;
run;
```

Output 50.8.1 shows two series that are selected by using KEEP="FCM*" in the LIBNAME statement.

**Output 50.8.1** Using the KEEP Option and Defining a Range Using START=20041101 and END=20041231

**Haver Analytics Database, Frequency=daily, infile=haverd.dat**
**Define a range inside the data range for OUT= dataset**
**Using the START=20041101 END=20041231 LIBNAME options.**
**Subset further: Using keep="FCM*" LIBNAME option**

You can use the DROP option to drop specific variables from a Haver database. To specify this option, use DROP= instead of KEEP=.

## Example 50.9: Using the SOURCE Option to Subset Time Series from a Haver Database

You can use the SOURCE= or DROPSOURCE= option to select specific variables that belong to a certain source, similar to the way you use the KEEP= or DROP= option.

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"
        freq=daily
        start=20041101
        end=20041223
        source="FRB";

data hwoutd;
   set lib1.haverd;
run;

title1 'Haver Analytics Database, Frequency=daily, infile=haverd.dat';
title2 '   Define a range inside the data range for OUT= dataset';
title3 '   Using the START=20041101 END=20041223 LIBNAME options.';
title4 '   Subset further: Using source="FRB" LIBNAME option';
proc print data=hwoutd;
run;
```

Output 50.9.1 shows two series that are selected by using SOURCE="FRB" in the LIBNAME statement.

**Output 50.9.1** Using the SOURCE Option and Defining a Range Using START=20041101 and END=20041223

**Haver Analytics Database, Frequency=daily, infile=haverd.dat**
**Define a range inside the data range for OUT= dataset**
**Using the START=20041101 END=20041223 LIBNAME options.**
**Subset further: Using source="FRB" LIBNAME option**

## Example 50.10: Using the GROUP Option to Subset Time Series from a Haver Database

You can use the GROUP= or DROPGROUP= option to select specific variables that belong to a certain group, similar to the way you use the KEEP= or DROP= option.

Output 50.10.1, Output 50.10.2, and Output 50.10.3 show three different cross sections of the same database, haverw, by specifying three unique GROUP= options: GROUP="F*" in LIBNAME LIB1, GROUP="M*" in LIBNAME LIB2, and GROUP="E*" in LIBNAME LIB3.

The following statements specify GROUP="F*" in the LIBNAME LIB1 statement:

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"
        freq=week.6
        force=freq
        start=20040102
        end=20041001
        group="F*";

data hwoutwA;
   set lib1.haverw;
run;

title1 'Haver Analytics Database, Frequency=week.6, infile=haverw.dat';
title2 '   Define a range inside the data range for OUT= dataset';
title3 '   Using the START=20040102 END=20041001 LIBNAME options.';
title4 '   Subset further: Using group="F*" LIBNAME option';
proc print data=hwoutwA;
run;
```

Output 50.10.1 shows the output.

**Output 50.10.1** Using the GROUP=F* Option and Defining a Range

**Haver Analytics Database, Frequency=week.6, infile=haverw.dat**
**Define a range inside the data range for OUT= dataset**
**Using the START=20040102 END=20041001 LIBNAME options.**
**Subset further: Using group="F*" LIBNAME option**

## Example 50.11: Using the OUTSELECT=ON Option to View the Key Selection Variables in a Haver Database

Suppose you want to select your time series based on geography codes or source codes. To construct your wildcard for selection, first run with the OUTSELECT=ON option to see the possible values for each selection key.

```
Libname lib1 sasehavr "%sysget(HAVER_DATA)"
        outselect=on ;

data validD1;
   set lib1.haverd;
run;

title1 'OUTSELECT=ON, Print the OUT= Data Set';
title2 'Shows the Values for Key Selection Variables:';
title3 'Name, Source, Geog1, Geog2, Shortsrc, Longsrc';
title4 'OUTSELECT=ON, the CONTENTS Procedure with Variable Names and Labels';
proc print data=validD1;
run;

proc contents data=validD1;
run;
```

Output 50.11.1 shows the output values for each key selection variable.

**Output 50.11.1** OUTSELECT=ON Option Shows the Values for Key Selection Variables

**OUTSELECT=ON, Print the OUT= Data Set**
**Shows the Values for Key Selection Variables:**
**Name, Source, Geog1, Geog2, Shortsrc, Longsrc**
**OUTSELECT=ON, the CONTENTS Procedure with Variable Names and Labels**

| Obs | NAME | SOURCE | GEOG1 | GEOG2 | SHORTSRC | LONGSRC | FCM10 | FCM1M | FFED | FFP1D | FXAUS | TCC |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 1 | NAME | SOURCE | GEOG1 | GEOG2 | SHORTSRC | LONGSRC | | | | | | |
| 2 | FCM10 | FRB | 0000000 | | FRB | Federal Reserve Board | | | | | | |
| 3 | FCM1M | UST | 0000000 | | FRB | Federal Reserve Board | | | | | | |
| 4 | FFED | FRB | 0000000 | | FRB | Federal Reserve Board | | | | | | |
| 5 | FFP1D | FRB | 0000000 | | FRB | Federal Reserve Board | | | | | | |

## Example 50.12: Selecting Variables Based on Short Source Key Code

Using the information from Example 50.11, you can now select time series by using selection keys such as the SHORT= , GEOG1=, or GEOG2= option. Since the short source values are nontrivial in the database haverd, it is best in this case to use the SHORT= option. For more information about using geography codes as selection keys, see Output 50.13.1 for the GEOG1= option and Output 50.13.2 for the GEOG2= option.

```
Libname lib1 sasehavr "%sysget(HAVER_DATA)"
        short="GOLDMAN, FRB, CRB";
data validE2;
   set lib1.haverd;
   where date  between '18jan2005'd and '29mar2005'd;
run;

title1 'SHORT= option list: GOLDMAN, FRB, CRB';
title2 'Should contain these time series:';
title3 'FCM10, FCM1M, FFED, FFP1D';
title4 'SHORT= option, Print the OUT= ValidE2 Data Set';
proc print data=validE2;
run;

title4 'SHORT= option, Print the Contents of OUT= ValidE2 Data Set';
proc contents data=validE2;
run;
```

Output 50.12.1 shows the output for the SHORT= option.

**Output 50.12.1** SHORT= Option Shows the Selected Variables

**SHORT= option list: GOLDMAN, FRB, CRB**
**Should contain these time series:**
**FCM10, FCM1M, FFED, FFP1D**
**SHORT= option, Print the OUT= ValidE2 Data Set**

## Example 50.13: Selecting Variables Based on Geography Key Codes

Since the haverd database did not have interesting geography codes, the following statements access the INTWKLY database by using its more complete geography key codes to select the desired time series from the specified geography codes:

```
Libname lib1 sasehavr "%sysget(HAVER_DATA_NEW)"
        outselect=on
   keep="R273RF3,X924USBE,R023DF,R273G1,F023A,F158FBS,F023ACR,X156VEB,F023ACE";

data valid1(keep=NAME SOURCE GEOG1 GEOG2 SHORTSRC LONGSRC);
   set lib1.intwkly;
run;

title1 'OUTSELECT=ON, Print the OUT= Data Set';
title2 'Shows the Values for Key Selection Variables:';
title3 'Name, Source, Geog1, Geog2, Shortsrc, Longsrc';
title4 'OUTSELECT=ON, the CONTENTS Procedure with Variable Names and Labels';
```

```
proc print data=valid1;
run;

Libname lib2 sasehavr "%sysget(HAVER_DATA_NEW)"
   geog1="156";

data valid2(
   keep=date R273RF3 X924USBE R023DF R273G1 F023A F158FBS F023ACR X156VEB F023ACE);
   set lib2.intwkly;
run;

title1 'Only one GEOG1 Code, 156, contains time series X156VEB';
title2 'Select Geography Code 1 Option:';
title3 'GEOG1= option';
title4 'Only Time Series X156VEB has Geog1 = 156';

proc contents
   data=valid2;
run;

Libname lib3 sasehavr "%sysget(HAVER_DATA_NEW)"
   geog2="299";

data valid3(
   keep=date R273RF3 X924USBE R023DF R273G1 F023A F158FBS F023ACR X156VEB F023ACE);
   set lib3.intwkly;
run;

title1 'Only one GEOG2 Code, 299, contains time series X156VEB';

# Overview: SASENOAA Interface Engine

The SASENOAA interface engine enables SAS programmers to retrieve severe weather data from the National Oceanic and Atmospheric Administration (NOAA) Severe Weather Data Inventory (SWDI) web service, which is hosted jointly by the NOAA's National Environmental Satellite Data and Information Service (NESDIS), the US Department of Commerce National Climatic Data Center (NCDC), the University of North Carolina at Asheville's National Environmental Modeling and Analysis Center (NEMAC), and the Renaissance Computing Institute (RENCI) at UNC Asheville.

The SWDI web service offers access to severe weather data such as tornado vortex signatures; mesocyclone signatures; the digital mesocyclone detection algorithm; hail data; storm cell structure; preliminary local storm reports; and severe thunderstorm, tornado, flash flood, and special marine warnings. The SWDI lightning data are not accessible to the public, so they are not supported by the SASENOAA interface engine.

It is important to note that the absence of SWDI weather data for a geographic region or time period does not necessarily indicate that severe weather did not occur at that place or time; instead, the interpretation should be that severe weather was not detected or reported by NOAA's SWDI data sources. In addition, because much of the SWDI's information is derived from radar data, its usefulness is primarily that it provides data that indicates probable conditions for an event rather than confirming the actual occurrence of an event.

The SASENOAA interface engine uses the LIBNAME statement to enable you to specify how to retrieve your NOAA Severe Weather data and which weather data time series or storm events you want to retrieve based on date range and weather station location. You can then use the SAS DATA step to perform further subsetting and to store the resulting time series in a SAS data set or in map files (such as Google Earth's KMZ files or Esri shapefiles). You can perform more analysis (if desired) either in the same SAS session or in a later session. You can map your results in Google Maps by importing the resulting KML file, or you can map your results in SAS by using PROC MAPIMPORT and PROC GMAP to create a map from the resulting Esri shapefiles (which have the file name extension .shp).

The SASENOAA interface engine is supported on SAS running on Linux X64 (LAX) and Windows. Although the SASENOAA engine uses the NOAA SWDI API, it is not endorsed or certified by either NOAA or the National Weather Service. By using the SASENOAA interface engine, you are agreeing to comply with the NOAA SWDI terms of use, which are described on the web page at the following URL:

**http://www.weather.gov/disclaimer/**

# Getting Started: SASENOAA Interface Engine

You can query the SWDI data sets to retrieve the observations or data values for a list of time series or events by specifying the data format (FORMAT= option), the data set to access (NOAASET= option), and the date range (RANGE= option).

The SASENOAA engine's FORMAT= option supports three formats: XML (default), SHP, and KMZ. The XML format stores the weather data results in a SAS data set (.sas7bdat) named in the OUTXML= option, and when applicable, in two additional data sets: one for message text output (_M.sas7bdat), and another for statistics output (_S.sas7bdat).

The SHP format produces a ZIP file that contains four Esri shapefiles (with the extensions .shp, .shx, .dbf, and .prj). The SASENOAA interface unzips the SHP ZIP file to surface the four Esri files. The KMZ format produces a ZIP file (with the extension .kmz) that can be opened in virtual globe software such as Google Earth. The SASENOAA engine unzips the KMZ file to produce the resulting KML file, which can then be imported into Google Maps to create a detailed map of the SWDI time series data.

The NOAASET= option is required. You can specify one of the following Next-Generation Radar (NEXRAD) Level III types: nx3tvs (tornado vortex signatures), nx3meso (mesocyclone signatures), nx3mda (digital mesocyclone detection algorithm), nx3hail (hail signatures), or nx3structure (storm cell structure information). You can also specify two other types: plsr (preliminary local storm reports) and warn (severe thunderstorm, tornado, flash flood, and special marine warnings).

After you specify both the NOAASET= option and the format, you must also use the RANGE= option to specify the date range of the data that you are selecting for output, as shown in the following example.

The statements that follow enable you to access the severe weather tornado vortex signature (TVS) events that are recorded in the nx3tvs database for the date range beginning May 5, 2006, and ending May 6, 2006. The observations are sorted in chronological order (the datetime variable is ztime). The output is shown in Figure 51.1.

```
options validvarname=any;

title 'Retrieve Tornado Vortex Signature Data for the Range 20060505:20060506';
libname mylib "/sasusr/noaa/doc/";
libname noaa sasenoaa "physical path to the folder where you want the NOAA data"
   NOAASET=nx3tvs
   RANGE='20060505:20060506'
   OUTXML=cinco
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="%sysget(NOAA_DATA)cinco.map"
   FORMAT=xml;

data mylib.mycinco;
   set noaa.cinco;
run;
```

```
proc contents data=mylib.mycinco; run;
proc print data=mylib.mycinco(obs=10); run;
```

The XML data that the NOAA SWDI web service returns are placed in a file that is named by the OUTXML= option—in this case, *CINCO1.xml*. Note that the SASENOAA engine appends a numeral to the XML file name, and the file extension (.xml) is excluded from the file name that appears in the OUTXML= option. The NOAA data reside in the location that is given inside the string enclosed in double quotation marks in the SASENOAA LIBNAME statement. So, if the NOAA_DATA environment variable is set to **/sasusr/noaa/test/**, then the NOAA data is located in the folder **/sasusr/noaa/test**. An equivalent LIBNAME statement that does not use any environment variables could be as follows:

```
libname noaa sasenoaa "physical path to the folder where you want the NOAA data"
   NOAASET=nx3tvs
   RANGE='20060505:20060506'
   OUTXML=cinco
   XMLMAP="/sasusr/noaa/test/cinco.map"
   AUTOMAP=replace
   MAPREF=MyMap
   FORMAT=xml;
```

The XML map that is created is assigned the full path name that the XMLMAP= option specifies. The SASENOAA engine appends a numeral to the XML file name to prevent file names from being overwritten during multiple read requests.

The RANGE= option specifies the start date and end date for the range of days for which you want to retrieve data. This option accepts a string, enclosed in single quotation marks, that gives start and end dates (in `'YYYYMMDD'` format) so that only the recorded severe weather events from the selected dates are included. The result, MYCINCO, is named in the DATA step and is shown in Figure 51.1.

It is more efficient to use the DATA step to store your NOAA SWDI data in a SAS data set and then refer to the SAS data set directly in your PROC statements. You can also refer to the SASENOAA libref directly, as in the statement

```
proc print data=noaa.cinco(obs=10);
```

The PROC PRINT statement uses the member name, CINCO; this usage corresponds to the OUTXML=CINCO option. Although using this statement might seem easier, it is not as efficient, because every time you use the SASENOAA libref, the SASENOAA interface engine reads the entire XML file into SAS again. So it is better to refer to the SAS data set repeatedly than to invoke the interface engine repeatedly.

The SASENOAA interface engine supports the XML format by placing the XML data that the NOAA SWDI web service returns in a file named by the OUTXML= option. The XML map that is automatically created is assigned the full path name specified by the XMLMAP= option, and the fileref that is used for the map assignment is specified by the MAPREF= option. In the preceding sample code, the SASENOAA engine uses the MAPREF= and XMLMAP= options in the FILENAME statement to assign a file name:

```
FILENAME MyMap "/sasusr/noaa/test/cinco.map";
```

You can use the MAPREF= and XMLMAP= options to control where the map resides, what you name the map, and how you refer to it with a fileref. You can use the OUTXML= option to name your XML data file; it is described in the section "SAS OUTXML File" on page 3689. The XML data file is placed in the folder that is designated by *physical-name,* which is described in the section "The LIBNAME *libref* SASENOAA Statement" on page 3677. You can refer to your data by using the NOAA libref defined in your SASENOAA LIBNAME statement. The NOAA libref is shown inside the DATA step in the SET statement. The SET statement reads observations from the input data set Noaa.cinco and stores them in a SAS data set named Mycinco, as shown in Figure 51.1. You can also use the SAS DATA step to perform further processing and to store the resulting time series in a SAS data set; this process is described in the section "SAS Output Data Set" on page 3687.

In summary, to specify the NOAA SWDI data set that you want to retrieve, use the NOAASET= option. This required option accepts a string that names the desired NOAA data set, in this case, NOAASET=NX3TVS. The RANGE= option is also required and selects the date range based on the ztime variable, which is the time ID variable for the resulting SAS data set. The Mycinco data set contains the NX3TVS data variables whose observation range is controlled by the RANGE= option. The Mycinco data set contains observations that start May 5, 2006, and end the same day, as specified by the end date May 6, 2006, which is excluded from the selected data. **NOTE:** The begin date on the RANGE= option is inclusive, but the end date is exclusive of the data.

# Syntax: SASENOAA Interface Engine

The SASENOAA interface engine uses standard engine syntax to read the observations or data values for NOAA SWDI data sets that can each contain one or more events or time series. Table 51.1 summarizes the options that the SASENOAA engine uses.

**Table 51.1** Summary of LIBNAME *libref* SASENOAA Options

| Option | Description |
|---|---|
| AUTOMAP= | Specifies whether or not to overwrite the existing XML map file |
| BBOX= | Specifies the geographic area to report on by defining a bounding box in the format `'minLon,minLat,maxLon,maxLat'` for minimum longitude, minimum latitude, maximum longitude, maximum latitude. For example: BBOX='-91,30,-90,31'. |
| CENTER= | Specifies the center point 'longitude,latitude' (to nearest tenth of a degree) of the geographic area to retrieve data for. Use this option with the RADIUS= option to complete the specification. |
| CONNECT= | Specifies whether or not you need the connect method for a secure connection via a proxy server. You must specify the PROXY= option when you specify CONNECT=ON. |
| DEBUG= | Specifies whether or not you need diagnostic message logging in the SAS log window |
| FILTERBY= | Specifies the weather station to retrieve data for |
| FILTERBYCONDITION= | Specifies the condition for selection of the weather station |
| FORMAT= | Specifies a file extension that indicates the type of file to retrieve. Only XML, SHP, and KMZ file types are supported for the SASENOAA engine. |
| ID= | Specifies an ID to retrieve the text message in the warning or the preliminary local storm report databases |
| KMZMAP= | Specifies the fully qualified file name for the KMZ map that the SASENOAA engine creates. This file name is usually the same as the one in the OUTKMZ= option. |
| LIMIT= | Specifies the maximum number of observations to use in the report |
| NOAASET= | Specifies the required NOAA data set name to access in the Severe Weather Data Inventory |
| OFFSET= | Specifies the offset to the number of observations to start the report |
| OUTKMZ= | Specifies the name for the downloaded KMZ file. The SASENOAA engine also unzips the KMZ file and gives the KML file this name. |
| OUTSHP= | Specifies the name for the downloaded SHP ZIP file. The SASENOAA engine also unzips the SHP file and uses this name for the four Esri shapefiles. |
| OUTXML= | Specifies the name for the XML data that are downloaded from the SWDI web service containing the time series/event data. This name is also used to create the SAS data sets that contain the SWDI data. |
| PROXY= | Specifies the proxy server that you want to use (if you have trouble connecting without specifying a proxy). If you also need the connect method for a secure connection, use the CONNECT=ON option in addition to the PROXY= option. See the CONNECT= option. |

**Table 51.1** *continued*

| Option | Description |
|---|---|
| RADIUS= | Specifies the radius (in miles, measured from the CENTER= option value's coordinates) of the geographic area to retrieve data for. This option must be used with the CENTER= option. |
| RANGE= | Specifies the start date and end date for reading the severe weather data in `'YYYYMMDD:YYYYMMDD'` format. The range must be within the same calendar year unless you are requesting statistics only by also specifying the STAT= option. The start date is inclusive of the data, but the end date is exclusive of the data. There is a special option (PERIODOFRECORD) that returns the valid range availability of data for the requested data set specified in the NOAASET= option. |
| SHPMAP= | Specifies the fully qualified file name for the SHP map that the SASENOAA engine creates. This file name is usually the same as the one in the OUTSHP= option. |
| STAT= | Specifies the statistical operation that you want to perform on the requested severe weather data |
| TILE= | Specifies the coordinates of a geographic location to the nearest tenth of a degree. For the earlier example of –95.45,36.88, the matching tile would contain values from –95.4500 to –95.5499 and from 36.8500 to 36.9499. |
| XMLMAP= | Specifies the fully qualified file name for the XML map that the SASENOAA engine creates. This file name is usually the same as the one in the OUTXML= option. |

## The LIBNAME *libref* SASENOAA Statement

**LIBNAME** *libref* **SASENOAA** '*physical-name*' *options* **;**

The LIBNAME statement assigns a SAS library reference (libref) to the physical path of the directory where you want the NOAA Severe Weather Data Inventory (SWDI) files to be downloaded and stored. The required *physical-name* argument specifies the location of the folder where your SWDI XML or data shapefiles reside. The *physical-name* should end with a backslash if you are in a Windows environment and a forward slash if you are in a UNIX environment. The designated folder that is specified in the *physical-name* argument must already exist before you submit the LIBNAME *libref* SASENOAA statement.

You can specify the following *options* in the LIBNAME *libref* SASENOAA statement.

**AUTOMAP=REPLACE | REUSE**
specifies whether or not to overwrite the existing XML map file.

**REPLACE** specifies that the XML map file be overwritten, and ensures that the most current XML map that is generated by the SASENOAA engine and named by the XMLMAP= option is used.

**REUSE** specifies that the XML map file not be overwritten, and ensures that a pre-existing XML map file that is named by the XMLMAP= option is used.

By default, AUTOMAP=REPLACE. The AUTOMAP= option is used only with the XML format (the default).

**BBOX=**'*noaa_bbox_coordinates*'
specifies the coordinates that define the bounding box in the format `'minLon,minLat,maxLon,maxLat'`. This option enables you to select the severe weather data that lie within the geographic area bounded by the box that is defined within the intersections of the specified paired sets of parallels and meridians.

**CENTER=**'*noaa_center_coordinates*'
specifies the center coordinates (longitude, latitude) of a geographic area that, when used along with the RADIUS= option, enable you to select the severe weather data from within the circle whose center is at the specified coordinates (CENTER= option) and of the specified radius (RADIUS= option). An example request follows for "Get all nx3tvs occurring on May 6, 2006, within 15 miles of latitude = 32.7 and longitude = –102.0 and return as XML":

```
LIBNAME libref sasenoaa 'physical-name'
        FORMAT=xml
        NOAASET=nx3tvs
        RANGE='20060506:20060507'
        RADIUS='15.0'
        CENTER='-102.0,32.7'
        OUTXML=mytvs;
```

**CONNECT=ON | OFF**
specifies whether or not to use the connect method along with the PROXY= option. **NOTE:** You must use the PROXY= option and specify your proxy server in addition to the CONNECT=ON option when you want to use the connect method. For more information about a secure connection, see the PROXY= option.

**DEBUG=ON | OFF**
specifies whether or not to include diagnostic message logging in the SAS log window. This information can be very useful for troubleshooting a problem.

**FILTERBY=**'*noaa_filterby_column_value_pair*'
specifies the column name and column value, separated by a colon, to filter the data by. Most often, the column name is WSR_ID and the column value is one of the NEXRAD III weather station ICAO codes shown in Table 51.2.

**FILTERBYCONDITION=**'*noaa_filterbyCond_column_cond_pair*'
specifies the column name and condition value, separated by a colon, to filter the data by. Most often, the column name is WSR_ID and the condition is AND | OR. An example request follows:

```
LIBNAME libref sasenoaa 'physical-name'
        FORMAT=xml
        NOAASET=nx3hail
        RANGE='20110521:20110522'
        FILTERBY='WSR_ID:KFWS'
        FILTERBYCONDITION='WSR_ID:or'
        OUTXML=byNexR;
```

See also the FILTERBY= option.

**FORMAT=XML | KMZ | SHP**
specifies the format of the file to be retrieved from the NOAA SWDI web service. Although this service can report data in many formats, the SASENOAA engine supports only the XML, SHP, and KMZ formats. When you specify FORMAT=XML, the downloaded data file is named by the OUTXML= option and mapped using the fully designated physical file name specified in the XMLMAP= option. Similarly, when you specify FORMAT=KMZ, use the OUTKMZ= and KMZMAP= options to name your results; and when you specify FORMAT=SHP, use the OUTSHP= and SHPMAP= options to name your results. **NOTE:** Only one format specification is allowed in each SASENOAA LIBNAME statement.

**ID=**'*noaa_id_messageno*'
specifies the message number to retrieve the complete text of the message for the data set specified in the NOAASET= option. ID numbers can be read from the ID column in the results data set (named in the OUTXML= option) for either the warn or plsr data set. The ID= option is used with either the warn or plsr data set to retrieve the entire message that matches the message number indicated in the ID= option for the desired data set, either the NOAA severe storm warnings (warn data set) or the preliminary local storm reports (plsr data set). See Example 51.1 for sample code that shows that the output from the ID= option is placed in the SAS data set named by appending _M to the member name specified in the OUTXML= option.

**KMZMAP=***noaa_kmzmapfile*
specifies the fully qualified name of the location where the KMZ map file (zipped KML map file) is automatically stored.

**LIMIT=***noaa_limit*
limits the number of observations in the results data set. Specify a number from 1 to 10,000,000.

**MAPREF=***noaa_xmlmapref*
specifies the fileref to use for the map assignment. For an example of the SASENOAA engine that uses the MAPREF= and XMLMAP= options in the FILENAME statement to assign a file name, as in the following, see the section "Getting Started: SASENOAA Interface Engine" on page 3673:

```
FILENAME MyMap "/sasusr/playpens/saskff/noaa/test/gstart.map";
```

You can use the MAPREF= and XMLMAP= options to control where the map resides, what you name the map, and how you refer to it with a fileref. You can use the OUTXML= option to name your XML data file. It is placed in the folder that is designated by *physical-name* in your SASENOAA LIBNAME statement, and you can reference it by using the myLib libref. This is shown in the section "Getting Started: SASENOAA Interface Engine" on page 3673, inside the DATA step in the SET statement. The SET statement reads observations from the input data set myLib.GSTART and stores them in a SAS data set named ShearV.

**NOAASET=***noaa_data set_SWDI_dsname*
specifies the name of the NOAA SWDI data set that you want to access. Use one of the following names: nx3tvs, nx3meso, nx3mda, nx3hail, nx3structure, plsr, or warn. For a complete description of each data set, see the section "Details: SASENOAA Interface Engine" on page 3682.

**OFFSET=***noaa_offset*

specifies a starting row number (offset) in the results to use as your first observation in the results data set.

**OUTKMZ=***noaa_kmzfile*

specifies the name of the file where the KMZ data (FORMAT=KMZ) that are returned from the SWDI web service are stored. It is recommended that you specify the OUTKMZ= option when the FORMAT=KMZ option is specified. In cases where the two options do not correspond, the FORMAT= option overrides the designated OUTKMZ= option.

**NOTE:** The KMZ format produces a ZIP file whose name contains the corresponding file extension (.kmz). The SASENOAA engine automatically unzips the KMZ file to produce a KML map file. The KMZMAP= option gives the name and location of the resulting .kml file.

**OUTSHP=***noaa_shpfile*

specifies the name of the file where the SHP data (FORMAT=SHP) that are returned from the SWDI web service are stored. It is recommended that you specify the OUTSHP= option when the FORMAT=SHP option is specified. In cases where the two options do not correspond, the FORMAT= option overrides the designated OUTSHP= option.

**NOTE:** The SHP format produces a ZIP file whose name contains the corresponding file extension (.shp). The SASENOAA engine automatically unzips the SHP file to produce four Esri map files with the file extensions .dbf, .prj, .shp, and .shx. For example, if OUTSHP=MYSBY and FORMAT=SHP, then the files that contain the SWDI data are named MYSBY.dbf, MYSBY.prj, MYSBY.shp, and MYSBY.shx.

**OUTXML=***noaa_xmlfile*

specifies the name of the file where the XML data (FORMAT=XML), KMZ data (FORMAT=KMZ), or SHP data (FORMAT=SHP) that are returned from the SWDI web service are stored. When FORMAT=XML, additional SAS data sets are provided by the SASENOAA engine, depending on two options: ID= and STAT=. When an ID= option is also specified, the engine appends _M to the OUTXML= specification to name the resulting SAS data set that contains the message text that the SWDI web service returns. When the STAT= option is also specified, the engine appends _S to the OUTXML= specification to name the resulting data set that contains the counts from the statistical operation that is performed.

It is recommended that you specify the OUTXML= option when the FORMAT=XML option is specified. In cases where the two options do not correspond, the FORMAT= option overrides the designated OUTXML= option.

**PROXY="***noaa_proxyserver***"**

specifies which proxy server to use. This option is not required. The specified proxy server is used only when a connection-refused error or a connection-timed-out error occurs. For *noaa_proxyserver*, specify the server's HTTP address followed by a colon and the port number, and enclose that string in double quotation marks; for example, PROXY="http://inetgw.unx.sas.com:8118". See also the CONNECT= option.

**RADIUS=**'*noaa_radius*'
specifies the search radius (in miles) of the area to retrieve the severe weather data for. The current limit for the search radius is 15 miles. This option must be used with the CENTER= option.

**RANGE=**'*noaa_range*'
specifies the date range to report severe (past) weather for. The format for *noaa_range* is `'YYYYMMDD:YYYYMMDD'`. The range must fall within the period of record for the desired data set. The NOAA SWDI data web service returns the period of record for the requested data set (in this case, nx3hail) at the following URL:

**http://www.ncdc.noaa.gov/swdiws/xml/nx3hail/periodOfRecord**

It also returns a begin date and end date, giving the available time range of data to choose from. Although the limit for a range is one year, often only a few days of data are requested, unless the STAT= option is used. More than one year is allowed in the RANGE= option when you also use the STAT= option to request the COUNT, which returns only the number of observations in the results data set.

**SHPMAP=***noaa_shpmapfile*
specifies the fully qualified name of the location where the SHP map file (zipped Esri shapefiles) is automatically stored.

**STAT=**'*noaa_stat_op*'
specifies the statistical operation that you want to perform on the requested severe weather data. You can specify one of the following values for *noaa_stat_op* within single quotes:

| | |
|---|---|
| **COUNT** | returns number of results only (no actual data). |
| **COUNTGROUPBY:WSR_ID** | returns number of results for each BY group (each WSR_ID that returns data). |
| **TILESUM:***longitude*,*latitude* | returns daily feature counts for a tenth-of-a-degree grid centered at the specified coordinates. |

Although the SASENOAA engine automatically checks the statistics to make sure there is a nonzero observation count before requesting the specified data, it is often useful to use the STAT= option to determine the best geographic area and the best date range to retrieve severe weather data that are of the most interest. Output from the STAT= option is placed in the SAS data set named by appending _S to the member name specified in the OUTXML= option.

**TILE=**'*noaa_tile_coordinates*'
specifies that you want to search for severe weather data in the geographic area within a 0.1 degree tile that is centered at the specified coordinates (longitude, latitude).

**XMLMAP=***noaa_xmlmapfile*
specifies the fully qualified name of the location where the XML map file is automatically stored.

# Details: SASENOAA Interface Engine

The SASENOAA interface engine enables SAS programmers to access the NOAA Severe Weather Data Inventory (SWDI) data sets. All dates and times are in Greenwich mean time (GMT), and all latitude and longitude values for input parameters and output data are in the World Geodetic System 1984 (WGS84) datum, the standard for geospatial information.

## NOAA Severe Weather Data Inventory Data Sets

The following data sets are supported:

| | |
|---|---|
| **NX3TVS** | NEXRAD level III tornado vortex signatures |
| **NX3MESO** | NEXRAD level III mesocyclone signatures |
| **NX3MDA** | NEXRAD level III digital mesocyclone detection algorithm |
| **NX3HAIL** | NEXRAD level III hail signatures |
| **NX3STRUCTURE** | NEXRAD level III storm cell structure information |
| **PLSR** | Preliminary local storm reports |
| **WARN** | Severe thunderstorm, tornado, flash flood, and special marine warnings |

To display details about the available inventory for the NEXRAD level III data sets, enter the following URL in your browser:

**http://www.ncdc.noaa.gov/swdiws/xml**

The result is a list of available SWDI web service data sets, each with a description, begin date, end date, tile summary allowed (yes or no), and ID query allowed (yes or no). The web page at the following URL describes the column definitions and units for each NEXRAD III product and includes a discussion about accuracy:

**http://www.ncdc.noaa.gov/swdiws/csv/nx3hail:inv**

## NOAA NEXRAD Sites and Their ICAO Codes and Coordinates

A list of the NEXRAD sites and their corresponding WSR_ID codes, also known as International Civil Aviation Organization (ICAO) codes, is given in Table 51.2. For examples of how to use this important BY variable, WSR_ID, to subset and gather statistics about NOAA SWDI data, see Example 51.6 and Example 51.4.

**Table 51.2** List of NEXRAD Sites and Their Coordinates

| State | City | ICAO Location Identifier | Coordinates |
|---|---|---|---|
| PR | San Juan | TJUA | 18.1155998°N 66.0780644°W |

## SAS Output Data Set

You can use a SAS DATA step to write the selected NOAA Severe Weather Data Inventory data to a SAS data set. This enables you to use SAS software to easily perform data analysis. If you specify the name of the output data set in the DATA statement, the SAS engine supervisor creates a SAS data set that has the specified name in either the SAS Work library or, if specified, the SAS User library.

The contents of the SAS data sets are described in the section "Examples: SASENOAA Interface Engine" on page 3690 and summarized in Table 51.3 through Table 51.7. Each type of SWDI data set contains its own columns and variables, and the resulting SAS data set is named by the OUTXML= option specification. When the ID= option is used, another SAS data set is created with _M appended to the original data set name, and if the STAT= option is used, then another data set is created with _S appended to the original data set name.

You can use the PRINT and CONTENTS procedures to print your output data set and its contents. Alternatively, you can view your SAS output observations by opening the desired output data set in a SAS Explorer window. You can also use the SQL procedure with your SASENOAA engine libref to create a custom view of your data.

**Table 51.3** NX3HAIL NEXRAD Level III Hail Data Set

| Variable Name | Description |
|---|---|
| wsr_id | NEXRAD or Terminal Doppler Weather Radar (TDWR) site ID |
| cell_id | Cell ID unique to radar site |
| prob | Probability of hail (percentage) |
| sevprob | Probability of severe hail (percentage) |
| maxsize | Maximum size of hail (in) |

**Table 51.4** NX3MESO NEXRAD Level III Legacy Mesocyclone Data Set

| Variable Name | Description |
|---|---|
| wsr_id | NEXRAD or Terminal Doppler Weather Radar (TDWR) site ID |
| cell_id | Cell ID unique to radar site |
| cell_type | 'Meso', '3dc shr', or 'unc shr' |
| range | Range (naut. miles) |
| azimuth | Azimuth (deg) |
| base_height | Base height of feature (kft) |
| height | Height of feature (kft) |
| radial_diam | Diameter of feature along range axis (naut. mi) |
| az_diam | Diameter of feature in azimuth angle (deg) |
| shear | Wind shear (E-3/s) |

**Table 51.5** NX3STRUCTURE NEXRAD Level III Storm Structure Data Set

| Variable Name | Description |
|---|---|
| wsr_id | NEXRAD or Terminal Doppler Weather Radar (TDWR) site ID |
| cell_id | Cell ID unique to radar site |
| range | Range (naut. mi) |
| azimuth | Azimuth (deg) |
| vil | Vertically integrated liquid ($kg/m^2$) |
| max_reflect | Maximum reflectivity (dbz) |

**Table 51.6** NX3TVS NEXRAD Level III Tornado Vortex Signature Data Set

| Variable Name | Description |
|---|---|
| wsr_id | NEXRAD or Terminal Doppler Weather Radar (TDWR) site ID |
| cell_id | Cell ID unique to radar site |
| range | Range (naut. mi) |
| azimuth | Azimuth (deg) |
| max_shear | Maximum shear (E-3/s) |
| mxdv | Maximum delta-velocity (knots) |

**Table 51.7** NX3MDA NEXRAD Level III Digital Mesocyclone Detection Algorithm Data Set

| Variable Name | Description |
|---|---|
| wsr_id | NEXRAD or Terminal Doppler Weather Radar (TDWR) site ID |
| cell_id | Cell ID unique to radar site |
| str_rank | Strength ranking |
| scit_id | ID in storm cell identification and tracking (SCIT) algorithm |
| range | Range (naut. mi) |
| azimuth | Azimuth (deg) |
| ll_rot_vel | Low-level rotational velocity (kt) |
| ll_dv | Low-level delta-velocity (kt) |
| ll_base | Base (kft) |
| depth_kft | Depth (kft) |
| dpth_stmrl | Storm-relative depth (percentage) |
| max_rv_kft | Maximum rotational velocity height (kft) |
| max_rv_kts | Maximum rotational velocity (knots) |
| tvs | Tornado vortex signature (yes or no) |
| motion_deg | Motion direction (deg) |
| motion_kts | Motion speed (kts) |
| msi | Mesocyclone strength index |

The storm cell identification and tracking (SCIT) algorithm is an enhanced WSR-88D algorithm that is outside the scope of this chapter, but this section briefly summarizes some of the variables in the NX3MDA

data set. Storm-relative depth is the ratio (expressed in percentage) of meso-depth divided by the storm depth as determined by the SCIT algorithm's cell. Strength ranking and mesocyclone strength index (MSI) are nondimensional numbers that provide a way to determine the 3D-integrated intensity value of the detection.

Max_rv_kft is the height (in kilofeet) at which maximum rotational velocity was detected; it might or might not be associated with the lowest radar elevation angle. Max_rv_kts is the rotational velocity in knots; it might or might not be associated with the lowest radar elevation angle. The variables ll_rot_vel, ll_dv, and ll_base are always associated with the lowest elevation angle, so max_ and ll_ values are sometimes identical.

## SAS OUTXML File

The SAS XML (XML format) data that are returned by the NOAA SWDI web service are placed in a file that is named by the OUTXML= option. The SASENOAA interface engine creates a separate XML file for each SAS data set that is created. By default, OUTXML=NOAA, which creates a file named NOAA.xml in the current working directory. The SAS data set created when the XML data are read into SAS is placed in the folder specified by the physical path in the LIBNAME libref SASENOAA statement, which is described in the section "The LIBNAME *libref* SASENOAA Statement" on page 3677. The name that you specify in the OUTXML= option is also used to form the names of other data sets, but a suffix is added to the name to maintain the identity of the file, such as _M for the message file data set (ID= option) and _S for the statistics results data set (STAT= option).

## SAS XML Map File

The XML map that (by default) is automatically created is assigned the full path name that is given by the XMLMAP= option in your LIBNAME *libref* SASENOAA statement. The map file is either reused (not overwritten) if you specify AUTOMAP=REUSE or overwritten by a new map if you specify AUTOMAP=REPLACE (the default). The SASENOAA interface engine invokes the XMLV2 engine to create the map and to read the data into SAS.

## Virtual Globe Mapping Output and ZIP Files

When you specify the FORMAT=KMZ option, the SASENOAA interface engine requests the SWDI data in KMZ format. This results in the retrieval of a zipped KML file, which is then unzipped, saved with the .kml extension, and named by the OUTKMZ= option. In addition, the corresponding KMZ file is saved in the location specified by the fully qualified file name given in the KMZMAP= option. You can then use virtual globe software provided by Google Maps to import your KML data so that you can visualize the results both geospatially and timewise by holding the mouse pointer over each data point to see the variable values that correspond to the requested NOAA data set.

When you specify the FORMAT=SHP option, the SASENOAA engine requests the SWDI data in SHP format. This results in the retrieval of a zipped SHP file, which is then unzipped; the four resulting files are saved with the extensions .dbf, .prj, .shp, and .shx and named by the OUTSHP= option. In addition, the corresponding SHP ZIP file is saved in the location that is specified by the fully qualified file name given in the SHPMAP= option. You can then use virtual globe software such as SAS Bridge for Esri or use PROC MAPIMPORT and PROC GMAP to map your results.

### SAS KMZ Map File

The KMZ map (by default) is automatically created and placed in the file that is named by the fully qualified file name specified in the KMZMAP= option of the LIBNAME *libref* SASENOAA statement. The SASENOAA interface engine invokes PROC HTTP to create the map and to read the KMZ data into SAS.

### SAS OUTKMZ File

The SAS KMZ (zipped KML format) data that are returned by the NOAA SWDI web service are placed in a file that is named by the OUTKMZ= option. The SASENOAA interface engine unzips the KMZ file and creates a separate KML file for each SASENOAA engine libref. The SAS KML data file is given the name specified by the OUTKMZ= option and is placed in the location that is specified by the *physical-name* in your LIBNAME *libref* SASENOAA statement, which is described in the section "The LIBNAME *libref* SASENOAA Statement" on page 3677.

### SAS OUTSHP File

The SAS SHP (zipped Esri shapefiles format) data that are returned by the NOAA SWDI web service are placed in a file that is named by the OUTSHP= option. The SASENOAA interface engine creates a separate SHP ZIP file for each SASENOAA engine libref. The SASENOAA engine unzips the SHP data file, creating four files that are given the name specified by the OUTSHP= option plus the four file extensions (.dbf, .prj, .shp, and .shx). The four files are saved in the location that is specified by the *physical-name* in your LIBNAME *libref* SASENOAA statement, which is described in the section "The LIBNAME *libref* SASENOAA Statement" on page 3677.

### SAS SHP Map File

The SHP map (by default) is automatically created and placed in the file that is named by the fully qualified file name specified in the SHPMAP= option of the LIBNAME *libref* SASENOAA statement. The SASENOAA interface engine invokes PROC HTTP to create the map and to read the SHP data into SAS.

## Examples: SASENOAA Interface Engine

### Example 51.1: Retrieving Severe Storm Warning Data with ID= Option for a Specific Date

This example shows how to use the RANGE= option to retrieve severe storm warning data for a specific date. It also shows how to use the ID= option to read the message text for one ID (ID='397190'). When the ID= option is used, there are two output data sets. The first data set consists of the warning results data (named C1nco in the OUTXML= option), which contain the actual list of storm warnings for the date range that is specified in the RANGE= option. The second data set, C1nco_M, contains the text of the message ID specified in the ID= option, which in this example is 397190.

The output of the PRINT procedure for the Myc1nco data set is shown in Output 51.1.1.

```
options validvarname=any;

title 'Retrieve Warning Data with ID= Option for May 5, 2006';
libname mylib "/sasusr/noaa/doc/";

libname noaa sasenoaa "%sysget(NOAA_DATA)"
   noaaset=warn
   id='397190'                 /* create c1nco_m data set */
   range='20060505:20060506'
   outXml=c1nco                /* create c1nco  data set */
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(NOAA_DATA)cinco.map"
   format=xml;

data mylib.myc1nco;
   set noaa.c1nco;
run;

proc contents data=mylib.myc1nco; run;
proc print data=mylib.myc1nco(obs=5); run;
```

**Output 51.1.1** NOAA Severe Storm Warnings with ID= Option for May 5, 2006

**Retrieve Warning Data with ID= Option for May 5, 2006**

| Obs | ztime_start | ztime_end | id | warningtype | issuewfo | messageid |

| Obs | shape |
|---|---|
| 1 | POLYGON ((-95.02 37.64, -95.02 37.02, -94.57 37.03, -94.59 36.52, -94.1 36.51, -94.12 37.62, -95.02 37.64)) |
| 2 | POLYGON ((-90.06 29.34, -89.8 29.15, -89.55 29.26, -89.61 29.27, -89.6 29.35, -89.67 29.31, -89.77 29.33, -89.75 29.41, -89.81 29.43, -89.83 29.49, -89.93 29.51, -89.94 29.48, -90.07 29.55, -90.17 29.51, -90.06 29.43, -90.06 29.34)) |
| 3 | POLYGON ((-90.06 29.34, -89.8 29.15, -89.55 29.26, -89.61 29.27, -89.6 29.35, -89.67 29.31, -89.77 29.33, -89.75 29.41, -89.81 29.43, -89.83 29.49, -89.93 29.51, -89.94 29.48, -90.07 29.55, -90.17 29.51, -90.06 29.43, -90.06 29.34)) |
| 4 | POLYGON ((-94.09 31.63, -94.04 31.6, -93.95 31.6, -93.93 31.61, -93.84 31.6, -93.8 31.71, -93.84 31.78, -94.11 31.78, -94.13 31.63, -94.09 31.63)) |
| 5 | POLYGON ((-91.57 33.33, -91.73 33.01, -91.17 33.02, -91.14 33.07, -91.2 33.14, -91.09 33.16, -91.14 33.29, -91.57 33.33)) |

The data sets, C1nco and C1nco_M, reside in the test folder, because the NOAA_DATA environment variable is defined to be the test folder, and that is the physical path given in the SASENOAA LIBNAME statement inside the double quotes:

```
libname noaa sasenoaa "/sasusr/noaa/test/"
```

**NOTE:** The DATA step that creates the Mylib.Myc1nco data set reads only the C1nco data into the document folder that is specified by the Mylib libref:

```
libname mylib "/sasusr/noaa/doc/";
```

But the other data set, which contains the message text data set, C1nco_M, is not copied into the document folder; instead it remains in the test folder where it was originally created by the SASENOAA engine. You could also copy it into the document folder using the following code:

```
libname myMes "/sasusr/noaa/test/";

data mylib.myc1nco_M;
   set myMes.c1nco_M;
run;
```

You should not use the SASENOAA engine libref (NOAA) to access the already created SAS data set C1nco_M, because the message results were already placed in that data set automatically when you ran the example code to download the XML from the SWDI web service. The ID= option causes the SASENOAA engine to create the second data set, C1nco_M. After you read the data into SAS, you should use the normal Base SAS engine to access the resulting SAS data sets, by using the myMes libref in the SET statement that invokes the Base SAS engine.

## Example 51.2: Retrieving a Preliminary Local Storm Report by Using a Bounding Box

This example shows how to use a bounding box (by specifying the BBOX= option) to define the geographic area to retrieve a preliminary local storm report (PLSR) starting May 5 and ending May 10 (not including May 10). The output is shown in Output 51.2.1 for the data set My8bb and in Output 51.2.2 for the data set My8bb_M.

```
options validvarname=any;

title 'Retrieve the NOAA SWDI PLSR Data for a Bounding Box';
libname mylib "/sasusr/noaa/doc/";

libname noaa sasenoaa "%sysget(NOAA_DATA)"
   noaaset=plsr
   range='20060505:20060510'
   bbox='-91,30,-90,31'
   id='427200'
   outXml=my8BB
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(NOAA_DATA)my8BB.map"
   format=xml
   ;

data mylib.PLSRbb;
```

```
   set noaa.my8BB;
run;

proc contents data=mylib.PLSRbb; run;
proc print data=mylib.PLSRbb; run;
```

**Output 51.2.1** Preliminary Local Storm Report for a Bounding Box with the RANGE= Option

**Retrieve the NOAA SWDI PLSR Data for a Bounding Box**

| Obs | ztime | id | event | magnitude | city | county | state | source | shape |
|---|---|---|---|---|---|---|---|---|---|
| 1 | 2006-05-09T02:20:00 | 427540 | HAIL | 1 | 5 E KENTWOOD | TANGIPAHOA | LA | TRAINED SPOTTER | POINT (-90.43 30.93) |
| 2 | 2006-05-09T02:40:00 | 427536 | HAIL | 1 | MOUNT HERMAN | WASHINGTON | LA | TRAINED SPOTTER | POINT (-90.3 30.96) |
| 3 | 2006-05-09T02:40:00 | 427537 | TSTM WND DMG | -9999 | MOUNT HERMAN | WASHINGTON | LA | TRAINED SPOTTER | POINT (-90.3 30.96) |

| 5 | 2006-05-09T03:17:00 | 427200 | TORNADO | -9999 | 5 S FRANKLINTON | WASHINGTON | LA | LAW ENFORCEMENT | POINT (-90.14 30.78) |

The RANGE= option selects only the storm reports for dates from May 5 to May 10, 2006 (not including May 10), and the BBOX= option limits the data returned to the geographic area defined by the intersection of the specified coordinates: minimum longitude,

minimum latitude, maximum longitude, and maximum latitude. The ID='427200' option returns additional data in the SAS data set my8bb_M for the storm event that has that ID, and the results can be viewed using the following sample code. **NOTE:** The SASENOAA engine appends _M to the name specified in the OUTXML= option for these additional data.

```
libname myreport "/sasusr/noaa/test/";

proc contents data=myreport.my8bb_m; run;
proc print data=myreport.my8bb_m; run;
```

**Output 51.2.2** Preliminary Local Storm Report for Tornado Event, ID=427200

**Retrieve the NOAA SWDI PLSR Data for a Bounding Box**

| Obs | remarks | swdiXmlResponse_ORDINAL | result_ORDINAL |

## Example 51.3: Retrieving Mesocyclone Data for a Specific Date

This example shows how to retrieve mesocyclone data for a specific date. The NX3MESO legacy database displays information about the existence and nature of rotations associated with thunderstorms. Numerical output includes the azimuth, range, and height of the mesocyclone. Output 51.3.1 shows the NX3MESO data for RANGE='20060505:20060506'. **NOTE:** The end date, May 6, 2006, is exclusive of the data.

```
title 'Mesocyclone Data for May 5, 2006';
options validvarname=any;
libname mylib "/sasusr/noaa/doc/";

libname noaa sasenoaa "%sysget(NOAA_DATA)"
   noaaset=nx3meso
   range='20060505:20060506'   /*  stat='countGroupBy:WSR_ID' */
   outxml=c3nco
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(NOAA_DATA)c3nco.map"
   format=xml
   ;

data mylib.myc3nco;
   set noaa.c3nco;
run;

proc contents data=mylib.myc3nco; run;
proc print data=mylib.myc3nco(obs=10); run;
```

**Output 51.3.1** Mesocyclone Data for May 5, 2006

**Mesocyclone Data for May 5, 2006**

The results are sorted by the ztime variable, along with WSR_ID, which is a BY variable that can be referenced in the STAT= option (such as STAT='COUNTGROUPBY:WSR_ID') or in the FILTERBY= option (such as FILTERBY='WSR_ID:KBLX'). For a list of possible values for WSR_ID, see the ICAO Location Identifiers column in Table 51.2.

## Example 51.4: Retrieving Hail Data for One Weather Station

This example shows how to use the FILTERBY= and FILTERBYCONDITION= options to retrieve the data for one weather station (WSR_ID=KFWS) by using the hail storm data from the NX3HAIL database for May 21, 2011. The output is shown in Output 51.4.1.

```
options validvarname=any;

title 'Retrieve NX3HAIL Data for WSR_ID=KFWS on May 21, 2011';
libname mylib "/sasusr/noaa/doc/";

libname noaa sasenoaa "%sysget(NOAA_DATA)"
   noaaset=nx3hail
   range='20110521:20110522'
   filterBy='WSR_ID:KFWS'
```

```
   filterByCondition='WSR_ID:or'
   outXml=myCby
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(NOAA_DATA)myCby.map"
   format=XML
   ;

data mylib.HAILbyC;
   set noaa.myCby;
run;

proc contents data=mylib.HAILbyC; run;
proc print data=mylib.HAILbyC(obs=10); run;
```

**Output 51.4.1** Severe Hail Storm Data Using FILTERBY= Option for Weather Station KFWS on May 21, 2011

**Retrieve NX3HAIL Data for WSR_ID=KFWS on May 21, 2011**

| Obs | ztime | wsr_id | cell_id | prob | sevprob | maxsize | shape |

You can see that the output data set, myCby, returns only the data for WSR_ID='KFWS' because of the FILTERBY= and FILTERBYCONDITION= options.

## Example 51.5: Retrieving Tornado Vortex Signature Data within a Distance Specified by a Center and a Radius

When you specify NOAASET=NX3TVS, you retrieve data that show an intense gate-to-gate azimuthal shear associated with tornadic-scale rotation. This example shows how to search the NX3TVS database by using the RADIUS= and CENTER= options to retrieve tornado vortex signature data for the date range from May 5 to May 16, 2006. The output is shown in Output 51.5.1.

```
options validvarname=any;

title 'Tornado Vortex Signatures with CENTER= and RADIUS= Options for a Date Range';
libname mylib "/sasusr/noaa/doc/";

libname noaa sasenoaa "%sysget(NOAA_DATA)"
```

```
   noaaset=nx3tvs
   range='20060505:20060516'
   radius='15.0'
   center='-102.0,32.7'
   outxml=my2CR
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(NOAA_DATA)my2CR.map"
   format=xml
   ;

data mylib.TVS2CR;
   set noaa.my2CR;
run;

proc contents data=mylib.TVS2CR; run;
proc print data=mylib.TVS2CR(obs=10); run;
```

**Output 51.5.1** NX3TVS Data Search Using CENTER= and RADIUS= Options

## Example 51.6: Retrieving Digital Mesocyclone Detection Algorithm Data for a Specific Date

The digital mesocyclone detection algorithm data (NX3MDA) are the successor to the legacy mesocyclone data (NX3MESO) and are designed to display information about the existence and nature of rotations associated with thunderstorms. Numerical output includes the azimuth, range, and height of the mesocyclone. This example retrieves these data for June 8, 2016. The first 10 observations are shown in Output 51.6.1.

```
options validvarname=any;

title 'Digital Mesocyclone Detection Algorithm Data for June 8, 2016';
libname mylib "/sasusr/noaa/doc/";
libname noaa sasenoaa "%sysget(NOAA_DATA)"
   noaaset=nx3mda
   range='20160608:20160609'
   stat='countGroupBy:WSR_ID'  /* need this to create c9nco_S */
   outXml=c9nco
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(NOAA_DATA)c9nco.map"
   format=xml
   ;

data mylib.myc9nco;
   set noaa.c9nco;
run;

proc contents data=mylib.myc9nco; run;
proc print data=mylib.myc9nco(obs=10); run;
```

**Output 51.6.1** Digital Mesocyclone Detection Algorithm Data for June 8, 2016

**Digital Mesocyclone Detection Algorithm Data for June 8, 2016**

The SASENOAA engine creates a temporary data set named OUTTP1 that shows the recorded feature (mesocyclone detection algorithm) count for each BY group by WSR_ID. The count represents the number of mesocyclones detected by that weather station. This information can be helpful for determining which geographic area to focus on and is generated automatically by the engine when you specify STAT='COUNTGROUPBY:WSR_ID'. The SASENOAA engine does not save this data set unless the STAT= option is specified; this results in a saved statistics data set that is named by appending _S to the name specified in the OUTXML= option, as shown by the following statements:

```
libname mystats "/sasusr/noaa/test/";

proc contents data=mystats.c9nco_S; run;
proc print data=mystats.c9nco_S(obs=20); run;
```

**Output 51.6.2** Digital Mesocyclone Detection Algorithm Statistics Data for June 8, 2016

For brevity, only the first 10 out of 525 observations are printed by using the OBS= option in the PROC PRINT statement for Output 51.6.1. The first 20 observations of the statistics data set c9nco_S are shown in Output 51.6.2.

In Example 51.8, another method is used to subset results by location when you use the TILE= option. In Example 51.7, the STAT= option is used to collect statistics based on a tile summary in a data set (Mytile_S).

## Example 51.7: Retrieving Tornado Vortex Signature Data Statistics by Using Tile Summary Statistics

This example retrieves tornado vortex signature data statistics for the range from May 5 to May 16, 2009, but only returns the actual NX3TVS data for 11 days starting on May 5, 2006. **NOTE:** The NOAA SWDI web service allows a range longer than one year for statistics reporting, but it allows only up to a year for the range of data that you retrieve. The SASENOAA engine uses the specified start and end dates unless the range exceeds one year (of data retrieval). When the range exceeds one year, the SASENOAA engine issues an invalid range warning and defaults to a different end date. The new end date uses an end year that matches the start date's year. Sometimes this default behavior might generate an end date that precedes the start date, resulting in only one day (corresponding to the start date) of data retrieved for the OUTXML= options results file.

This example generates an 11-day default range when the end year is changed to 2006 (from 2009); the results in the Mytile data set are shown in Output 51.7.1. The Mytile_S data set shows the recorded feature

(tornado vortex signature) count for the specified tile in the tile summary specification, and it includes the centerlat, centerlon, day (date), fcount (feature count for that day), and shapefile. The count represents the number of tornado vortex signatures detected within the tile summary coordinates. This information can be helpful for determining which geographic area and dates to focus on.

**NOTE:** The date range that is specified in the RANGE= option is invalid for the OUTXML data because it spans more than one year, but the STAT= option can use the longer range (as specified) to report the tile summary statistics. For the file specified in the OUTXML= option, the SASENOAA engine issues a warning that the range is invalid, and it changes the end year to the same year as the start year in an attempt to keep the range under one year. In this example, for brevity, OBS=10 is specified in the PROC PRINT statement. You can use the following statements to generate the statistics results, which are shown in Output 51.7.2.
**NOTE:** The data that are shown in Output 51.7.2 are restricted only by the date range, not by the tile summary coordinates. To restrict the data results by the coordinates of a tile, use the TILE= option as shown in Example 51.8.

```
libname mystats "/sasusr/noaa/test/";

proc contents data=mystats.mytile_S; run;
proc print data=mystats.mytile_S; run;
```

**Output 51.7.2** Tornado Vortex Signature Statistics Using the STAT=TILESUM Option

**Retrieve NOAA NX3TVS Tile Summary Statistics and Data for Date Range**

| Obs | day | centerlat | centerlon | fcount | shape |
|---|---|---|---|---|---|
| 1 | 2007-03-29 | 32.7 | -102 | 2 | POLYGON ((-102.05 32.65, -102.05 32.75, -101.95 32.75, -101.95 32.65, -102.05 32.65)) |
| 2 | 2007-09-07 | 32.7 | -102 | 1 | POLYGON ((-102.05 32.65, -102.05 32.75, -101.95 32.75, -101.95 32.65, -102.05 32.65)) |
| 3 | 2008-05-27 | 32.7 | -102 | 4 | POLYGON ((-102.05 32.65, -102.05 32.75, -101.95 32.75, -101.95 32.65, -102.05 32.65)) |
| 4 | 2008-06-20 | 32.7 | -102 | 2 | POLYGON ((-102.05 32.65, -102.05 32.75, -101.95 32.75, -101.95 32.65, -102.05 32.65)) |
| 5 | 2009-04-11 | 32.7 | -102 | 1 | POLYGON ((-102.05 32.65, -102.05 32.75, -101.95 32.75, -101.95 32.65, -102.05 32.65)) |

**NOTE:** You can get one day of results for the OUTXML= option by using an end date that is earlier than the start date specified in the RANGE= option. Furthermore, in this example, because both the specified start and end dates are in May, if the specified end date had been May 1, 2009, instead of May 16, 2009, then the statistics results would have been very similar, but the XML file would contain only the results for May 5, 2006. The SASENOAA engine forces the range to use the same year when the specified range exceeds one year. This can sometimes result in an invalid end date that precedes the start date, but the SASENOAA engine then discards the end date so that the range spans only one day, which is the start date.

## Example 51.8: Retrieving Tornado Vortex Signature Data by Using Tile Coordinates

This example retrieves the tornado vortex signature (TVS) data for the range May 5 to May 16, 2006, but it selects only the data that fall inside the geographic area defined by the specified tile's longitude and latitude coordinates (to the nearest tenth of a degree). Output 51.8.1 shows five observations within range of the coordinates specified in the TILE= option.

```
options validvarname=any;

title 'Retrieve NOAA NX3TVS Using TILE= Option with a Date Range';
libname mylib "/sasusr/noaa/doc/";
libname noaa sasenoaa "%sysget(NOAA_DATA)"
   noaaset=nx3tvs
   range='20060505:20060516'
   tile='-102.12,32.62'
   outXml=my2TL
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(NOAA_DATA)my2TL.map"
   format=xml
   ;

data mylib.TVStil;
   set noaa.my2TL;
run;

proc contents data=mylib.TVStil; run;
proc print data=mylib.TVStil; run;
```

**Output 51.8.1** Using the TILE= Option to Retrieve TVS Data for a Date Range

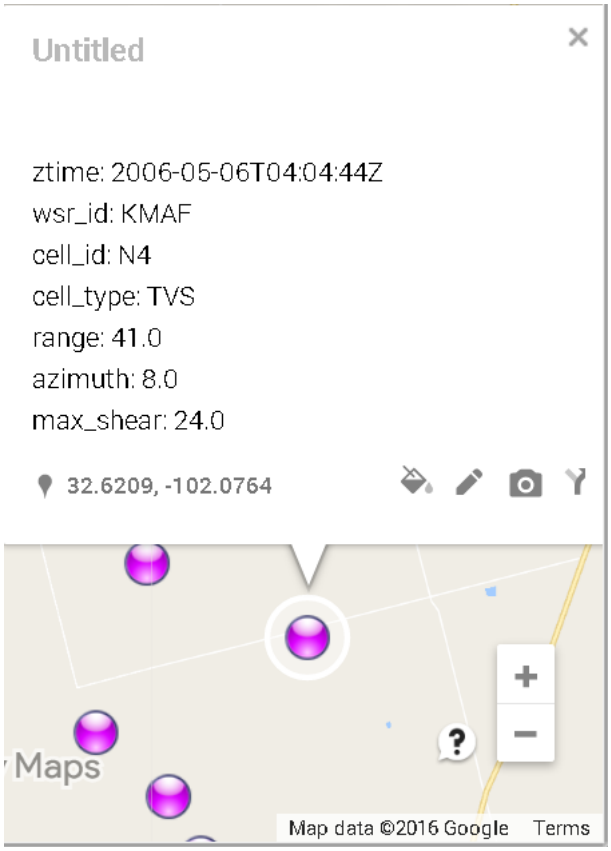
**Retrieve NOAA NX3TVS Using TILE= Option with a Date Range**

| Obs | ztime | wsr_id | cell_id | cell_type | range | azimuth | max_shear | mxdv | shape |
|---|---|---|---|---|---|---|---|---|---|
| 1 | 2006-05-06T00:41:29 | KMAF | D9 | TVS | 37 | 6 | 39 | 85 | POINT (-102.112726356403 32.5574494581267) |
| 2 | 2006-05-06T03:56:18 | KMAF | N4 | TVS | 39 | 3 | 30 | 73 | POINT (-102.14873079873 32.5933553250156) |
| 3 | 2006-05-06T03:56:18 | KMAF | N4 | TVS | 42 | 4 | 20 | 52 | POINT (-102.131167022161 32.6426287452898) |
| 4 | 2006-05-06T04:00:30 | KMAF | N4 | TVS | 38 | 5 | 35 | 86 | POINT (-102.123671677514 32.5751241756203) |
| 5 | 2006-05-06T04:04:44 | KMAF | N4 | TVS | 41 | 8 | 24 | 62 | POINT (-102.076389686189 32.6209390786829) |

**NOTE:** You could add the option STAT='COUNTGROUPBY:WSR_ID', and the statistics would be stored in a data set named My2TL_S. The statistics results data show all the reporting weather stations by WSR_ID for the specified date range and the summary count of TVS features recorded for each station.

If you want to see a Google map of the same tile's NX3TVS data, you can rerun this example with the FORMAT=KMZ, KMZMAP=, and OUTKMZ= options to download the corresponding KML file. After you import it to Google My Maps, you see a map like the one shown in Output 51.8.2. When you click on the rightmost data point, you can examine the details of that particular location on the map.

**Output 51.8.2** Screen Shot of Google Earth Map of the NX3TVS Data for TILE=-102.12,32.62



## Example 51.9: Mapping Hail Data in a Geospatial Framework (KMZ Format) for a Specific Weather Station

This example retrieves the same hail data as in Example 51.4, but instead of requesting the XML format, it requests the KMZ format, so that you can look at the data in a geospatial framework such as that provided by Google Maps.

```
options validvarname=any;

title 'Retrieve NOAA NX3HAIL Data for WSR_ID=KFWS on May 21, 2011';
libname mylib "/sasusr/noaa/doc/";
libname noaa sasenoaa "%sysget(NOAA_DATA)"
   debug=on
   noaaset=nx3hail
   range='20110521:20110522'
   filterBy='WSR_ID:KFWS'
   filterByCondition='WSR_ID:or'
   outkmz=myK2by
   automap=replace
   mapref=MyMap
   kmxmap="%sysget(NOAA_DATA)myK2by.kmz"
```

```
   format=kmz
   ;

data mylib.HAILby2;
   set noaa.myK2by;
run;

proc contents data=mylib.HAILby2; run;
proc print data=mylib.HAILby2; run;
```

**Output 51.9.1** Using FORMAT= KMZ Option to Retrieve NX3HAIL Data for WSR_ID:KFWS

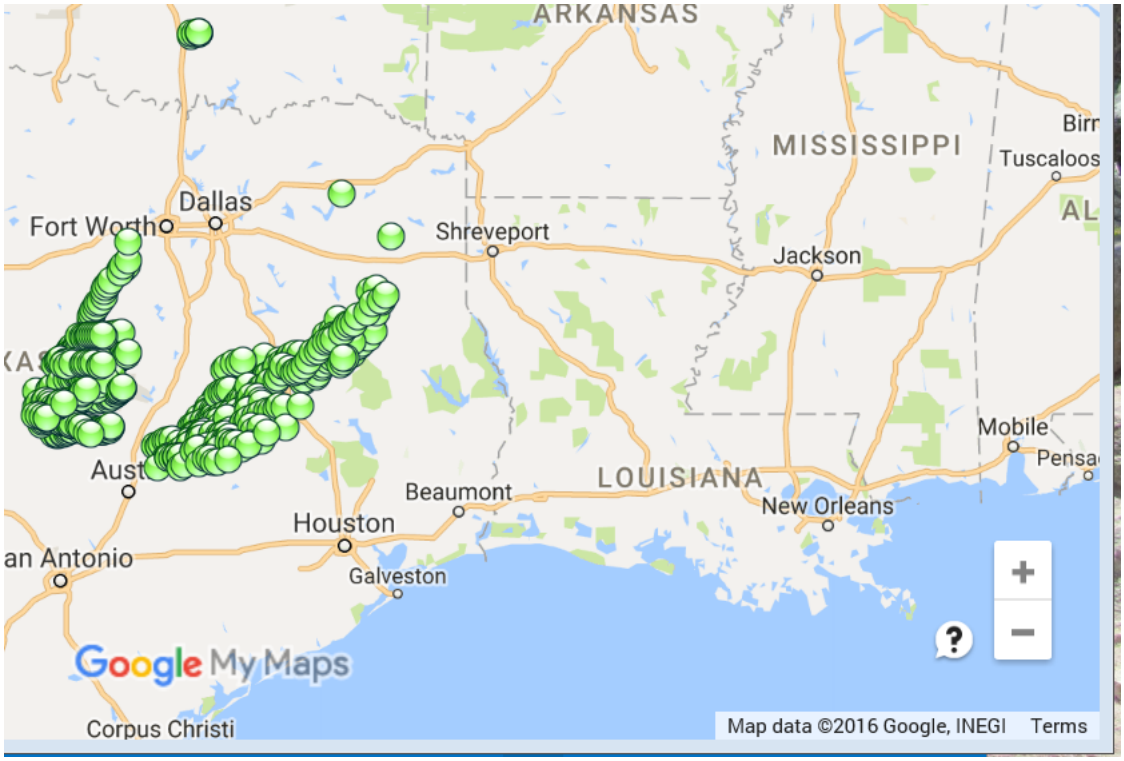
**Files in the ZIP file**

| Obs | memname | isFolder | memcount |
|---|---|---|---|
| 1 | swdi-export.kml | 0 | 1 |

**NOTE:** The KMZ file shown in Output 51.9.1 is automatically unzipped and renamed *MYK2BY.kml* by the SASENOAA engine.

Output 51.9.2 shows the Google Earth map for the observations within range of the weather station designated by the filter WSR_ID=KFWS. When you import your KML file (*MYK2BY.kml*) into Google My Maps, you can examine the details of each set of mapped coordinates on the map by clicking on the data point you want to look at.

**Output 51.9.2** Screen Shot of Google Earth Map of the NX3HAIL Data in MYK2BY.kml



## Example 51.10: Mapping Hail Data in a Geospatial Framework (SHP Format) for a Specific Weather Station

This example retrieves the same hail data as in Example 51.9, but instead of requesting the KMZ format, it requests the SHP format, so that you can look at the data in a geospatial framework such as that provided by Esri mapping software. Output 51.10.1 shows the retrieved Esri shapefiles that contain the data for the observations within range of the weather station designated by the filter WSR_ID=KFWS.

```
options validvarname=any;

title 'Retrieve NOAA NX3HAIL Data for WSR_ID=KFWS on May 21, 2011';
libname mylib "/sasusr/noaa/doc/";
libname noaa sasenoaa "%sysget(NOAA_DATA)"
   debug=on
   noaaset=nx3hail
   range='20110521:20110522'
   filterBy='WSR_ID:KFWS'
   filterByCondition='WSR_ID:or'
   outshp=mySby
   automap=replace
   mapref=MyMap
   shpmap="%sysget(NOAA_DATA)mySby.map"
   format=shp
   ;

data mylib.HAILbyS;
   set noaa.mySby;
run;

proc contents data=mylib.HAILbyS; run;
proc print data=mylib.HAILbyS; run;
```

**Output 51.10.1** Using FORMAT= SHP Option to Retrieve NX3HAIL Data for WSR_ID:KFWS

**Files in the ZIP file**

| Obs | memname | isFolder | memcount |
|---|---|---|---|
| 1 | swdi-nx3hail-all-20180904-035109-488.dbf | 0 | 4 |
| 2 | swdi-nx3hail-all-20180904-035109-488.prj | 0 | 4 |
| 3 | swdi-nx3hail-all-20180904-035109-488.shp | 0 | 4 |
| 4 | swdi-nx3hail-all-20180904-035109-488.shx | 0 | 4 |

**NOTE:** The SASENOAA engine automatically unzips the ZIP file that contains the four shapefiles and renames them *MYSBY.dbf*, *MYSBY.prj*, *MYSBY.shp*, and *MYSBY.shx*.

# Overview: SASEOECD Interface Engine

The SASEOECD interface engine enables SAS users to retrieve time series data from the Organisation for Economic Co-operation and Development (OECD) website. This website offers access to statistical data on topics such as agriculture and fisheries, economy, education, employment, energy, environment, finance, health, industry and entrepreneurship, innovation, insurance and pensions, international migration, internet economy, investment, rural and urban development, science and technology, social and welfare issues, tax, trade, and transport, as well as access to the OECD.Stat data warehouse. Time series are offered in yearly, semesterly, quarterly, and monthly frequencies.

The SASEOECD interface engine uses the LIBNAME statement to enable you to download OECD online data from the website at the following URL:

**http://stats.oecd.org/**

It also enables you to specify which time series you want to retrieve, by using the corresponding data set ID and keysets. You specify the time range of the retrieved data by using a start date and an end date. You can then use the SAS DATA step to perform further subsetting, retrieve the data, and store the resulting time series in a SAS data set. You can view a list of all OECD databases on the web page at the following URL:

**http://www.oecd.org/statistics/listofoecddatabases.htm**

The SASEOECD interface engine supports Linux X64 (LAX) and Windows. Although the SASEOECD engine uses the OECD's sdmx-json statistical online API, it is not endorsed or certified by the Organisation for Economic Co-operation and Development. By using the SASEOECD interface engine, you are agreeing to comply with the terms of use, which are described on the web page at the following URL:

**http://www.oecd.org/termsandconditions/**

To get started using the SASEOECD engine, follow the steps in the next section, which enable you to view the MEI_CLI (Composite Leading Indicators in the Main Economic Indicators) database to retrieve the time series CSCICP03, also known as "OECD Standardized CCI, Amplitude adjusted (Long term average=100, sa)." Understanding how each OECD data set is organized enables you to write the SAS code to access the data. The sample SAS code for accessing the OECD's MEI_CLI data set appears at the end of the section.

# Getting Started: SASEOECD Interface Engine

You can query the OECD API by using the graphical user interface (GUI) at

**http://stats.oecd.org**

The OECD documentation on the web page at the following URL describes how to use the OECD GUI:

**https://stats.oecd.org/Content/themes/OECD/static/help/WBOS%20User%20Guide%20(EN).PDF**

## Using the OECD Graphical User Interface

*Step 1*: Go to the web page at the following URL. This is where you start to build your query for retrieving OECD data.

**http://stats.oecd.org**

*Step 2*: On the left side, click **Popular Queries** and select **Composite Leading Indicators**. You can view the default selection of Main Economic Indicators (MEI) data for Composite Leading Indicators on the main screen.

*Step 3*: Choose **Customize ►Selection**. The selection keys (also called dimensions) are shown. They are **Subject**, **Country**, and **Time & Frequency**. Click **Subject** and then select the box labeled **OECD Standardized CCI, Amplitude adjusted (Long term average=100), sa**. When you hover the mouse pointer over **CCI**, the subject code is displayed as CSCICP03. In the sample code at the end of this section, the INSET0= data set defines Key0 as CSCICP03 in KeyList0.

*Step 4*: Click **Country** (in the same Customize selection window). Now select the countries that you want to retrieve the data for, which in this case are Australia, Germany, and Japan. When you hover the mouse pointer over each country name, you can see its corresponding country code. In the sample code at the end of this section, the INSET1= data set defines Key1 as AUS, DEU, and JPN in KeyList1.

*Step 5*: Click **Time & Frequency** (in the same Customize selection window). Select the monthly frequency. Click **Select date range**, and choose a start date of 2015M9 and an end date of 2017M8.

*Step 6*: Click **View data**. If you get an error, repeat steps 2 through 6. Then select **Export ►Developer API**, and click the **Generate API queries** button.

*Step 7*: The **Data query** box shows the URL for the selected data that you want to retrieve:

**http://stats.oecd.org/SDMX-JSON/data/MEI_CLI/CSCICP03.AUS+DEU+JPN.M/all?startTime=2015-09&endTime=2017-08&dimensionAtObservation=allDimensions**

*Step 8*: From the generated API query, find the data set code, MEI_CLI, which follows 'SDMX-JSON/data/' in the generated API query (URL). In the sample code at the end of this section, the SETID= option is set to MEI_CLI.

*Step 9*: The dimensions are described in the API query (URL) after the OECD data set code and are separated by periods. In the sample code, Key0 (in KeyList0) gives the subject as 'CSCICP03'; Key1 (in KeyList1) gives the country as 'AUS', 'DEU', and 'JPN'; and Key2 (in KeyList2) gives the frequency as 'M'.

*Step 10*: In the sample code at the end of this section, the START= and ENDTIME= options are defined using the startTime= and endTime= parameters from the generated API query. The format of the START= and END= options is shown in Table 52.2.

The statements at the end of this section enable you to access the setID MEI_CLI (Composite Leading Indicators in the Main Economic Indicators database) to retrieve the time series CSCICP03, also known as "OECD Standardized CCI, Amplitude adjusted (Long term average=100, sa)."

The SETID= option specifies the data set's ID code in order to retrieve data from the OECD library of data. You can view the data set from the OECD website by referring to the data set code at the following URL, which in this example is MEI_CLI:

**http://stats.oecd.org/Index.aspx?DataSetCode=MEI_CLI**

To specify the INSET*n*= option, name the SAS input data set for each of the three keysets that define your selection: INSET0=KEYLIST0, INSET1=KEYLIST1, and INSET2=KEYLIST2.

The OUT= option specifies both the name of the resulting JSON file(s) and the name of the SAS data set (MEI3C).

The range of the retrieved data is determined by the START= and END= options. Because this example retrieves monthly data, the start date (2015-09) and the end date (2017-08) are specified in "YYYY-MM" format.

The JSON data that the OECD website returns are placed in a file that is named by the OUT= option—in this case, *MEI3C.json*. **NOTE:** The SASEOECD engine appends a numeral to the JSON file name, and the file extension (.json) is excluded from the file name that appears in the OUT= option. When the SET statement is executed, the JSON data are read (and merged) into a SAS data set named MEI3C.sas7bdat, which resides in the location that is specified inside the string enclosed in double quotation marks in the SASEOECD LIBNAME statement.

The result, MEI3C, is named in the DATA step in the SET statement and is shown in Output 52.1. The preceding example uses three keysets. These keysets are used to request data for every possible combination of each key's values. Some combinations produce data, and some do not, but after each combination's requested data are downloaded, the results are merged into one data set. These data are shown in Output 52.1.

For another example that uses more SASEOECD LIBNAME statement options, see the section "Examples: SASEOECD Interface Engine" on page 3734.

```
options validvarname=any;

# Syntax: SASEOECD Interface Engine

The SASEOECD interface engine uses standard engine syntax to read the observations or data values for one or more time series from an OECD data set. Table 52.1 summarizes the options that the SASEOECD engine uses.

**Table 52.1** Summary of LIBNAME *libref* SASEOECD Options

| Option | Description |
|---|---|
| DEBUG= | Specifies whether to include diagnostic message logging in the SAS log window |
| ENDTIME= | Specifies the end date for the retrieved data |
| INSET*n*= | Specifies the name of the input data set that contains values for a particular keyset, such as subject, measure, country, and frequency, where $n < 10$, and begins with $n = 0$ |
| OUT= | Specifies the name of the SAS data set and the JSON file, which contains the data that the SASEOECD interface engine returns |
| SETID= | Specifies the required OECD data set code that enables you to access the data that the OECD website provides |
| START= | Specifies the start date for the retrieved data |

## The LIBNAME *libref* SASEOECD Statement

**LIBNAME** *libref* **SASEOECD** '*physical-name*' *options* **;**

The LIBNAME statement assigns a SAS library reference (libref) to the physical path of the directory of OECD data files in which the downloaded OECD JSON data are stored. The required *physical-name* argument specifies the location of the folder where your OECD JSON data reside. It should end with a backslash if you are in a Windows environment or a forward slash if you are in a UNIX environment.

You can specify the following *options*:

**DEBUG=ON | OFF**

specifies whether or not to include diagnostic message logging in the SAS log window. This information can be very useful for troubleshooting a problem.

**ENDTIME=***oecd_endTime*

specifies the end date for requesting OECD data. Specify *oecd_endTime* in one of the formats shown in Table 52.2. The valid data range of available data varies with each OECD data set. You can check data availability by selecting the period that you want to download on the OECD data set's web page and using the Export window to select the **Developer API** tab. You can preview the generated URL link for downloading the selected data by clicking **Generate API queries**. The URL for the data query shows the time period in the request. The OECD URL parameter, *&EndTime=*, corresponds to the SASEOECD engine's ENDTIME= option.

**INSET***n*=*oecd_keylist_name*
specifies the name of the input data set, INSET*n*, that contains the key values to select the data that you want to retrieve. There are *n* + 1 insets, depending on the dimensions of the OECD data set, where *n* cannot exceed 9. Key0 is defined in INSET0, Key1 is defined in INSET1, and so on, up to Key*n*, which is defined in INSET*n*, where *n* < 10.

**OUT=***oecd_jsonfile*
specifies the name of both the JSON file (downloaded) and the SAS data set that is created when the JSON data are read into SAS. You can use the OUT= option to name your JSON data file. It is stored in the SAS Work library. The SAS data set that is created (when the JSON data are read into SAS) is stored in the folder specified by *physical-name,* and you can refer to it by using the myLib libref in your SASEOECD LIBNAME statement.

**SETID='***oecd_setid***'**
specifies the OECD data set ID or code that enables you to access the data set corresponding to that code. The data set ID or code is the same one that you use on the OECD web page at the following URL:

```
http://stats.oecd.org/Index.aspx?DataSetCode=<your_data_set_code>
```

For a list of some of the available OECD data sets and their key fields, see Table 52.5 in the section "Data Elements Reference: SASEOECD Interface Engine" on page 3720.

**START=***oecd_start*
specifies the start date for requesting OECD data. Specify *oecd_start* in one of the formats shown in Table 52.2.

**Table 52.2** Formats for START= Option and ENDTIME= Option

| Interval or Frequency | Format |
|---|---|
| Year | YYYY |
| Year-semester | YYYY-S1 – YYYY-S2 |
| Year-quarter | YYYY-Q1 – YYYY-Q4 |
| Year-month | YYYY-M1 – YYYY-M12 |

The valid data range for available data varies with each OECD data set. You can check data availability by selecting the period that you want to download on the data set's web page and using the Export window to select the **Developer API** tab. You can preview the generated URL link for downloading the selected data by clicking **Generate API queries**. The URL for the data query shows the time period in the request. The OECD URL parameter, *&StartTime=*, corresponds to the SASEOECD engine's START= option.

# Details: SASEOECD Interface Engine

The SASEOECD interface engine enables SAS users to access time series data that are stored in OECD data sets that the OECD website provides. Every OECD data set is identified by a unique set of keys (a keyset). A data set must have at least one key (excluding the date/time) and can have up to ten keys. The SASEOECD engine retrieves each time series and names each one by concatenating the *n* keysets that are stored in the following format:

**key0.key1.key2.<...up to key*n*>**

The keys are listed on the OECD web page for each data set at the following URL:

**http://www.oecd.org/statistics/listofoecddatabases.htm**

Click the data set symbol to view the web page that gives the details for that data set.

## Customizing Your Selection Keys

In the OECD GUI for your OECD data set, from the **Customize** menu click **Selection** to view the defining keysets for that data set. When you select a key, you see all the possible choices for selecting the values for that key. Check or clear the box next to each key value to select or deselect it. After you make a selection for each key listed on the **Selection** menu, you can proceed to exporting the selected OECD data.

## Exporting Your Data

From the **Export** menu, click **Developer API** to view the query necessary to retrieve your selected data in JSON format. Complete the query builder form if you want to be notified about updates to the OECD's application interface (API). Click **Generate API queries** to see the URL query for your data selection. If you want, you can use this URL to specify the key values in each inset for your SAS code. The keys are separated by periods, and the order of the keys in the URL shows Key0 first, Key1 second (after the dot), and so on, up to Key*n*. Each '+' separates the values for that key.

## Dimensions of the OECD Data

When you specify the SETID= option, you give the OECD data set code for the data set that you want to access. The SASEOECD engine checks the OECD website for the validity of the specified data set code by requesting its data-flow structure. If the request is successful, the SETID is validated, and the SASEOECD engine prints the data-flow information about the selection keys available for the requested OECD data. The dimensions (key values) for SETID=MEI_CLI are given in Table 52.3.

**Table 52.3** Dimensions of the MEI_CLI Data Set

| Obs | keyPosition | id | name | role |
|---|---|---|---|---|
| 1 | 0 | SUBJECT | Subject | |
| 2 | 1 | LOCATION | Country | REF_AREA |
| 3 | 2 | FREQUENCY | Frequency | FREQ |
| 4 | 3 | TIME_PERIOD | Time | TIME_PERIOD |

Key position 0 corresponds to Key0 in the first inset (INSET=KEYLIST0). Key position 1 corresponds to Key1 in the second inset (INSET=KEYLIST1). Key position 2 corresponds to Key2 in the third inset (INSET=KEYLIST2).

The last key position, Time_Period, is determined by the options START= and ENDTIME=.

## SAS INSET Data Sets

The query URL for the MEI_CLI data set that selects the three keys (SUBJECT=CSCICP03, COUNTRY=Australia, Germany and Japan, TIME/FREQUENCY=MONTHLY) looks like this:

```
http://stats.oecd.org/SDMX-JSON/data/MEI_CLI/CSCICP03.AUS+DEU+JPN.M/
all?startTime=2016-04&endTime=201803
```

The keys are shown in the part of the preceding URL that follows the data set code:

```
CSCICP03.AUS+DEU+JPN.M/all?startTime=2016-04&endTime=201803
```

The keys end at the slash preceding “all”:

```
CSCICP03.AUS+DEU+JPN.M
```

The key types are separated by periods. The first key is “CSCICP03”, which is named Key0.

As shown in the following code, the first inset, KeyList0, contains the Key0 value for subject, which is “CSCICP03”. Because there is only one subject (time series) in the request, there is only one value listed for Key0.

```
/* specify selection keys; key0 is the time series */
data keylist0;
   length key0 $8;
   key0='CSCICP03'; output;
run;
```

In KeyList0, use a LENGTH statement so that the string “CSCICP03” is not truncated. It is a good idea to use a LENGTH statement to account for the maximum number of bytes that a key value can have. This ensures that SAS does not truncate the key values in any of the input data sets, so that the key values match the ones expected in the OECD data set.

The second key type is found in "AUS+DEU+JPN", so it is named Key1 and has three values separated by "+". As shown in the following code, the second inset, KeyList1, contains the key values for country. Each value of country must have its own output line, so there are three output lines, each with a different country value. There are three values listed for Key1:

```
/* select Australia, Japan, and Germany */
data keylist1;
   length key1 $3;
   key1='AUS'; output;
   key1='JPN'; output;
   key1='DEU'; output;
run;
```

The third key type, which follows the second, is "M" and is named Key2. The third inset defines the frequency as monthly. The SASEOECD engine can provide only one frequency per libref view. If you want, you can specify another SASEOECD LIBNAME statement, using a different inset for another frequency.

The following inset for frequency defines Key2, which is contained in KeyList2:

```
/* select monthly data */
data keylist2;
   length key2 $2;
   key2='M'; output;
run;
```

## Building the URL Request for OECD Data

The SASEOECD interface engine takes the crossproduct of all the insets' key values. Before you request the MEI_CLI data set, the SASEOECD engine takes the crossproduct of KeyList0 with KeyList1 and KeyList2. Each row in Table 52.4 represents a request for time series data. If data are returned, then the SASEOECD engine names the time series by using that row's values (separated by '.'). The first time series is named "CSCICP03.AUS.M", the second is named "CSCICP03.JPN.M", and the third is named "CSCICP03.DEU.M".

**Table 52.4** Cross-Key Data Set for MEI_CLI

| Obs | Key0 | Key1 | Key2 |
|---|---|---|---|
| 1 | CSCICP03 | AUS | M |
| 2 | CSCICP03 | JPN | M |
| 3 | CSCICP03 | DEU | M |

## SAS Output Data Set

You can use a SAS DATA step to write the selected OECD data to a SAS data set. This enables you to use SAS software to easily analyze the data. If you specify the name of the output data set in the DATA statement, the SAS engine supervisor creates a SAS data set that has the specified name in the location specified by the SASEOECD libref's *physical-name*.

The contents of the SAS data set include the date of each observation and the name of each time series that is read from the OECD website.

You can use the PRINT and CONTENTS procedures to print your output data set and its contents. Alternatively, you can view your SAS output observations by opening the desired output data set in a SAS Explorer window. You can also use the SQL procedure with your SASEOECD libref to create a custom view of your data.

Because each SASEOECD libref results in retrieving the requested data from the OECD website, it is best to use a DATA step to store the data. You should avoid the inefficient use of the SASEOECD libref that follows:

```
proc print data=oecd.MEI3C; run;
```

This statement uses the member name, MEI3C, in the PROC PRINT statement that invokes the OECD libref to run the SASEOECD engine. It is more efficient to refer to the SAS data set myMEI repeatedly than to invoke the interface engine repeatedly. This use of the member name, MEI3C, corresponds to specifying the OUT=MEI3C option. Although using this statement might seem easier, it is not as efficient, because every time you use the SASEOECD libref, the SASEOECD engine reads the entire JSON file into SAS again.

## Data Elements Reference: SASEOECD Interface Engine

Table 52.5 lists the OECD data set codes (setIDs) and respective selection keys for each data set. This table is not exhaustive, nor is it complete, because the OECD website is updated constantly. Consult the website for current OECD data set codes and customized selection keys. For most OECD data sets, the time is not represented in a key or inset, but instead is defined by the start and end dates. Time or frequency is included in Table 52.5 for information purposes, but it is usually not used in the INSET*n*= option if the data are available only in one frequency. **NOTE:** The table is organized by topic rather than alphabetically so that it matches the order of the OECD catalog online.

**Table 52.5** OECD Data Set Codes and Keys

# Examples: SASEOECD Interface Engine

## Example 52.1: Retrieving OECD Gross Domestic Product Data for One Region

You can start building an OECD query for this example on the web page at the following URL:

```
http://stats.oecd.org/index.aspx?datasetcode=SNA_TABLE1_SNA93
```

Select **Customize ►Selection**, which shows the dimension values that are the key values for **Country**, **Transaction**, and **Measure**. Select **Euro area (17 countries)** from the **Country** list. Select **Gross domestic product (output approach)** from the **Transaction** box, and **Current prices** from the **Measure** list. Specify the Observation period to limit the time range to the span 1995 to 2013. On the **Export** tab, select **Developer API**. Then click **Generate API queries**.

The **Data query** box shows the URL for the key values that you selected for **Country**, **Transaction**, and **Measure**:

```
http://stats.oecd.org/sdmx-json/data/SNA_TABLE1_SNA93/EA17.B1_GA.C/all?
startTime=1995&endTime=2013
```

In your SAS code, use SETID=SNA_TABLE1_SNA93 to indicate the OECD data set. Next, you can specify the INSET*n*= options by using *n*=0,1,2 for **Country**, **Transaction**, and **Measure**, respectively. The SAS code is shown after the next paragraph, followed by the output, which is shown in Output 52.1.1.

The SET statement reads observations from the input data set myLib.GSTART and stores them in a SAS data set named myGDP. When you specify the INSET*n*= option, you name the SAS input data set for each of the *n* keysets that define your selection of data. The SASEOECD engine takes the crossproduct of all the insets and creates a temporary data set named CrossKey. Each row in CrossKey defines a unique time series request. Not every row in CrossKey yields meaningful data. Only the rows that contain valid data are placed in a JSON file. When a request for data (using the values in each row) generates a valid JSON file, the file is named by concatenating the OUT= option name to the observation number (*n*) in the CrossKey data set that corresponds to the row whose values generated the request. When all the data are retrieved, they are placed in a SAS data set that is named by the OUT= option and that is located in the folder specified by the *physical-name* in the LIBNAME *libref* SASEOECD statement.

```
options validvarname=any;

data keylist0;
   length key0 $8;
   key0='EA17'; output; /* country is euro area; 17 countries */
run;

data keylist1;
   length key1 $8;
   key1='B1_GA'; output; /* transaction is GDP; output approach */
run;

data keylist2;
   length key2 $2;
   key2='C'; output;     /* measure is current prices */
run;

title 'Request GDP for EA_17 in Current Prices';

## Example 52.2: Retrieving the Short-Term Labor Market Statistics for Australia

This example shows how to retrieve OECD labor statistics data for one country, Australia, starting in the third quarter of 2014 and ending in the third quarter of 2017. The output is shown in Output 52.2.1, which contains two variables, Date and AUS.LREM64FE.STSA.Q. The SASEOECD engine automatically sets the VALIDVARNAME=ANY option to allow for the special character '.' in the SAS variable's series name.

The SETID= option names the OECD data set to retrieve the data from, whose OECD data set code is STLABOUR. The following URL describes the StLabour data set:

**http://stats.oecd.org/Index.aspx?DataSetCode=STLABOUR**

Key0 selects Australia as the country key (in INSET0=KEYLIST0), Key1 selects the LREM64E time series in the subject key (in INSET1=KEYLIST1), Key2 selects STSA as the measure key (in INSET2=KEYLIST2), and Key3 selects the quarterly frequency, Q (in INSET3=KEYLIST3). The START= and END= options define the date range of the retrieved data.

```
options validvarname=any;

data keylist0;
   length key0 $3;
   key0='AUS'; output; /* country is Australia */
run;

data keylist1;
```

```
   length key1 $8;
   key1='LREM64FE'; output; /* subject is employment rate */
run;

data keylist2;
   length key2 $8;
   key2='STSA'; output;     /* measure is level, rate, or quantity series, s.a. */
run;

data keylist3;              /* quarterly data */
   length key3 $1;
   key3='Q'; output;
run;

title 'Request LREM64FE for AUS in STSA, Quarterly Data';
LIBNAME myLib saseoecd "physical path to your folder for storing the OECD data"
   setid=STLABOUR
   inset0=keylist0
   inset1=keylist1
   inset2=keylist2
   inset3=keylist3
   start='2014-Q3'
   end='2017-Q3'
   ;

data mylab;
    set myLib.stlab;
run;

proc print data=mylab; run;
```

**Output 52.2.1** Short-Term Labor Market Statistics for AUS in STSA

**Request LREM64FE for AUS in STSA, Quarterly Data**

| Obs | date | AUS.LREM64FE.STSA.Q |
|---|---|---|
| 1 | 2014-Q3 | 66.0799 |
| 2 | 2014-Q4 | 65.9477 |
| 3 | 2015-Q1 | 66.3210 |
| 4 | 2015-Q2 | 66.6583 |
| 5 | 2015-Q3 | 66.8309 |
| 6 | 2015-Q4 | 67.4171 |
| 7 | 2016-Q1 | 67.4288 |
| 8 | 2016-Q2 | 67.4313 |
| 9 | 2016-Q3 | 67.3130 |
| 10 | 2016-Q4 | 67.2861 |
| 11 | 2017-Q1 | 67.4236 |
| 12 | 2017-Q2 | 67.8598 |
| 13 | 2017-Q3 | 68.3549 |

## Example 52.3: Retrieving Bank Profitability Statistics for USA, NMEC, and RUS

This example shows how to retrieve OECD bank profitability statistics data for three country codes, starting in 1999 and ending in 2009. (NMEC stands for nonmember economies, which include Russia, China, and the Baltic States.) The output is shown in Output 52.3.1. The SETID= option names the OECD data set to retrieve the data from, whose OECD data set code is BPF1. The following URL describes the BPF1 data set:

**http://stats.oecd.org/Index.aspx?DataSetCode=BPF1**

Key0 selects three time series, BALSH_TOT, BT25TE, and BT26TE; Key1 selects all banks; and Key2 selects three country codes, USA, NMEC, and RUS. The START= and END= options define the date range of data, 1999 to 2009.

```
options validvarname=any;

data keylist0;
   length key0 $16;
   key0='BALSH_TOT'; output;
   key0='BT25TE'; output;
   key0='BT26TE'; output;
run;

data keylist1;
   length key1 $8;
   key1='ALL'; output;
run;

data keylist2;
   length key2 $8;
   key2='USA'; output;
   key2='NMEC'; output;
   key2='RUS'; output;
run;

title 'Request BPF1 for USA,NMEC and RUS, Annual Data';
LIBNAME myLib saseoecd "physical path to your folder for storing the OECD data"
   setid=BPF1
   inset0=keylist0
   inset1=keylist1
   inset2=keylist2
   out=BALBK
   start='1999'
   end='2009'
   format=json;

data myBALBK;
    set myLib.BALBK;
run;
```

```
proc contents data=myBALBK; run;
proc print data=myBALBK; run;
```

**Output 52.3.1** Bank Profitability Statistics for All Banks in USA, NMEC, and RUS

## Example 52.4: Retrieving Fisheries and Aquaculture Employment for the Czech Republic

This example shows how to retrieve OECD fisheries and aquaculture statistics data for the Czech Republic (CZE), starting in 2009 and ending in 2016. The output is shown in Output 52.4.1. The SETID= option names the OECD data set to retrieve the data from, whose OECD data set code is FISH_EMPL. The following URL describes the Fish_Empl data set:

**http://stats.oecd.org/Index.aspx?DataSetCode=FISH_EMPL**

Key0 selects one country code, CZE (Czech Republic). Key1 selects the economic sector, ETOT, the total by economic sector. Key2 selects two genders, MAL (male) and FEM (female). Key3 selects two occupation rates, PA (part time) and FU (full time). The START= and END= options define the date range of data, 2009 to 2016.

```
options validvarname=any;

data keylist0;
   length key0 $3;
   key0='CZE'; output;
run;

data keylist1;
   length key1 $8;
   key1='ETOT'; output;
run;

data keylist2;
   length key2 $3;
```

```
   key2='MAL'; output;
   key2='FEM'; output;
run;

data keylist3;
   length key3 $3;
   key3='PA'; output;
   key3='FU'; output;
run;

title 'Request FISH_EMPL Data, Annual Data';
LIBNAME myLib saseoecd "physical path to your folder for storing the OECD data"
   setid=FISH_EMPL
   inset0=keylist0
   inset1=keylist1
   inset2=keylist2
   inset3=keylist3
   out=FISHEMP
   start='2009'
   end='2016'
   ;

data myfish;
    set myLib.fishemp;
run;

proc print data=myfish; run;
```

**Output 52.4.1** Fisheries and Aquaculture Employment Data for CZE

**Request FISH_EMPL Data, Annual Data**

| Obs | date | CZE.ETOT.MAL.FU | CZE.ETOT.FEM.FU |
|---|---|---|---|
| 1 | 2009 | 1248 | 287 |
| 2 | 2010 | 1277 | 286 |
| 3 | 2011 | 1277 | 286 |
| 4 | 2012 | 1277 | 286 |

## Example 52.5: Retrieving the Trade by Enterprise Characteristics by Ownership Statistics for the United Kingdom

This example shows how to retrieve OECD trade by enterprise statistics data for one country, the United Kingdom, starting in 2011 and ending in 2015. The output is shown in Output 52.5.1, which contains three variables, Date, 2.GBR.1.TOTAL.D.TOTAL, and 2.GBR.2.TOTAL.D.TOTAL. The SASEOECD engine automatically sets the VALIDVARNAME=ANY option to allow for the special character '.' in the SAS variable's series name.

The SETID= option names the OECD data set to retrieve the data from, whose OECD data set code is TEC7_REV4. The following URL describes the TEC7_REV4 data set:

**http://stats.oecd.org/Index.aspx?DataSetCode=TEC7_REV4**

Key0, in INSET0=KEYLIST0, selects trade value as the indicator key. Key1, in INSET1=KEYLIST1, selects United Kingdom as the reporting country. Key2, in INSET2=KEYLIST2, selects the flow, 1 for imports and 2 for exports. Key3, in INSET3=KEYLIST3, selects the zone or partner country as the total. Key4, in INSET4=KEYLIST4, selects the ownership as domestic or foreign. Key5, in INSET5=KEYLIST5, selects the ISIC sectors (rev 4) as domestically controlled enterprises. The START= and END= options define the date range of data, 2011 to 2015.

```
options validvarname=any;

data keylist0;
   length key0 $2;
   key0='2'; output; /* indicator is trade value */
run;

data keylist1;
   length key1 $3;
   key1='GBR'; output; /* reporting country is United Kingdom */
run;

data keylist2;
   length key2 $2;
   key2='1'; output; /* flow is imports */
   key2='2'; output; /* flow is exports */
run;

data keylist3;
   length key3 $8;
   key3='TOTAL'; output;  /* partner country or zone is Total */
run;

data keylist4;
   length key4 $3;
   key4='D'; output;  /* ownership is domestically controlled enterprises */
run;

data keylist5;
   length key5 $8;
   key5='TOTAL'; output;  /* ISIC Sectors is total economy */
run;

title 'Request TEC7_REV4 Data for United Kingdom';

LIBNAME myLib saseoecd "physical path to your folder for storing the OECD data"
   setid=TEC7_REV4
   inset0=keylist0
   inset1=keylist1
   inset2=keylist2
   inset3=keylist3
   inset4=keylist4
   inset5=keylist5
   out=TR7
   start='2011'
   end='2015'
```

```
   ;

data mytech;
    set myLib.TR7;
run;

proc print data=mytech; run;
```

**Output 52.5.1** Trade by Enterprise Characteristics - TEC by Ownership (Domestic or Foreign)

**Request TEC7_REV4 Data for United Kingdom**

| Obs | date | 2.GBR.1.TOTAL.D.TOTAL | 2.GBR.2.TOTAL.D.TOTAL |

# Overview: SASEQUAN Interface Engine

The SASEQUAN interface engine enables SAS users to retrieve economic and other time series data from the Quandl website, which is hosted by Quandl. The Quandl website offers access to 8 million time series data sets from 400 sources in finance, economics, society, health, energy, demography, and more. These time series are updated at annual, quarterly, monthly, weekly, and daily intervals. The time series on the Quandl website contain observation or measurement periods that are associated with data values. Although the Quandl API also supports data tables, the SASEQUAN engine does not support data tables at this time.

The SASEQUAN interface engine uses the LIBNAME statement to enable you to specify how to subset your Quandl data and how to collapse the selected time series to the same update frequency. You can then use the SAS DATA step to perform further subsetting and to store the resulting time series in a SAS data set. You can perform more analysis (if desired) either in the same SAS session or in a later session.

The SASEQUAN interface engine supports Linux X64 (LAX) and Windows. Although the SASEQUAN engine uses the Quandl API (default is version 3), it is not endorsed or certified by Quandl. By using the SASEQUAN interface engine, you are agreeing to comply with the Quandl terms of use, which are described on the web page at the following URL: **https://www.quandl.com/about/terms**.

# Getting Started: SASEQUAN Interface Engine

You can query the Quandl data set to retrieve the observations or data values for a list of time series by specifying the Quandl code of the data set. The Quandl code consists of a source code and a table code for the data set that contains the time series that you want to read into SAS. You must also specify your unique Quandl API key (authentication token for unlimited access). To obtain your own unique API key, visit the Quandl website at the following URL: **https://www.quandl.com/users/sign_up**.

The Quandl API key is a 20-character mixed-case alphanumeric string, such as "abCDefghiJKLMn123456," and is represented by 'XXXXXXXXXXXXXXXXXXXX' in the APIKEY= option in the following example. In addition, the example URLs in this section and in the section "Examples: SASEQUAN Interface Engine" on page 3755 use the same Quandl API key as the argument *your_quan_apikey*.

After you have your assigned Quandl API key and have agreed to the Quandl terms of use, you are almost ready to download Quandl data. Before you download, make sure you have the necessary rights to work with the data.

Now that your are informed about the terms of use of the Quandl data, you can use your Quandl API key to access the Quandl data, as shown in the following example.

The statements that follow enable you to access oil prices from the National Stock Exchange of India's time series data from September 1, 2013, to November 5, 2013, on a daily basis. The observations are sorted by the time ID variable DATE. The output is shown in Output 53.1.

```
options validvarname=any;
title 'Retrieve Data for Oil India Limited Prices';
libname quan sasequan "physical path to the folder where you want the QUANDL data"
   OUTXML=oiltd
   XMLMAP="%sysget(QUANDL)oiltd.map"
```

```
   APIKEY='XXXXXXXXXXXXXXXXXXX'
   IDLIST='NSE/OIL';

data oil_gsa;
   set quan.oiltd;
run;

proc contents data=oil_gsa; run;
proc print data=oil_gsa(firstobs=1328 obs=1342); run;
```

| **1339** | 2015-02-18 | 501.80 | 506.50 | 494.40 | 500.95 | 501.10 | 261958 | 1314.47 |
| **1340** | 2015-02-19 | 503.30 | 506.00 | 494.15 | 497.00 | 497.30 | 161816 | 806.24 |
| **1341** | 2015-02-20 | 499.00 | 502.90 | 493.00 | 494.30 | 494.40 | 220134 | 1092.32 |
| **1342** | 2015-02-23 | 500.00 | 500.00 | 485.20 | 487.80 | 487.30 | 194121 | 952.37 |

The XML data that the Quandl website returns are placed in a file that is named by the OUTXML= option—in this case, *OILTD1.xml*. Note that the SASEQUAN engine appends a numeral to the XML file name, and the file extension (.xml) is excluded from the file name that appears in the OUTXML= option. This XML data file resides in the current working directory. These data are read into a SAS data set in the folder location that is given inside the string enclosed in double quotation marks in the SASEQUAN LIBNAME statement. So, in the preceding example, if the QUANDL environment variable is defined as

```
/sasusr/quan/test/
```

Then the SAS data set (created when the XML file is read into SAS) is located at

```
/sasusr/quan/test/OIL_GSA.sas7bdat
```

An equivalent LIBNAME statement that does not use any environment variables could be as follows:

```
libname quan sasequan "/sasusr/quan/test/"
   OUTXML=oiltd
   XMLMAP="/sasusr/quan/test/oiltd.map"
   APIKEY='XXXXXXXXXXXXXXXXXXX'
   IDLIST='NSE/OIL';
```

You could also use either a SAS macro variable or a system environment variable to store the value of your Quandl API key so that the key does not appear explicitly in your SAS code. The XML map that is created is assigned the full path name that the XMLMAP= option specifies. The SASEQUAN engine appends a numeral to the XML file name to indicate the position of the Quandl code in the IDLIST= option.

The IDLIST= option specifies the list of Quandl data sets (that contain time series) that you want to retrieve. This option accepts a string, enclosed in single quotation marks, that denotes a list of one or more Quandl data sets that you select (keep) in the resulting SAS data set. The result, OILTD, is named in the DATA step and is shown in Figure 53.1. The preceding example uses only one Quandl code, which is in the first position of the IDLIST= option, so the numeral 1 is appended to the name of the XML file, resulting in OILTD1.xml.

It is more efficient to use the DATA step to store your Quandl data in a SAS data set and then refer to the SAS data set directly in your PROC PRINT or PROC SGPLOT statement. You can also refer to the SASEQUAN libref directly, as in the statement

```
proc print data=quan.oiltd; run;
```

This statement uses the member name, OILTD, in the PROC PRINT statement; this usage corresponds to specifying the OUTXML=OILTD option. Although using this statement might seem easier, it is not as efficient, because every time you use the SASEQUAN libref, the Quandl interface engine reads the entire XML file into SAS again. So it is better to refer to the SAS data set repeatedly than to invoke the interface engine repeatedly.

## Syntax: SASEQUAN Interface Engine

The SASEQUAN interface engine uses standard engine syntax to read the observations or data values for one or more Quandl data sets that can contain one or more time series in each data set. Table 53.1 summarizes the options that the SASEQUAN engine uses. In addition, there is one required option: API_KEY='*quan_api_key*'.

**Table 53.1** Summary of LIBNAME *libref* SASEQUAN Options

| Option | Description |
|---|---|
| APIKEY= | Specifies the required Quandl access key that enables you to access the data that the Quandl website provides |
| AUTOMAP= | Specifies whether or not to overwrite the existing XML map file |
| COLLAPSE= | Specifies the reporting frequency (lower frequency to collapse the output results to). The valid reporting frequencies are daily, weekly, monthly, quarterly, annual, and none. |
| COLUMN= | Specifies one column (time series) to keep in the output results. The rest of the columns are dropped from the output results. When more than one ID is specified in the IDLIST= option, the specified column index is kept for each ID. |
| CONNECT= | Specifies whether or not to use the connect method for a secure connection via a proxy server. You must specify the PROXY= option when you use the CONNECT=ON option. See the PROXY= option. |
| DEBUG= | Specifies whether or not to include diagnostic message logging in the SAS log window |
| END= | Specifies the end date (trim_end) for the observation period (`'YYYY-MM-DD'` formatted string, optional; the default is 1776-07-04 (earliest available)) |
| FORMAT= | Specifies a file extension that indicates the type of file to retrieve. Only XML is supported for the SASEQUAN interface engine. |
| FREQ= | Specifies the frequency of the selected data: daily, weekly, monthly, quarterly, or annual. When the IDLIST= option contains more than one Quandl code, the FREQ= option aggregates higher-frequency data series to lower-frequency time series (such as converting a monthly time series to an annual time series). |
| IDLIST= | Specifies a list of Quandl codes for Quandl data set codes for accessing Quandl time series data. To select more than one data set, list the unique Quandl codes, separated by commas. There is a limit of nine Quandl codes in the IDLIST= option. |
| MAPREF= | Specifies the fileref used for the map file assignment |
| OUTXML= | Specifies the name of the output SAS data set and the XML file(s) requested by the IDLIST= option. When more than one time series ID is listed in the IDLIST= option, the SASEQUAN engine appends the positional integer (1 f or the first time series ID, 2 for the second time series ID, and so on) to the name specified by the OUTXML= option. |
| PROXY= | Specifies the proxy server that you want to use (if you have trouble connecting without specifying a proxy). If you also need the connect method for a secure connection, use the CONNECT=ON option in addition to the PROXY= option. See the CONNECT= option. |
| ROWS= | Specifies the maximum number of observations (rows) to return (integer between 1 and 100,000, optional; the default is 100,000) |
| SORT= | Specifies the order of the results in ascending or descending observation-date order. The valid sort arguments are *asc* and *desc*; the default is *asc*. |
| START= | Specifies the start date (trim_start) for the observation period (`'YYYY-MM-DD'` formatted string, optional; the default is 9999-12-31 (latest available)) |
| TRANS= | Specifies the transformation method to be used for data transformation. The valid transformation arguments are DIFF, RDIFF, RDIFF_FROM, CUMUL, NORMALIZE, and NONE; the default is NONE. See Table 53.2 for formulas. |
| XMLMAP= | Specifies the fully qualified name of the location where the XMLmap file is automatically stored. By default, XMLMAP=Quan.map. |

## The LIBNAME *libref* SASEQUAN Statement

**LIBNAME** *libref* **SASEQUAN** '*physical-name*' *options* **;**

The LIBNAME statement assigns a SAS library reference (libref) to the physical path of the directory where the SAS data set is stored that contains the downloaded Quandl data. The required *physical-name* argument specifies the location of the folder where your SAS data set resides. It should end with a backslash if you are in a Windows environment and a forward slash if you are in a UNIX environment.

You can specify the following *options* in the LIBNAME *libref* SASEQUAN statement.

**APIKEY='***quan_apikey***'**
specifies the Quandl authentication token or access key that enables you to access the data that the Quandl website provides. The Quandl access key is a 20-character mixed-case alphanumeric string, and it is required. It must be enclosed in single quotation marks. You can request your *quan_apikey* by visiting the website at the following URL:

```
https://www.quandl.com/users/sign_up
```

**AUTOMAP=REPLACE | REUSE**
specifies whether or not to overwrite the existing XML map file. You can specify the following values:

**REPLACE** specifies that the XML map file be overwritten, and ensures that the most current XML map that is generated by the SASEQUAN engine and named by the XMLMAP= option is used.

**REUSE** specifies that the XML map file not be overwritten, and ensures that a pre-existing XML map file that is named by the XMLMAP= option is used.

By default, AUTOMAP=REPLACE.

**COLLAPSE=DAILY | WEEKLY | MONTHLY | QUARTERLY | ANNUAL | NONE**
specifies the frequency to which you want to collapse the reporting frequency. You can specify the following values:

**DAILY** collapses the report to a daily frequency.

**WEEKLY** collapses the report to a weekly frequency.

**MONTHLY** collapses the report to a monthly frequency.

**QUARTERLY** collapses the report to a quarterly frequency.

**ANNUAL** collapses the report to an annual frequency.

**NONE** does not collapse the report.

This option is not required. By default, COLLAPSE=NONE when IDLIST=option specifies one Quandl code, but when the IDLIST= option specifies more than one Quandl code, the default for the collapse frequency is set to the same frequency that is specified in the FREQ= option.

The Quandl frequency-collapsing feature reports the native (higher-frequency) time series at a lower frequency (the collapse frequency). When you collapse the frequency of a data set, Quandl returns the last observation for the given period. So if you collapse a daily data set to monthly, you get a

sample of the original data set in which the observation for each month is the last data point available for that month. When you specify more than one Quandl code in the IDLIST= option, it is important to check that the *from* date and *to* date of every selected series use the same fiscal year, so that the reporting interval of the merged date values from all the data sets aligns to the same date for the first observation in the range. For example, if multiple Quandl codes are listed in the IDLIST= option, some annual time series have *from* dates that start in January, and some annual time series have *from* dates that start in June, then the merged data set will have observation dates reported for both January and June (if COLLAPSE=NONE), resulting in a semiannual interval instead of an annual interval in the merged data. To preserve the annual frequency, specify COLLAPSE=ANNUAL so that each annual time series aligns with the appropriate annual date in the merged data set. The COLLAPSE= option is applied to each Quandl data set that is specified in the IDLIST= option, so that when the data sets are merged, the reporting frequency is equal to the COLLAPSE= frequency. The resulting merged SAS data set contains the same data as the Quandl "supersets" that were created from the same Quandl codes in the IDLIST= option. Although Quandl supersets are no longer supported by Quandl, newer Quandl API methods are available for merging multiple time series by using the Quandl Excel Add-In. The SASEQUAN interface engine uses the Quandl data sets API to request each time series in the IDLIST= option, enabling you to seamlessly store the merged time series in one SAS data set. For more information about the various available methods for Quandl data access, see the web page at following URL: **`https://www.quandl.com/docs/api#data-organization`**.

**NOTE:** The COLLAPSE=MONTHLY option reports the daily, weekly, and monthly native frequencies of the time series at a monthly frequency (the collapse frequency). If you specify an annual native frequency time series in the IDLIST= option, then it will not be selected when COLLAPSE=MONTHLY is specified. Only the time series that have native frequencies higher than the reporting frequency specified in the COLLAPSE= option are selected.

**NOTE:** It is highly recommended that you use the COLLAPSE= option when you specify more than one Quandl code in the IDLIST= option.

**CAUTION:** If the COLLAPSE=NONE option is specified, then undesirable time intervals can occur when you specify more than one Quandl code in the IDLIST= option.

**COLUMN=***quan_column_index*

specifies the column index that you want to keep in the output results. Specify only one column index, and it will be applied to each Quandl code (ID) that is specified in the IDLIST= option. For example, if there are three columns of data, you can specify COLUMN=1 to keep the first column, COLUMN=2 to keep the second column, or COLUMN=3 to keep the third column.

**CONNECT=ON | OFF**

specifies whether or not to use the connect method along with the PROXY= option. **NOTE:** You must use the PROXY= option and specify your proxy server in addition to the CONNECT=ON option when you want to use the connect method. For more information about secure connections, see the PROXY= option.

**DEBUG=ON | OFF**

specifies whether or not to include diagnostic message logging in the SAS log window. This information can be very useful for troubleshooting a problem.

**END=**'*quan_enddate*'
specifies the end date for the time series in the format `'YYYY-MM-DD'`. This option is not required, and the default is 9999-12-31 (latest available). The date must be enclosed in single quotation marks.

**FORMAT=XML**
specifies the format of the file to be received from the Quandl website. Although Quandl can report data in many formats, the SASEQUAN engine supports only the XML format.

**FREQ=DAILY | WEEKLY | MONTHLY | QUARTERLY | ANNUAL**
specifies a lower frequency to aggregate values to. The FREQ= option also selects only those time series that aggregate to the specified frequency. In Quandl data, the highest frequency is daily, and the lowest frequency is annual. You can specify the following values:

| | |
|---|---|
| **DAILY** | selects time series that aggregate to a daily frequency. |
| **WEEKLY** | selects time series that aggregate to a weekly frequency. |
| **MONTHLY** | selects time series that aggregate to a monthly frequency. |
| **QUARTERLY** | selects time series that aggregate to a quarterly frequency. |
| **ANNUAL** | selects time series that aggregate to an annual frequency. |

The FREQ= option is not required, and the default value is the native frequency of the Quandl data set.

**NOTE:** An error is returned if you specify a frequency higher than the native frequency of the selected series. For example, if a series has the native frequency "Annual," it is not possible to aggregate the series to the higher "Monthly" frequency. To find the native frequency of a time series, enter the time series' Quandl code (in the database_code and dataset_code fields) in the following URL in your web browser:

**`https://www.quandl.com/api/v3/datasets/database_code/dataset_code/data.xml`**

The output gives you the time series data along with its native frequency, which is given in the "Frequency" field.

**NOTE:** When you specify a single Quandl code in the IDLIST= option and the FREQ= option is not specified or is an empty string, the native frequency of the time series in that data set is used as the reporting frequency unless you specify the reporting frequency in the COLLAPSE= option. When you specify multiple data sets (and time series) in the IDLIST= option, the "Annual" frequency is used as the default frequency unless you specify the reporting frequency in the COLLAPSE= option. If any time series in the IDLIST= option have a lower native frequency than the specified frequency, then those time series are dropped from the list and excluded from the output.

**IDLIST=**'*quan_idlist*'
specifies the list of Quandl codes for the data sets that contain the time series to be included in the output SAS data set. There is a limit of nine Quandl codes in the IDLIST= option. This list is comma-delimited and must be enclosed in single quotation marks.

**MAPREF=***quan_xmlmapref*

specifies the fileref to use for the map assignment. For an example of the SASEQUAN engine that uses the MAPREF= and XMLMAP= options in the FILENAME statement in order to assign a file name, as in the following, see the section "Getting Started: SASEQUAN Interface Engine" on page 3744:

```
FILENAME MyMap "%sysget(QUANDL)oiltd.map";
```

You can use the MAPREF= and XMLMAP= options to control where the map resides, what you name the map, and how you refer to it with a fileref. You can use the OUTXML= option to name your XML data file. It is placed in the current working directory. For more information, see the section "SAS OUTXML File" on page 3754. The SET statement (see the section "Getting Started: SASEQUAN Interface Engine" on page 3744) reads observations from the input data set OILTD and stores them in a SAS data set named OIL_GSA.

**OUTXML=***quan_xmlfile*

specifies the name of the file where the XML data that are returned from the Quandl website are stored. Each Quandl code that is listed in the IDLIST= option is given a positional numeral: 1 for the first code in the IDLIST, 2 for the second code in the IDLIST, and so on. The engine appends this numeral to the file name of the XML of each data set that the website returns. When all the XML files are retrieved, the data are merged into a SAS data set. When only one Quandl code is used in the IDLIST= option, the file name has the numeral 1 appended to the OUTXML file name. By default, OUTXML=QUAN, which creates a file named *QUAN1.xml* in the current working directory. The SAS data set that is created when the XML data are read into SAS is placed in the folder specified by the physical path in the LIBNAME libref SASEQUAN statement.

**PROXY="***quan_proxyserver***"**

specifies which proxy server to use. This option is not required. The specified proxy server is used only when a connection-refused error or a connection-timed-out error occurs. For *quan_proxyserver*, specify the server's HTTP address followed by a colon and the port number, and enclose that string in double quotation marks; for example, PROXY="http://inetgw.unx.sas.com:8118". See also the CONNECT= option.

**ROWS=***quan_rows*

**LIMIT=***quan_rows*

specifies the maximum number of rows (time series observations) to return, which is an integer between 1 and 100,000. This option is not required. By default, ROWS=100000.

**SORT=ASC | DESC**

**ORDER=ASC | DESC**

specifies the order in which to sort the date of time series observations. You can specify the following values:

**ASC** sorts time series observations in ascending date order.

**DESC** sorts time series observations in descending date order.

This option is not required. By default, SORT=ASC.

**START=**'*quan_startdate*'
specifies the start date for the time series in the format `'YYYY-MM-DD'`. This option is not required, and the default is 1776-07-04 (earliest available). The date must be enclosed in single quotation marks.

**TRANS=CUMUL | DIFF | NORMALIZE | RDIFF | RDIFF_FROM | NONE**
**TRANSFORMATION=CUMUL | DIFF | NORMALIZE | RDIFF | RDIFF_FROM | NONE**
specifies the data value transformation. You can specify the following values:

| | |
|---|---|
| **CUMUL** | performs the cumulative function. |
| **DIFF** | performs the difference function. |
| **NORMALIZE** | performs the normalize function. |
| **RDIFF** | performs the ratio difference function. |
| **RDIFF_FROM** | gives the latest (nearest to the end date) value as a percentage increment. |
| **NONE** | performs no transformation on the data. |

This option is not required. By default, TRANS=NONE. The details of the arguments and the corresponding function formulas are presented in Table 53.2.

**Table 53.2** Quandl Transformation Codes

| Trans Code | Description | Formula |
|---|---|---|
| cumul | Cumulative sum | $x_t + x_{t-1} + \cdots + x_{t-N}$ |
| diff | Row-on-row change | $x_t - x_{t-1}$ |
| normalize | Scale series to start at 100 | $(\frac{x_t}{x_{t-N}}) \times 100$ |
| rdiff | Row-on-row percentage change | $(\frac{x_t - x_{t-1}}{x_{t-1}})$ |
| rdiff_from | Latest value as percentage increment | $(\frac{x_{\text{latest}} - x_t}{x_t})$ |

$x_t$ is the value of series $x$ at time period $t$. $N$ is the number of observations per year, which differs by frequency: Daily ($N = 260$), Annual ($N = 1$), Monthly ($N = 12$), Quarterly ($N = 4$), and Weekly ($N = 52$).

**XMLMAP=***quan_xmlmapfile*
specifies the fully qualified name of the location where the XML map file is automatically stored.

# Details: SASEQUAN Interface Engine

The SASEQUAN interface engine enables SAS users to access time series data that are stored in Quandl data sets that the Quandl website provides. Every Quandl data set is identified by a unique ID. For example, the Prague Stock Index is uniquely identified by the code PRAGUESE/PX, which you can view by visiting the website at the following URL:

**https://www.quandl.com/data/PRAGUESE/PX-Prague-Stock-Index-PX**

The unique code for any data set is always visible on the data set page, next to the words "Quandl Code."

## Quandl API Key

The API key that is used in these examples, abCDefghiJKLMn123456, is for demonstration purposes only. To successfully download data from the Quandl website, use your own Quandl API key, which is a 20-character mixed-case alphanumeric string. You can request your own API key by visiting the website at the following URL:

**https://www.quandl.com/users/sign_up**

## Available Sources That Provide Quandl Economic Time Series Data

To obtain a list of the available sources of Quandl economic data, visit the website at the following URL:

**https://blog.quandl.com/api-for-economic-data**

## Useful Lists for Easy Downloading of Quandl Time Series Data

You can use the Quandl data browser to get a list of Quandl codes for the available time series for a specific database. Enter the following URL in your web browser and click on the category or the particular link for that source:

**https://www.quandl.com/search?query=**

For example, to find the Quandl codes for the Dow Jones Industrial Average Index, you can enter the following URL in your web browser:

**https://www.quandl.com/search?query=dow%20jones%20industrial%20average%20index**

To see only the free databases, select the free filter in the browser box. The 19 free databases are listed along with each time series Quandl codes.

## Available Time Series for Each Quandl Code

To download all the data set codes and data set names available in the FRED (Federal Reserve Economic Data) database, enter the following URL in your web browser:

```
https://www.quandl.com/api/v3/databases/FRED/codes?api_key=YOURAPIKEY
```

## SAS Output Data Set

You can use a SAS DATA step to write the selected Quandl data to a SAS data set. This enables you to use SAS software to easily analyze the data. If you specify the name of the output data set in the DATA statement, the engine supervisor creates a SAS data set that has the specified name in either the SAS Work library or, if specified, the SAS User library.

The contents of the SAS data set include the date of each observation and the series name of each series that is read from the Quandl data source.

The SASEQUAN interface engine maintains the sort order, so the time series are sorted in the resulting SAS data set by the order that is specified in the SORT= option, by date (time ID), and by variable (time series item name).

You can use the PRINT and CONTENTS procedures to print your output data set and its contents. Alternatively, you can view your SAS output observations by opening the desired output data set in a SAS Explorer window. You can also use the SQL procedure along with your SASEQUAN libref to create a custom view of your data.

## SAS OUTXML File

The SAS XML (XML format) data that are returned from the Quandl website are placed in a file that is named by the OUTXML= option. The SASEQUAN interface engine creates a separate XML file for each Quandl code that is listed in the IDLIST= option. The engine numbers each data set's XML file in the order in which it appears in the IDLIST= option, so the first data set has a 1 concatenated to the file name, the second data set has a 2 concatenated to the file name, and so on. In instances of the IDLIST= option that contain more than one Quandl code, the variable names also have the same numeral concatenated to them. This naming convention enables the engine to merge all the selected time series into one SAS data set while preserving the identity of each time series. The SAS XML data file is placed in the current working directory, but the SAS data set (created by reading the XML data into SAS) is placed in the folder specified by the *physical-name* in the LIBNAME *libref* SASEQUAN statement, which is described in the section "The LIBNAME *libref* SASEQUAN Statement" on page 3748.

## SAS XML Map File

The XML map that (by default) is automatically created is assigned the full path name that is given by the XMLMAP= option in your LIBNAME *libref* SASEQUAN statement. The map file is either reused (not overwritten) if you specify AUTOMAP=REUSE or overwritten by a new map if you specify AUTOMAP=REPLACE (the default). The SASEQUAN interface engine invokes the XMLV2 engine to create the map and to read the data into SAS.

# Examples: SASEQUAN Interface Engine

## Example 53.1: Retrieving Historical Price Data for Oil India Limited

This example shows how to use one Quandl code, NSE/OIL, to retrieve historical prices for Oil India Limited, starting September 1, 2013, and ending November 5, 2013, with a daily frequency. The output is shown in Output 53.1.1.

```
options validvarname=any;

title 'Historical Prices for Oil India Limited';
libname mylib "/sasusr/quan/doc/";

/* export QUANDL=/sasusr/quan/test/ */
libname myQoil sasequan "%sysget(QUANDL)"
   apikey='XXXXXXXXXXXXXXXXXXX'
   idlist='NSE/OIL'
   format=XML
   outXml=oil
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(QUANDL)oil.map"
   start='2013-09-01'
   end='2013-11-05'
   freq='daily'
   collapse='daily'
   ;

data mylib.oilall;
   set myQoil.oil;
run;

proc contents data=mylib.oilall; run;
proc print data=mylib.oilall; run;
```

**Output 53.1.1** Historical Prices for Oil India Limited

**Historical Prices for Oil India Limited**

| Obs | date | Open | High | Low | Last | Close | Total Trade Quantity | Turnover (Lacs) |

## Example 53.2: Retrieving Data by Using Three Quandl Codes

This example shows how to use three Quandl codes of different native frequencies to retrieve quarterly data for corporate profits after tax (FRED/CP), gross domestic product (FRED/GDP), and total consumer credit owned and securitized, outstanding (TOTALSL). The output is shown in Output 53.2.1.

```
title 'Retrieve Data for Three Time Series: FRED/CP, FRED/GDP, FRED/TOTALSL';
options validvarname=any;
libname mylib "/sasusr/quan/doc/";

/* export QUANDL=/sasusr/quan/test/ */
libname myQ3 sasequan "%sysget(QUANDL)"
   OUTXML=fred3
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="%sysget(QUANDL)fred3.map"
   APIKEY='XXXXXXXXXXXXXXXXXXXX'
   IDLIST='FRED/CP,FRED/GDP,FRED/TOTALSL'
   FORMAT=xml
   START='2009-07-01'
   END='2013-07-01'
   FREQ='quarterly'
   COLLAPSE='quarterly'
   ;

data mylib.thrall;
   set myQ3.fred3;
   label Value_1 = "Corporate Profits After Tax";
   label Value_2 = "Gross Domestic Product, 1 Decimal";
   label Value_3 = "Total Consumer Credit Owned and Securitized, Outstanding";
run;

proc contents data=mylib.thrall; run;
proc print data=mylib.thrall label; run;
```

**Output 53.2.1** Retrieve Data for Corporate Profits after Tax, Gross Domestic Product, Total Consumer Credit Owned and Securitized, Outstanding

**Retrieve Data for Three Time Series: FRED/CP, FRED/GDP, FRED/TOTALSL**

| Obs | date | Corporate Profits After Tax | Gross Domestic Product, 1 Decimal | Total Consumer Credit Owned and Securitized, Outstanding |
|---|---|---|---|---|
| 1 | 2009-09-30 | 1346.76 | 14420.31 | 2573.28 |
| 2 | 2009-12-31 | 1462.69 | 14628.02 | 2555.02 |
| 3 | 2010-03-31 | 1530.36 | 14721.35 | 2536.75 |
| 4 | 2010-06-30 | 1516.85 | 14926.10 | 2520.00 |

## Example 53.3: Retrieving Data for the NIKKEI JASDAQ Stock Average Index

This example shows how to use one Quandl code, NIKKEI/JASDAQ, to retrieve the price data for the Nikkei JASDAQ Stock Average Index, which is adjusted by 'Dow adjustment' starting June 6, 2018, and ending September 5, 2018, with a daily native frequency. The output is shown in Output 53.3.1.

```
options validvarname=any;

title 'NIKKEI JASDAQ Stock Average Index ';
libname mylib "/sasusr/quan/doc/";

/* export QUANDL=/sasusr/quan/test/ */
libname myTOP20 sasequan "%sysget(QUANDL)"
   apikey='XXXXXXXXXXXXXXXXXXXX'
   idlist='NIKKEI/JASDAQ'
   format=XML
   outXml=jasdaq
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(QUANDL)jasdaq.map"
   start='2018-06-06'
   end='2018-09-05'
   ;
```

```
data mylib.jasdaq;
   set myTOP20.jasdaq;
run;

proc contents data=mylib.jasdaq; run;
proc print data=mylib.jasdaq(obs=35); run;
```

**Output 53.3.1** Nikkei JASDAQ Stock Average Index

**NIKKEI JASDAQ Stock Average Index**

## Example 53.4: Collapsing Data for the Nikkei JASDAQ Stock Average Index

This example shows how to collapse daily data to a weekly interval by using the same Quandl code as in Example 53.3, NIKKEI/JASDAQ, to retrieve the price data for the Nikkei JASDAQ Stock Average Index, starting June 6, 2018, and ending September 5, 2018, with a daily native frequency. You collapse the data to a weekly frequency by using the COLLAPSE= option. The output is shown in Output 53.4.1.

```
options validvarname=any;

title 'NIKKEI JASDAQ Stock Average index, COLLAPSE=WEEKLY Option';
libname mylib "/sasusr/quan/doc/";

/* export QUANDL=/sasusr/quan/test/ */
libname myTOP20 sasequan "%sysget(QUANDL)"
   apikey='XXXXXXXXXXXXXXXXXXXX'
   idlist='NIKKEI/JASDAQ'
   format=XML
   outXml=jasdaqW
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(QUANDL)jasdaqw.map"
   start='2018-06-06'
   end='2018-09-05'
   collapse=weekly
   ;

data mylib.jasdaqW;
   set myTOP20.jasdaqW;
run;

proc contents data=mylib.jasdaqW; run;
proc print data=mylib.jasdaqW; run;
```

**Output 53.4.1** Nikkei JASDAQ Stock Average Index, with COLLAPSE=WEEKLY

**NIKKEI JASDAQ Stock Average index, COLLAPSE=WEEKLY Option**

## Example 53.5: Transforming Data for the Nikkei JASDAQ Stock Average Index

This example shows how to transform daily data by using the DIFF transformation and the same Quandl code as in Example 53.3 and Example 53.4, NIKKEI/JASDAQ, to retrieve the price data for the Nikkei JASDAQ Stock Average Index, starting June 6, 2018, and ending September 5, 2018, with a daily native frequency. You collapse the data to a weekly frequency by using the COLLAPSE= option and perform a transformation by using the TRANS= option. Specify a range by using START='2018-06-06' and END='2018-09-05', a collapse frequency by using COLLAPSE=WEEKLY, and a transformation function by using TRANS=DIFF. The output is shown on Output 53.5.1.

```
options validvarname=any;

title 'NIKKEI JASDAQ Stock Average Index, TRANS=DIFF Option';
libname mylib "/sasusr/quan/doc/";

/* export QUANDL=/sasusr/quan/test/ */
libname myTOP20 sasequan "%sysget(QUANDL)"
   apikey='XXXXXXXXXXXXXXXXXXXX'
   idlist='NIKKEI/JASDAQ'
   format=XML
   outXml=jasdaqX
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(QUANDL)jasdaqX.map"
   start='2018-06-06'
   end='2018-09-05'
   collapse=weekly
   trans=diff
   ;

data mylib.jasdaqX;
   set myTOP20.jasdaqX;
run;

proc contents data=mylib.jasdaqX; run;
proc print data=mylib.jasdaqX; run;
```

**Output 53.5.1** Nikkei JASDAQ Stock Average Index, Weekly Data with TRANS=DIFF

**NIKKEI JASDAQ Stock Average Index, TRANS=DIFF Option**

| Obs | date | Close | Open | High | Low |

## Example 53.6: Reading Data from Multiple Quandl Data Sets to Merge Multiple Time Series

This example shows how to read data from three Quandl data sets by using the Quandl codes EIA/ELEC_PLANT_CONS_EG_BTU_57692_ALL_ALL_M, BUNDESBANK/BBK01_WT5511, and YALE/SPCOMP to retrieve oil, gold, and S&P Composite prices, dividends, and earnings data. There are eleven time series (one for fuel, one for gold, and nine for the S&P Composite), taken from three different Quandl data sets: DOE/RWTC, BUNDESBANK/BBK01_WT5511, and YAHOO/INDEX_GSPC, respectively. Because the Fuel, Gold, and S&P Composite columns are all from monthly native frequency data sets, you can use the "Annual" collapse frequency to minimize the missing values in the output. Specify a range by using START='2010-12-31' and END='2016-12-31', and specify a collapse frequency by using COLLAPSE=ANNUAL. The output is shown in Output 53.6.1.

```
options validvarname=any;

title 'Fuels Used for Generating Electricity, Gold, and S&P Composite Stock
       Time Series';
libname mylib "/sasusr/quan/doc/"

/* export QUANDL=/sasusr/quan/test/ */
libname mysup sasequan "%sysget(QUANDL)"
   apikey='XXXXXXXXXXXXXXXXXXXX'
   idlist='EIA/ELEC_PLANT_CONS_EG_BTU_57692_ALL_ALL_M,BUNDESBANK/BBK01_WT5511,YALE/SPCOMP'
   format=XML
   outXml=Tsupe
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(QUANDL)Tsupe.map"
   start='2010-12-31'
   end='2016-12-31'
```

```
   collapse=annual
   ;

data mylib.Tsupe;
   set mysup.Tsupe;
   label Value_1 = "Electric Fuel Consumption";
   label Value_2= "Gold Price (USD)";
   label 'S&P Composite_3'n= "S&P Composite from SPCOMP";
   label Dividend_3= "Dividend (SPCOMP)";
   label Earnings_3= "Earnings (SPCOMP)";
   label CPI_3= "CPI (SPCOMP)";
   label 'Long Interest Rate_3'n= "Long Interest Rate (SPCOMP)";
   label 'Real Price_3'n= "Real Price (SPCOMP)";
   label 'Real Dividend_3'n= "Real Dividend (SPCOMP)";
   label 'Real Earnings_3'n= "Real Earnings (SPCOMP)";
   label 'Cyclically Adjusted PE Ratio_3'n= "Cyclically Adjusted PE Ratio (SPCOMP)";
run;

proc contents data=mylib.Tsupe; run;
proc print data=mylib.Tsupe label; run;
```

**Output 53.6.1** Reading from Multiple Quandl Data Sets: Fuel, Gold, and S&P Composite Data Using COLLAPSE= Option

**Fuels Used for Generating Electricity, Gold, and S&P Composite Stock Time Series**

| Obs | date | Electric Fuel Consumption | Gold Price (USD) | S&P Composite from SPCOMP | Dividend (SPCOMP) | Earnings (SPCOMP) | CPI (SPCOMP) | Long Interest Rate (SPCOMP) |

## Overview: SASERAIN Interface Engine

The SASERAIN interface engine enables SAS users to retrieve weather data from the World Weather Online website. This website offers access to time series of weather data such as temperature, precipitation (rainfall), weather description, weather icon, and wind speed. These time series are updated at intervals that the user selects. The weather time series on the World Weather Online website contain observation or measurement periods that are associated with data values.

The SASERAIN interface engine uses the LIBNAME statement to enable you to download World Weather Online data and to specify which weather data time series you want to retrieve based on location. You can then use the SAS DATA step to perform further subsetting and to store the resulting time series in a SAS data set.

There are two types of major weather application interfaces (APIs) that return World Weather Online data for the SASERAIN engine. The first type is a local weather API that returns forecasting data and current conditions data, which usually start with today and end with tomorrow's forecast. You can request up to 15 days of premium local weather forecast data. The SASERAIN engine supports only the premium local

weather API because World Weather Online has discontinued the nonpremium API. The default range for the SASERAIN engine is 2 days. You can use the premium local weather forecast API if you subscribe to the premium service and also specify your premium API key. The premium API key provides a maximum date range of 15 days.

The second type of API is a historical weather API that returns past weather. When you have a premium subscription, you can use a range that starts as early as July 1, 2008.

When no dates are specified, the default type of data that the SASERAIN interface engine returns is the local forecast weather data. **NOTE:** The SASERAIN interface uses the past weather API whenever a range of dates is specified by a start date and an end date.

You can choose to retrieve the following types of data for a single location or multiple locations:

- current conditions only
- local weather forecast only
- both current conditions and the local weather forecast
- 24-hour weather forecast only (the frequency is auto-set to 3 hours over one 24-hour period)
- historical (past) weather for a specified date range

The SASERAIN interface engine supports Linux X64 (LAX) and Windows. Although the SASERAIN engine uses the World Weather Online API, it is not endorsed or certified by World Weather Online. By using the SASERAIN interface engine, you are agreeing to comply with the World Weather Online terms of use, which are described on the web page at the following URL:

**https://www.worldweatheronline.com/terms-and-conditions.aspx**

## Getting Started: SASERAIN Interface Engine

You can query the World Weather Online database to retrieve the observations or data values for a list of time series by specifying the World Weather Online code for the location (q-code). The World Weather Online q-code consists of a location code such as one for City and Country, latitude and longitude, IP address, US zip code, UK/Canadian postal code, or airport code (IATA). To specify more than one location, list each q-code in the QUERY= option, and separate the locations with a semicolon. Neither a comma nor a blank can be used as a separator between the q-codes, because one q-code can contain any number of commas or blanks.

You must also specify your unique World Weather Online premium API key (authentication token). To obtain your own unique API key, visit the World Weather Online website at the following URL:

**https://developer.worldweatheronline.com/login.aspx**

For more information about the web service (including pricing and premium service information), visit the website at the following URL:

**https://developer.worldweatheronline.com/api/faq.aspx**

The World Weather Online API key is a 31-character mixed-case alphanumeric string, such as "abCDefghijklmnopqrstuv123456789," and is represented by 'XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX' in the APIKEY= option in the following example. In addition, the example URLs in this section and in the section "Examples: SASERAIN Interface Engine" on page 3778 use the same World Weather Online API key as the argument *your_rain_apikey*.

After you have your assigned World Weather Online API key and have agreed to the World Weather Online terms of use, you can use your API key to access the World Weather Online data, as shown in the following example.

The statements that follow enable you to access the weather for London, Paris, and Dubai. For brevity of output, the request is for only one day (NUM_OF_DAYS=1), which starts with today. The FX24=YES option returns observations at a frequency of every 3 hours with an additional observation for the 24-hour average (the value of the TIME variable is 24), and the observations are sorted in chronological order. For brevity, only the current conditions output is shown in Figure 54.1.

```
options validvarname=any;

title 'Retrieve Weather Data for London, Paris, and Dubai';
libname mylib "/sasusr/rain/doc";
libname rain saserain "/sasusr/rain/test"
   QUERY='London,United Kingdom;Paris,France;Dubai,United Arab Emirates'
   FX24=yes
   CONDITIONS=yes
   OUTXML=tricky
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="/sasusr/rain/test/tricky.map"
   APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   NUM_OF_DAYS=1
   FORMAT=xml;

data mylib.my24a;
   set rain.tricky;
run;
proc contents data=mylib.my24a; run;
proc print data=mylib.my24a; run;

libname condo "/sasusr/rain/test";
data mylib.mycca;
   set condo.cc_tricky;
run;

proc contents data=mylib.mycca; run;
proc print data=mylib.mycca; run;
```

**Figure 54.1** Current Conditions for London, Paris, and Dubai

**Retrieve Weather Data for London, Paris, and Dubai**

| Obs | AreaName | Country | Region | weatherDesc | winddir16Point | observation_time | oc |
|---|---|---|---|---|---|---|---|
| 1 | London | United Kingdom | City of London, Greater London | Clear | ESE | 21:13:00 | 1 |
| 2 | Paris | France | Ile-de-France | Clear | ESE | 21:13:00 | 2 |
| 3 | Dubai | United Arab Emirates | Dubai | Clear | S | 21:14:00 | 3 |

| Obs | latitude | longitude | temp_C | temp_F | weatherCode | windspeedMiles | windspeedKmph |
|---|---|---|---|---|---|---|---|
| 1 | 51.517 | -0.106 | 16 | 61 | 113 | 12 | 19 |
| 2 | 48.867 | 2.333 | 16 | 61 | 113 | 4 | 6 |
| 3 | 25.252 | 55.280 | 30 | 86 | 113 | 4 | 7 |

| Obs | winddirDegree | precipMM | humidity | visibility | pressure | cloudcover | FeelsLikeC | FeelsLikeF |
|---|---|---|---|---|---|---|---|---|
| 1 | 110 | 0.2 | 55 | 10 | 1012 | 0 | 16 | 61 |
| 2 | 120 | 0.0 | 55 | 10 | 1014 | 0 | 16 | 61 |
| 3 | 180 | 0.0 | 43 | 10 | 1007 | 0 | 31 | 87 |

The XML data that the World Weather Online website returns are placed in a file that is named by the OUTXML= option—in this case, *TRICKY1.xml*. **NOTE:** The SASERAIN engine appends a numeral to the XML file name, and the file extension (.xml) is excluded from the file name that appears in the OUTXML= option. When the SET statement is executed, the XML data are read into a SAS data set named TRICKY.sas7bdat, which resides in the location given inside the string enclosed in double quotation marks in the SASERAIN LIBNAME statement.

You could use either a SAS macro variable or a system environment variable to store the value of your World Weather Online API key so that the key does not appear explicitly in your SAS code. The XML map that is created is assigned the full path name that the XMLMAP= option specifies. The SASERAIN engine appends a numeral to the XML file name to indicate the position of the World Weather Online location code in the QUERY= option.

The QUERY= option specifies the list of World Weather Online locations that you want to retrieve weather data for. This option accepts a string, enclosed in single quotation marks, that denotes a list of one or more World Weather Online locations that you select (keep) in the resulting SAS data set. The result, TRICKY, is named in the DATA step and is shown in Figure 54.1. The preceding example uses three World Weather Online location codes. London, which is in the first position of the QUERY= option, has the numeral 1 appended to the name of the XML file, resulting in *TRICKY1.xml*. Paris is in the second position of the QUERY= option, so the numeral 2 is appended to the name of the XML file, resulting in *TRICKY2.xml*. Dubai is in the third position of the QUERY= option, so the numeral 3 is appended to the name of the XML file, resulting in *TRICKY3.xml*. The SASERAIN engine merges the three XML files to produce one merged output data set named TRICKY.sas7bdat. The current conditions data set is named CC_TRICKY. The second DATA step uses the SET statement to read the current conditions data into a new data set named MYCCA. These data are shown in Figure 54.1.

It is more efficient to use the DATA step to store your World Weather Online data in a SAS data set and then refer to the SAS data set directly in your PROC PRINT or PROC SGPLOT statement. You can also refer to the SASERAIN libref directly, as in the statement

```
proc print data=rain.tricky;
```

This statement uses the member name, TRICKY, in the PROC PRINT statement which invokes the RAIN libref to run the SASERAIN engine. This usage of the member name, TRICKY, corresponds to specifying the OUTXML=TRICKY option. Although using this statement might seem easier, it is not as efficient, because every time you use the SASERAIN libref, the SASERAIN interface engine reads the entire XML file into SAS again. So it is better to refer to the SAS data set repeatedly than to invoke the interface engine repeatedly. For another example that uses more SASERAIN LIBNAME statement options, see the section "Examples: SASERAIN Interface Engine" on page 3778.

## Syntax: SASERAIN Interface Engine

The SASERAIN interface engine uses standard engine syntax to read the observations or data values for one or more World Weather Online data sets that can each contain one or more time series. Table 54.1 summarizes the options that the SASERAIN engine uses. In addition, there is one required option: APIKEY='*rain_api_key*'.

**Table 54.1** Summary of LIBNAME *libref* SASERAIN Options

| Option | Description |
|---|---|
| APIKEY= | Specifies the required World Weather Online access key that enables you to access the data that the World Weather Online website provides |
| AUTOMAP= | Specifies whether or not to overwrite the existing XML map file |
| CONDITIONS= | Specifies whether or not to return only the current weather conditions upon output. CONDITIONS=YES means that variables for both the current conditions and the weather forecast appear in the output. The default (NO) means that only the local weather forecast variables appear in the output. |
| CONNECT= | Specifies whether or not you need the connect method for a secure connection via a proxy server. You must specify the PROXY= option when you use the CONNECT=ON option. |
| DATE= | Specifies the beginning date for past weather data for the specified range: specify the start date in `'YYYY-MM-DD'` format. |
| DAY= | Specifies that the local weather forecast is to be current weather, not past weather. When you specify either today or tomorrow, you get today's weather forecast. This is used with the NUM_OF_DAYS= option to specify a range for obtaining local weather forecast data. |
| DEBUG= | Specifies whether or not to include diagnostic message logging in the SAS log window |
| ENDDATE= | Specifies the end date for past weather for the specified range: specify the end date in `'YYYY-MM-DD'` format. The end date must have the same month and year as the DATE= option. |
| FORECAST= | Specifies whether or not to return the weather forecast for a given postal code, zip code, and latitude/longitude values |
| FORMAT= | Specifies a file extension that indicates the type of file to retrieve. Only XML is supported for the SASERAIN interface engine. |

**Table 54.1** *continued*

| Option | Description |
|---|---|
| FREQ= | Specifies the frequency (interval) of the selected weather forecast data as a character string, such as DAILY, 24HOURLY, HOURLY, 3HOURLY, 6HOURLY, 12HOURLY, or DAY/NIGHT |
| FX24= | Specifies whether or not to return the 24-hour weather forecast at a three-hour interval for a given location (city and country, postal code, zip code, or latitude and longitude) |
| NUM_OF_DAYS= | Specifies the number of days to report (starting from today). This is used for reading the local weather forecast data. The default for the SASERAIN engine is 2 days of forecast data, and the maximum is 15 days (premium weather API). |
| OUTCC= | Specifies the name of the current conditions SAS data set, which contains current conditions data returned by the World Weather Online API. This option is ignored when CONDITIONS=NO. For more information, see the CONDITIONS= option. |
| OUTXML= | Specifies the name of the SAS data set and the XML file, which usually contains the weather forecast data returned by the World Weather Online API. When you do not specify the OUTCC= option, the SASERAIN interface prepends 'CC_' to the name specified in the OUTXML= option to create the name for the current conditions SAS data set. See the OUTCC= option. |
| PROXY= | Specifies the proxy server that you want to use (if you have trouble connecting without specifying a proxy). If you also need the connect method for a secure connection, use the CONNECT=ON option in addition to the PROXY= option. See the CONNECT= option. |
| QUERY= | Specifies a required list of World Weather Online location codes. To select more than one location, list the World Weather Online query codes (q-codes), separated by semicolons. There is a limit of nine World Weather Online location codes in the QUERY= option. This is a required option. |
| TP= | Specifies the time period (interval) of the selected weather forecast data in number of hours: 1, 3, 6 (default), 12, or 24 hours. |
| XMLMAP= | Specifies the fully qualified file name for the XML map that the SASERAIN engine creates. This file name is usually the same as the one in the OUTXML= option. |

## The LIBNAME *libref* SASERAIN Statement

**LIBNAME** *libref* **SASERAIN** '*physical-name*' *options* **;**

The LIBNAME statement assigns a SAS library reference (libref) to the physical path of the directory of World Weather Online data files in which the downloaded World Weather Online XML data are stored. The required *physical-name* argument specifies the location of the folder where your World Weather Online XML data reside. It should end with a backslash if you are in a Windows environment and a forward slash if you are in a UNIX environment.

You can specify the following *options* in the LIBNAME *libref* SASERAIN statement.

**APIKEY=**'*rain_apikey*'

specifies the World Weather Online authentication token or access key that enables you to access the data that the World Weather Online website provides. This access key is a 29-character mixed-case alphanumeric string, and it is required. It must be enclosed in single quotation marks. You can request your *rain_apikey* by visiting the website at the following URL:

**https://www.worldweatheronline.com/developer/signup.aspx**

**AUTOMAP=REPLACE | REUSE**

specifies whether or not to overwrite the existing XML map file.

**REPLACE** specifies that the XML map file be overwritten, and ensures that the most current XML map that is generated by the SASERAIN engine and named by the XMLMAP= option is used.

**REUSE** specifies that the XML map file not be overwritten, and ensures that a pre-existing XML map file that is named by the XMLMAP= option is used.

By default, AUTOMAP=REPLACE.

**CONDITIONS=ONLYCC | YES | NO**

specifies whether or not to return only current conditions data. CONDITIONS=ONLYCC enables the SASERAIN interface to output the current conditions data but not the forecast data. For more about current conditions, see Table 54.2.

**ONLYCC** specifies that only the current conditions be output.

**YES** specifies that the current conditions be output.

**NO** specifies that the current conditions variables be excluded from the output.

By default, the SASERAIN engine uses CONDITIONS=NO and FORECAST=YES. Specify CONDITIONS=YES to create both the current conditions output data set (named in the OUTCC= option) and the weather forecast output data set (named in the OUTXML= option). When the OUTCC= option is not specified, the prefix 'CC_' is added to the name specified in the OUTXML= option. For more information, see the FORECAST= and OUTCC= options. The SASERAIN engine issues a warning when both past weather and current conditions are selected in the same SASERAIN LIBNAME statement.

**Table 54.2** Current Conditions Forecast Variables

| Variable Name | Description |
|---|---|
| observation_time | Time in UTC `'hhmm tt'` format. For example: 06:45 AM or 11:34 PM. |
| temp_C | Temperature in degrees Celsius |
| windspeedMiles | Wind speed in miles per hour |
| windspeedKmph | Wind speed in kilometers per hour |
| winddirDegree | Wind direction in degrees |
| winddir16Point | Wind direction on a 16-point compass |
| weatherCode | Weather condition code |
| weatherDesc | Weather condition description |
| weatherIconUrl | URL for weather icon |
| precipMM | Precipitation in millimeters |
| precipInches | Precipitation in inches |
| humidity | Humidity in percentage |
| visibility | Visibility in kilometers |
| visibilityMiles | Visibility in miles |
| pressure | Atmospheric pressure in millibars |
| pressureInches | Atmospheric pressure in inches |
| cloudcover | Cloud cover in percentage |

**CONNECT=ON | OFF**

specifies whether or not to use the connect method along with the PROXY= option. **NOTE:** You must use the PROXY= option and specify your proxy server in addition to the CONNECT=ON option when you want to use the connect method. For more information about a secure connection, see the PROXY= option.

**DATE=***rain_date_start*

specifies the start date for requesting past (historical) weather data: specify `'YYYY-MM-DD'` (format for the *rain_date_start*). The earliest start date for premium users is July 1, 2008.

**DAY=TODAY | TOMORROW**

specifies the start date for the local current weather forecast: specify today or tomorrow, but results are the same—they start today. If you want a start date other than today, then use the DATE= option. Use the NUM_OF_DAYS= option to specify the number of days to report.

**DEBUG=ON | OFF**

specifies whether or not to include diagnostic message logging in the SAS log window. This information can be very useful for troubleshooting a problem.

**ENDDATE=***rain_date_enddate*

specifies the end date for the range to report past weather: `'YYYY-MM-DD'` (format for the *rain_date_enddate*). The earliest start date (which you specify in the DATE= option) for premium past weather is July 1, 2008, but the ENDDATE= option must have the same month and year as the start date. The date must be enclosed in single quotation marks. The ENDDATE= option

is not required, and the default range is 2 days.

**FORECAST=YES | NO**

specifies whether or not to return the weather forecast for a given location (city and country, postal code, zip code, or latitude and longitude values). By default, the SASERAIN engine uses FORECAST=YES. For more about weather forecast variables, see Table 54.3. When the type of data is not specified in the LIBNAME statement options, the SASERAIN engine defaults to normal weather forecast data and automatically defaults to the FX=YES option. Use either the FX24= option or the FX= option (but not both). When you specify FX24=YES, you do not need to specify any interval (FREQ= option) or any range specification, because the default is 24 hours of data at an interval of every 3 hours (and an extra observation for the 24-hour average).

**Table 54.3** Weather Forecast Variables

| Variable Name | Description |
|---|---|
| date | Local forecast date in `'YYYY-MM-DD'` format. For example: 2013-05-31. |
| maxtempC | Maximum temperature of the day in degrees Celsius |
| maxtempF | Maximum temperature of the day in degrees Fahrenheit |
| mintempC | Minimum temperature of the day in degrees Celsius |
| mintempF | Minimum temperature of the day in degrees Fahrenheit |
| uvIndex | Ultraviolet radiation index |
| time | Local time in `'hmm'` format. For example: 100 or 1500. |
| tempC | Temperature in degrees Celsius |
| tempF | Temperature in degrees Fahrenheit |
| windspeedMiles | Wind speed in miles per hour |
| windspeedKmph | Wind speed in kilometers per hour |
| windspeedKnots | Wind speed in knots |
| windspeedMeterSec | Wind speed in meters per second |
| winddirDegree | Wind direction in degrees |
| winddir16Point | Wind direction on a 16-point compass |
| weatherCode | Weather condition code |
| weatherDesc | Weather condition description |
| weatherIconUrl | URL for weather icon |
| precipMM | Precipitation in millimeters |
| precipinches | Precipitation in inches |
| humidity | Humidity in percentage |
| visibility | Visibility in kilometers |
| visibilityMiles | Visibility in miles |
| pressure | Atmospheric pressure in millibars |
| pressureInches | Atmospheric pressure in inches |
| cloudcover | Cloud cover in percentage |
| chanceofrain | Chance of rain (precipitation) in percentage |
| chanceofwindy | Chance of being windy in percentage |
| chanceofovercast | Chance of being cloudy in percentage |
| chanceofsunny | Chance of being sunny in percentage |
| chanceoffrost | Chance of frost in percentage |
| chanceoffog | Chance of fog in percentage |

**Table 54.3** *continued*

| Variable Name | Description |
|---|---|
| chanceofsnow | Chance of snow in percentage |
| chanceofthunder | Chance of thunder in percentage |

**FORMAT=XML**

specifies the format of the file to be retrieved from the World Weather Online website. Although World Weather Online can report data in many formats, the SASERAIN engine supports only the XML format.

**FREQ=DAILY | HOURLY | 3HOURLY | 6HOURLY | 12HOURLY | 24HOURLY | DAY/NIGHT**

specifies the frequency of the weather data. In World Weather Online weather forecast data, the highest frequency is hourly, and the lowest frequency is daily.

The FREQ= option is not required, and the default interval value is 6 hours.

**FX24=YES | NO**

specifies whether or not to return the 24-hour weather forecast at a three-hour interval for city/country, postal code, zip code, and latitude/longitude values. By default, the SASERAIN engine uses FX24=NO. When the type of data is not specified in the LIBNAME statement options, the SASERAIN engine defaults to normal weather forecast data and automatically defaults to the FX=YES option. **NOTE:** Use either the FX24= option or the FX= option (but not both). When you specify FX24=YES, you do not need to specify any interval (FREQ= option) or any range specification, because the default is 24 hours of data at an interval of 3 hours, but there is also an extra observation for the 24-hour averages for the reported variables.

**MAPREF=***rain_xmlmapref*

specifies the fileref to use for the map assignment. For an example of the SASERAIN engine that uses the MAPREF= and XMLMAP= options in the FILENAME statement in order to assign a file name, as in the following statement, see the section "Examples: SASERAIN Interface Engine" on page 3778:

```
FILENAME MyMap "/sasusr/rain/test/gstart.map";
```

You can use the MAPREF= and XMLMAP= options to control where the map resides, what you name the map, and how you refer to it with a fileref. You can use the OUTXML= option to name your XML data file. It is placed in the current working folder. The SAS data set that is created (when the XML data are read into SAS) is placed in the folder specified by *physical-name,* and you can reference it by using the myLib libref in your SASERAIN LIBNAME statement. This is shown in the section "Examples: SASERAIN Interface Engine" on page 3778, inside the DATA step in the SET statement. The SET statement reads observations from the input data set myLib.GSTART and stores them in a SAS data set named HowCool.

**NUM_OF_DAYS=***rain_numdays*
specifies the number of days to report local weather (starting from today). The maximum is 15 days.

**OUTCC=***rain_outcc*
specifies the name of the SAS data set where the current conditions data that are returned from the World Weather Online website are stored. When OUTCC= option is not specified, the SASERAIN interface stores the current conditions data in a SAS data set named by adding the prefix 'CC_' to the name specified in the OUTXML= option. If there is no request for current conditions data, then the OUTCC= option is ignored.

**OUTXML=***rain_xmlfile*
specifies the name of both the XML file (downloaded) and the SAS data set created when the XML data are read into SAS. Each World Weather Online location code that is listed in the QUERY= option is given a positional numeral: 1 for the first code in the QUERY= option, 2 for the second code, and so on. The SASERAIN engine appends this numeral to the file name of the XML of each data set that the website returns. When all the XML files are retrieved, the data are merged into a SAS data set. When only one World Weather Online location code is specified in the QUERY= option, the file name has the numeral 1 appended to the OUTXML file name. By default, OUTXML=RAIN, which creates a file named *RAIN1.xml* in the current working directory. The SAS data set that is created when the XML data are read into SAS is placed in the folder specified by the physical path in the LIBNAME libref SASERAIN statement.

**PROXY="***rain_proxyserver***"**
specifies which proxy server to use. This option is not required. The specified proxy server is used only when a connection-refused error or a connection-timed-out error occurs. For *rain_proxyserver*, specify the server's HTTP address followed by a colon and the port number, and enclose that string in double quotation marks; for example, PROXY="http://inetgw.unx.sas.com:8118". See also the CONNECT= option.

**QUERY=***'rain_qcode_list'*
specifies the list of World Weather Online locations for the data sets that contain the time series to be included in the output SAS data set. There is a limit of nine World Weather Online location codes in the QUERY= option. The argument *'rain_qcode_list'* is semicolon-delimited and must be enclosed in single quotation marks. For example:

```
QUERY='QCODE1;QCODE2;...QcodeN'}
```

Each **QCODE** specifies a weather data location in one of the following location formats:

| | |
|---|---|
| *Latitude,Longitude* | specifies the location of the selected weather forecast in decimal degrees (XX.XXX,XX.XXX). |
| *UScityName,State* | specifies the location of the selected US city and state. |
| *cityName,Country* | specifies the location of the selected city in the specified country, or if the location is in the United States, you can specify *cityName,State*. |
| *IPaddress* | specifies the location by using the Internet Protocol address in XXX.XXX.XXX.XXX format. |
| *USzipcode* | specifies the location by using the US zip code format. |

*UK_CANpostalcode* specifies the location by using the United Kingdom or Canadian postal code format.

You can specify a maximum of nine q-code locations in the QUERY= option, separated by semicolons. Each q-code can contain commas, blanks, or both. The QUERY= option is required.

**TP=1 | 3 | 6 | 12 | 24**
specifies the number of hours in a time period. In World Weather Online weather forecast data, the highest frequency is 1 (hourly), and the lowest frequency is 24 (daily).

The TP= option is not required, and the default interval value is 6 hours.

**XMLMAP=***rain_xmlmapfile*
specifies the fully qualified name of the location where the XML map file is automatically stored.

## Details: SASERAIN Interface Engine

The SASERAIN interface engine enables SAS users to access time series data that are stored in World Weather Online data sets that the World Weather Online website provides. Every World Weather Online data set is identified by a unique location code ID (which you specify in the QUERY= option). For example, London (England) is uniquely identified by the latitude and longitude that you obtain by using the search API on the web

page with the following URL:

```
https://api.worldweatheronline.com/premium/v1/search.ashx?query=LONDON,
UNITED%20KINGDOM&key=XXXXXXXXXXXXXXXXXXXXXXXXXXXX
```

When you specify the QUERY= option (for one to nine locations), the SASERAIN engine automatically calls the search API to find the unique latitude and longitude for each location that you want. If the request is ambiguous (too vague), then the SASERAIN engine issues a warning that it is using the best first match, and then lists the three possible matches that were searched. If the wrong latitude and longitude for a location were selected, you c

an rerun the SASERAIN engine with a different QUERY= option from the list of possibilities that best match your desired location. **NOTE:** It is best to specify latitude and longitude if you are having difficulty pinpointing your desired location.

## World Weather Online API Key

The API key that is used in these examples, 'XXXXXXXXXXXXXXXXXXXXXXXXXXXXX', is for demonstration only. To successfully download data from the World Weather Online website, use your own World Weather Online API key, which is a 29-character mixed-case alphanumeric string. You can request your own API key by visiting the website at the following URL:

**https://www.worldweatheronline.com/developer/signup.aspx**.

## SAS Output Data Set

You can use a SAS DATA step to write the selected World Weather Online data to a SAS data set. This enables you to use SAS software to easily analyze the data. If you specify the name of the output data set in the DATA statement, the SAS engine supervisor creates a SAS data set that has the specified name in either the SAS Work library or, if specified, the SAS User library.

The contents of the SAS data set include the date of each observation and the name of each location whose weather data is read from the World Weather Online website.

The SASERAIN interface engine maintains the sort order, so the locations (q-codes) are sorted in the resulting SAS data set by the order that you specify in the QUERY= option, by date (time ID), and by variable (time series item name).

You can use the PRINT and CONTENTS procedures to print your output data set and its contents. Alternatively, you can view your SAS output observations by opening the desired output data set in a SAS Explorer window. You can also use the SQL procedure with your SASERAIN libref to create a custom view of your data.

## SAS OUTXML File

The SAS XML (XML format) data that are returned from the World Weather Online website are placed in a file that is named by the OUTXML= option. The SASERAIN interface engine creates a separate XML file for each World Weather Online code that you list in the QUERY= option. The engine numbers each data set's XML file in the order in which it appears in the QUERY= option, so the first data set has a 1 concatenated to the file name, the second data set has a 2 concatenated to the file name, and so on. When the QUERY= option contains more than one World Weather Online code, the variable names also have the same numeral concatenated to them. This naming convention enables the engine to merge all the selected time series into one SAS data set while preserving the identity of each time series. The SAS XML data are placed in the current working directory. The SAS data set created when the XML data are read into SAS is placed in the location specified by the *physical-name* in the LIBNAME *libref* SASERAIN statement, which is described in the section "The LIBNAME *libref* SASERAIN Statement" on page 3770.

## SAS XML Map File

The XML map that (by default) is automatically created is assigned the full path name that you specify in the XMLMAP= option in your LIBNAME *libref* SASERAIN statement. The map file is either reused (not overwritten) if you specify AUTOMAP=REUSE or overwritten by a new map if you specify AUTOMAP=REPLACE (the default). The SASERAIN interface engine invokes the XMLV2 engine to create the map and to read the data into SAS.

# Examples: SASERAIN Interface Engine

## Example 54.1: Retrieving Weather Forecast Data for One Location

When you are specifying one location by city, it is important to also specify the country. Because spaces are allowed in city names and country names, a comma (without spaces) is required to separate the city name from the country name. The following statements enable you to access the World Weather Online data for Paris. The output is shown in Output 54.1.1.

```
options validvarname=any;

title 'World Weather Online Data for Paris';
LIBNAME myLib saserain "%sysget(RAIN_DATA)"
   OUTXML=gstart

The SASERAIN interface engine supports the XML format. The XML data that the World Weather Online website returns are placed in a file named by the OUTXML= option (GSTART). The XML map that is automatically created is assigned the full path name specified by the XMLMAP= option, and the fileref that is used for the map assignment is specified by the MAPREF= option. Because the XMLMAP= option is specified as /sasusr/rain/test/, the SASERAIN engine uses the MAPREF= and XMLMAP= options in the FILENAME statement to assign a file name:

```
FILENAME MyMap "/sasusr/rain/test/gstart.map";
```

You can use the MAPREF= and XMLMAP= options to control where the map resides, what you name the map, and how you refer to it with a fileref. You can use the OUTXML= option to name your XML data file; it is described in the section "SAS OUTXML File" on page 3777. The XML data file is placed

in the current working folder and the SAS data set that is created when the XML data are read into SAS is placed in the location specified by *physical-name,* which is described in the section "The LIBNAME *libref* SASERAIN Statement" on page 3770. You can refer to your data by using the myLib libref in your SASERAIN LIBNAME statement. The myLib libref is shown inside the DATA step in the SET statement. The SET statement reads observations from the input data set myLib.gstart and stores them in a SAS data set named HowCool, as shown in Figure 54.1.1. You can also use the SAS DATA step to perform further processing and to store the resulting time series in a SAS data set; this process is described in the section "SAS Output Data Set" on page 3777.

To specify the list of World Weather Online data sets that you want to retrieve, use the QUERY= option. This option accepts a string, enclosed in single quotation marks, that denotes a list of World Weather Online location codes that specify the places where you want the weather forecast data to be selected for the resulting SAS data set. The World Weather Online location codes are separated by semicolons, so valid World Weather Online codes cannot contain embedded semicolons or quotes. The HowCool data set contains the local weather forecast variables The observation range is controlled by the NUM_OF_DAYS= option, which is a required option. The HowCool data set contains observations that start today and end the same day, as specified by the NUM_OF_DAYS option. The frequency of the data is the six-hour default, because the FREQ= option is not specified.

**NOTE:** The "%20" is a special character for URL encoding of blanks. If the World Weather Online code that you name in the QUERY= option contains a blank, the SASERAIN engine uses "%20" wherever the blank appears in the World Weather Online code. If the World Weather Online code contains an underscore, then you must use an underscore in the QUERY= option. The underscore and the blank are not equivalent in World Weather Online databases.

## Example 54.2: Retrieving the Two-Day Local Weather Forecast for One Location

The statements that follow enable you to access the weather for London for two days (NUM_OF_DAYS=2), which starts with today. The observations are given at a frequency of every 24 hours and are sorted in chronological order. The output is shown in Output 54.2.1.

```
options validvarname=any;

title 'Retrieve Two Day Weather Forecast for London';
libname mylib "/sasusr/rain/doc/";
libname rain saserain "%sysget(RAIN_DATA)"
   QUERY='London,United Kingdom'
   OUTXML=foggy
   XMLMAP="%sysget(RAIN_DATA)foggy.map"
   APIKEY='XXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   NUM_OF_DAYS=2
   TP=24
   FORMAT=xml;

data mylib.london_fog;
   set rain.foggy;
run;
```

```
proc contents data=mylib.london_fog; run;
proc print data=mylib.london_fog; run;
```

**Output 54.2.1** London Weather for Today and Tomorrow: London_fog

**Retrieve Two Day Weather Forecast for London**

| Obs | chanceofsunshine | chanceoffrost | chanceofhightemp | chanceoffog | chanceofsnow | chanceofthunder |
|---|---|---|---|---|---|---|
| 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| 2 | 0 | 0 | 0 | 0 | 0 | 0 |

The XML data that the World Weather Online website returns are placed in a file that is named by the OUTXML= option—in this case, *FOGGY1.xml*. **NOTE:** The SASERAIN engine appends a numeral to the XML file name, and the file extension (.xml) is excluded from the file name that appears in the OUTXML= option. The SAS data set created when the XML data file is read into SAS is placed in the location that is specified inside the string enclosed in double quotation marks in the SASERAIN LIBNAME statement.

You could use either a SAS macro variable or a system environment variable to store the value of your World Weather Online API key so that the key does not appear explicitly in your SAS code. The XML map that is created is assigned the full path name that the XMLMAP= option specifies. The SASERAIN engine appends a numeral to the XML file name to indicate the position of the World Weather Online location code in the QUERY= option.

The QUERY= option specifies the list of World Weather Online locations that you want to retrieve weather data for. This option accepts a string, enclosed in single quotation marks, that consists of one or more World Weather Online locations that you select (keep) in the resulting SAS data set. The result, FOGGY, is named in the DATA step and is shown in Figure 54.2.1. The preceding example uses only one World Weather Online code, which is in the first position of the QUERY= option, so the numeral 1 is appended to the name of the XML file, resulting in *FOGGY1.xml*.

It is more efficient to use the DATA step to store your World Weather Online data in a SAS data set and then refer to the SAS data set directly in your PROC PRINT or PROC GPLOT statement. You can also refer to the SASERAIN libref directly, as in the statement

```
proc print data=rain.foggy;
```

This statement uses the member name, FOGGY, in the PROC PRINT statement; this usage corresponds to specifying the OUTXML=FOGGY option. Although using this statement might seem easier, it is not as efficient, because every time you use the SASERAIN libref, the SASERAIN interface engine reads the entire XML file into SAS again. So it is better to refer to the SAS data set repeatedly than to invoke the interface engine repeatedly.

## Example 54.3: Retrieving the Local Weather Forecast for One Location

This example shows how to use one World Weather Online location query to retrieve weather data for Dubai, starting today and ending tomorrow (num_of_days=2), with a 24-hour frequency. The output is shown in Output 54.3.1.

```
options validvarname=any;

title 'Retrieve Weather Data for Dubai';
libname mylib "/sasusr/rain/doc/";
libname myplace saserain "%sysget(RAIN_DATA)"
   apikey='XXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   query='Dubai,United Arab Emirates'
   format=XML
   outXml=dubhot
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(RAIN_DATA)dubhot.map"
   num_of_days=2
   tp=24
   ;

data mylib.hotdub;
   set myplace.dubhot;
run;

proc contents data=mylib.hotdub; run;
proc print data=mylib.hotdub; run;
```

**Output 54.3.1** Local Weather for Dubai

## Example 54.5: Retrieving Current Conditions for One Location

This example shows how to retrieve current conditions data for one location, Paris. Output 54.5.1 shows the current weather conditions data.

```
title 'Current Conditions for Paris';

options validvarname=any;

libname mylib "/sasusr/rain/doc/";

libname myRain saserain "%sysget(RAIN_DATA)"
   apikey='XXXXXXXXXXXXXXXXXXXXXXXXXXXXX'
   query='Paris,France'
   num_of_days=1
   conditions=onlycc
   outxml=parcon
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(RAIN_DATA)parcon.map"
   format=xml
   ;

data mylib.parcon;
   set myRain.parcon;
run;

proc contents data=mylib.parcon; run;
proc print data=mylib.parcon; run;
```

**Output 54.5.1** Local Current Weather Conditions for Paris

**Current Conditions for Paris**

| Obs | AreaName | Country | Region | observation_time | oc | latitude | longitude | temp_C | temp_F |

## Example 54.6: Retrieving Historical Weather Data for Two Cities for a Date Range

This example shows how to retrieve past weather data for two locations (London and Paris) by using a date range. The historical (past) weather API is invoked because the DATE= and ENDDATE= options are specified. The concept of current conditions does not have any meaning when you specify past dates, so the historical weather data are returned instead of the current conditions. The output is shown in Output 54.6.1. When you specify past dates, the same data are returned whether or not you specify the CC= option. The SAS log shows the following warning:

```
*****WARNING: Using historical (past) weather API, so current conditions are
not reported.
```

```
options validvarname=any;

title 'Historical Weather for Date Range MAY 01, 2017 - MAY 02, 2017 for
   London and Paris';
libname mylib "/sasusr/rain/doc/";

libname myRain saserain "%sysget(RAIN_DATA)"
   apikey='XXXXXXXXXXXXXXXXXXX'
   query='London,United Kingdom;Paris,France'
   date='2017-05-01'
   enddate='2017-05-02'
   tp=24
   cc=onlycc
   format=XML
   outXml=rainex05
   automap=replace
   mapref=MyMap
   xmlmap="%SYSGET(RAIN_DATA)rainex05.map"
   ;

data mylib.cc3day;
   set myRain.rainex05;
run;

proc contents data=mylib.cc3day; run;
proc print data=mylib.cc3day; run;
```

**Output 54.6.1** Historical Weather Data for Date Range for London and Paris

**Historical Weather for Date Range MAY 01, 2017 - MAY 02, 2017 for London and Paris**

| Obs | date | AreaName | Country | Region | oc | latitude | longitude | maxtempC | maxtempF | mintempC | mintempF |

# Overview: SASEWBGO Interface Engine

The SASEWBGO interface engine enables SAS programmers to retrieve time series data from the World Bank Group Open (WBGO) data website, hosted by the World Bank Group, which consists of the following five organizations:

**IBRD** International Bank of Reconstruction and Development, which lends to middle-income and creditworthy low-income countries

**IDA** International Development Association, which provides interest-free loans and grants to governments of the poorest countries

**IFC** International Finance Corporation, which focuses exclusively on the private sector by helping developing countries achieve sustainable growth through investment financing, capital mobilization in international financial markets, and advisory services to businesses and governments

**MIGA** Multilateral Investment Guarantee Agency, which offers political risk insurance (guarantees) to investors and lenders to promote foreign direct investment in developing countries to support economic growth, reduce poverty, and improve people's lives

**ICSID** International Centre for Settlement of Investment Disputes, which provides international facilities for conciliation and arbitration of investment disputes

The first two organizations, the IBRD and the IDA, make up the World Bank.

The World Bank Group Open data catalog contains the databases listed on the web page at the following URL:

**http://datacatalog.worldbank.org/**

The most popular is the World Development Indicators (WDI) database. This database presents the most current and accurate global development data available, including national, regional, and global estimates. The SASEWBGO interface engine supports access to the WDI database, but it also provides access to time series in other WBGO databases, such as the Global Economic Monitor (GEM) and the Special Data Dissemination Standard (SDDS). For a complete list of WBGO databases, see Table 55.5.

The SASEWBGO interface engine uses the LIBNAME statement to enable you to specify how to retrieve your WBGO data by specifying a country list, a list of time series indicators, a range of years, and an optional page number and number of observations per page to report. You can then use the SAS DATA step to perform further subsetting and to store the resulting time series in a SAS data set. You can perform more analysis (if desired) either in the same SAS session or in a later session.

The SASEWBGO interface engine is supported on SAS running on Linux X64 (LAX) and Windows.

Although the SASEWBGO engine uses the WBGO API, it is not endorsed or certified by the World Bank Group. By using the SASEWBGO interface, you are agreeing to comply with the WBGO terms of use, which are described on the web page at the following URL:

**http://data.worldbank.org/summary-terms-of-use**

# Getting Started: SASEWBGO Interface Engine

You can query the World Bank Group Open Data (WDI) database to retrieve the observations or data values for a list of economic time series by specifying the series ID (indicator) of each time series that you want to read into SAS and by specifying a list of the countries for which you want to retrieve the time series.

Before downloading any copyright-protected data series, be aware that you are solely responsible for obtaining copyright permissions for any copyright-protected time series that you download (other than for personal use). To obtain a list of the copyright-protected data series, visit the web page at the following URL:

**http://data.worldbank.org/restricted-data**

Now that your are informed about the terms of use of the WBGO data, you can access these data, as shown in the following example.

The following statements enable you to access the time series data for gross domestic product per capita in current US dollars for Brazil and China for the seven years starting with 2010 and ending with 2016 (on an annual basis). The observations are sorted by the COUNTRY_ID and the time ID variable DATE. Specify the ISO three-letter or ISO two-letter country code for each country for which you want to retrieve time series, separated by a semicolon. In the following LIBNAME statement, you specify the COUNTRYLIST= option by giving the ISO three-letter code for China as ‘chn’ and the ISO three-letter code for Brazil as ‘bra’, separated by a semicolon.

```
options validvarname=any;

title 'Retrieve Data for GDP per Capita for Brazil and China';
libname wbgo sasewbgo "%sysget(WBGO)"
   OUTXML=gdpgs
   XMLMAP="%sysget(WBGO)gdpgs.map"
   COUNTRYLIST='chn;bra'
   IDLIST='NY.GDP.PCAP.CD'
   RANGE='2010:2016';

data gdp_gsa;
   set wbgo.gdpgs ;
run;

proc contents data=gdp_gsa; run;
proc print data=gdp_gsa; run;
```

**Figure 55.1** Getting Started with Gross Domestic Product per Capita: gdp_gsa

**Retrieve Data for GDP per Capita for Brazil and China**

| Obs | country_id | country | date | NY.GDP.PCAP.CD | total_count |
|---|---|---|---|---|---|
| 1 | BR | Brazil | 2010 | 11121.42 | 14 |
| 2 | BR | Brazil | 2011 | 13047.24 | 14 |
| 3 | BR | Brazil | 2012 | 12179.69 | 14 |
| 4 | BR | Brazil | 2013 | 12106.21 | 14 |
| 5 | BR | Brazil | 2014 | 11917.79 | 14 |
| 6 | BR | Brazil | 2015 | 8677.77 | 14 |
| 7 | BR | Brazil | 2016 | . | 14 |
| 8 | CN | China | 2010 | 4560.51 | 14 |
| 9 | CN | China | 2011 | 5633.80 | 14 |
| 10 | CN | China | 2012 | 6337.88 | 14 |
| 11 | CN | China | 2013 | 7077.77 | 14 |
| 12 | CN | China | 2014 | 7683.50 | 14 |
| 13 | CN | China | 2015 | 8069.21 | 14 |
| 14 | CN | China | 2016 | . | 14 |

The XML data that the WBGO website returns are placed in a file named by the OUTXML= option—in this case, *GDPGS.xml*. Note that the XML file extension is excluded from the file name specified in the OUTXML= option. When the SET statement is executed, the XML data are read into a SAS data set named Gdp_gsa.sas7bdat, which resides in the location specified by the string enclosed in double quotation marks in the SASEWBGO LIBNAME statement. So, in the preceding example, assume that you use the following SASEWBGO LIBNAME statement:

```
libname wbgo sasewbgo "/sasusr/playpens/saskff/wbgo/test/"
```

Then, the SAS data set is named by the OUTXML= option specification, created by reading the downloaded XML file, and placed in the location

```
/sasuser/playpens/saskff/wbgo/test/gdpgs.sas7bdat
```

The XML map that is created is assigned the full path name specified by the XMLMAP= option. The IDLIST= option specifies the list of time series indicators that you want to retrieve. This option accepts a string, enclosed in single quotation marks, that denotes a list of one or more time series that you select (keep) in the resulting SAS data set. The result, Gdp_gsa, is named in the DATA step and shown in Figure 55.1. The Total_count gives the total number of available observation values in the requested range. Example 55.9 demonstrates how to use multiple SASEWBGO LIBNAME statements to access the entire range of data.

It is more efficient to use the DATA step to store your WBGO data in a SAS data set and then refer to the SAS data set directly in later SAS program steps, but you can also refer to the SASEWBGO SAS library reference (libref) directly, as in the following statements:

```
proc print data=wbgo.gdpgs; run;
```

This statement uses the member name, gdpgs, in the PROC PRINT statement; this usage corresponds to specifying the OUTXML=GDPGS option. Although using this statement might seem easier, it is not as efficient, because every time you use the SASEWBGO libref, the SASEWBGO engine reads the entire XML file into SAS. So it is better to refer to the SAS data set repeatedly than to invoke the interface engine

repeatedly. See Example 55.1 for sample code that demonstrates how to retrieve multiple time series from one country (China).

## Syntax: SASEWBGO Interface Engine

The SASEWBGO interface engine uses standard engine syntax to read the observations or data values for one or more time series indicators for one or more countries. Table 55.1 summarizes the options that the SASEWBGO engine uses. Two options are required: COUNTRYLIST= and IDLIST= .

**Table 55.1** Summary of LIBNAME *libref* SASEWBGO Options

| Option | Description |
|---|---|
| AUTOMAP= | Specifies whether or not to overwrite the existing XML map file |
| COUNTRYLIST= | Specifies the ISO three-letter or two-letter code for each country for which to retrieve time series. When you specify more than one country code, use a semicolon as a delimiter and enclose the country list in single quotes. This option also enables you to specify region IDs or income-level IDs for aggregating your selected time series. |
| DEBUG= | Specifies whether or not to include diagnostic messages in the SAS log |
| FREQ= | Specifies whether to retrieve quarterly (Q), monthly (M), or yearly (Y) values. The FREQ= option is used only in conjunction with the MRV= option. |
| GAPFILL= | Specifies whether or not to backfill missing values: if data are not available, the API backtracks to the next available period. This option is used only with the MRV= option (the maximum number of backtracked periods is limited by the MRV value specified). |
| IDLIST= | Specifies a list of time series IDs (indicators) for accessing WBGO data. To select more than one time series, list the unique time series indicators, separated by commas. |
| LANG= | Specifies the language to use for text fields returned by the SASEWBGO engine |
| MAPREF= | Specifies the fileref used for the map file assignment |
| MRV= | Specifies the number of observations retrieved relative to the most recent value |
| OUTXML= | Specifies the name of the output SAS data set and the XML file(s) requested by the IDLIST= option. When you specify more than one time series ID in the IDLIST= option, the SASEWBGO engine appends the positional integer (‘1’ for the first time series ID, ‘2’ for the second time series ID, and so on) to the name specified by the OUTXML= option. |
| PAGE= | Specifies the page number of the data to retrieve in the returned data |
| PER_PAGE= | Specifies the number of observations to view in one page of the retrieved data |
| RANGE= | Specifies the range of observations for the retrieved data, such as ‘2000:2001’ for annual data, ‘2009M01:2010M08’ for monthly data, and ‘2009Q1:2010Q3’ for quarterly data |
| SORT= | Specifies the order of the results in ascending or descending order by observation date. The valid sort arguments are ‘asc’ and ‘desc’; the default is ‘asc’. |

**Table 55.1** *continued*

| Option | Description |
|---|---|
| URL= | Specifies a URL from which to request useful information about countries based on income level, time series indicators based on source ID, or time series indicators based on topic ID. The information is downloaded from the web page at the specified URL and stored in the XWBGOTPU data set (a temporary utility data set), which can then be saved or renamed to a permanent SAS data set. |
| XMLMAP= | Specifies the fully qualified name of the location where the XMLmap file is automatically stored. By default, XMLMAP=Wbgo.map. |

## The LIBNAME *libref* SASEWBGO Statement

**LIBNAME** *libref* **SASEWBGO '***physical-name***'** *options* **;**

The LIBNAME statement assigns a SAS library reference (libref) to the physical path of the directory of WBGO data files in which the downloaded WBGO XML data are stored.

You must specify the following arguments:

"*physical name*"
specifies the location of the folder where your WBGO XML data reside. Enclose the *physical name* in double quotation marks, and end it with a backslash if the folder is in a Windows environment or a forward slash if it is in a UNIX environment.

**COUNTRYLIST=**'*wbgo_countrylist*'
specifies the list of country codes, region IDs, or income-level IDs to be included in the output SAS data set. See Table 55.2 and Table 55.3 for the IDs available for each aggregation type. This list is semicolon-delimited and must be enclosed in single quotation marks. To list all countries, specify 'all'. Otherwise, you can use the following information to designate the countries listed in the World Bank API. The World Bank uses the ISO three-letter and two-letter codes to represent most of the countries, with the following exceptions:

- Three-letter code differences: Andorra, Democratic Republic of the Congo, Isle of Man, Romania, Timor-Leste, West Bank and Gaza
- Two-letter code differences: Democratic Republic of the Congo, Serbia, Timor-Leste, Republic of Yemen, West Bank and Gaza
- Countries not using ISO codes: Channel Islands, Kosovo

For more information about country codes, visit the web page at the following URL:

**http://www.nationsonline.org/oneworld/country_code_list.htm**

**IDLIST='***wbgo_idlist***'**
specifies the list of time series indicators to be included in the output SAS data set. This list is comma-delimited and must be enclosed in single quotation marks. The crossproduct of the country list and the ID list defines the cross sections of the resulting SAS output data set. For a complete list of available indicators, visit the web page at the following URL:

```
http://api.worldbank.org/v2/indicators
```

You can also specify the following *options*.

**AUTOMAP=REPLACE | REUSE**
specifies which XMLmap file to use. You can specify the following values:

**REPLACE** overwrites the existing XMLmap file and uses the most current XMLmap that is generated by the SASEWBGO engine and specified in the XMLMAP= option.

**REUSE** uses a preexisting XMLmap file that is specified in the XMLMAP= option.

**DEBUG=ON | OFF**
specifies whether or not to include diagnostic message logging in the SAS log. This information can be very useful for troubleshooting a problem.

**FREQ=M | Q | Y | A**
specifies the frequency of the file to be retrieved from the WBGO website. This option is used only in conjunction with the MRV= option. M is monthly, Q is quarterly, and Y (or A) is yearly (annual). By default, FREQ=Y.

**GAPFILL=Y | N**
specifies whether or not to backfill the unavailable (missing) values in the data retrieved from the WBGO website. This option is used only in conjunction with the MRV= option.

**LANGUAGE=EN | ES | FR**
specifies the language of the text fields for the retrieved data. The following languages are supported: English (EN), Spanish (ES), and French (FR). The SASEWBGO engine does not support Chinese or Arabic. By default, LANGUAGE=EN.

**MAPREF=***wbgo_xmlmapfileref*
specifies the fileref used for the map assignment. The SASEWBGO engine uses the MAPREF= and XMLMAP= options in the FILENAME statement to assign a file name, as in the following:

```
FILENAME MyMap "/sasusr/playpens/saskff/wbgo/test/gstart.map";
```

You can use the MAPREF= and XMLMAP= options to control where the map resides, what you name the map, and how you refer to it with a fileref. You can use the OUTXML= option to name your XML data file and to name the SAS data set that you created by reading the XML data into SAS. The resulting SAS data set is placed in the folder designated by 'physical-name', and you can reference it by using the myLib libref in your SASEWBGO LIBNAME statement. This is shown in Example 55.1, inside the DATA step in the SET statement. In the example, the SET statement reads observations from the input data set myLib.g2start and stores them in a SAS data set named Gdp2chn.

**MRV=***wbgo_mrv*
specifies the number of observations to retrieve relative to the most recent value. You must specify this option when you specify either the GAPFILL= or FREQ= option.

**OUTXML=***wbgo_xmlfile*
specifies the name of both the XML file (downloaded) and the SAS data set created when the XML data are read into SAS. Each WBGO time series that you list in the IDS= option is given a positional numeral: 1 for the first time series ID listed in the ID= option, 2 for the second time series ID listed, and so on. The SASEWBGO engine appends this numeral to the file name of the XML of each data set that the website returns. When all the XML files are retrieved, the data are merged into a SAS data set. When you specify only one WBGO time series ID in the ID= option, the file name has the numeral 1 appended to the OUTXML= file name. By default, OUTXML=WBGO, which creates a file named *WBGO1.xml* in the current working directory. The SAS data set that is created when the XML data are read into SAS is placed in the folder specified by the physical path in the LIBNAME libref SASEWBGO statement.

**PAGE=***wbgo_page*
specifies the page number of the data to retrieve. Only one page is retrieved for a request, but the page total can be quite large. By default, the first page is retrieved when the page number is not specified. When you want to see more data than what is retrieved for the first page, make another request by specifying the PAGE= option with the number of the page that you want to retrieve. For the page number, you must specify an integer between 1 and the total page count given by the DATA_PAGES variable in the SAS data set named OUTXML1.sas7bdat, which can be viewed in the SAS listing.

**PER_PAGE=***wbgo_perpage*
specifies the number of observations per page of the data to retrieve. The default is 50 observations per page. You can set the per-page number that you want to retrieve by using this option. The per-page count is given by the DATA_PER_PAGE in the SAS data set named OUTXML1.sas7bdat, which can be viewed in the SAS listing. If you want the entire range of data to be downloaded all at once (in one page), you can specify the PER_PAGE= option to be the value of the TOTAL_COUNT that is given in the output SAS data set named by your OUTXML= option. See Example 55.9 for an example of a SAS macro that enables you to download the entire range of data in one page.

**RANGE='***wbgo_range***'**
specifies the date range of the data that you want to retrieve in the following formats:

'*yyyy:yyyy*' designates the start year and end year for the range of annual time series; for example, RANGE=2000:2001.

'*yyyyQn:yyyyQn*' designates the start year and quarter (*n*) and the end year and quarter (*n*) for the quarterly time series; for example, RANGE=2009Q1:2010Q3.

'*yyyyMnn:yyyyMnn*' designates the start year and month (*nn*) and the end year and month (*nn*) for the monthly time series; for example, RANGE=2009M01:2010M08.

For quarterly time series, *n* is an integer between 1 and 4. For monthly time series, *nn* is an integer between 1 and 12. Most series in the WDI database are annual. For more information about quarterly and monthly data, consult the World Bank data catalog by visiting the website at the following URL:

**http://datacatalog.worldbank.org/**

See Example 55.7 for sample code that retrieves Quarterly External Debt Statistics data, and see Example 55.8 for sample code that retrieves monthly Global Economic Monitor commodities data.

**SORT=ASC | DESC**
specifies the order of the time series observations. You can specify the following values:

**ASC** specifies that the dates for the time series observations be in ascending order (within each country's cross section of data).

**DESC** specifies that the dates for the time series observations be in descending order (within each country's cross section of data).

By default, SORT='ASC'.

**URL=***"wbgo_url_link/*<*query_type*`?`<*query_option=value*>><**LIMIT=***obs_limit*>*"*
queries for useful information, such as listing countries by income level, indicators by source ID, or indicators by topic ID. The SASEWBGO engine stores the information in a temporary utility data set named XWBGOTPU. Specify the following fields in double quotation marks:

*wbgo_url_link/*
specifies the base WBGO URL that you want to use. The *wbgo_url_link* in the following example is 'http://api.worldbank.org/'.

```
URL="http://api.worldbank.org/topic/5/indicator?format=xml"
```

*query_type*`?`*query_option*
specifies the type of information that you want to query. You can specify the following *query_types* and *query_options*:

`countries?incomeLevels=`*income_level_code*
retrieves the countries available for a specified income level, such as

```
URL="http://api.worldbank.org/countries?incomeLevel=LIC"
```

`source/`*source_id*`/indicators?format=xml`
retrieves the series indicators available for a specified source ID, such as

```
URL="http://api.worldbank.org/source/1/indicators?format=xml"
```

`topic/`*topic_id*`/indicator?format=xml`
retrieves the series indicators available for a specified topic ID, such as

```
URL="http://api.worldbank.org/topic/5/indicator?format=xml"
```

For a list of available sources, topics, and income levels, see Table 55.4, Table 55.5, and Table 55.2, respectively.

**LIMIT=***obs_limit*
specifies the maximum number of observations to retrieve.

**XMLMAP=***wbgo_xmlmapfile*
specifies the fully qualified name of the location where the XMLmap file is automatically stored. By default, XMLMAP=Wbgo.map.

# Details: SASEWBGO Interface Engine

The SASEWBGO interface engine enables SAS programmers to access time series World Bank Group Open (WBGO) data that the WBGO website provides. Time series selection is provided by the IDLIST= option and the COUNTRYLIST= option. Because both options are required, the SASEWBGO engine issues an error message if either option is not specified. See the Table 55.6 for a list of time series indicators available from the World Development Indicators (WDI) database. For a list of country codes (both the ISO two-letter and three-letter codes), visit the web page at the following URL:

**`http://www.nationsonline.org/oneworld/country_code_list.htm`**

For a list of available time series indicators, see the section "Available Time Series Data Reference: SASEWBGO Interface Engine" on page 3810.

## Available Income Levels and Regions to Aggregate WBGO Time Series Data

In addition to aggregating your data based on country ID, you can also aggregate your selected data by specifying income-level IDs or region IDs in the COUNTRYLIST= option. To get a list of the available income levels of WBGO data, enter the following URL in your web browser: **`http://api.worldbank.org/incomeLevels?format=xml`**. Table 55.2 shows the income levels that are available.

**Table 55.2** Income Levels of the World Bank Group Open Data

| Income-Level ID | Income-Level Name |
|---|---|
| HIC | High income |
| HPC | Heavily indebted poor countries (HIPC) |
| LIC | Low income |
| LMC | Lower middle income |
| LMY | Low and middle income |
| MIC | Middle income |
| NOC | High income: nonOECD |
| OEC | High income: OECD |
| UMC | Upper middle income |

To get a list of the regions for WBGO data, enter the following URL in your web browser:

**`http://api.worldbank.org/v2/regions?format=xml`**

Table 55.3 shows the regions that are available.

**Table 55.3** Regions of the World Bank Group Open Data

| Region ID | Region Name |
|---|---|
| AFR | Africa |
| ANR | Andean Region |
| ARB | Arab World |
| CAA | Sub-Saharan Africa (IFC classification) |
| CEA | East Asia and the Pacific (IFC classification) |
| CEB | Central Europe and the Baltics |
| CEU | Europe and Central Asia (IFC classification) |
| CLA | Latin America and the Caribbean (IFC classification) |
| CME | Middle East and North Africa (IFC classification) |
| CSA | South Asia (IFC classification) |
| CSS | Caribbean small states |
| EAP | East Asia and Pacific (excluding high income; developing only) |
| EAR | Early-demographic dividend |
| EAS | East Asia and Pacific (all income levels) |
| ECA | Europe and Central Asia (excluding high income; developing only) |
| ECS | Europe and Central Asia (all income levels) |
| EMU | EURO area |
| EUU | European Union |
| FCS | Fragile and conflict-affected situations |
| HPC | Heavily indebted poor countries |
| LAC | Latin America and the Caribbean (developing only) |
| LCN | Latin America and the Caribbean (all income levels) |
| LCR | Latin America and the Caribbean |
| LDC | Least developed countries: UN classification |
| LTE | Late-demographic dividend |
| MCA | Central America |
| MDE | Middle East (developing only) |
| MEA | Middle East and North Africa (all income levels) |
| MNA | Middle East and North Africa (excluding high income; developing only) |
| NAC | North America |
| NAF | North Africa |
| NLS | Non-resource-rich Sub-Saharan Africa, of which landlocked |
| NRS | Non-resource-rich Sub-Saharan Africa |
| OED | OECD members |
| OSS | Other small states |
| PRE | Pre-demographic dividend |
| PSS | Pacific Island small states |
| PST | Post-demographic dividend |
| RRS | Resource-rich Sub-Saharan Africa countries |
| RSO | Resource-rich Sub-Saharan Africa countries, of which oil exporters |
| SAS | South Asia |
| SCE | Southern Cone |
| SSA | Sub-Saharan Africa (developing only) |
| SSF | Sub-Saharan Africa (all income levels) |
| SST | Small states |
| SXZ | Sub-Saharan Africa excluding South Africa |
| WLD | All countries (world) |
| XZN | Sub-Saharan Africa excluding South Africa and Nigeria |

## Available Topics That Provide WBGO Time Series Data

To get a list of the available topics of WBGO data, enter the following URL in your web browser:

```
http://api.worldbank.org/v2/topics?format=xml
```

Table 55.4 shows the topics that are available.

**Table 55.4** Topics of the World Bank Group Open Data

| Topic ID | Topic Name and Description |
|---|---|
| 1 | **Agriculture and Rural Development**<br>For the 70% of the world's poor who live in rural areas, agriculture is the main source of income and employment. But depletion and degradation of land and water pose serious challenges to producing enough food and other agricultural products to sustain livelihoods here and meet the needs of urban populations. Data presented here include measures of agricultural inputs, outputs, and productivity compiled by the United Nations' Food and Agriculture Organization. |
| 2 | **Aid Effectiveness**<br>Aid effectiveness is the impact that aid has in reducing poverty and inequality, increasing growth, building capacity, and accelerating achievement of the Millennium Development Goals set by the international community. Indicators here cover aid received as well as progress in reducing poverty and improving education, health, and other measures of human welfare. |
| 3 | **Economy and Growth**<br>Economic growth is central to economic development. When national income grows, real people benefit. While there is no known formula for stimulating economic growth, data can help policy makers better understand their countries' economic situations and guide any work toward improvement. Data here cover measures of economic growth, such as gross domestic product (GDP) and gross national income (GNI). They also include indicators that represent factors known to be relevant to economic growth, such as capital stock, employment, investment, savings, consumption, government spending, imports, and exports. |
| 4 | **Education**<br>Education is one of the most powerful instruments for reducing poverty and inequality and lays a foundation for sustained economic growth. The World Bank compiles data on education inputs, participation, efficiency, and outcomes. Data on education are compiled by the United Nations Educational, Scientific, and Cultural Organization (UNESCO) Institute for Statistics from official responses to surveys and from reports provided by education authorities in each country. |
| 5 | **Energy and Mining**<br>The world economy needs ever-increasing amounts of energy to sustain economic growth, raise living standards, and reduce poverty. But today's trends in energy use are not sustainable. As the world's population grows and economies become more industrialized, nonrenewable energy sources will become scarcer and more costly. Data here on energy production, use, dependency, and efficiency are compiled by the World Bank from the International Energy Agency and the Carbon Dioxide Information Analysis Center. |

**Table 55.4** *continued*

| Topic ID | Topic Name and Description |
|---|---|
| 6 | **Environment**<br>Natural and man-made environmental resources—fresh water, clean air, forests, grasslands, marine resources, and agro-ecosystems—provide sustenance and a foundation for social and economic development. The need to safeguard these resources crosses all borders. Today, the World Bank is one of the key promoters and financiers of environmental upgrading in the developing world. Data here cover forests, biodiversity, emissions, and pollution. Other indicators relevant to the environment are found under data pages for Agriculture and Rural Development, Energy and Mining, Infrastructure, and Urban Development. |
| 7 | **Financial Sector**<br>An economy's financial markets are critical to its overall development. Banking systems and stock markets enhance growth, the main factor in poverty reduction. Strong financial systems provide reliable and accessible information that lowers transaction costs, which in turn bolsters resource allocation and economic growth. Indicators here include the size and liquidity of stock markets; the accessibility, stability, and efficiency of financial systems; and international migration and workers' remittances, which affect growth and social welfare in both sending and receiving countries. |
| 8 | **Health**<br>Improving health is central to the Millennium Development Goals, and the public sector is the main provider of health care in developing countries. To reduce inequities, many countries have emphasized primary health care, including immunization, sanitation, access to safe drinking water, and safe motherhood initiatives. Data here cover health systems, disease prevention, reproductive health, nutrition, and population dynamics. Data are from the United Nations Population Division, World Health Organization, United Nations Children's Fund, Joint United Nations Programme on HIV/AIDS, and other sources. |
| 9 | **Infrastructure**<br>Infrastructure helps determine the success of manufacturing and agricultural activities. Investments in water, sanitation, energy, housing, and transport also improve lives and help reduce poverty. And new information and communication technologies promote growth, improve delivery of health and other services, expand the reach of education and support social and cultural advances. Data here are compiled from such sources as the International Road Federation, Containerisation International, the International Civil Aviation Organization, the International Energy Association, and the International Telecommunications Union. |
| 10 | **Social Protection and Labor**<br>The supply of labor available in an economy includes people who are employed, those who are unemployed but seeking work, and first-time job seekers. Not everyone who works is included: unpaid workers, family workers, and students are often omitted, while some countries do not count members of the armed forces. Data on labor and employment are compiled by the International Labour Organization (ILO) from labor force surveys, censuses, establishment censuses and surveys, and administrative records such as employment exchange registers and unemployment insurance schemes. |
| 11 | **Poverty**<br>For countries with an active poverty monitoring program, the World Bank—in collaboration |

**Table 55.4** *continued*

| Topic ID | Topic Name and Description |
|---|---|
| | with national institutions, other development agencies, and civil society—regularly conducts analytical work to assess the extent and causes of poverty and inequality, examine the impact of growth and public policy, and review household survey data and measurement methods. Data here include poverty and inequality measures generated from analytical reports, from national poverty monitoring programs, and from the World Bank's Development Research Group, which has been producing internationally comparable and global poverty estimates and lines since 1990. |
| 12 | **Private Sector**<br>Private markets drive economic growth, tapping initiative and investment to create productive jobs and raise incomes. Trade is also a driver of economic growth as it integrates developing countries into the world economy and generates benefits for their people. Data on the private sector and trade are from the World Bank Group's Private Participation in Infrastructure Project Database, Enterprise Surveys, and Doing Business Indicators, as well as from the International Monetary Fund's Balance of Payments database and International Financial Statistics, the UN Commission on Trade and Development, the World Trade Organization, and other sources. |
| 13 | **Public Sector**<br>Effective governments improve people's standard of living by ensuring access to essential services—health, education, water and sanitation, electricity, transport—and the opportunity to live and work in peace and security. Data here include World Bank staff assessments of country performance in economic management, structural policies, policies for social inclusion and equity, and public sector management and institutions for the poorest countries. Also included are indicators on revenues and expenses from the International Monetary Fund's Government Finance Statistics, and on tax policies from various sources. |
| 14 | **Science and Technology**<br>Technological innovation, often fueled by governments, drives industrial growth and helps raise living standards. Data here aim to shed light on countries' technology base: research and development, scientific and technical journal articles, high-technology exports, royalty and license fees, and patents and trademarks. Sources include the UNESCO Institute for Statistics, the US National Science Board, the UN Statistics Division, the International Monetary Fund, and the World Intellectual Property Organization. |
| 15 | **Social Development**<br>Data here cover child labor, gender issues, refugees, and asylum seekers. Children in many countries work long hours, often combining studying with work for pay. The data on their paid work are from household surveys conducted by the International Labour Organization (ILO), the United Nations Children's Fund (UNICEF), the World Bank, and national statistical offices. Gender disparities are measured using a compilation of data on key topics such as education, health, labor force participation, and political participation. Data on refugees are from the United Nations High Commissioner for Refugees complemented by statistics on Palestinian refugees under the mandate of the United Nations Relief and Works Agency. |

**Table 55.4** *continued*

| Topic ID | Topic Name and Description |
|---|---|
| 16 | **Urban Development**<br>Cities can be tremendously efficient. It is easier to provide water and sanitation to people living closer together, while access to health, education, and other social and cultural services is also much more readily available. However, as cities grow, the cost of meeting basic needs increases, as does the strain on the environment and natural resources. Data on urbanization, traffic and congestion, and air pollution are from the United Nations Population Division, World Health Organization, International Road Federation, World Resources Institute, and other sources. |
| 17 | **Gender**<br>Gender equality is a core development objective in its own right. It is also smart development policy and sound business practice. It is integral to economic growth, business growth, and good development outcomes. Gender equality can boost productivity, enhance prospects for the next generation, build resilience, and make institutions more representative and effective. In December 2015, the World Bank Group Board discussed its new Gender Equality Strategy 2016–2023, which aims to address persistent gaps and proposed a sharpened focus on more and better gender data. The World Bank Group is continually scaling up commitments and expanding partnerships to fill significant gaps in gender data. The database hosts the latest sex-disaggregated data and gender statistics covering demography, education, health, access to economic opportunities, public life and decision-making, and agency. |
| 18 | **Millennium Development Goals**<br>Achieve the following by 2015: To eradicate extreme poverty and hunger; to achieve universal primary education; to promote gender equality and empower women; to reduce child mortality; to improve maternal health; to combat HIV/AIDS, malaria, and other diseases; to ensure environmental sustainability; to develop a global partnership for development. |
| 19 | **Climate Change**<br>Climate change is expected to hit developing countries the hardest. Its effects—higher temperatures, changes in precipitation patterns, rising sea levels, and more frequent weather-related disasters—pose risks for agriculture, food, and water supplies. At stake are recent gains in the fight against poverty, hunger, and disease, and the lives and livelihoods of billions of people in developing countries. Addressing climate change requires unprecedented global cooperation across borders. The World Bank Group is helping support developing countries and contributing to a global solution, while tailoring its approach to the differing needs of developing country partners. Data here cover climate systems, exposure to climate impacts, resilience, greenhouse gas emissions, and energy use. Other indicators relevant to climate change are found under other data pages, particularly Environment, Agriculture and Rural Development, Energy and Mining, Health, Infrastructure, Poverty, and Urban Development. |

**Table 55.4** *continued*

| Topic ID | Topic Name and Description |
|---|---|
| 20 | **External Debt**<br>Debt statistics provide a detailed picture of debt stocks and flows of developing countries. Data presented as part of the Quarterly External Debt Statistics take a closer look at the external debt of high-income countries and emerging markets to enable a more complete understanding of global financial flows. The Quarterly Public Sector debt database provides further data on public sector valuation methods; tiers of debt for central, state, and local debt instruments; and clearly defined government, as well as extra-budgetary agencies and funds. Data are gathered from national statistical organizations and central banks as well as by various major multilateral institutions and World Bank staff. |
| 21 | **Trade**<br>Trade is a key means to fight poverty and achieve the Millennium Development Goals, specifically by improving developing country access to markets and by supporting a rules-based, predictable trading system. In cooperation with other international development partners, the World Bank launched the Transparency in Trade Initiative to provide free and easy access to data on country-specific trade policies. |

## Available Sources of WBGO Time Series Data

To get a list of the available sources of WBGO economic time series data, enter the following URL in your web browser:

```
http://api.worldbank.org/v2/sources
```

Table 55.5 shows some of the sources available.

You can use the URL= option to retrieve the series indicators available for a specified source ID. For an

example, see Example 55.5.

You can use the URL= option to retrieve the series indicators available for a specified topic ID. For an example, see Example 55.6.

You can also use the URL= option to retrieve the country codes available for a specified income level. For more about income levels, see the section "Available Countries for a Specified Income Level" (which follows).

## Available Countries for a Specified Income Level

Each of the WBGO income levels has a corresponding country list. To get a list of countries for a specific income level, such as low income level (LIC), use the following URL= option in your LIBNAME statement:

```
title 'WBGO Data for Low-Income-Level Countries';
LIBNAME myLib sasewbgo "<physical path name>"
   URL="http://api.worldbank.org/countries?incomeLevel=LIC&format=xml";

data LICinc;
   set myLib.XWBGOTPU ;
run;

proc contents data=LICinc; run;
proc print data=LICinc; run;
```

## Available Time Series for a Specified Source ID

Each source in the WBGO data has many time series. To get the list of time series indicators for a specific source ID (for example, source_id=1), use the following URL= option in your LIBNAME statement:

```
LIBNAME myLib sasewbgo "<physical path name>"
   URL="http://api.worldbank.org/source/1/indicators?format=xml";
```

See Example 55.5 for the sample code.

## Available Time Series for a Specified Topic ID

Each topic in the WBGO data has many time series. To get the list of time series indicators for a specific topic ID (for example, topic_id=5), use the following URL= option in your LIBNAME statement:

```
LIBNAME myLib sasewbgo "<physical path name>"
   URL="http://api.worldbank.org/topic/5/indicator?format=xml";
```

See Example 55.6 for the sample code.

## SAS Output Data Set

You can use the SAS DATA step to write the selected WBGO data to a SAS data set. This enables you to use SAS software to easily analyze the data.

The contents of the SAS data set include the date of each observation and the indicator of each series that is read from the WBGO data source.

The SASEWBGO interface engine maintains the sort order, so the time series are sorted in the resulting SAS data set by the order specified in the SORT= option, by date (time ID), and by variable (time series indicator).

You can use the PRINT and CONTENTS procedures to print your output data set and its contents. Alternatively, you can view your SAS output observations by opening the desired output data set in a SAS Explorer window. You can also use the SQL procedure with your SASEWBGO libref to create a custom view of your data.

## SAS OUTXML File

The SAS XML (XML format) data that are retrieved from the WBGO website are placed in a file named by the OUTXML= option. The SAS XML data file is placed in the current working directory, but the SAS data set that is created by reading the XML data into SAS is placed in the location that is specified by the *physical-name* in the LIBNAME *libref* SASEWBGO statement, which is described in the section "The LIBNAME *libref* SASEWBGO Statement" on page 3794.

## SAS XML Map File

The XML map that (by default) is automatically created is assigned the full path name given by the XMLMAP= option in your LIBNAME *libref* SASEWBGO statement. The map file is either reused (not overwritten) if you specify AUTOMAP=REUSE or overwritten by a new map if you specify AUTOMAP=REPLACE (the default). The SASEWBGO engine invokes the XMLV2 engine to create the map and to read the data into SAS.

## XWBGOTPU SAS Data Set

You can use the URL= option to query for useful information such as income-level categories, sources, and topics and store the information in a temporary utility data set named XWBGOTPU. After you have this information, you can use it to select the data that you want to include in a subsequent SASEWBGO *libref* statement. For more information about the three possible types of XWBGOTPU contents, see the URL= option.

## Available Time Series Data Reference: SASEWBGO Interface Engine

Table 55.6 shows the 2010 WDI time series indicators available for the IDLIST= option. Each indicator is unique. When you specify multiple indicators, separate them with commas.

**Table 55.6** List of 2010 WDI Indicators

| Indicator | Description |
|---|---|
| NY.ADJ.SVNX.GN.ZS | Adjusted net savings, excluding particulate emission damage (% of GNI) |
| NY.ADJ.SVNX.CD | Adjusted net savings, excluding particulate emission damage (current US$) |
| NY.ADJ.SVNG.GN.ZS | Adjusted net savings, including particulate emission damage (% of GNI) |
| NY.ADJ.SVNG.CD | Adjusted net savings, including particulate emission damage (current US$) |
| NY.ADJ.DCO2.GN.ZS | Adjusted savings: carbon dioxide damage (% of GNI) |
| NY.ADJ.DCO2.CD | Adjusted savings: carbon dioxide damage (current US$) |
| NY.ADJ.DKAP.GN.ZS | Adjusted savings: consumption of fixed capital (% of GNI) |
| NY.ADJ.DKAP.CD | Adjusted savings: consumption of fixed capital (current US$) |
| NY.ADJ.AEDU.GN.ZS | Adjusted savings: education expenditure (% of GNI) |
| NY.ADJ.AEDU.CD | Adjusted savings: education expenditure (current US$) |
| NY.ADJ.DNGY.GN.ZS | Adjusted savings: energy depletion (% of GNI) |
| NY.ADJ.DNGY.CD | Adjusted savings: energy depletion (current US$) |
| NY.ADJ.ICTR.GN.ZS | Adjusted savings: gross savings (% of GNI) |
| NY.ADJ.DMIN.GN.ZS | Adjusted savings: mineral depletion (% of GNI) |
| NY.ADJ.DMIN.CD | Adjusted savings: mineral depletion (current US$) |
| NY.ADJ.DFOR.GN.ZS | Adjusted savings: net forest depletion (% of GNI) |
| NY.ADJ.DFOR.CD | Adjusted savings: net forest depletion (current US$) |
| NY.ADJ.NNAT.GN.ZS | Adjusted savings: net national savings (% of GNI) |
| NY.ADJ.NNAT.CD | Adjusted savings: net national savings (current US$) |
| NY.ADJ.DPEM.GN.ZS | Adjusted savings: particulate emission damage (% of GNI) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| NY.ADJ.DPEM.CD | Adjusted savings: particulate emission damage (current US$) |
| SP.ADO.TFRT | Adolescent fertility rate (births per 1,000 women ages 15–19) |
| SP.POP.DPND | Age dependency ratio (% of working-age population) |
| SP.POP.DPND.OL | Age dependency ratio, old (% of working-age population) |
| SP.POP.DPND.YG | Age dependency ratio, young (% of working-age population) |
| AG.LND.IRIG.AG.ZS | Agricultural irrigated land (% of total agricultural land) |
| AG.LND.AGRI.ZS | Agricultural land (% of land area) |
| AG.LND.AGRI.K2 | Agricultural land (sq. km) |
| AG.AGR.TRAC.NO | Agricultural machinery, tractors |
| AG.LND.TRAC.ZS | Agricultural machinery, tractors per 100 sq. km of arable land |
| EN.ATM.METH.AG.ZS | Agricultural methane emissions (% of total) |
| EN.ATM.NOXE.AG.ZS | Agricultural nitrous oxide emissions (% of total) |
| TX.VAL.AGRI.ZS.UN | Agricultural raw materials exports (% of merchandise exports) |
| TM.VAL.AGRI.ZS.UN | Agricultural raw materials imports (% of merchandise imports) |
| EA.PRD.AGRI.KD | Agriculture value added per worker (constant 2000 US$) |
| NV.AGR.TOTL.ZS | Agriculture, value added (% of GDP) |
| NV.AGR.TOTL.KD.ZG | Agriculture, value added (annual % growth) |
| NV.AGR.TOTL.KD | Agriculture, value added (constant 2000 US$) |
| NV.AGR.TOTL.KN | Agriculture, value added (constant LCU) |
| NV.AGR.TOTL.CN | Agriculture, value added (current LCU) |
| NV.AGR.TOTL.CD | Agriculture, value added (current US$) |
| IS.AIR.GOOD.MT.K1 | Air transport, freight (million ton-km) |
| IS.AIR.PSGR | Air transport, passengers carried |
| IS.AIR.DPRT | Air transport, registered carrier departures worldwide |
| EG.USE.COMM.CL.ZS | Alternative and nuclear energy (% of total energy use) |
| ER.H2O.FWAG.ZS | Annual freshwater withdrawals, agriculture (% of total freshwater withdrawal) |
| ER.H2O.FWDM.ZS | Annual freshwater withdrawals, domestic (% of total freshwater withdrawal) |
| ER.H2O.FWIN.ZS | Annual freshwater withdrawals, industry (% of total freshwater withdrawal) |
| ER.H2O.FWTL.ZS | Annual freshwater withdrawals, total (% of internal resources) |
| ER.H2O.FWTL.K3 | Annual freshwater withdrawals, total (billion cubic meters) |
| AG.LND.ARBL.ZS | Arable land (% of land area) |
| AG.LND.ARBL.HA.PC | Arable land (hectares per person) |
| AG.LND.ARBL.HA | Arable land (hectares) |
| SH.STA.ARIC.ZS | ARI treatment (% of children under 5 taken to a health provider) |
| MS.MIL.TOTL.TF.ZS | Armed forces personnel (% of total labor force) |
| MS.MIL.TOTL.P1 | Armed forces personnel, total |
| MS.MIL.XPRT.KD | Arms exports (constant 1990 US$) |
| MS.MIL.MPRT.KD | Arms imports (constant 1990 US$) |
| IC.TAX.METG | Average number of times firms spent in meetings with tax officials |
| AG.LND.PRCP.MM | Average precipitation in depth (mm per year) |
| IC.CUS.DURS.EX | Average time to clear exports through customs (days) |
| FB.BNK.CAPA.ZS | Bank capital to assets ratio (%) |
| FD.RES.LIQU.AS.ZS | Bank liquid reserves to bank assets ratio (%) |
| FB.AST.NPER.ZS | Bank nonperforming loans to total gross loans (%) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| VC.BTL.DETH | Battle-related deaths (number of people) |

| IQ.WEF.CUST.XQ | Burden of customs procedure, WEF (1=extremely inefficient to 7=extremely efficient) |
| IC.BUS.NREG.ZS | Business entry rate (new registrations as % of total) |
| IC.BUS.DISC.XQ | Business extent of disclosure index (0=less disclosure to 10=more disclosure) |
| GC.BAL.CASH.GD.ZS | Cash surplus/deficit (% of GDP) |
| GC.BAL.CASH.CN | Cash surplus/deficit (current LCU) |
| GC.DOD.TOTL.GD.ZS | Central government debt, total (% of GDP) |
| GC.DOD.TOTL.CN | Central government debt, total (current LCU) |
| AG.YLD.CREL.KG | Cereal yield (kg per hectare) |
| NE.GDI.STKB.KN | Changes in inventories (constant LCU) |
| NE.GDI.STKB.CN | Changes in inventories (current LCU) |
| NE.GDI.STKB.CD | Changes in inventories (current US$) |
| BN.RES.INCL.CD | Changes in net reserves (BoP, current US$) |
| NV.MNF.CHEM.ZS.UN | Chemicals (% of value added in manufacturing) |
| SL.AGR.0714.ZS | Child employment in agriculture (% of economically active children ages 7–14) |
| SL.AGR.0714.FE.ZS | Child employment in agriculture, female (% of female economically active children ages 7–14) |
| SL.AGR.0714.MA.ZS | Child employment in agriculture, male (% of male economically active children ages 7–14) |
| SL.MNF.0714.ZS | Child employment in manufacturing (% of economically active children ages 7–14) |
| SL.MNF.0714.FE.ZS | Child employment in manufacturing, female (% of female economically active children ages 7–14) |
| SL.MNF.0714.MA.ZS | Child employment in manufacturing, male (% of male economically active children ages 7–14) |
| SL.SRV.0714.ZS | Child employment in services (% of economically active children ages 7–14) |
| SL.SRV.0714.FE.ZS | Child employment in services, female (% of female economically active children ages 7–14) |
| SL.SRV.0714.MA.ZS | Child employment in services, male (% of male economically active children ages 7–14) |
| SE.PRM.UNCR | Children out of school, primary |
| SE.PRM.UNER.FE | Children out of school, primary, female |
| SE.PRM.UNER.MA | Children out of school, primary, male |
| SH.MLR.TRET.ZS | Children with fever receiving antimalarial drugs (% of children under age 5 with fever) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| FM.AST.GOVT.CN | Claims on governments and other public entities (current LCU) |
| FM.AST.GOVT.ZG.M2 | Claims on governments, etc. (annual growth as % of M2) |
| FM.AST.PRVT.ZG.M2 | Claims on private sector (annual growth as % of M2) |
| EN.ATM.CO2E.KD.GD | CO2 emissions (kg per 2000 US$ of GDP) |
| EN.ATM.CO2E.PP.GD.KD | CO2 emissions (kg per 2005 PPP $ of GDP) |
| EN.ATM.CO2E.PP.GD | CO2 emissions (kg per PPP $ of GDP) |
| EN.ATM.CO2E.KT | CO2 emissions (kt) |
| EN.ATM.CO2E.PC | CO2 emissions (metric tons per capita) |
| EN.ATM.CO2E.EG.ZS | CO2 intensity (kg per kg of oil equivalent energy use) |
| EG.USE.CRNW.ZS | Combustible renewables and waste (% of total energy) |
| EG.USE.CRNW.KT.OE | Combustible renewables and waste (metric tons of oil equivalent) |
| DT.NFL.PCBO.CD | Commercial banks and other lending (PPG + PNG) (NFL, current US$) |
| TX.VAL.SERV.CD.WT | Commercial service exports (current US$) |
| TM.VAL.SERV.CD.WT | Commercial service imports (current US$) |
| BX.GSR.CMCP.ZS | Communications, computer, etc. (% of service exports, BoP) |
| BM.GSR.CMCP.ZS | Communications, computer, etc. (% of service imports, BoP) |
| SH.MED.CMHW.P3 | Community health workers (per 1,000 people) |
| GC.XPN.COMP.ZS | Compensation of employees (% of expense) |
| GC.XPN.COMP.CN | Compensation of employees (current LCU) |
| SP.REG.BRTH.ZS | Completeness of birth registration (%) |
| SP.REG.BRTH.RU.ZS | Completeness of birth registration, rural (%) |
| SP.REG.BRTH.UR.ZS | Completeness of birth registration, urban (%) |
| SP.DTH.INFR.ZS | Completeness of infant death reporting (% of reported infant deaths to estimated infant deaths) |
| SP.DTH.REPT.ZS | Completeness of total death reporting (% of reported total deaths to estimated total deaths) |
| TX.VAL.OTHR.ZS.WT | Computer, communications, and other services (% of commercial service exports) |
| TM.VAL.OTHR.ZS.WT | Computer, communications, and other services (% of commercial service imports) |
| FP.CPI.TOTL | Consumer price index (2005 = 100) |
| SN.ITK.SALT.ZS | Consumption of iodized salt (% of households) |
| IS.SHP.GOOD.TU | Container port traffic (TEU: 20-foot equivalent units) |
| SP.DYN.CONU.ZS | Contraceptive prevalence (% of women ages 15–49) |
| IC.REG.COST.PC.ZS | Cost of business start-up procedures (% of GNI per capita) |
| IC.EXP.COST.CD | Cost to export (US$ per container) |
| IC.IMP.COST.CD | Cost to import (US$ per container) |
| IQ.CPA.HRES.XQ | CPIA building human resources rating (1=low to 6=high) |
| IQ.CPA.BREG.XQ | CPIA business regulatory environment rating (1=low to 6=high) |
| IQ.CPA.DEBT.XQ | CPIA debt policy rating (1=low to 6=high) |
| IQ.CPA.ECON.XQ | CPIA economic management cluster average (1=low to 6=high) |
| IQ.CPA.REVN.XQ | CPIA efficiency of revenue mobilization rating (1=low to 6=high) |
| IQ.CPA.PRES.XQ | CPIA equity of public resource use rating (1=low to 6=high) |
| IQ.CPA.FINS.XQ | CPIA financial sector rating (1=low to 6=high) |
| IQ.CPA.FISP.XQ | CPIA fiscal policy rating (1=low to 6=high) |
| IQ.CPA.GNDR.XQ | CPIA gender equality rating (1=low to 6=high) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| IQ.CPA.MACR.XQ | CPIA macroeconomic management rating (1=low to 6=high) |
| IQ.CPA.SOCI.XQ | CPIA policies for social inclusion/equity cluster average (1=low to 6=high) |
| IQ.CPA.ENVR.XQ | CPIA policy and institutions for environmental sustainability rating (1=low to 6=high) |
| IQ.CPA.PROP.XQ | CPIA property rights and rule-based governance rating (1=low to 6=high) |
| IQ.CPA.PUBS.XQ | CPIA public sector management and institutions cluster average (1=low to 6=high) |
| IQ.CPA.FINQ.XQ | CPIA quality of budgetary and financial management rating (1=low to 6=high) |
| IQ.CPA.PADM.XQ | CPIA quality of public administration rating (1=low to 6=high) |
| IQ.CPA.PROT.XQ | CPIA social protection rating (1=low to 6=high) |
| IQ.CPA.STRC.XQ | CPIA structural policies cluster average (1=low to 6=high) |
| IQ.CPA.TRAD.XQ | CPIA trade rating (1=low to 6=high) |
| IQ.CPA.TRAN.XQ | CPIA transparency, accountability, and corruption in the public sector rating (1=low to 6=high) |
| IC.CRD.INFO.XQ | Credit depth of information index (0=low to 6=high) |
| AG.PRD.CROP.XD | Crop production index (1999–2001 = 100) |
| BN.CAB.XOKA.GD.ZS | Current account balance (% of GDP) |
| BN.CAB.XOKA.CD | Current account balance (BoP, current US$) |
| BX.TRF.CURR.CD | Current transfers, receipts (BoP, current US$) |
| GC.TAX.IMPT.ZS | Customs and other import duties (% of tax revenue) |
| GC.TAX.IMPT.CN | Customs and other import duties (current LCU) |
| IT.PRT.NEWS.P3 | Daily newspapers (per 1,000 people) |
| SP.DYN.CDRT.IN | Death rate, crude (per 1,000 people) |
| DT.TDS.DPPF.XP.ZS | Debt service (PPG and IMF only, % of exports, excluding workers' remittances) |
| DT.TDS.DPPG.CD | Debt service on external debt, public and publicly guaranteed (PPG) (TDS, current US$) |
| DT.TDS.DECT.CD | Debt service on external debt, total (TDS, current US$) |
| PA.NUS.ATLS | DEC alternative conversion factor (LCU per US$) |
| FR.INR.DPST | Deposit interest rate (%) |
| SN.ITK.DPTH | Depth of hunger (kilocalories per person per day) |
| SH.STA.ORCF.ZS | Diarrhea treatment (% of children under 5 receiving oral rehydration and continued feeding) |
| NY.GDP.DISC.KN | Discrepancy in expenditure estimate of GDP (constant LCU) |
| NY.GDP.DISC.CN | Discrepancy in expenditure estimate of GDP (current LCU) |
| IC.EXP.DOCS | Documents to export (number) |
| IC.IMP.DOCS | Documents to import (number) |
| FS.AST.DOMS.GD.ZS | Domestic credit provided by banking sector (% of GDP) |
| FS.AST.PRVT.GD.ZS | Domestic credit to private sector (% of GDP) |
| IC.BUS.EASE.XQ | Ease of doing business index (1=most business-friendly regulations) |
| SL.TLF.0714.FE.ZS | Economically active children, female (% of female children ages 7–14) |
| SL.TLF.0714.MA.ZS | Economically active children, male (% of male children ages 7–14) |
| SL.TLF.0714.SW.ZS | Economically active children, study and work (% of economically active children, ages 7–14) |
| SL.TLF.0714.SW.FE.ZS | Economically active children, study and work, female (% of female economically active children, ages 7–14) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| SL.TLF.0714.SW.MA.ZS | Economically active children, study and work, male (% of male economically active children, ages 7–14) |
| SL.TLF.0714.ZS | Economically active children, total (% of children ages 7–14) |
| SL.TLF.0714.WK.ZS | Economically active children, work only (% of economically active children, ages 7–14) |
| SL.TLF.0714.WK.FE.ZS | Economically active children, work only, female (% of female economically active children, ages 7–14) |
| SL.TLF.0714.WK.MA.ZS | Economically active children, work only, male (% of male economically active children, ages 7–14) |
| EN.AGR.EMPL | Economically active population in agriculture (number) |
| EG.USE.ELEC.KH.PC | Electric power consumption (kWh per capita) |
| EG.USE.ELEC.KH | Electric power consumption (kWh) |
| EG.ELC.LOSS.ZS | Electric power transmission and distribution losses (% of output) |
| EG.ELC.LOSS.KH | Electric power transmission and distribution losses (kWh) |
| EG.ELC.PROD.KH | Electricity production (kWh) |
| EG.ELC.COAL.ZS | Electricity production from coal sources (% of total) |
| EG.ELC.COAL.KH | Electricity production from coal sources (kWh) |
| EG.ELC.HYRO.ZS | Electricity production from hydroelectric sources (% of total) |
| EG.ELC.HYRO.KH | Electricity production from hydroelectric sources (kWh) |
| EG.ELC.NGAS.ZS | Electricity production from natural gas sources (% of total) |
| EG.ELC.NGAS.KH | Electricity production from natural gas sources (kWh) |
| EG.ELC.NUCL.ZS | Electricity production from nuclear sources (% of total) |
| EG.ELC.NUCL.KH | Electricity production from nuclear sources (kWh) |
| EG.ELC.PETR.ZS | Electricity production from oil sources (% of total) |
| EG.ELC.PETR.KH | Electricity production from oil sources (kWh) |
| SM.EMI.TERT.ZS | Emigration rate of tertiary educated (% of total tertiary educated population) |
| SL.AGR.EMPL.FE.ZS | Employees, agriculture, female (% of female employment) |
| SL.AGR.EMPL.MA.ZS | Employees, agriculture, male (% of male employment) |
| SL.IND.EMPL.FE.ZS | Employees, industry, female (% of female employment) |
| SL.IND.EMPL.MA.ZS | Employees, industry, male (% of male employment) |
| SL.SRV.EMPL.FE.ZS | Employees, services, female (% of female employment) |
| SL.SRV.EMPL.MA.ZS | Employees, services, male (% of male employment) |
| SL.AGR.EMPL.ZS | Employment in agriculture (% of total employment) |
| SL.IND.EMPL.ZS | Employment in industry (% of total employment) |
| SL.SRV.EMPL.ZS | Employment in services (% of total employment) |
| SL.EMP.TOTL.SP.FE.ZS | Employment to population ratio, 15+, female (%) |
| SL.EMP.TOTL.SP.MA.ZS | Employment to population ratio, 15+, male (%) |
| SL.EMP.TOTL.SP.ZS | Employment to population ratio, 15+, total (%) |
| SL.EMP.1524.SP.FE.ZS | Employment to population ratio, ages 15–24, female (%) |
| SL.EMP.1524.SP.MA.ZS | Employment to population ratio, ages 15–24, male (%) |
| SL.EMP.1524.SP.ZS | Employment to population ratio, ages 15–24, total (%) |
| EG.IMP.CONS.ZS | Energy imports, net (% of energy use) |
| EG.EGY.PROD.KT.OE | Energy production (kt of oil equivalent) |
| EN.ATM.METH.IN.ZS | Energy-related methane emissions (% of total) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| EN.ATM.NOXE.IN.ZS | Energy-related nitrous oxide emissions (% of total) |
| EG.USE.PCAP.KG.OE | Energy use (kg of oil equivalent per capita) |
| EG.USE.COMM.GD.PP.KD | Energy use (kg of oil equivalent) per $1,000 GDP (constant 2005 PPP) |
| EG.USE.COMM.KT.OE | Energy use (kt of oil equivalent) |
| SH.STA.BFED.ZS | Exclusive breastfeeding (% of children under 6 months) |
| SE.XPD.PRIM.PC.ZS | Expenditure per student, primary (% of GDP per capita) |
| SE.XPD.SECO.PC.ZS | Expenditure per student, secondary (% of GDP per capita) |
| SE.XPD.TERT.PC.ZS | Expenditure per student, tertiary (% of GDP per capita) |
| GC.XPN.TOTL.GD.ZS | Expense (% of GDP) |
| GC.XPN.TOTL.CN | Expense (current LCU) |
| TX.VAL.MRCH.XD.WD | Export value index (2000 = 100) |
| TX.QTY.MRCH.XD.WD | Export volume index (2000 = 100) |
| NY.EXP.CAPM.KN | Exports as a capacity to import (constant LCU) |
| NE.EXP.GNFS.ZS | Exports of goods and services (% of GDP) |
| NE.EXP.GNFS.KD.ZG | Exports of goods and services (annual % growth) |
| BX.GSR.GNFS.CD | Exports of goods and services (BoP, current US$) |
| NE.EXP.GNFS.KD | Exports of goods and services (constant 2000 US$) |
| NE.EXP.GNFS.KN | Exports of goods and services (constant LCU) |
| NE.EXP.GNFS.CN | Exports of goods and services (current LCU) |
| NE.EXP.GNFS.CD | Exports of goods and services (current US$) |
| BX.GSR.TOTL.CD | Exports of goods, services, and income (BoP, current US$) |
| NE.RSB.GNFS.ZS | External balance on goods and services (% of GDP) |
| NE.RSB.GNFS.KN | External balance on goods and services (constant LCU) |
| NE.RSB.GNFS.CN | External balance on goods and services (current LCU) |
| NE.RSB.GNFS.CD | External balance on goods and services (current US$) |
| DT.DOD.DECT.GN.ZS | External debt stocks (% of GNI) |
| DT.DOD.DLXF.CD | External debt stocks, long-term (DOD, current US$) |
| DT.DOD.DPNG.CD | External debt stocks, private nonguaranteed (PNG) (DOD, current US$) |
| DT.DOD.DPPG.CD | External debt stocks, public and publicly guaranteed (PPG) (DOD, current US$) |
| DT.DOD.DSTC.CD | External debt stocks, short-term (DOD, current US$) |
| DT.DOD.DECT.CD | External debt stocks, total (DOD, current US$) |
| SH.XPD.EXTR.ZS | External resources for health (% of total expenditure on health) |
| SH.DYN.AIDS.FE.ZS | Female adults with HIV (% of population ages 15+ with HIV) |
| SP.DYN.TFRT.IN | Fertility rate, total (births per woman) |
| AG.CON.FERT.PT.ZS | Fertilizer consumption (% of fertilizer production) |
| AG.CON.FERT.ZS | Fertilizer consumption (kilograms per hectare of arable land) |
| AG.CON.FERT.MT | Fertilizer consumption (metric tons) |
| NE.CON.TOTL.KD | Final consumption expenditure (constant 2000 US$) |
| NE.CON.TOTL.KN | Final consumption expenditure (constant LCU) |
| NE.CON.TOTL.CN | Final consumption expenditure (current LCU) |
| NE.CON.TOTL.CD | Final consumption expenditure (current US$) |
| NE.CON.TETC.ZS | Final consumption expenditure, etc. (% of GDP) |
| NE.CON.TETC.KD.ZG | Final consumption expenditure, etc. (annual % growth) |
| NE.CON.TETC.KD | Final consumption expenditure, etc. (constant 2000 US$) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| NE.CON.TETC.KN | Final consumption expenditure, etc. (constant LCU) |
| NE.CON.TETC.CN | Final consumption expenditure, etc. (current LCU) |
| NE.CON.TETC.CD | Final consumption expenditure, etc. (current US$) |
| CM.FIN.INTL.GD.ZS | Financing via international capital markets (gross inflows, % of GDP) |
| IC.FRM.FREG.ZS | Firms formally registered when operations started (% of firms) |
| IC.FRM.TRNG.ZS | Firms offering formal training (% of firms) |
| IC.FRM.BNKS.ZS | Firms using banks to finance investment (% of firms) |
| IC.FRM.FEMO.ZS | Firms with female participation in ownership (% of firms) |
| EN.FSH.THRD.NO | Fish species, threatened |
| IT.BBD.USEC.CD | Fixed broadband internet access tariff (US$ per month) |
| IT.NET.BBND | Fixed broadband internet subscribers |
| IT.NET.BBND.P2 | Fixed broadband internet subscribers (per 100 people) |
| TX.VAL.FOOD.ZS.UN | Food exports (% of merchandise exports) |
| TM.VAL.FOOD.ZS.UN | Food imports (% of merchandise imports) |
| AG.PRD.FOOD.XD | Food production index (1999–2001 = 100) |
| NV.MNF.FBTO.ZS.UN | Food, beverages, and tobacco (% of value added in manufacturing) |
| BN.KLT.DINV.CD | Foreign direct investment, net (BoP, current US$) |
| BX.KLT.DINV.WD.GD.ZS | Foreign direct investment, net inflows (% of GDP) |
| BX.KLT.DINV.CD.WD | Foreign direct investment, net inflows (BoP, current US$) |
| BM.KLT.DINV.GD.ZS | Foreign direct investment, net out flows (% of GDP) |
| AG.LND.FRST.ZS | Forest area (% of land area) |
| AG.LND.FRST.K2 | Forest area (sq. km) |
| EG.USE.COMM.FO.ZS | Fossil fuel energy consumption (% of total) |
| TX.VAL.FUEL.ZS.UN | Fuel exports (% of merchandise exports) |
| TM.VAL.FUEL.ZS.UN | Fuel imports (% of merchandise imports) |
| NY.GDP.MKTP.KD | GDP (constant 2000 US$) |
| NY.GDP.MKTP.KN | GDP (constant LCU) |
| NY.GDP.MKTP.CN | GDP (current LCU) |
| NY.GDP.MKTP.CD | GDP (current US$) |
| NY.GDP.DEFL.ZS | GDP deflator (base year varies by country) |
| NY.GDP.MKTP.KD.ZG | GDP growth (annual %) |
| NY.GDP.PCAP.KD | GDP per capita (constant 2000 US$) |
| NY.GDP.PCAP.KN | GDP per capita (constant LCU) |
| NY.GDP.PCAP.CD | GDP per capita (current US$) |
| NY.GDP.PCAP.KD.ZG | GDP per capita growth (annual %) |
| NY.GDP.PCAP.PP.KD | GDP per capita, PPP (constant 2005 international $) |
| NY.GDP.PCAP.PP.CD | GDP per capita, PPP (current international $) |
| SL.GDP.PCAP.EM.KD | GDP per person employed (constant 1990 PPP $) |
| EG.GDP.PUSE.KO.PP.KD | GDP per unit of energy use (constant 2005 PPP $ per kg of oil equivalent) |
| EG.GDP.PUSE.KO.PP | GDP per unit of energy use (PPP $ per kg of oil equivalent) |
| NY.GDP.MKTP.PP.KD | GDP, PPP (constant 2005 international $) |
| NY.GDP.MKTP.PP.CD | GDP, PPP (current international $) |
| ER.BDV.TOTL.XQ | GEF benefits index for biodiversity (0 = no biodiversity potential to 100 = maximum) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| NE.CON.GOVT.ZS | General government final consumption expenditure (% of GDP) |
| NE.CON.GOVT.KD.ZG | General government final consumption expenditure (annual % growth) |
| NE.CON.GOVT.KD | General government final consumption expenditure (constant 2000 US$) |
| NE.CON.GOVT.KN | General government final consumption expenditure (constant LCU) |
| NE.CON.GOVT.CN | General government final consumption expenditure (current LCU) |
| NE.CON.GOVT.CD | General government final consumption expenditure (current US$) |
| SI.POV.GINI | GINI index |
| NY.GNP.MKTP.CN | GNI (current LCU) |
| NY.GNP.MKTP.CD | GNI (current US$) |
| NY.GNP.PCAP.CD | GNI per capita, Atlas method (current US$) |
| NY.GNP.PCAP.PP.CD | GNI per capita, PPP (current international $) |
| NY.GNP.ATLS.CD | GNI, Atlas method (current US$) |
| NY.GNP.MKTP.PP.CD | GNI, PPP (current international $) |
| GC.XPN.GSRV.ZS | Goods and services expense (% of expense) |
| GC.XPN.GSRV.CN | Goods and services expense (current LCU) |
| BX.GSR.MRCH.CD | Goods exports (BoP, current US$) |
| BM.GSR.MRCH.CD | Goods imports (BoP, current US$) |
| GC.REV.GOTR.ZS | Grants and other revenue (% of revenue) |
| GC.REV.GOTR.CN | Grants and other revenue (current LCU) |
| NE.GDI.TOTL.ZS | Gross capital formation (% of GDP) |
| NE.GDI.TOTL.KD.ZG | Gross capital formation (annual % growth) |
| NE.GDI.TOTL.KD | Gross capital formation (constant 2000 US$) |
| NE.GDI.TOTL.KN | Gross capital formation (constant LCU) |
| NE.GDI.TOTL.CN | Gross capital formation (current LCU) |
| NE.GDI.TOTL.CD | Gross capital formation (current US$) |
| NY.GDY.TOTL.KD | Gross domestic income (constant 2000 US$) |
| NY.GDY.TOTL.KN | Gross domestic income (constant LCU) |
| NY.GDS.TOTL.ZS | Gross domestic savings (% of GDP) |
| NY.GDS.TOTL.KN | Gross domestic savings (constant LCU) |
| NY.GDS.TOTL.CN | Gross domestic savings (current LCU) |
| NY.GDS.TOTL.CD | Gross domestic savings (current US$) |
| NE.GDI.FTOT.ZS | Gross fixed capital formation (% of GDP) |
| NE.GDI.FTOT.KD.ZG | Gross fixed capital formation (annual % growth) |
| NE.GDI.FTOT.KD | Gross fixed capital formation (constant 2000 US$) |
| NE.GDI.FTOT.KN | Gross fixed capital formation (constant LCU) |
| NE.GDI.FTOT.CN | Gross fixed capital formation (current LCU) |
| NE.GDI.FTOT.CD | Gross fixed capital formation (current US$) |
| SE.PRM.GINT.FE.ZS | Gross intake rate in grade 1, female (% of relevant age group) |
| SE.PRM.GINT.MA.ZS | Gross intake rate in grade 1, male (% of relevant age group) |
| SE.PRM.GINT.ZS | Gross intake rate in grade 1, total (% of relevant age group) |
| NE.DAB.TOTL.ZS | Gross national expenditure (% of GDP) |
| NE.DAB.TOTL.KD | Gross national expenditure (constant 2000 US$) |
| NE.DAB.TOTL.KN | Gross national expenditure (constant LCU) |
| NE.DAB.TOTL.CN | Gross national expenditure (current LCU) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| NE.DAB.TOTL.CD | Gross national expenditure (current US$) |
| NY.GNY.TOTL.KN | Gross national income (constant LCU) |
| NY.GNS.ICTR.ZS | Gross savings (% of GDP) |
| NY.GNS.ICTR.GN.ZS | Gross savings (% of GNI) |
| NY.GNS.ICTR.CN | Gross savings (current LCU) |
| NY.GNS.ICTR.CD | Gross savings (current US$) |
| NY.GDP.FCST.KD | Gross value added at factor cost (constant 2000 US$) |
| NY.GDP.FCST.KN | Gross value added at factor cost (constant LCU) |
| NY.GDP.FCST.CN | Gross value added at factor cost (current LCU) |
| NY.GDP.FCST.CD | Gross value added at factor cost (current US$) |
| SH.XPD.PCAP | Health expenditure per capita (current US$) |
| SH.XPD.PCAP.PP.KD | Health expenditure per capita, PPP (constant 2005 international $) |
| SH.XPD.PRIV.ZS | Health expenditure, private (% of GDP) |
| SH.XPD.PUBL.ZS | Health expenditure, public (% of GDP) |
| SH.XPD.PUBL.GX.ZS | Health expenditure, public (% of government expenditure) |
| SH.XPD.PUBL | Health expenditure, public (% of total health expenditure) |
| SH.XPD.TOTL.ZS | Health expenditure, total (% of GDP) |
| GB.TAX.CMAR.ZS | Highest marginal tax rate, corporate rate (%) |
| GB.TAX.IMAR.CD | Highest marginal tax rate, individual (on income exceeding, US$) |
| GB.TAX.IMAR.ZS | Highest marginal tax rate, individual rate (%) |
| TX.VAL.TECH.MF.ZS | High-technology exports (% of manufactured exports) |
| TX.VAL.TECH.CD | High-technology exports (current US$) |
| SH.MED.BEDS.ZS | Hospital beds (per 1,000 people) |
| NE.CON.PRVT.KD.ZG | Household final consumption expenditure (annual % growth) |
| NE.CON.PRVT.KD | Household final consumption expenditure (constant 2000 US$) |
| NE.CON.PRVT.KN | Household final consumption expenditure (constant LCU) |
| NE.CON.PRVT.CN | Household final consumption expenditure (current LCU) |
| NE.CON.PRVT.CD | Household final consumption expenditure (current US$) |
| NE.CON.PRVT.PC.KD | Household final consumption expenditure per capita (constant 2000 US$) |
| NE.CON.PRVT.PC.KD.ZG | Household final consumption expenditure per capita growth (annual %) |
| NE.CON.PETC.ZS | Household final consumption expenditure, etc. (% of GDP) |
| NE.CON.PETC.KD.ZG | Household final consumption expenditure, etc. (annual % growth) |
| NE.CON.PETC.KD | Household final consumption expenditure, etc. (constant 2000 US$) |
| NE.CON.PETC.KN | Household final consumption expenditure, etc. (constant LCU) |
| NE.CON.PETC.CN | Household final consumption expenditure, etc. (current LCU) |
| NE.CON.PETC.CD | Household final consumption expenditure, etc. (current US$) |
| NE.CON.PRVT.PP.KD | Household final consumption expenditure, PPP (constant 2005 international $) |
| NE.CON.PRVT.PP.CD | Household final consumption expenditure, PPP (current international $) |
| IT.TVS.HOUS.ZS | Households with television (%) |
| DT.DOD.MWBG.CD | IBRD loans and IDA credits (DOD, current US$) |
| TX.VAL.ICTG.ZS.UN | ICT goods exports (% of total goods exports) |
| TM.VAL.ICTG.ZS.UN | ICT goods imports (% total goods imports) |
| BX.GSR.CCIS.ZS | ICT service exports (% of service exports, BoP) |
| BX.GSR.CCIS.CD | ICT service exports (BoP, current US$) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| IQ.CPA.IRAI.XQ | IDA resource allocation index (1=low to 6=high) |
| SH.IMM.IDPT | Immunization, DPT (% of children ages 12–23 months) |
| SH.IMM.MEAS | Immunization, measles (% of children ages 12–23 months) |
| TM.VAL.MRCH.XD.WD | Import value index (2000 = 100) |
| TM.QTY.MRCH.XD.WD | Import volume index (2000 = 100) |
| NE.IMP.GNFS.ZS | Imports of goods and services (% of GDP) |
| NE.IMP.GNFS.KD.ZG | Imports of goods and services (annual % growth) |
| BM.GSR.GNFS.CD | Imports of goods and services (BoP, current US$) |
| NE.IMP.GNFS.KD | Imports of goods and services (constant 2000 US$) |
| NE.IMP.GNFS.KN | Imports of goods and services (constant LCU) |
| NE.IMP.GNFS.CN | Imports of goods and services (current LCU) |
| NE.IMP.GNFS.CD | Imports of goods and services (current US$) |
| BM.GSR.TOTL.CD | Imports of goods, services, and income (BoP, current US$) |
| SH.STA.ACSN | Improved sanitation facilities (% of population with access) |
| SH.STA.ACSN.RU | Improved sanitation facilities, rural (% of rural population with access) |
| SH.STA.ACSN.UR | Improved sanitation facilities, urban (% of urban population with access) |
| SH.H2O.SAFE.ZS | Improved water source (% of population with access) |
| SH.H2O.SAFE.RU.ZS | Improved water source, rural (% of rural population with access) |
| SH.H2O.SAFE.UR.ZS | Improved water source, urban (% of urban population with access) |
| SH.TBS.INCD | Incidence of tuberculosis (per 100,000 people) |
| BM.GSR.FCTY.CD | Income payments (BoP, current US$) |
| BX.GSR.FCTY.CD | Income receipts (BoP, current US$) |
| SI.DST.10TH.10 | Income share held by highest 10% |
| SI.DST.05TH.20 | Income share held by highest 20% |
| SI.DST.FRST.10 | Income share held by lowest 10% |
| SI.DST.FRST.20 | Income share held by lowest 20% |
| SI.DST.02ND.20 | Income share held by second 20% |
| SI.DST.03RD.20 | Income share held by third 20% |
| SI.DST.04TH.20 | Income share held by fourth 20% |
| NV.IND.TOTL.ZS | Industry, value added (% of GDP) |
| NV.IND.TOTL.KD.ZG | Industry, value added (annual % growth) |
| NV.IND.TOTL.KD | Industry, value added (constant 2000 US$) |
| NV.IND.TOTL.KN | Industry, value added (constant LCU) |
| NV.IND.TOTL.CN | Industry, value added (current LCU) |
| NV.IND.TOTL.CD | Industry, value added (current US$) |
| FP.CPI.TOTL.ZG | Inflation, consumer prices (annual %) |
| NY.GDP.DEFL.KD.ZG | Inflation, GDP deflator (annual %) |
| IC.FRM.CORR.ZS | Informal payments to public officials (% of firms) |
| IE.ICT.TOTL.GD.ZS | Information and communication technology expenditure (% of GDP) |
| IE.ICT.TOTL.CD | Information and communication technology expenditure (current US$) |
| IE.ICT.PCAP.CD | Information and communication technology expenditure per capita (current US$) |
| TX.VAL.INSF.ZS.WT | Insurance and financial services (% of commercial service exports) |
| TM.VAL.INSF.ZS.WT | Insurance and financial services (% of commercial service imports) |
| BX.GSR.INSF.ZS | Insurance and financial services (% of service exports, BoP) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| BM.GSR.INSF.ZS | Insurance and financial services (% of service imports, BoP) |
| VC.HOM.ITEN.P5.HE | Intentional homicide rate (per 100,000 people, CTS and national sources) |
| VC.HOM.ITEN.P5.LE | Intentional homicide rate (per 100,000 people, WHO) |
| GC.XPN.INTP.ZS | Interest payments (% of expense) |
| GC.XPN.INTP.RV.ZS | Interest payments (% of revenue) |
| GC.XPN.INTP.CN | Interest payments (current LCU) |
| FR.INR.LNDP | Interest rate spread (lending rate minus deposit rate, %) |
| VC.IDP.TOTL | Internally displaced persons (number) |
| IT.NET.BNDW.PC | International internet bandwidth (bits per person) |
| IT.NET.BNDW | International internet bandwidth (Mbps) |
| SM.POP.TOTL.ZS | International migrant stock (% of population) |
| SM.POP.TOTL | International migrant stock, total |
| ST.INT.XPND.MP.ZS | International tourism, expenditures (% of total imports) |
| ST.INT.XPND.CD | International tourism, expenditures (current US$) |
| ST.INT.TRNX.CD | International tourism, expenditures for passenger transport items (current US$) |
| ST.INT.TVLX.CD | International tourism, expenditures for travel items (current US$) |
| ST.INT.ARVL | International tourism, number of arrivals |
| ST.INT.DPRT | International tourism, number of departures |
| ST.INT.RCPT.XP.ZS | International tourism, receipts (% of total exports) |
| ST.INT.RCPT.CD | International tourism, receipts (current US$) |
| ST.INT.TRNR.CD | International tourism, receipts for passenger transport items (current US$) |
| ST.INT.TVLR.CD | International tourism, receipts for travel items (current US$) |
| IT.INT.TTRF.MN.PC | International voice traffic (minutes per person) |
| IT.INT.TTRF.MN | International voice traffic (out and in, minutes) |
| IT.NET.USER | Internet users |
| IT.NET.USER.P2 | Internet users (per 100 people) |
| IE.PPI.ENGY.CD | Investment in energy with private participation (current US$) |
| IE.PPI.TELE.CD | Investment in telecoms with private participation (current US$) |
| IE.PPI.TRAN.CD | Investment in transport with private participation (current US$) |
| IE.PPI.WATR.CD | Investment in water and sanitation with private participation (current US$) |
| IC.FRM.ISOC.ZS | ISO certification ownership (% of firms) |
| SL.TLF.PRIM.ZS | Labor force with primary education (% of total) |
| SL.TLF.PRIM.FE.ZS | Labor force with primary education, female (% of female labor force) |
| SL.TLF.PRIM.MA.ZS | Labor force with primary education, male (% of male labor force) |
| SL.TLF.SECO.ZS | Labor force with secondary education (% of total) |
| SL.TLF.SECO.FE.ZS | Labor force with secondary education, female (% of female labor force) |
| SL.TLF.SECO.MA.ZS | Labor force with secondary education, male (% of male labor force) |
| SL.TLF.TERT.ZS | Labor force with tertiary education (% of total) |
| SL.TLF.TERT.FE.ZS | Labor force with tertiary education, female (% of female labor force) |
| SL.TLF.TERT.MA.ZS | Labor force with tertiary education, male (% of male labor force) |
| SL.TLF.TOTL.FE.ZS | Labor force, female (% of total labor force) |
| SL.TLF.TOTL.IN | Labor force, total |
| SL.TLF.CACT.FE.ZS | Labor participation rate, female (% of female population ages 15+) |
| SL.TLF.CACT.MA.ZS | Labor participation rate, male (% of male population ages 15+) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| SL.TLF.CACT.ZS | Labor participation rate, total (% of total population ages 15+) |
| AG.LND.TOTL.K2 | Land area (sq. km) |
| AG.LND.CREL.HA | Land under cereal production (hectares) |
| IC.EXP.DURS | Lead time to export (days) |
| LP.EXP.DURS.MD | Lead time to export, median case (days) |
| IC.IMP.DURS | Lead time to import (days) |
| LP.IMP.DURS.MD | Lead time to import, median case (days) |
| FR.INR.LEND | Lending interest rate (%) |
| SP.DYN.LE00.FE.IN | Life expectancy at birth, female (years) |
| SP.DYN.LE00.MA.IN | Life expectancy at birth, male (years) |
| SP.DYN.LE00.IN | Life expectancy at birth, total (years) |
| SH.MMR.RISK | Lifetime risk of maternal death (1 in: rate varies by country) |
| IS.SHP.GCNW.XQ | Liner shipping connectivity index (maximum value in 2004 = 100) |
| FS.LBL.LIQU.GD.ZS | Liquid liabilities (M3) as % of GDP |
| CM.MKT.LDOM.NO | Listed domestic companies, total |
| SE.ADT.LITR.FE.ZS | Literacy rate, adult female (% of females ages 15 and above) |
| SE.ADT.LITR.MA.ZS | Literacy rate, adult male (% of males ages 15 and above) |
| SE.ADT.LITR.ZS | Literacy rate, adult total (% of people ages 15 and above) |
| SE.ADT.1524.LT.FE.ZS | Literacy rate, youth female (% of females ages 15–24) |
| SE.ADT.1524.LT.MA.ZS | Literacy rate, youth male (% of males ages 15–24) |
| SE.ADT.1524.LT.ZS | Literacy rate, youth total (% of people ages 15–24) |
| AG.PRD.LVSK.XD | Livestock production index (1999–2001 = 100) |
| LP.LPI.TRAC.XQ | Logistics performance index: Ability to track and trace consignments (1=low to 5=high) |
| LP.LPI.LOGS.XQ | Logistics performance index: Competence and quality of logistics services (1=low to 5=high) |
| LP.LPI.ITRN.XQ | Logistics performance index: Ease of arranging competitively priced shipments (1=low to 5=high) |
| LP.LPI.CUST.XQ | Logistics performance index: Efficiency of customs clearance process (1=low to 5=high) |
| LP.LPI.TIME.XQ | Logistics performance index: Frequency with which shipments reach consignee within scheduled or expected time (1=low to 5=high) |
| LP.LPI.OVRL.XQ | Logistics performance index: Overall (1=low to 5=high) |
| LP.LPI.INFR.XQ | Logistics performance index: Quality of trade and transport-related infrastructure (1=low to 5=high) |
| SL.UEM.LTRM.ZS | Long-term unemployment (% of total unemployment) |
| SL.UEM.LTRM.FE.ZS | Long-term unemployment, female (% of female unemployment) |
| SL.UEM.LTRM.MA.ZS | Long-term unemployment, male (% of male unemployment) |
| IC.FRM.CRIM.ZS | Losses due to theft, robbery, vandalism, and arson (% sales) |
| SH.STA.BRTW.ZS | Low-birthweight babies (% of births) |
| NV.MNF.MTRN.ZS.UN | Machinery and transport equipment (% of value added in manufacturing) |
| SH.STA.STNT.ZS | Malnutrition prevalence, height for age (% of children under 5) |
| SH.STA.MALN.ZS | Malnutrition prevalence, weight for age (% of children under 5) |
| EN.MAM.THRD.NO | Mammal species, threatened |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| IC.GOV.DURS.ZS | Management time dealing with officials (% of management time) |
| TX.VAL.MANF.ZS.UN | Manufactures exports (% of merchandise exports) |
| TM.VAL.MANF.ZS.UN | Manufactures imports (% of merchandise imports) |
| NV.IND.MANF.ZS | Manufacturing, value added (% of GDP) |
| NV.IND.MANF.KD.ZG | Manufacturing, value added (annual % growth) |
| NV.IND.MANF.KD | Manufacturing, value added (constant 2000 US$) |
| NV.IND.MANF.KN | Manufacturing, value added (constant LCU) |
| NV.IND.MANF.CN | Manufacturing, value added (current LCU) |
| NV.IND.MANF.CD | Manufacturing, value added (current US$) |
| ER.MRN.PTMR.ZS | Marine protected areas (% of total surface area) |
| ER.MRN.PTMR.NO | Marine protected areas (number) |
| CM.MKT.LCAP.GD.ZS | Market capitalization of listed companies (% of GDP) |
| CM.MKT.LCAP.CD | Market capitalization of listed companies (current US$) |
| SH.STA.MMRT | Maternal mortality ratio (modeled estimate, per 100,000 live births) |
| TX.VAL.MRCH.CD.WT | Merchandise exports (current US$) |
| TX.VAL.MRCH.WL.CD | Merchandise exports by the reporting economy (current US$) |
| TX.VAL.MRCH.RS.ZS | Merchandise exports by the reporting economy, residual (% of total merchandise exports) |
| TX.VAL.MRCH.R1.ZS | Merchandise exports to developing economies in East Asia and Pacific (% of total merchandise exports) |
| TX.VAL.MRCH.R2.ZS | Merchandise exports to developing economies in Europe and Central Asia (% of total merchandise exports) |
| TX.VAL.MRCH.R3.ZS | Merchandise exports to developing economies in Latin America and the Caribbean (% of total merchandise exports) |
| TX.VAL.MRCH.R4.ZS | Merchandise exports to developing economies in the Middle East and North Africa (% of total merchandise exports) |
| TX.VAL.MRCH.R5.ZS | Merchandise exports to developing economies in South Asia (% of total merchandise exports) |
| TX.VAL.MRCH.R6.ZS | Merchandise exports to developing economies in Sub-Saharan Africa (% of total merchandise exports) |
| TX.VAL.MRCH.OR.ZS | Merchandise exports to developing economies outside region (% of total merchandise exports) |
| TX.VAL.MRCH.WR.ZS | Merchandise exports to developing economies within region (% of total merchandise exports) |
| TX.VAL.MRCH.HI.ZS | Merchandise exports to high-income economies (% of total merchandise exports) |
| TM.VAL.MRCH.CD.WT | Merchandise imports (current US$) |
| TM.VAL.MRCH.WL.CD | Merchandise imports by the reporting economy (current US$) |
| TM.VAL.MRCH.RS.ZS | Merchandise imports by the reporting economy, residual (% of total merchandise imports) |
| TM.VAL.MRCH.R1.ZS | Merchandise imports from developing economies in East Asia and Pacific (% of total merchandise imports) |
| TM.VAL.MRCH.R2.ZS | Merchandise imports from developing economies in Europe and Central Asia (% of total merchandise imports) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| TM.VAL.MRCH.R3.ZS | Merchandise imports from developing economies in Latin America and the Caribbean (% of total merchandise imports) |
| TM.VAL.MRCH.R4.ZS | Merchandise imports from developing economies in the Middle East and North Africa (% of total merchandise imports) |
| TM.VAL.MRCH.R5.ZS | Merchandise imports from developing economies in South Asia (% of total merchandise imports) |
| TM.VAL.MRCH.R6.ZS | Merchandise imports from developing economies in Sub-Saharan Africa (% of total merchandise imports) |
| TM.VAL.MRCH.OR.ZS | Merchandise imports from developing economies outside region (% of total merchandise imports) |
| TM.VAL.MRCH.WR.ZS | Merchandise imports from developing economies within region (% of total merchandise imports) |
| TM.VAL.MRCH.HI.ZS | Merchandise imports from high-income economies (% of total merchandise imports) |
| TG.VAL.TOTL.GD.ZS | Merchandise trade (% of GDP) |
| EN.ATM.METH.KT.CE | Methane emissions (kt of CO2 equivalent) |
| MS.MIL.XPND.ZS | Military expenditure (% of central government expenditure) |
| MS.MIL.XPND.GD.ZS | Military expenditure (% of GDP) |
| MS.MIL.XPND.CN | Military expenditure (current LCU) |
| IT.TEL.TOTL | Mobile and fixed-line telephone subscribers |
| IT.TEL.TOTL.P2 | Mobile and fixed-line telephone subscribers (per 100 people) |
| IT.TEL.TOTL.EM | Mobile and fixed-line telephone subscribers per employee |
| IT.MBL.USEC.CD | Mobile cellular prepaid tariff (US$ per month) |
| IT.CEL.SETS | Mobile cellular subscriptions |
| IT.CEL.SETS.P2 | Mobile cellular subscriptions (per 100 people) |
| FM.LBL.MONY.CN | Money (current LCU) |
| FM.LBL.MQMY.CN | Money and quasi money (M2) (current LCU) |
| FM.LBL.MQMY.GD.ZS | Money and quasi money (M2) as % of GDP |
| FM.LBL.MQMY.IR.ZS | Money and quasi money (M2) to total reserves ratio |
| FM.LBL.MQMY.ZG | Money and quasi money growth (annual %) |
| SP.DYN.AMRT.FE | Mortality rate, adult, female (per 1,000 female adults) |
| SP.DYN.AMRT.MA | Mortality rate, adult, male (per 1,000 male adults) |
| SH.DYN.CHLD.FE | Mortality rate, female child (per 1,000 female children age one) |
| SP.DYN.IMRT.IN | Mortality rate, infant (per 1,000 live births) |
| SH.DYN.CHLD.MA | Mortality rate, male child (per 1,000 male children age one) |
| SH.DYN.MORT | Mortality rate, under-5 (per 1,000) |
| IS.VEH.NVEH.P3 | Motor vehicles (per 1,000 people) |
| DT.TDS.MLAT.PG.ZS | Multilateral debt service (% of public and publicly guaranteed debt service) |
| DT.TDS.MLAT.CD | Multilateral debt service (TDS, current US$) |
| TT.PRI.MRCH.XD.WD | Net barter terms of trade index (2000 = 100) |
| DC.DAC.AUSL.CD | Net bilateral aid flows from DAC donors, Australia (current US$) |
| DC.DAC.AUTL.CD | Net bilateral aid flows from DAC donors, Austria (current US$) |
| DC.DAC.BELL.CD | Net bilateral aid flows from DAC donors, Belgium (current US$) |
| DC.DAC.CANL.CD | Net bilateral aid flows from DAC donors, Canada (current US$) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| DC.DAC.DNKL.CD | Net bilateral aid flows from DAC donors, Denmark (current US$) |
| DC.DAC.CECL.CD | Net bilateral aid flows from DAC donors, European Commission (current US$) |
| DC.DAC.FINL.CD | Net bilateral aid flows from DAC donors, Finland (current US$) |
| DC.DAC.FRAL.CD | Net bilateral aid flows from DAC donors, France (current US$) |
| DC.DAC.DEUL.CD | Net bilateral aid flows from DAC donors, Germany (current US$) |
| DC.DAC.GRCL.CD | Net bilateral aid flows from DAC donors, Greece (current US$) |
| DC.DAC.IRLL.CD | Net bilateral aid flows from DAC donors, Ireland (current US$) |
| DC.DAC.ITAL.CD | Net bilateral aid flows from DAC donors, Italy (current US$) |
| DC.DAC.JPNL.CD | Net bilateral aid flows from DAC donors, Japan (current US$) |
| DC.DAC.KORL.CD | Net bilateral aid flows from DAC donors, Korea, Rep. (current US$) |
| DC.DAC.LUXL.CD | Net bilateral aid flows from DAC donors, Luxembourg (current US$) |
| DC.DAC.NLDL.CD | Net bilateral aid flows from DAC donors, Netherlands (current US$) |
| DC.DAC.NZLL.CD | Net bilateral aid flows from DAC donors, New Zealand (current US$) |
| DC.DAC.NORL.CD | Net bilateral aid flows from DAC donors, Norway (current US$) |
| DC.DAC.PRTL.CD | Net bilateral aid flows from DAC donors, Portugal (current US$) |
| DC.DAC.ESPL.CD | Net bilateral aid flows from DAC donors, Spain (current US$) |
| DC.DAC.SWEL.CD | Net bilateral aid flows from DAC donors, Sweden (current US$) |
| DC.DAC.CHEL.CD | Net bilateral aid flows from DAC donors, Switzerland (current US$) |
| DC.DAC.TOTL.CD | Net bilateral aid flows from DAC donors, Total (current US$) |
| DC.DAC.GBRL.CD | Net bilateral aid flows from DAC donors, United Kingdom (current US$) |
| DC.DAC.USAL.CD | Net bilateral aid flows from DAC donors, United States (current US$) |
| BN.TRF.KOGT.CD | Net capital account (BoP, current US$) |
| BN.TRF.CURR.CD | Net current transfers (BoP, current US$) |
| NY.TRF.NCTR.KN | Net current transfers from abroad (constant LCU) |
| NY.TRF.NCTR.CN | Net current transfers from abroad (current LCU) |
| NY.TRF.NCTR.CD | Net current transfers from abroad (current US$) |
| FM.AST.DOMS.CN | Net domestic credit (current LCU) |
| BN.KAC.EOMS.CD | Net errors and omissions, adjusted (BoP, current US$) |
| DT.NFL.BLAT.CD | Net financial flows, bilateral (NFL, current US$) |
| DT.NFL.MIBR.CD | Net financial flows, IBRD (NFL, current US$) |
| DT.NFL.MIDA.CD | Net financial flows, IDA (NFL, current US$) |
| DT.NFL.IMFC.CD | Net financial flows, IMF concessional (NFL, current US$) |
| DT.NFL.IMFN.CD | Net financial flows, IMF nonconcessional (NFL, current US$) |
| DT.NFL.MLAT.CD | Net financial flows, multilateral (NFL, current US$) |
| DT.NFL.MOTH.CD | Net financial flows, others (NFL, current US$) |
| DT.NFL.RDBC.CD | Net financial flows, RDB concessional (NFL, current US$) |
| DT.NFL.RDBN.CD | Net financial flows, RDB nonconcessional (NFL, current US$) |
| FM.AST.NFRG.CN | Net foreign assets (current LCU) |
| BN.GSR.FCTY.CD | Net income (BoP, current US$) |
| NY.GSR.NFCY.KN | Net income from abroad (constant LCU) |
| NY.GSR.NFCY.CN | Net income from abroad (current LCU) |
| NY.GSR.NFCY.CD | Net income from abroad (current US$) |
| GC.FIN.DOMS.GD.ZS | Net incurrence of liabilities, domestic (% of GDP) |
| GC.FIN.DOMS.CN | Net incurrence of liabilities, domestic (current LCU) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| GC.FIN.FRGN.GD.ZS | Net incurrence of liabilities, foreign (% of GDP) |
| GC.FIN.FRGN.CN | Net incurrence of liabilities, foreign (current LCU) |
| SE.PRM.NINT.ZS | Net intake rate in grade 1 (% of official school-age population) |
| SE.PRM.NINT.FE.ZS | Net intake rate in grade 1, female (% of official school-age population) |
| SE.PRM.NINT.MA.ZS | Net intake rate in grade 1, male (% of official school-age population) |
| SM.POP.NETM | Net migration |
| DT.ODA.ODAT.XP.ZS | Net ODA received (% of central government expense) |
| DT.ODA.ODAT.GN.ZS | Net ODA received (% of GNI) |
| DT.ODA.ODAT.GI.ZS | Net ODA received (% of gross capital formation) |
| DT.ODA.ODAT.MP.ZS | Net ODA received (% of imports of goods and services) |
| DT.ODA.ODAT.PC.ZS | Net ODA received per capita (current US$) |
| DT.ODA.OATL.KD | Net official aid received (constant 2008 US$) |
| DT.ODA.OATL.CD | Net official aid received (current US$) |
| DT.ODA.ALLD.KD | Net official development assistance and official aid received (constant 2008 US$) |
| DT.ODA.ALLD.CD | Net official development assistance and official aid received (current US$) |
| DT.ODA.ODAT.KD | Net official development assistance received (constant 2008 US$) |
| DT.ODA.ODAT.CD | Net official development assistance received (current US$) |
| DT.NFL.IFAD.CD | Net official flows from UN agencies, IFAD (current US$) |
| DT.NFL.UNAI.CD | Net official flows from UN agencies, UNAIDS (current US$) |
| DT.NFL.UNDP.CD | Net official flows from UN agencies, UNDP (current US$) |
| DT.NFL.UNFP.CD | Net official flows from UN agencies, UNFPA (current US$) |
| DT.NFL.UNCR.CD | Net official flows from UN agencies, UNHCR (current US$) |
| DT.NFL.UNCF.CD | Net official flows from UN agencies, UNICEF (current US$) |
| DT.NFL.UNRW.CD | Net official flows from UN agencies, UNRWA (current US$) |
| DT.NFL.UNTA.CD | Net official flows from UN agencies, UNTA (current US$) |
| DT.NFL.WFPG.CD | Net official flows from UN agencies, WFP (current US$) |
| NY.TAX.NIND.KN | Net taxes on products (constant LCU) |
| NY.TAX.NIND.CN | Net taxes on products (current LCU) |
| NY.TAX.NIND.CD | Net taxes on products (current US$) |
| BN.GSR.MRCH.CD | Net trade in goods (BoP, current US$) |
| BN.GSR.GNFS.CD | Net trade in goods and services (BoP, current US$) |
| IC.BUS.NREG | New businesses registered (number) |
| EN.ATM.NOXE.KT.CE | Nitrous oxide emissions (thousand metric tons of CO2 equivalent) |
| SH.MED.NUMW.P3 | Nurses and midwives (per 1,000 people) |
| PA.NUS.FCRF | Official exchange rate (LCU per US$, period average) |
| TX.VAL.MMTL.ZS.UN | Ores and metals exports (% of merchandise exports) |
| TM.VAL.MMTL.ZS.UN | Ores and metals imports (% of merchandise imports) |
| EE.BOD.WRKR.KG | Organic water pollutant (BOD) emissions (kg per day per worker) |
| EE.BOD.TOTL.KG | Organic water pollutant (BOD) emissions (kg per day) |
| GC.XPN.OTHR.ZS | Other expense (% of expense) |
| GC.XPN.OTHR.CN | Other expense (current LCU) |
| EN.ATM.GHGO.KT.CE | Other greenhouse gas emissions, HFC, PFC, and SF6 (thousand metric tons of CO2 equivalent) |
| NV.MNF.OTHR.ZS.UN | Other manufacturing (% of value added in manufacturing) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| GC.TAX.OTHR.RV.ZS | Other taxes (% of revenue) |
| GC.TAX.OTHR.CN | Other taxes (current LCU) |
| SH.XPD.OOPC.ZS | Out-of-pocket health expenditure (% of private expenditure on health) |
| SH.VST.OUTP | Outpatient visits per capita |
| IS.VEH.PCAR.P3 | Passenger cars (per 1,000 people) |
| IP.PAT.NRES | Patent applications, nonresidents |
| IP.PAT.RESD | Patent applications, residents |
| AG.LND.CROP.ZS | Permanent cropland (% of land area) |
| SE.PRM.PRS5.FE.ZS | Persistence to grade 5, female (% of cohort) |
| SE.PRM.PRS5.MA.ZS | Persistence to grade 5, male (% of cohort) |
| SE.PRM.PRS5.ZS | Persistence to grade 5, total (% of cohort) |
| SE.PRM.PRSL.FE.ZS | Persistence to last grade of primary, female (% of cohort) |
| SE.PRM.PRSL.MA.ZS | Persistence to last grade of primary, male (% of cohort) |
| SE.PRM.PRSL.ZS | Persistence to last grade of primary, total (% of cohort) |
| IT.CMP.PCMP | Personal computers |
| IT.CMP.PCMP.P2 | Personal computers (per 100 people) |
| SH.MED.PHYS.ZS | Physicians (per 1,000 people) |
| EN.HPT.THRD.NO | Plant species (higher), threatened |
| EN.ATM.PM10.MC.M3 | PM10, country level (micrograms per cubic meter) |
| SP.POP.0014.TO.ZS | Population ages 0–14 (% of total) |
| SP.POP.1564.TO.ZS | Population ages 15–64 (% of total) |
| SP.POP.65UP.TO.ZS | Population ages 65 and above (% of total) |
| IT.CEL.COVR.ZS | Population covered by mobile cellular network (%) |
| EN.POP.DNST | Population density (people per sq. km of land area) |
| SP.POP.GROW | Population growth (annual %) |
| EN.URB.LCTY | Population in the largest city |
| EN.URB.LCTY.UR.ZS | Population in the largest city (% of urban population) |
| EN.URB.MCTY | Population in urban agglomerations of more than 1 million |
| EN.URB.MCTY.TL.ZS | Population in urban agglomerations of more than 1 million (% of total population) |
| SP.POP.TOTL.FE.ZS | Population, female (% of total) |
| SP.POP.TOTL | Population, total |
| BX.PEF.TOTL.CD.WD | Portfolio equity, net inflows (BoP, current US$) |
| DT.NFL.BOND.CD | Portfolio investment, bonds (PPG + PNG) (NFL, current US$) |
| BN.KLT.PTXL.CD | Portfolio investment, excluding LCFAR (BoP, current US$) |
| SI.POV.GAPS | Poverty gap at $1.25 a day (PPP) (%) |
| SI.POV.GAP2 | Poverty gap at $2 a day (PPP) (%) |
| SI.POV.NAGP | Poverty gap at national poverty line (%) |
| SI.POV.RUGP | Poverty gap at rural poverty line (%) |
| SI.POV.URGP | Poverty gap at urban poverty line (%) |
| SI.POV.DDAY | Poverty head count ratio at $1.25 a day (PPP) (% of population) |
| SI.POV.2DAY | Poverty head count ratio at $2 a day (PPP) (% of population) |
| SI.POV.NAHC | Poverty head count ratio at national poverty line (% of population) |
| SI.POV.RUHC | Poverty head count ratio at rural poverty line (% of rural population) |
| SI.POV.URHC | Poverty head count ratio at urban poverty line (% of urban population) |

**Table 55.6** *continued*

| Indicator | Description |
|---|---|
| PA.NUS.PPPC.RF | PPP conversion factor (GDP) to market exchange rate ratio |
| PA.NUS.PPP | PPP conversion factor, GDP (LCU per international $) |
| PA.NUS.PRVT.PP | PPP conversion factor, private consumption (LCU per international $) |
| SH.STA.ANVC.ZS | Pregnant women receiving prenatal care (%) |
| VC.PKP.TOTL.UN | Presence of peacekeepers (number of troops, police, and military observers in mandate) |
| DT.DOD.PVLX.EX.ZS | Present value of external debt (% of exports of goods, services, and income) |
| DT.DOD.PVLX.GN.ZS | Present value of external debt (% of GNI) |
| DT.DOD.PVLX.CD | Present value of external debt (current US$) |
| SH.HIV.1524.FE.ZS | Prevalence of HIV, female (% ages 15–24) |
| SH.HIV.1524.MA.ZS | Prevalence of HIV, male (% ages 15–24) |
| SH.DYN.AIDS.ZS | Prevalence of HIV, total (% of population ages 15–49) |
| SH.STA.OWGH.ZS | Prevalence of overweight (% of children under 5) |
| SN.ITK.DEFC.ZS | Prevalence of undernourishment (% of population) |
| SH.STA.WAST.ZS | Prevalence of wasting (% of children under 5) |
| SE.PRM.CMPT.FE.ZS | Primary completion rate, female (% of relevant age group) |
| SE.PRM.CMPT.MA.ZS | Primary completion rate, male (% of relevant age group) |
| SE.PRM.CMPT.ZS | Primary completion rate, total (% of relevant age group) |
| SE.PRM.DURS | Primary education, duration (years) |
| SE.PRM.ENRL | Primary education, pupils |
| SE.PRM.ENRL.FE.ZS | Primary education, pupils (% female) |
| SE.PRM.TCHR | Primary education, teachers |
| SE.PRM.TCHR.FE.ZS | Primary education, teachers (% female) |
| SE.PRM.AGES | Primary school starting age (years) |
| IC.CRD.PRVT.ZS | Private credit bureau coverage (% of adults) |
| IC.WRH.PROC | Procedures to build a warehouse (number) |

# Examples: SASEWBGO Interface Engine

## Example 55.1: Reading Gross Domestic Product Data

This example shows how to access three of China's GDP time series.

```
options validvarname=any;

title 'WBGO Data: Gross Domestic Product (3 Series) for China';
LIBNAME myLib sasewbgo "%sysget(WBGO)"
   OUTXML=g2start
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="%sysget(WBGO)g2start.map"
   COUNTRYLIST='chn'
   IDLIST='NY.GDP.PCAP.CD,NY.GDP.PCAP.KN,NY.GDP.PCAP.PP.KD'
   RANGE='2010:2016'
   ;

data gdp2chn;
   set myLib.g2start ;
run;

proc contents data=gdp2chn; run;
proc print data=gdp2chn(drop=total_count); run;
```

**Output 55.1.1** WBGO Data: Gross Domestic Product for China

**WBGO Data: Gross Domestic Product (3 Series) for China**

| Obs | country_id | date | country | NY.GDP.PCAP.CD | NY.GDP.PCAP.KN | NY.GDP.PCAP.PP.KD |
|---|---|---|---|---|---|---|
| 1 | CN | 2010 | China | 4560.51 | 30876.04 | 9525.82 |
| 2 | CN | 2011 | China | 5633.80 | 33658.85 | 10384.37 |
| 3 | CN | 2012 | China | 6337.88 | 36126.73 | 11145.75 |
| 4 | CN | 2013 | China | 7077.77 | 38737.58 | 11951.25 |
| 5 | CN | 2014 | China | 7683.50 | 41354.61 | 12758.65 |
| 6 | CN | 2015 | China | 8069.21 | 43991.55 | 13572.19 |
| 7 | CN | 2016 | China | . | . | . |

The SASEWBGO interface engine supports the XML format. The XML data that the WBGO website returns are placed in a file specified by the OUTXML= option. The XML map that is automatically created is assigned the full path name specified by the XMLMAP= option, and the fileref that is used for the map assignment is specified by the MAPREF= option.

To specify the list of time series that you want to retrieve, use the IDLIST= option. This option accepts a string enclosed in single quotation marks that denotes a list of time series indicators that you select for the resulting SAS data set. The series IDs (indicators) are separated by commas, so valid time series IDs cannot contain embedded commas or quotes. The gdp2chn data set contains three time series variables (NY.GDP.PCAP.CD, NY.GDP.PCAP.KN, and NY.GDP.PCAP.PP.KD), as specified in the IDLIST= option, and the observation range is controlled by the RANGE='2010:2016' option. The gdp2chn data set contains observations that range from the year 2010 to the year 2016, as specified by the RANGE= option. The frequency of the data is annual (default).

**NOTE:** The string '%20' is a special character for URL encoding of blanks. If the time series ID that you name in the IDLIST= option contains a blank, you must use '%20' wherever the blank appears in the time series name. If the time series ID contains an underscore, then you must use an underscore in the time series indicator. The blank and the underscore are not equivalent in the WBGO databases, so make sure that you use '%20' (URL encoded space) to designate blank characters.

## Example 55.2: Retrieving Data for All Countries

This example shows how to get the GDP data for all countries by using the COUNTRYLIST='all' option. Because the amount of data retrieved shows only the first 50 observations (default for the PER_PAGE= option), and the total number of observations is large, use the PAGE= option to request a particular page of the data, such as PAGE=22.

```
options validvarname=any;

title 'Retrieve GDP Data for All Countries';
libname wbgo sasewbgo "%sysget(WBGO)"
   OUTXML=gdp5all
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="%sysget(WBGO)gdp5all.map"
   COUNTRYLIST='all'
```

```
   IDLIST='NY.GDP.PCAP.CD,NY.GDP.PCAP.KN,NY.GDP.PCAP.PP.KD'
   RANGE='2010:2016'
   PAGE=22
   ;

data mygdp5all;
   set wbgo.gdp5all;
run;

proc contents data=mygdp5all; run;
proc print data=mygdp5all(drop=total_count); run;
```

**Output 55.2.1** Retrieve Page 22 of the GDP Data for All Countries

**Retrieve GDP Data for All Countries**

| **50** | XK | 2016 | Kosovo | . | . | . |

Output 55.2.1 shows the data for the Kyrgyz Republic, the Republic of Korea, the Lao PDR, Lebanon, Latvia, and Kosovo. The SASEWBGO engine gives the information about the total number of pages (data_pages), the requested page number (data_page), the number of observations per page (data_per_page), and the total number of observations (data_total) in the SAS listing.

## Example 55.3: Setting the Number of Observations Retrieved in One Page of Data

This example shows how to change the number of observations retrieved in one page of data by using the PER_PAGE= option.

```
options validvarname=any;

title 'Using the PER_PAGE= Option';
libname wbgo sasewbgo "%sysget(WBGO)"
   OUTXML=gdp2all
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="%sysget(WBGO)gdp2all.map"
   COUNTRYLIST='all'
   IDLIST='NY.GDP.PCAP.CD,NY.GDP.PCAP.KN,NY.GDP.PCAP.PP.KD'
   RANGE='2010:2016'
   PER_PAGE=75
   PAGE=2
   ;

data mygdp2all;
     set wbgo.gdp2all;
run;

proc contents data=mygdp2all; run;
proc print data=mygdp2all(drop=total_count); run;
```

**Output 55.3.1** Using the PER_PAGE= Option

**Using the PER_PAGE= Option**

Output 55.3.1 shows the data for page 2 (when PER_PAGE=75) for the countries with the following country IDs: EU, F1, T7, V3, XD, XE, XF, XG, XH, XI, ZJ, and ZT. Most of these country codes are aggregated subsets, based on debt, income level, or location.

## Example 55.4: Sorting Time Series in Descending Order Using the Sort= Option

This example shows how to retrieve data that are sorted in descending order (within each country's BY group).

```
options validvarname=any;

title 'Using the SORT= Option';
libname wbgo sasewbgo "%sysget(WBGO)"
   OUTXML=gdpdes
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="%sysget(WBGO)gdpdes.map"
   COUNTRYLIST='chn;bra'
   IDLIST='NY.GDP.PCAP.CD,NY.GDP.PCAP.KN,NY.GDP.PCAP.PP.KD'
   RANGE='2010:2016'
   PER_PAGE=25
   SORT=desc
   ;

data mygdpdesc;
     set wbgo.gdpdes;
run;

proc contents data=mygdpdesc; run;
proc print data=mygdpdesc(drop=total_count); run;
```

**Output 55.4.1** Using the SORT= Option

**Using the SORT= Option**

| Obs | country_id | date | country | NY.GDP.PCAP.CD | NY.GDP.PCAP.KN | NY.GDP.PCAP.PP.KD |
|---|---|---|---|---|---|---|
| 1 | BR | 2016 | Brazil | . | . | . |
| 2 | BR | 2015 | Brazil | 8677.77 | 8743.15 | 14532.98 |
| 3 | BR | 2014 | Brazil | 11917.79 | 9163.63 | 15231.91 |
| 4 | BR | 2013 | Brazil | 12106.21 | 9198.86 | 15290.46 |

| 12 | CN | 2012 | China | 6337.88 | 36126.73 | 11145.75 |
| 13 | CN | 2011 | China | 5633.80 | 33658.85 | 10384.37 |
| 14 | CN | 2010 | China | 4560.51 | 30876.04 | 9525.82 |

Output 55.4.1 shows the results of using the SORT= option to sort each country's observations in descending order (most recent observation first). There are only 25 observations because the PER_PAGE=25 option is specified, and the default page is the first page of observations. The SASEWBGO engine defaults to

SORT=ASC (ascending dates) within each BY group (country).

## Example 55.5: Retrieving a List of Indicators for a Specified Source Using the URL= Option

This example demonstrates how to use the URL= option to retrieve a list of available time series indicators from a specified source.

```
options validvarname=any;

title 'Retrieve a List of Indicators for a Specified Source Using the URL= Option';
libname wbgo sasewbgo "%sysget(WBGO)"
   url="http://api.worldbank.org/source/1/indicators?format=xml";

data my1source;
   set wbgo.XWBGOTPU;
run;

proc contents data=my1source; run;
proc print data=my1source; run;
```

**Output 55.5.1** Specifying the URL= Option for a List of Indicators from a Specified Source

**Retrieve a List of Indicators for a Specified Source Using the URL= Option**

| 51 | . | | IC.DCP.PROC | Procedures required to build a warehouse (number) | 1 | Doing Business |
| 52 | . | | IC.DCP.COST | Cost to build a warehouse (% of income per capita) | 1 | Doing Business |
| 53 | 7 | Financial Sector | IC.CRD.PUBL.ZS | Public credit registry coverage (% of adults) | 1 | Doing Business |
| 54 | 12 | Private Sector | IC.CRD.PUBL.ZS | Public credit registry coverage (% of adults) | 1 | Doing Business |

**Output 55.5.1** *continued*

**Retrieve a List of Indicators for a Specified Source Using the URL= Option**

| Obs | topic_id | topic | indicator_id | name | source_id | source |
|---|---|---|---|---|---|---|
| 55 | 13 | Public Sector | IC.CRD.PUBL.ZS | Public credit registry coverage (% of adults) | 1 | Doing Business |
| 56 | 7 | Financial Sector | IC.CRD.PRVT.ZS | Private credit bureau coverage (% of adults) | 1 | Doing Business |
| 57 | 12 | Private Sector | IC.CRD.PRVT.ZS | Private credit bureau coverage (% of adults) | 1 | Doing Business |
| 58 | 7 | Financial Sector | IC.CRD.INFO.XQ | Depth of credit information index (0=low to 8=high) | 1 | Doing Business |
| 59 | 12 | Private Sector | IC.CRD.INFO.XQ | Depth of credit information index (0=low to 8=high) | 1 | Doing Business |
| 60 | 19 | Climate Change | IC.BUS.EASE.XQ | Ease of doing business index (1=most business-friendly regulations) | 1 | Doing Business |
| 61 | 12 | Private Sector | IC.BUS.EASE.XQ | Ease of doing business index (1=most business-friendly regulations) | 1 | Doing Business |

Output 55.5.1 shows the list of indicators for the specified source. Each indicator can be listed in more that one topic, so an indicator might be listed multiple times in the results.

## Example 55.6: Retrieving a List of Indicators for a Specified Topic Using the URL= Option

This example demonstrates how to use the URL= option to retrieve a list of available time series indicators for a specified topic.

```
options validvarname=any;
title 'Retrieve a List of Indicators for a Specified Topic ID Using the URL= Option';
libname wbgo sasewbgo "%sysget(WBGO)"
   url="http://api.worldbank.org/topic/5/indicator?format=xml"
   page=2;

data my5top2;
   set wbgo.XWBGOTPU;
run;

proc contents data=my5top2; run;
proc print data=my5top2; run;
```

**Output 55.6.1** Specifying the URL= Option for a List of Indicators for a Specified Topic

**Retrieve a List of Indicators for a Specified Topic ID Using the URL= Option**

| Obs | topic_id | topic | indicator_id | name | source_id | source |
|---|---|---|---|---|---|---|
| 1 | 5 | Energy & Mining | TX.VAL.MMTL.ZS.UN | Ores and metals exports (% of merchandise exports) | 2 | World Development Indicators |
| 2 | 12 | Private Sector | TX.VAL.MMTL.ZS.UN | Ores and metals exports (% of merchandise exports) | 2 | World Development Indicators |
| 3 | 21 | Trade | TX.VAL.MMTL.ZS.UN | Ores and metals exports (% of merchandise exports) | 2 | World Development Indicators |
| 4 | 5 | Energy & Mining | TX.VAL.FUEL.ZS.UN | Fuel exports (% of merchandise exports) | 2 | World Development Indicators |
| 5 | 12 | Private Sector | TX.VAL.FUEL.ZS.UN | Fuel exports (% of merchandise exports) | 2 | World Development Indicators |
| 6 | 21 | Trade | TX.VAL.FUEL.ZS.UN | Fuel exports (% of merchandise exports) | 2 | World Development Indicators |
| 7 | 5 | Energy & Mining | TM.VAL.MMTL.ZS.UN | Ores and metals imports (% of merchandise imports) | 2 | World Development Indicators |
| 8 | 12 | Private Sector | TM.VAL.MMTL.ZS.UN | Ores and metals imports (% of merchandise imports) | 2 | World Development Indicators |
| 9 | 21 | Trade | TM.VAL.MMTL.ZS.UN | Ores and metals imports (% of merchandise imports) | 2 | World Development Indicators |

Output 55.6.1 shows page 2 of the results. You can retrieve page 1 by removing the PAGE=2 option from the LIBNAME statement. Even though an indicator is selected based on the specified topic ID, all corresponding topics for that selected indicator are listed in the results.

## Example 55.7: Retrieving Quarterly External Debt Statistics for Multiple Countries

This example demonstrates how to retrieve quarterly external debt statistics (SDDS database) for multiple countries.

```
title 'Retrieve Quarterly External Debt Statistics';
options validvarname=any;
libname wbgo sasewbgo "%sysget(WBGO)"
   countrylist='aus;gbr;usa'
   idlist='DT.DOD.DSTM.CD.GG.AR.US,DT.DOD.DECT.CD.GG.AR.US,DT.DOD.DSTC.CD.GG.AR.US,
           DT.DOD.DSCD.CD.GG.AR.US'
   range='2014Q2:2016Q3'
   outxml=debtext
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="%sysget(WBGO)debtext.map"
   ;

data mydebtext;
   set wbgo.debtext;
run;

proc contents data=mydebtext; run;
proc print data=mydebtext(drop=total_count); run;
```

**Output 55.7.1** Retrieving Quarterly External Debt Statistics for RANGE=2014Q2:2016Q3

**Retrieve Quarterly External Debt Statistics**

Output 55.7.1 shows the results for all three countries listed in the COUNTRYLIST= option. Four time series are specified in the IDLIST= option. The sort order of the observations defaults to ascending dates within each country's cross section of data.

## Example 55.8: Retrieving Monthly Global Economic Monitor Commodities for the World

This example demonstrates how to retrieve monthly Global Economic Monitor (GEM) commodities for the world.

```
title 'Retrieve Monthly Global Economic Monitor (GEM) Commodities';
options validvarname=any;
libname wbgo sasewbgo "%sysget(WBGO)"
   countrylist='WLD'
   idlist='KSOYBEAN_MEAL,SOYBEAN_MEAL,SOYBEAN_OIL,KSOYBEAN_OIL,IFERTILIZERS'
   range='2016M01:2017M02'
   outxml=wldcomm
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="%sysget(WBGO)wldcomm.map"
   ;

data mywldcomm;
   set wbgo.wldcomm;
run;
```

```
proc contents data=mywldcomm; run;
proc print data=mywldcomm(drop=total_count); run;
```

**Output 55.8.1** Retrieving Monthly GEM Commodities for RANGE=2016M01:2017M02

**Retrieve Monthly Global Economic Monitor (GEM) Commodities**

| Obs | country_id | date | country | KSOYBEAN_MEAL | SOYBEAN_MEAL | SOYBEAN_OIL | KSOYBEAN_OIL | IFERTILIZERS |
|---|---|---|---|---|---|---|---|---|
| 1 | 1W | 2016M01 | World | | 333 | 727 | | 85.9793 |
| 2 | 1W | 2016M02 | World | | 326 | 758 | | 81.4727 |
| 3 | 1W | 2016M03 | World | | 325 | 761 | | 77.2456 |
| 4 | 1W | 2016M04 | World | | 355 | 796 | | 77.0739 |
| 5 | 1W | 2016M05 | World | | 434 | 791 | | 76.5381 |
| 6 | 1W | 2016M06 | World | | 467 | 798 | | 74.8202 |
| 7 | 1W | 2016M07 | World | | 441 | 788 | | 71.1164 |
| 8 | 1W | 2016M08 | World | | 403 | 814 | | 70.6859 |

| 11 | 1W | 2016M11 | World | | 369 | 880 | | 72.8405 |
| 12 | 1W | 2016M12 | World | | 365 | 907 | | 73.2496 |
| 13 | 1W | 2017M01 | World | | 382 | 872 | | 76.3966 |
| 14 | 1W | 2017M02 | World | | 383 | 835 | | 77.1153 |

Output 55.8.1 shows the results for the world (WLD) listed in the COUNTRYLIST= option. Five time series are specified in the IDLIST= option. For the specified range, the KSOYBEAN_MEAL and KSOYBEAN_OIL time series contain all missing values.

## Example 55.9: Retrieving the Full Range of Data in One Page

This example demonstrates the use of the PER_PAGE= option inside the SAS macro named X.

```
options validvarname=any;

title 'Retrieve the Entire Range of Data Observations in One Page';
%macro x(per_page=);

%let i=&per_page;
%if &i<=50 %then %do;
    libname wbgo sasewbgo "%sysget(WBGO)"
       OUTXML=gdpMall
       AUTOMAP=replace
       MAPREF=MyMap
       XMLMAP="%sysget(WBGO)gdpMall.map"
       COUNTRYLIST='all'
       IDLIST='NY.GDP.PCAP.CD,NY.GDP.PCAP.KN,NY.GDP.PCAP.PP.KD'
       RANGE='2010:2016'
       PER_PAGE=&i
       PAGE=1;
```

```
   data mygdpMall;
      set wbgo.gdpMall;
   run;

   proc contents data=mygdpMall; run;
   proc print data=mygdpMall; run;

   proc sql noprint;
      select t.total_count into :allnobs
      from work.mygdpMall t;
   quit;

  %if &allnobs>50 %then %do;
    libname wbgo sasewbgo "%sysget(WBGO)"
       OUTXML=gdpTall
       AUTOMAP=replace
       MAPREF=MyMap
       XMLMAP="%sysget(WBGO)gdpTall.map"

| **1846** | ZW | 2014 | Zimbabwe | 931.20 | 800.01 | 1709.14 |
| **1847** | ZW | 2015 | Zimbabwe | 924.14 | 785.41 | 1677.97 |
| **1848** | ZW | 2016 | Zimbabwe | . | . | . |

Output 55.9.1 shows the results for all countries (ALL) listed in the COUNTRYLIST= option. Three time series are specified in the IDLIST= option. For the entire specified range, for years 2010–2016, the time series have a total of 1,848 observation values.

The X macro shows how to obtain the total observation count by first requesting only 50 observations (PER_PAGE=50, PAGE=1) in the first SASEWBGO LIBNAME statement. The SAS data set that the SASEWBGO engine creates is named GdpMall by the OUTXML= option in the first SASEWBGO LIBNAME statement. The PROC SQL SELECT statement stores the total number of observations from the SAS variable TOTAL_COUNT in the SAS macro variable named ALLNOBS. This allows the second SASEWBGO LIBNAME statement to use the total observation count in the PER_PAGE= option so that all 1,848 observations are downloaded in one page. The SAS data set gdpTall contains all 1,848 observations. For brevity, only the last 48 observations are shown in Output 55.9.1.

# Overview: SASEXCCM Interface Engine

The SASEXCCM interface engine enables SAS users to access the CRSP/Compustat Merged (CCM) Database, which is created from data delivered via Compustat's Xpressfeed product, the CRSP US Stock (STK) Database, and the CRSP US Stock and Indices (IND) Database. The SASEXCCM engine provides a seamless interface for CRSP, Compustat, and SAS data processing.

The SASEXCCM engine uses the LIBNAME statement to specify which database to open and what parts of the database to access.

To specify the database, you supply the combination of a physical path to indicate the location of the data files (CCM, STK, or IND data) and a set identifier (SETID) to identify the database that you want to access from those available at the physical path. The SASEXCCM engine supports data-item-handling access methods for the SETIDs in Table 56.1.

The SASECRSP engine no longer supports COMPUSTAT access. Instead, use the SASEXCCM engine, SETID 250, to read your CRSP/Compustat Merged data.

**Table 56.1** CRSP Database SETIDs

| SETID | Data Set |
|---|---|
| 10 | CRSP Stock, daily data |
| 20 | CRSP Stock, monthly data |
| 250 | CRSP/Compustat Merged data |
| 400 | CRSP Indices data, monthly index groups |
| 420 | CRSP Indices data, monthly index series |
| 440 | CRSP Indices data, daily index groups |
| 460 | CRSP Indices data, daily index series |

# Getting Started: SASEXCCM Interface Engine

To specify what parts of the database to access, you supply two things: the appropriate keys for companies or securities that you want to access, and the list of data items that you want to retrieve.

When accessing CCM data, you select the companies that you want to access by specifying the GVKEY for each company. A GVKEY is Compustat's unique identifier and primary key. CRSP uses KYGVKEY to refer to GVKEY in the CCM database. Use the GVKEY= option to specify which GVKEY to include. If no GVKEYs are specified, data for all companies are retrieved. You can use the KEEP= KYGVKEY CONM option to obtain a list of all companies (including their name and GVKEY) in the CCM database, as shown in Example 56.5.

For example, the following statements access the CCM database to retrieve annual sales data for IBM (GVKEY=6066) and Microsoft (GVKEY=12141):

```
LIBNAME myLib sasexccm 'physical-name'
   SETID=250
   GVKEY=6066   /* IBM */
   GVKEY=12141  /* MSFT */
   ITEMLIST='SALE';
data yrlysale;
   set myLib.annitem;
run;
```

When accessing CRSP US Stock (STK) data, you select the securities you want to access by specifying their PERMNOs. A PERMNO is CRSP's unique permanent issue identification number and the primary key for its stock databases. You specify a PERMNO by using the PERMNO= option. If no PERMNOs are specified, data for all securities in the database are retrieved. You can use this feature to obtain a list of all PERMNOs in the STK database.

For example, the following statements access the STK database to retrieve monthly shares data for IBM (PERMNO=12490) and Microsoft (PERMNO=10107):

```
LIBNAME myLib sasexccm 'physical-name'
   SETID=20
   PERMNO=12490   /* IBM */
   PERMNO=10107  /* MSFT */
   ITEMLIST="MSHROUT.*;MSHRFLG.*";

data mshares_all;
   set myLib.mshares;
run;
```

When accessing CRSP US Stock and Indices (IND) data, you select the security and indices data from the CRSP Daily or Monthly Stock and Indices database by specifying their INDNOs. An INDNO is the primary key for CRSP Indices Databases. You specify an INDNO by using the INDNO= option. If no INDNOs are specified, data for all securities in the database are retrieved. You can use this feature to obtain a list of all INDNOs in the IND database.

For example, the following statements access the IND database to retrieve monthly Consumer Price Index data (INDNO=1000709):

```
LIBNAME myLib sasexccm 'physical-name'
   SETID=420
   INDNO=1000709  /* Consumer Price Index */
   ITEMLIST=
    "MREBAL.*;MRBBEGDT.*;MRBENDDT.*;MRUSDCNT.*;MMINID.*;MMAXID.*;MMINSTAT.*";

data mindts_all;
   set myLib.mindhdr;
   set myLib.mrebal;
run;
```

To specify the list of data items that you want to retrieve, use the ITEMLIST= option. This option accepts a string that denotes a list of requested data items and the reporting format (for example, data format, population source, consolidation level, and so on) in standard CRSP notation by using CRSP's unique mnemonic text name *itm_name* and the mnemonic tag *keyset*. For more information about CRSP notation, see the ITEMLIST= option in the section "The LIBNAME *libref* SASEXCCM Statement" on page 3859.

After the SAS library reference (libref) is assigned by the LIBNAME statement, the database is opened. The selected data are organized into groups such as ANNITEM for annual time series data or LINK for event-based CRSP/Compustat link data. You can also use the SAS DATA step to perform further subsetting and to store the resulting time series in a SAS data set.

The SASEXCCM engine supports Linux X64 (LAX), Solaris X64 (SAX), Solaris SPARC (S64), and Windows. Windows no longer requires you to install the CRSPAccess API, because it is now distributed automatically by your SAS/ETS installation. Your Windows setup does not require any special environment variables.

## Syntax: SASEXCCM Interface Engine

The SASEXCCM interface engine uses standard engine syntax. Options that the SASEXCCM engine uses are summarized in Table 56.2. The SETID= and ITEMLIST= options are required.

**Table 56.2** Summary of LIBNAME *libref*

| Option | Description |
|---|---|
| SETID= | Specifies which CRSP database at the physical path to open. For the complete list of supported SETIDs, see Table 56.1. |
| GVKEY= | Specifies a Compustat GVKEY for accessing CCM data. To select more than one GVKEY, use this option multiple times. See Example 56.1 and Example 56.2. |
| GVIIDKEY= | Specifies a composite GVKEY.IID for accessing security related items by both GVKEY and IID. |
| PERMNO= | Specifies a CRSP PERMNO for accessing STK data. To select more than one PERMNO, use this option multiple times. |
| INDNO= | Specifies a CRSP INDNO for accessing IND data. To select more than one INDNO, use this option multiple times. |
| ITEMLIST= | Specifies the selected data items to be accessed. This option accepts a string in standard CRSP notation. |

## The LIBNAME *libref* SASEXCCM Statement

**LIBNAME** *libref* **SASEXCCM** '*physical-name*' **SETID=***crsp_setidnumber options* **;**

The LIBNAME statement assigns a SAS library reference (libref) to the physical path of the directory of CRSP data files where the CRSP database that you want to open is located. The required *physical-name* argument must end in a slash for UNIX environments and a backslash for Windows environments. The required *SETID=crsp_setidnumber* argument specifies the CRSP database that you want to read from. Choose one SETID from these values: 10, 20, 250, 400, 420, 440, and 460. For example, the following statement accesses the CCM database and retrieves the annual sales data for IBM (GVKEY=6066):

```
LIBNAME myLib SASEXCCM 'physical-name' SETID=250 GVKEY=6066 ITEMLIST='SALE';
```

You can specify the following *options*:

**GVKEY=***crsp_gvkey*

selects the companies or issues whose data you want to retrieve. Specify the GVKEY (Compustat's permanent SPC identifier) for the *crsp_gvkey*. There is no limit to the number of GVKEY= options that you can specify. If no GVKEY= options are specified, all GVKEYs in the database are selected.

For example, the following statement accesses the CCM database to retrieve annual sales data for IBM (GVKEY=6066) and Microsoft (GVKEY=12141):

```
LIBNAME myLib sasexccm 'physical-name'
   SETID=250
   GVKEY=6066   /* IBM */
   GVKEY=12141  /* MSFT */
   ITEMLIST='SALE';
```

**GVIIDKEY='***crsp_gviidkey***'**

selects the companies and issues whose data you want to retrieve. Specify both the GVKEY and the IID (Compustat's permanent issue identifier) by concatenating the two with a '.' and enclosing them in double quotation marks. There is no limit to the number of GVIIDKEY= options that you can specify. The following members use GVIIDKEY access: IDXCST_HIS, MTHSEC, SECHIST, SECURITY, SEC_MDIVFN, SEC_MSPTFN, SEC_MTHSPT, SEC_SPIND, SEC_TS_ITM, and SPIDX_CST.

For example, the following statements access the CCM database to retrieve the security member that gives security header information for Microsoft issue ID=01, IBM issue ID=01, and some other companies' issues shown in the GVIIDKEY= options:

```
LIBNAME crsp sasexccm 'physical-name'
   SETID=250
   GVIIDKEY="12141.01" /* MSFT issue id 01 */
   GVIIDKEY="6066.01"  /* IBM issue id 01 */
   GVIIDKEY="6008.01"  /* INTC issue id 01 */
   GVIIDKEY="12142.01" /* ORCL issue id 01 */
   GVIIDKEY="62634.01" /* YHOO issue id 01 */
   GVIIDKEY="5047.01"  /* GE issue id 01 */
   GVIIDKEY="7866.01"  /* NYT issue id 01 */
   GVIIDKEY="7866.02"  /* NYTAB issue id 02 */
```

```
   ITEMLIST="DLDTEI;DLRSNI;DSCI;EPF;EXCHG;IID;IID_SEQ_NUM;ISIN;SBEGDT;SENDDT;SCUSIP;
            !SEDOL;SSECSTAT;TIC;TPCI";
 data headersecurity;
    set crsp.security;
 run;
```

**PERMNO=***crsp_permno*

selects the companies or issues whose data you want to retrieve. Specify a CRSP company issue's PERMNO for the *crsp_permno*. There is no limit to the number of PERMNO= options that you can specify. If no PERMNO= options are specified, all PERMNOs in the database are selected.

For example, the following statements access the STK database to retrieve monthly shares data for IBM (PERMNO=12490) and Microsoft (PERMNO=10107):

```
LIBNAME myLib sasexccm 'physical-name'
   SETID=20
   PERMNO=12490   /* IBM */
   PERMNO=10107  /* MSFT */
   ITEMLIST="MSHROUT.*;MSHRFLG.*";
data mshares_all;
   set myLib.mshares;
run;
```

**INDNO=***crsp_indno*

selects the time series or the group data from the index whose data you want to retrieve. Specify a CRSP Index's INDNO for the *crsp_indno*. There is no limit to the number of INDNO= options that you can specify. If no INDNO= options are specified, all INDNOs in the database are selected.

For example, the following statements access the IND database to retrieve monthly consumer price index data (INDNO=1000709):

```
LIBNAME myLib sasexccm 'physical-name'
   SETID=420
   INDNO=1000709  /* Consumer Price Index */
   ITEMLIST=
    "MREBAL.*;MRBBEGDT.*;MRBENDDT.*;MRUSDCNT.*;MMINID.*;MMAXID.*;MMINSTAT.*";

data mindts_all;
   set myLib.mindhdr;
   set myLib.mrebal;
run;
```

**ITEMLIST="***crsp_itemlist***"**

specifies the items and groups of interest for selection based on keysets, which define the reporting format that you want. Specify a string in CRSP standard notation for *crsp_itemlist*. For an overview of items, groups, and reporting formats, see the section "Data Reference: Introduction" on page 3863. Reference sections that are based on CRSP documentation follow the overview. For more information, see the *CRSPAccess User Guide for the CRSP/Compustat Merged Database*, the *CRSP US Stock and Indices Database*, and the *CRSP US Treasury Database*.

The CRSP standard notation has the form

```
[global_section:]list_section
```

The *list_section* consists of a semicolon-delimited string of list elements in the form

```
list_element[;list_element]
```

Each *list_element* can be an item or group name. You can also specify a particular keyset for the item or group by appending a period and its keyset number. For example, "sale.2" selects the sales item for keyset 2, which contains the industrial format, consolidated information, and standardized summary data from the latest annual filing.

The optional *global_section* holds flags that modify all elements in the list section. The following flags are recognized:

f — adds applicable and populated footnote items for every item selected. For example, "f:sale;at;ceq" selects sales, total assets, and common equity items with default keysets and available footnotes for the selected items.

d — adds applicable and populated data code items for every item selected. For example, "d:sale;at;ceq" selects sales, total assets, and common equity items with default keysets and available data codes for the selected items.

k.list — applies the list of keysets to all items in the list that do not have a specified keyset. The list can be either `*` to select all available keysets or `#-#,#...` to select keysets by their number. For example, "k.1:sale;at;ceq" selects the default keyset, keyset 1, for all items.

The following LIBNAME statement shows how to access the CCM database to retrieve the annual sales data and quarterly total assets data for IBM (GVKEY=6066) and Microsoft (GVKEY=12141):

```
LIBNAME myLib sasexccm 'physical-name'
   SETID=250
   GVKEY=6066   /* IBM */
   GVKEY=12141  /* MSFT */
   ITEMLIST='f:sale;actq';
```

After the libref is assigned, you can access any of the available groups (members) within the opened database:

STK daily — For more information about groups in the Daily Stock Database, SETID 10, see the section "Daily STK Data Groups" on page 3868.

STK mthly — For more information about groups in the Monthly Stock Database, SETID 20, see the section "Monthly STK Data Groups" on page 3869.

CCM — For more information about groups in the CRSP/Compustat Merged Databases, SETID 250, see the section "CCM Data Groups" on page 3866.

IND mthly grp — For more information about groups in the Monthly Indices Group Data Database, SETID 400, see the section "Monthly IND Group Data Group Names" on page 3870.

IND mthly ts — For more information about groups in the Monthly Indices Time Series Database, SETID 420, see the section "Monthly IND Time Series Data Group Names" on page 3871.

IND daily grp — For more information about groups in the Daily Indices Group Data Database, SETID 440, see the section "Daily IND Group Data Group Names" on page 3870.

IND daily ts — For more information about groups in the Daily Indices Time Series Database, SETID 460, see the section "Daily IND Time Series Data Group Names" on page 3872.

# Details: SASEXCCM Interface Engine

## SAS Output Data Set

You can use the SAS DATA step to write the selected CRSP or Compustat data to a SAS data set. This enables you to easily analyze the data by using SAS software. If you specify the name of the output data set in the DATA statement, the engine supervisor creates a SAS data set that has the specified name in either the SAS Work library or, if specified, the User library.

The contents of the SAS data set include the DATE of each observation, the series name of each series read from the CRSPAccess database, event variables, and the label or description of each series, event, or array.

You can use the PRINT and CONTENTS procedures to print your output data set and its contents. Alternatively, you can view your SAS output observations by opening the desired output data set in a SAS Explorer window. You can also use the SQL procedure with your SASEXCCM *libref* to create a custom view of your data.

## Missing Values

In general, CRSP missing values are represented as '.' in the SAS data set. When accessing the CCM database, the SASEXCCM engine interprets missing values according to the conditions and codes defined by Compustat and represents them as SAS missing codes, as shown in Table 56.3.

**Table 56.3** Mapping of Compustat and SAS Missing Codes

| Missing Value | Missing Code | Condition |
|---|---|---|
| 0.0001 | . | No data for data item |
| 0.0002 | .S | Data are available only on a semi-annual basis |
| 0.0003 | .A | Data are available only on an annual basis |
| 0.0004 | .C | Combined into other item |
| 0.0007 | .N | Data are not meaningful |
| 0.0008 | .I | Reported as insignificant |

Missing value codes conform with Compustat's Strategic Insight and binary conventions for missing values. For more information about how CRSP handles Compustat missing codes, see the section "Notes on Missing Values" in the second chapter of the *CRSP/Compustat Merged Database Guide*.

## Data Reference: Introduction

Data reference details are presented for items, keysets, and groups available from four CRSPAccess databases in this order: CCM database, STK databases, and IND databases. In addition to summary tables, sample SAS statements show how to generate a customized list of item names available from each group for a particular database.

## CCM Data Items

The CRSP/Compustat Merged (CCM) database is organized by company and security according to Compustat's Permanent SPC Identifier (GVKEY) and Compustat's Permanent Issue Identifier (IID). An identifying relationship exists between IID and GVKEY. The two identifiers must be accessed as a pair to properly identify a Compustat security. One GVKEY can have multiple IIDs. The SASEXCCM interface engine provides the GVIIDKEY= option to provide access to Compustat securities through the composite key designated by "GVKEY.IID".

CCM data are broken down into items, and items can be further qualified by a set of secondary keys. CRSP calls these known collections of keys and values a *keyset*, and it assigns a numeric code and mnemonic tag to each unique collection. Each keyset represents different output series. Items are also organized into groups for selection and presentation. A group can include other groups, or a group can include items. Items can belong to more than one group. Sometimes groups are also called members.

For example, the Compustat data item SALE has secondary keys for industry format, data format, population source, and consolidation level. A different value of company sales can be available for any combination of these keys, such as a combination that represents the originally reported sales or the final restated sales from a later filing. The SALE data item is a part of the ANNITEM (Annual Time Series Items, including footnotes and data codes) group.

The CCM database contains data items provided by Compustat in addition to structures and supplementary data items provided by CRSP. All data items include a mnemonic and a field name. This section provides a summary of Compustat data items whose mnemonic differs in the CCM database, and a summary of the supplementary data items provided by CRSP. For more information about the Compustat data items, refer to your Compustat data documentation or see `http://www.compustatresources.com/support/index.html`. For more information about the supplementary CRSP data items, see your CCM Database Guide.

**Table 56.4** Items with Different CRSP and Compustat Names

| Compustat Mnemonic | CRSP itm_name | Description | Definition |
|---|---|---|---|
| BETA | XPFBETA | Data item | Xpressfeed beta |
| DVPSXM | XDVPXSM | Data item | Index monthly dividend |
| PRC | XPFPRC | Data item | Participation rights certificates |
| PRCCM | XPRCCM | Data item | Index price close monthly |
| PRCHM | XPRCHM | Data item | Index price high monthly |
| PRCLM | XPRCLM | Data item | Index price low monthly |
| PRC_DC | XPFPRC_DC | Data code | Participation rights certificates data code |
| PRC_FN | XPFPRC_FN | Footnote | Participation rights certificates footnote |
| RET | XPFRET | Data item | Total real estate property |
| RET_DC | XPFRET_DC | Data code | Total real estate property data code |
| RET_FN | XPFRET_FN | Footnote | Total real estate property footnote |
| YEAR | YEARQ | Data item | Year quarterly |

Supplemental CRSP data items are organized into groups. For a list of the supplemental data groups, see the section "CCM Data Groups" on page 3866.

## CCM Keysets

Compustat items can be qualified by a set of secondary keys. This collection of secondary keys and values creates a keyset that assigns a numeric code and mnemonic tag to each unique collection. Each keyset represents different output series. For example, one keyset might represent originally reported sales, and another might represent the final restated sales from a later filing. Full details about keysets can be found in the *CRSP/Compustat Merged Database Guide*. For your convenience, Table 56.5 summarizes the keysets.

**Table 56.5** Summary of CCM Keysets

| Keyset | Tag | Keyset Description |
|---|---|---|
| 0 | | Indices |
| 1 | STD | Industrial format, consolidated information, standardized presentation |
| 2 | SUMM | Industrial format, standardized summary data (StdSumData) from the latest annual filing |
| 3 | PRES | Industrial format, StdSumData collected prior to company amendment |
| 4 | FS | Financial services format, consolidated information, standardized presentation |
| 5 | PFO | Industrial format, pro forma reporting, standardized presentation |
| 6 | PFAS | Pre-FASB reporting |
| 7 | SFAS | Industrial format, pre-FASB reporting, standardized presentation |
| 8 | PRE | Industrial format, StdSumData collected from the latest annual filing |
| 10 | PDIV | Industrial format, pre-divestiture reporting, standardized presentation |
| 11 | DOM | Domestic |
| 12 | SUPF | Industrial format, pre-FASB reporting, StdSumData from the latest annual filing |
| 14 | STD1 | Industrial format, consolidated information, standardized presentation, rank 1 |
| 15 | FSFO | Financial services format, pro forma reporting, standardized presentation |
| 16 | FS1 | Financial services format, consolidated information, standardized presentation, rank 1 |
| 17 | FS2 | Financial services format, consolidated information, standardized presentation, rank 2 |
| 18 | SUFS | Industrial format, pro forma reporting, StdSumData from the latest annual filing |
| 19 | PDI1 | Industrial format, pre-divestiture reporting, standardized presentation, rank 1 |
| 20 | PFA1 | Industrial format, pre-FASB reporting, standardized presentation, rank 1 |
| 21 | SUPD | Industrial format, pre-divestiture reporting, StdSumData from the latest annual filing |
| 22 | FS3 | Financial services format, consolidated information, standardized presentation, rank 3 |
| 23 | PDI2 | Industrial format, consolidated information, standardized presentation, rank 2 |
| 24 | CONS | Consolidated information |
| 25 | STD2 | Industrial format, consolidated information, standardized presentation, rank 2 |
| 26 | STD3 | Industrial format, consolidated information, standardized presentation, rank 3 |
| 27 | STD4 | Industrial format, consolidated information, standardized presentation, rank 4 |
| 28 | STD5 | Industrial format, consolidated information, standardized presentation, rank 5 |
| 29 | PFA2 | Industrial format, pre-FASB reporting, standardized presentation, rank 2 |
| 30 | PFA3 | Industrial format, pre-FASB reporting, standardized presentation, rank 3 |
| 31 | CUSD | Calendar-based reporting in US dollars |
| 32 | FUSD | Fiscal-based reporting in US dollars |
| 33 | CCAD | Calendar-based reporting in Canadian dollars |
| 34 | FCAD | Fiscal-based reporting in Canadian dollars |
| 35 | PFA4 | Industrial format, pre-FASB reporting, standardized presentation, rank 4 |
| 36 | PFO2 | Industrial format, pro forma reporting, standardized presentation, rank 2 |
| 37 | PFO1 | Industrial format, pro forma reporting, standardized presentation, rank 1 |
| 38 | PRE1 | Industrial format, standardized data collected before company amendment, rank 1 |
| 39 | FFO1 | Financial services format, pro forma reporting, standardized presentation, rank 1 |
| 40 | FS4 | Financial services format, consolidated information, standardized presentation, rank 4 |

| 48 | BASUMM | Bank format, average standardized summary presentation from the latest annual filing |
| 49 | BAPFO | Bank format, pro forma reporting, average standardized presentation |

## CCM Data Groups

CCM items are organized into groups for ease of selection and presentation. Each group is given a group name. These names are unique and do not overlap with item names. A group can be made up of either items or other groups. Items can belong to more than one group. Table 56.6 provides a summary of some groups. For more information about CCM data groups, see your *CCM Database Guide*.

**Table 56.6** Selected Xpressfeed Primary and CRSP Supplemental Groups

| Item Name | Description |
|---|---|
| MASTER | CCM company ID and range data |
| COMPANY | CCM company header information |
| IDX_INDEX | CCM idx_index header information |
| SPIND | Standard & Poor's (S&P) index header (pre-GICS) |
| COMPHIST | CCM company header history |
| CSTHIST | CST header history |
| LINK | Link history |
| LINKUSED | CCM company CRSP link used data |
| LINKRNG | CCM company CRSP link range data |
| ADJFACT | CCM company adjustment factor history |
| HGIC | CCM company GICS code history |
| OFFTITL | CCM company officer title data |
| CCM_FILEDATE | CCM company filing date data |
| CCM_IPCD | CCM industry presentation code data |
| SECURITY | CCM security header information |
| SECHIST | CCM security header history |
| SEC_MTHSPT | CCM security monthly split events |
| SEC_MSPT_FN | CCM security monthly split event footnotes |
| SEC_MDIV_FN | CCM security monthly dividend event footnotes |
| SEC_SPIND | CCM security S&P information events |
| IDXCST_HIS | CCM security historical index constituents |
| SPIDX_CST | CCM security S&P index constituent events |
| CCM_SEGCUR | CCM operating segment currency rate data |
| CCM_SEGSRC | CCM operating segment source data |
| CCM_SEGPROD | CCM operating segment product data |
| CCM_SEGCUST | CCM operating segment customer data |
| CCM_SEGDTL | CCM operating segment detail data |
| CCM_SEGITM | CCM operating segment item data |
| CCM_SEGNAICS | CCM operating segment NAICS data |
| CCM_SEGGEO | CCM operating segment geographic data |

## Daily STK Data Items

You can generate a customized list of item names available in the daily stock database (SETID=10) by running the following sample statements for each group name in Table 56.8:

```
libname dstock sasexccm
   "/thirdparty/crspdata/DIZ201006/"
   setid=10 permno=12490
   itemlist="group_name.*";

proc contents data=dstock.group_name; run;
```

The following statements generate an item list of all the item names available in the group named STKHDR_ID:

```
libname crsp sasexccm
   "/thirdparty/crspdata/DIZ201006/"
   setid=10 permno=12490
   itemlist="STKHDR_ID.*";

proc contents data=crsp.stkhdr_id; run;
```

The item names in group STKHDR_ID are listed in Table 56.7.

**Table 56.7** US Daily Stock Items in Group STKHDR_ID

| Item Name | Description |
|---|---|
| BEGDT | Begdt |
| COMPNO | COMPNO |
| CUSIP | CUSIP |
| ENDDT | Enddt |
| HCOMNAM | Latest company name |
| HDLSTCD | DEL |
| HEXCD | EX |
| HPRIMEXCH | Ex1 |
| HSECSTAT | Sst |
| HSHRCD | SH |
| HSICCD | SIC |
| HSNAICS | Naics |
| HSUBEXCH | Ex2 |
| HTICK | Htick |
| HTRDSTAT | Tst |
| HTSYMBOL | Symbol |
| ISSUNO | Issuno |
| KYPERMNO | PERMNO |
| PERMCO | PERMCO |
| PERMNO | PERMNO |

## Daily STK Data Groups

Daily stock groups are shown in Table 56.8.

**Table 56.8** US Daily Stock Group Names

| Group Name | Description |
|---|---|
| STKHDR_ID | Stock header (summary) |
| STKHDR_ALL | All stock headers |
| STKHDR_RNG | Stock header plus ranges |
| LSTKHDR_RNG | Stock header plus calendar index ranges |
| NAMES_SHORT | Name history (short list) |
| NAMES | Name history |
| NAMES_ALL | All names |
| DISTS | Distribution events |
| ADJDISTS | Daily adjusted distribution events |
| SHARES | Shares outstanding observations |
| RSHARES | Raw shares outstanding observations |
| ADJSHARES | Daily adjusted shares outstanding observations |
| DELIST | Delisting history |
| ADJDELIST | Adjusted delisting events |
| NASDIN | NASDAQ information history |
| DLY_DATA | Daily price summary time series |
| DLY_ADJDATA | Daily adjusted price summary time series |
| DSTK_TS | Daily time series |
| DLY_WGT | Daily price, shares, and returns |
| DLY_ADJ_WGT | Daily adjusted price, shares, and returns |
| DLY_LVL | Daily index level |
| DLY_RET | Daily returns |
| PORTF | Portfolio data |
| GROUP | Group membership data |
| DLY_TS_NAT | Daily time series (native only) |
| DSTK_VOLUME | Volume |
| DSTK_CAP | Capitalization |

## Monthly STK Data Items

You can generate a customized list of item names available in the monthly stock database by running the following sample statements for each group name in Table 56.9:

```
libname crsp sasexccm
   "/r/tappan/vol/vol1/crsp1/data201008_little/MIZ201006/"
   setid=20 permno=12490
   itemlist="group_name.*";

proc contents data=crsp.group_name; run;
```

## Monthly STK Data Groups

Monthly stock groups are shown in Table 56.9.

**Table 56.9** US Monthly Stock Group Names

| Group Name | Description |
|---|---|
| MSTKHDR_ID | Stock header (summary) |
| MSTKHDR_RNG | Stock header plus ranges |
| LMSTKHDR_RNG | Stock header plus calendar index ranges |
| MNAMES_SHORT | Name history (short list) |
| MNAMES | Name history |
| MNAMES_ALL | All MNAMES (monthly name histories) |
| MDISTS | Distribution events |
| MADJDISTS | Monthly adjusted distribution events |
| MSHARES | Shares outstanding observations |
| RMSHARES | Raw shares outstanding observations |
| MADJSHARES | Monthly adjusted shares outstanding observations |
| MDELIST | Delisting history |
| MADJDELIST | Adjusted delisting events |
| MNASDIN | NASDAQ information history |
| MTH_DATA | Monthly price summary time series |
| MTH_ADJDATA | Monthly adjusted price summary time series |
| MTH_TS | Monthly time series |
| MTH_WGT | Monthly price, shares, and returns |
| MTH_ADJ_WGT | Monthly adjusted price, shares, and returns |
| MTH_LVL | Monthly index level |
| MTH_RET | Monthly returns |
| MPORTF | Portfolio data |
| MGROUP | Group membership data |
| MTH_TS_NAT | Monthly time series (native only) |
| MSTK_VOLUME | Volume |
| MSTK_CAP | Capitalization |

## IND Group Data Item Names

You can generate a customized list of available indices group data item names by running the following sample statements for each daily or monthly group name from Table 56.10 or Table 56.11 and substituting the corresponding SETID, data path, and actual daily (or monthly) group name for the **group_name**:

```
libname crsp sasexccm
   "/thirdparty/crspdata/DIZ201006/"
   setid=440
   indno=1000040
   itemlist="group_name.*";

proc contents data=crsp.group_name; run;
```

## Monthly IND Group Data Group Names

The monthly group indices data consist of the groups listed in Table 56.10.

**Table 56.10** US IND Monthly Group Data Group Names

| Group Name | Description |
|---|---|
| MINDHDRG | Monthly index group header |
| MINDSUMMG | Monthly index group summary |
| MLISTG | Monthly index group list history |
| MREBALG | Monthly index group rebalancing history |
| MREBALG_ALL | Monthly index group rebalancing |
| MTHGIND_LVL | Monthly index group levels |
| MTHGIND_RET | Monthly index group returns |
| MTHGIND_TS | Monthly index group series |
| MTHGIND_VAL | Monthly index group values |

## Daily IND Group Data Group Names

The daily group indices data consist of the groups listed in Table 56.11.

**Table 56.11** US IND Daily Group Data Group Names

| Group Name | Description |
|---|---|
| INDHDRG | Index group header |
| INDSUMMG | Index group summary |
| LISTG | Index group list history |
| REBALG | Index group rebalancing history |
| REBALG_ALL | Index group rebalancing |
| DLYGIND_LVL | Index group levels |
| DLYGIND_RET | Index group returns |
| DLYGIND_TS | Index group series |
| DLYGIND_VAL | Index group values |

## IND Time Series Data Item Names

You can generate a customized list of available item names by running the following sample statements for each daily or monthly time series group name from Table 56.12 or Table 56.13 and substituting the corresponding SETID, data path, and actual daily (or monthly) time series group name for the **group_name**:

```
libname daycrsp sasexccm
   "/thirdparty/crspdata/DIZ201006/"
   setid=460
   indno=1000040
   itemlist="group_name.*";

proc contents data=daycrsp.group_name; run;
```

## Monthly IND Time Series Data Group Names

The monthly indices data consist of the groups listed in Table 56.12.

**Table 56.12** US IND Monthly Series Data Group Names

| Group Name | Description |
|---|---|
| MINDHDR | Monthly index header |
| MINDSUMM | Monthly index summary |
| MLIST | Monthly index list history |
| MREBAL | Monthly index rebalancing history |
| MREBAL_ALL | Monthly index rebalancing |
| MTHIND_LVL | Monthly index levels |
| MTHIND_RET | Monthly index returns |
| MTHIND_TS | Monthly index series |
| MTHIND_VAL | Monthly index values |

## Daily IND Time Series Data Group Names

The daily indices data consist of the groups listed in Table 56.13.

**Table 56.13** US IND Daily Time Series Data Group Names

| Group Name | Description |
|---|---|
| INDHDR | Index header |
| INDSUMM | Index summary |
| LIST | Index list history |
| REBAL | Index rebalancing history |
| REBAL_ALL | Index rebalancing |
| DLYIND_LVL | Index levels |
| DLYIND_RET | Index returns |
| DLYIND_TS | Index series |
| DLYIND_VAL | Index values |

# Examples: SASEXCCM Interface Engine

## Example 56.1: Retrieving SALE Data for One GVKEY

This simple example shows how to retrieve SALE data for one particular GVKEY=6066 (IBM). Because the ITEMLIST= option does not specify a keyset, the default (standard) keyset, KEYSET_TAG=STD, is selected. For brevity, a subset of the data that contains the most recent figures is specified by the WHERE statement.

```
title 'Retrieve SALE data for IBM';
libname _all_ clear;

libname crsp sasexccm "/thirdparty/crspdata/CMZ201201/"
   setid=250
   gvkey=6066
   itemlist="sale";

data recentsales;
    set crsp.annitem;
    where datadate >= '1jan2000'd;

proc print data=recentsales;
run;
```

**Output 56.1.1** SALE Data for GVKEY=6066

**Retrieve SALE data for IBM**

| Obs | KYGVKEY | KEYSET_TAG | DATADATE | SALE |
|---|---|---|---|---|
| 1 | 6066 | STD | 20001229 | 88396.0000 |
| 2 | 6066 | STD | 20011231 | 85866.0000 |
| 3 | 6066 | STD | 20021231 | 81186.0000 |
| 4 | 6066 | STD | 20031231 | 89131.0000 |
| 5 | 6066 | STD | 20041231 | 96293.0000 |
| 6 | 6066 | STD | 20051230 | 91134.0000 |
| 7 | 6066 | STD | 20061229 | 91424.0000 |
| 8 | 6066 | STD | 20071231 | 98786.0000 |
| 9 | 6066 | STD | 20081231 | 103630.0000 |
| 10 | 6066 | STD | 20091231 | 95758.0000 |
| 11 | 6066 | STD | 20101231 | 99871.0000 |

## Example 56.2: Retrieving SALE Data for Multiple Companies

This example shows how to retrieve several data items for several GVKEYs. Note how the item **offtitl** is not an annual item and is stored in its own member. The default (standard) keyset is used for all items. For brevity, a subset of the data that contains the most recent figures is specified by the WHERE statement.

```
title 'Retrieve Sales, Revenue, Liabilities, and Officer data for IBM and MSFT';
libname _all_ clear;

libname crsp sasexccm "/thirdparty/crspdata/CMZ201201/"
   setid=250
   gvkey=6066
   gvkey=12141
   itemlist="sale;revt;lct;offtitl";

data recentannitems;
    set crsp.annitem;
    where datadate >= '1jan2000'd;

proc print data=recentannitems;
proc print data=crsp.offtitl;
run;
```

**Output 56.2.1** Data Items for IBM and Microsoft

**Retrieve Sales, Revenue, Liabilities, and Officer data for IBM and MSFT**

| Obs | KYGVKEY | KEYSET_TAG | DATADATE | SALE | REVT | LCT |
|---|---|---|---|---|---|---|

## Example 56.3: Retrieving Data from Different Keysets

This example shows how to retrieve several data items from different keysets. You request data about research and development (R&D) expenses (XRD) and net income (NI) over all available keysets by using the **itm_name.*** syntax in the ITEMLIST= option. Note that data are not available for all items in all keysets. For brevity, a subset of the data that contains the most recent figures is specified by the WHERE statement.

```
title 'Retrieve R&D Expenses and Net Income for IBM';
libname _all_ clear;

libname crsp sasexccm "/thirdparty/crspdata/CMZ201201/"
   setid=250
   gvkey=6066
   itemlist="xrd.*;ni.*";

data recent;
    set crsp.annitem;
    where datadate >= '1jan2001'd;

proc print data=recent;
run;
```

**Output 56.3.1** R&D Expenses and Net Income for GVKEY=6066

**Retrieve R&D Expenses and Net Income for IBM**

| Obs | KYGVKEY | KEYSET_TAG | DATADATE | XRD | NI |
|---|---|---|---|---|---|
| 1 | 6066 | STD | 20011231 | 4620.0000 | 7723.0000 |
| 2 | 6066 | STD | 20021231 | 4754.0000 | 3579.0000 |

## Example 56.4: Retrieving Items by Using Global Options

This example shows how to retrieve data on total assets (ATQ) and after tax gain or loss (GLAQ) by using the global option for turning on footnote items, which uses the following syntax:

```
ITEMLIST="f:itm_name1;itm_name2;....itm_nameN"
```

The default (standard) keyset is used for all items. For brevity, a subset of the data that contains the most recent figures is specified by the WHERE statement.

```
title 'Retrieve data for IBM with Footnotes';
libname _all_ clear;

libname crsp sasexccm "/thirdparty/crspdata/CMZ201201/"
  setid=250
  gvkey=6066
  itemlist="f:atq;glaq";

data recent;
    set crsp.qtritem;
    where datadate >= '1jan2004'd;

proc print data=recent;
run;
```

**Output 56.4.1** Data Items with Footnotes

**Retrieve data for IBM with Footnotes**

| Obs | KYGVKEY | KEYSET_TAG | DATADATE | ATQ | ATQ_FN1 | GLAQ | GLAQ_FN |

## Example 56.5: Retrieving All GVKEYs and Company Names

This example shows how to retrieve the GVKEY and name for every company in the CCM database.

```
title 'Retrieve All GVKEYs and Company Names';
libname _all_ clear;

libname crsp sasexccm "/thirdparty/crspdata/CMZ201201/"
  setid=250
  itemlist="company";

proc contents data=crsp.company;
proc print data=crsp.company(keep=kygvkey conm obs=20);
run;
```

For brevity, only the first 20 observations are shown, and only KYGVKEY and CONM are kept in Output 56.5.1.

## Example 56.9: Retrieving Information for Availability of Group INDNOs

This example shows how to retrieve header information about group data and how to obtain a list of all the available INDNO keys in the IND database. The INDNO= option is intentionally omitted so that a default list is generated of all INDNOs in the database that are available for SETID 440.

```
title 'Retrieve Header Information for a Complete INDNO list';
libname _all_ clear;

libname crsp sasexccm
   "/thirdparty/crspdata/DIZ201006/"
   setid=440
   itemlist="INDNOG.*;INDCOG.*;INDNAMEG.*;GROUPNAMEG.*";

data dgindts_all;
   set crsp.indhdrg;
run;

proc print data=dgindts_all(keep=kyindno indnameg); run;
```

**Output 56.9.1** Daily Group Indices Header by INDNO

**Retrieve Header Information for a Complete INDNO list**

| Obs | KYINDNO | INDNAMEG |

## Example 56.10: Retrieving Daily Group Time Series by the INDNO= Option

This example shows how to retrieve daily group time series by using the INDNO keys in the IND database that were found in Example 56.9.

```
title 'Retrieve Daily Group Time Series by INDNO';
libname _all_ clear;

libname crsp sasexccm
   "/thirdparty/crspdata/DIZ201006/"
   setid=440
   indno=1000012 indno=1000032
   itemlist="AINDG.*;ARETG.*;USDCNTG.*;USDVALG.*";
```

```
data dgindts_all ( where=( caldt >= '29jun2010'd) );
   set crsp.dlygind_ts;
run;

proc print data=dgindts_all; run;
```

**Output 56.10.1** Daily Group Indices Time Series by INDNO

**Retrieve Daily Group Time Series by INDNO**

# Overview: SASEXFSD Interface Engine

The SASEXFSD interface engine enables SAS users to access both FactSet data and FactSet-sourced data that are provided by the FactSet OnDemand service (formerly known as FASTFetch). This service provides access to many FactSet Data Sources and to many other databases. This chapter focuses on accessing the FactSet Fundamentals database, but additional databases and data types are available for use with the SASEXFSD interface engine. For a more comprehensive list of available data, enter the following URL in your web browser:

```
http://www.factset.com/data
```

For detailed descriptions of other databases that you can access, refer to the FactSet workstation Online Assistant.

The SASEXFSD engine uses the LIBNAME statement to specify which factlet (provided by FactSet) to use to open a database and what parts of the database to access. Factlets are functions that encapsulate business logic and data collection procedures. The technology is capable of cross referencing and dealing with time series for a large amount of data.

To specify the factlet, name one of the supported factlets that are listed in Table 57.1. Table 57.5 shows where to find a summary of each factlet's options.

**Table 57.1** Supported FactSet OnDemand Factlets

| Supported Factlet | Example |
|---|---|
| ExtractEconData | Example 57.1, Example 57.2 |
| ExtractEconData (cont.) | Example 57.3, Example 57.4, Example 57.5 |
| ExtractFormulaHistory | Example 57.6, Example 57.7, Example 57.8 |
| ExtractDataSnapshot | Example 57.9, Example 57.10 |
| ExtractBenchmarkDetail | Example 57.11, Example 57.12 |
| ExtractOFDBItem | Example 57.13 |
| ExtractOFDBUniverse | Example 57.14 |
| ExtractScreenUniverse | Example 57.15 |

The Prefix column in Table 57.2 contains the parameters that you are most likely to refer to when requesting data, but each factlet has its own set of optional parameters and default settings. Often the items that you select use a prefix (see the Prefix column) to designate the database where the item resides. Because the availability of data libraries and their contents are constantly changing, Table 57.2 is included for instructional purposes only.

**Table 57.2** Sample Databases Available through FactSet

| Prefix | Database |
|---|---|
| ff | FactSet Fundamentals |
| fe | FactSet Estimates |
| fg | FactSet Global |
| p | FactSet Prices—Security Price Data |

Table 57.2 shows only a subset of the available FactSet databases. For a more comprehensive list that also includes third-party databases available through FactSet, refer to the FactSet Online Assistant, page ID 2014.

To specify the data library, specify both a physical path to indicate the location of the data files (XML data returned from FactSet OnDemand) and the LIBNAME statement options to specify which factlet to use to request data items and the desired key IDs (identifiers, such as tickers or country codes) for your selection. The orientation of the data that are returned is ETI, entity-time-item, and is kept with sorted keys (entities or BY groups); each observation is indexed by time interval, and each time series data item is organized in columns by item name (time series variable name). The SASEXFSD engine supports the parameters that are required for each supported factlet.

Use the SASEXFSD engine to access all available data library items. To get started, look at the FactSet Fundamentals data items in Table 57.3.

For a complete list of data items for every category, refer to the FactSet Online Assistant, page ID 16331. FactSet workstation user name and serial number credentials are necessary to launch the FactSet Online Assistant from the FactSet workstation. A FactSet representative can provide these credentials.

Because the availability of data libraries and their contents are constantly changing, Table 57.3 is included for instructional purposes only. At the time of this writing, the available data list and items for the FactSet Fundamentals database are as shown in Table 57.3.

**Table 57.3** FactSet Fundamentals Database Sets

| Formulas by Category | Data Items (SAS Variable Names) in Category |
|---|---|
| Identifiers | FF_CUSIP, FF_DISCL_ID, FF_ISIN, FF_SEDOL, FF_TICKER, FF_WS_ID |
| Balance sheet | FF_ASSETS, FF_BDEBT, FF_GW, FF_INVEN_FG, FF_PPE_DEP, FF_PPE_GROSS, FF_PAY_ACCT |
| Income statement | FF_COGS, FF_DEP_EXP, FF_DIL_ADJ, FF_EBIT, FF_EQ_AFF_INC, FF_EXP_OPER, FF_GROSS_INC |
| Cash flow | FF_DEBT_CF, FF_DIV_CF, FF_FIN_CF, FF_CAPEX, FF_INVEST_CF, FF_INVEST_PURCH_CF, FF_SALE_ASSAETS_BUS_CF |
| Ratios | FF_ASSETS_EQ, FF_DEBT_EQ, FF_LIFE_INS, FF_LOAN_ASSETS, FF_NET_CAP_REQUIRE, FF_RD_SALES |
| Market data | FF_ACQ_DATE, FF_DIV_RATE, FF_ENTITY_TYPE, FF_PRICE_CLOSE, FF_PRICE_HIGH_52WK |
| Corporate data and classifications | FF_GEN_IND, FF_IND_GRP, FF_MAJOR_SUBIND, FF_SIC_CODE, FF_EMP_NUM |
| Financial records | FF_ACTG_STANDARD, FF_COVERAGE, FF_CURN_DOC, FF_DEPS_BK, FF_FREQ_CODE, FF_US_GAAP_AVAIL |

For a comprehensive list of FactSet Fundamentals data items, refer to the FactSet Online Assistant, page ID 15099. If the page is not found, enter “FactSet Fundamentals” in the search box near the top of the page.

## Getting Started: SASEXFSD Interface Engine

To specify the parts of the database that you want to access, you supply two things: the list of IDs for the companies or securities that you want to access, and the list of data items that you want to retrieve.

When accessing company or security data, use the ExtractFormulaHistory factlet. Use the IDS= option to specify the list of IDs that identify the companies that you want to access by specifying the entity ID (such as the ticker symbol) for each company.

For example, the following statements access the FactSet Fundamentals database for monthly sales data (ff_sales) and the Prices database for pricing data (p_price) for IBM (ID='ibm') and for FactSet Research Systems (ID='fds'). To include both IDs in the same request, specify IDS='ibm,fds'; to include both data items in the same request, specify ITEMS='p_price,ff_sales', as follows:

```
options validvarname=any;

LIBNAME myLib sasexfsd "%sysget(FACTSET)"
   DEBUG=on
   FACTLET=ExtractFormulaHistory
   FORMAT=sml
   OUTXML=gstart1
   AUTOMAP=replace
   MAPREF=MyMap
   XMLMAP="%sysget(FACTSET)gstart1.map"
   IDS='ibm,fds'
   ITEMS='p_price,ff_sales'
   DATES='20110130:20110631:m'
   ORIENTATION=eti
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';
   ;

data company_pvol;
   set myLib.gstart1;
run;

proc contents data=company_pvol; run;
proc print data=company_pvol; run;
```

**Figure 57.1** Getting Started with ExtractFormulaHistory: Company_pvol

| Obs | FQL_ENTITY | date | p_price | ff_sales |
|---|---|---|---|---|
| 1 | ibm | 01-31-2011 | 162.000 | 99870.00 |
| 2 | ibm | 02-28-2011 | 161.880 | 99870.00 |
| 3 | ibm | 03-31-2011 | 163.070 | 99870.00 |
| 4 | ibm | 04-30-2011 | 170.580 | 99870.00 |
| 5 | ibm | 05-31-2011 | 168.930 | 99870.00 |
| 6 | ibm | 06-30-2011 | 171.550 | 99870.00 |
| 7 | fds | 01-31-2011 | 100.800 | 641.06 |
| 8 | fds | 02-28-2011 | 104.880 | 641.06 |
| 9 | fds | 03-31-2011 | 104.730 | 641.06 |
| 10 | fds | 04-30-2011 | 109.410 | 641.06 |
| 11 | fds | 05-31-2011 | 110.860 | 641.06 |
| 12 | fds | 06-30-2011 | 102.320 | 641.06 |

The SASEXFSD engine supports only the SAS XML (SML) format and the ETI orientation. The XML data that are returned from the FactSet OnDemand service are placed in a file specified by the OUTXML= option. The XML map that is automatically created is assigned the full path name specified by the XMLMAP= option, and the fileref that is used for the map assignment is specified by the MAPREF= option. In the preceding example, the SASEXFSD engine uses the MAPREF= and XMLMAP= options in the FILENAME statement to assign a file name:

```
FILENAME MyMap "%sysget(FACTSET)gstart1.map";
```

You can use the MAPREF= and XMLMAP= options to control where the map resides, what you name the map, and how you refer to it with a fileref. You can use the OUTXML= option to name your XML data file; this is described in the section "SAS OUTXML File" on page 3916. This data file is placed in the folder designated by "physical-name", which is described in the section "Syntax: SASEXFSD Interface Engine" on page 3898. You can refer to your data by using the myLib libref in your SASEXFSD LIBNAME statement. In the preceding program, this statement appears inside the DATA step in the SET statement, which names the input data set myLib.gstart1 and causes the reading of the *GSTART1.xml* file to be input and stored in the SAS data set Company_pvol.

The Company_pvol data set contains two time series variables (data items), p_price and ff_sales, as specified in the ITEMS= option, and the observation range is controlled by the DATES= option. The prefixes, ff_ and p_, are the database designators for the FactSet Fundamentals and Prices databases, respectively, as shown in Table 57.2. The Company_pvol data set contains observations that range from January 30, 2011, to June 31, 2011, as specified in the DATES= option. The frequency of the data is monthly, as specified by the "m" at the end of the DATES= option. Figure 57.1 shows the results.

To specify the list of data items that you want to retrieve, use the ITEMS= option. This option accepts a string, enclosed in single quotation marks, that denotes a list of data items that you are selecting for the resulting SAS data set. The data item names are separated by commas, so valid item names cannot contain embedded commas or quotation marks. The prefix in each data item name designates the data source as defined in the Prefix column of Table 57.2.

After the libref is assigned by the LIBNAME statement, the database is opened. The selected data are organized into group entities (BY groups) that are sorted by date. In Figure 57.1, the tickers are the BY groups, and within each ticker, the observations are sorted by the time ID variable DATE.

You can also use the SAS DATA step to perform further subsetting and to store the resulting time series in a SAS data set.

The SASEXFSD engine is supported on 64-bit Windows and Linux X64 (LAX) platforms.

## Syntax: SASEXFSD Interface Engine

The SASEXFSD interface engine uses standard engine syntax. Table 57.4 summarizes the options that the SASEXFSD engine supports. In addition, there are two required options: USERNAME='*fact_username*' and PASS='*fact_password*'.

**Table 57.4** Summary of LIBNAME *libref* SASEXFSD Statement Options

| Option | Description |
|---|---|
| CAL= | Specifies the calendar that replicates the PSETCAL function |
| CONNECT= | Specifies whether or not you need the connect method for a secure connection via a proxy server. You must specify the PROXY= option when you use the CONNECT=ON option. See the PROXY= option. |
| CONV= | Specifies the conversion technique for aggregating periods, when a data series of a higher frequency is converted to a lower frequency; for example, converting a quarterly series to an annual series (such as SUM, AVERAGE, or AVERAGENP) |
| CURRENCY= | Specifies a currency in which the data are returned, using a three-character ISO code, such as USD for US dollars or EUR for euros |
| DATE= | Specifies one date in `'YYYYMMDD'` format (default is 0B, for today's date) |
| DATES= | Specifies a list with the start date, end date, and frequency, separated by colons (:) |
| DBSOURCE= | Specifies a standardized database source name, such as EWIN_ECON, GI_ECON, OECD_MEI, FDS_ECON, FDS_COM, or the default, a null string, which uses the standardized economic data (EWIN_ECON_RGDPR_Y) |
| DEBUG= | Specifies whether or not to include diagnostic message logging in the SAS log window |
| DIST= | Specifies the distribution technique for spreading over periods when a data series of a lower frequency is distributed to a higher frequency; for example, distributing an annual series to a quarterly series (such as STEP, EVEN, or NONE) |
| END= | Specifies the end date for the selected data range (in `'YYYYMMDD'` format) |
| FACTLET= | Specifies which factlet you want to use. For the complete list, see Table 57.5. |
| FORMAT= | Specifies a FactSet format. Only SAS XML format (SML format) is supported. |
| FQLFLAG= | Sets dates to use FQL instead of screening; FQLFLAG=N (default) or Y |
| FREQ= | Specifies the reporting frequency of the selected data, such as M for monthly and D for daily. For the complete list of frequencies, see Table 57.20. |
| FUNCTION= | Adds the FQL function property to change data value; for example, FUNCTION=ZSCORE |
| IDS= | Specifies a list of FactSet keys or entity identifiers for accessing FactSet OnDemand data. To select more than one ID, list the unique entity identifiers separated by commas. |

**Table 57.4** *continued*

| Option | Description |
|---|---|
| ISON= | Specifies whether the company (security), such as SP500 or MSCI_WORLD, *is on* the specified database or index. For a list of additional ISON= option examples, refer to the FactSet Online Assistant, page ID 2014. |
| ISONPARAMS= | Specifies the parameters used by the ISON code |
| ITEM= | Specifies one FactSet data item name (time series name) |
| ITEMS= | Specifies a list of FactSet data items for accessing FactSet data sources. To select more than one item, list the data item names, separated by commas. |
| NAME= | Specifies whether to see the names of each security along with the CUSIP |
| NFB= | Specifies the "no-feel-back" option in FQL codes. If you do not use the NFB= option, the returned data series contains NAs where the data are not available (default is NFB=1). |
| OFDB= | Specifies the OFDB file name |
| ORIENTATION= | Specifies the layout of the selected data items for access. Only the ETI (entity-time-item) orientation is supported. |
| PERIOD= | Specifies the time interval between the data points (observations) in a time series. The valid period parameters are ANN, QTR, SEMI, MON, YTD, YTD_SEMI, LTM, LTM_SEMI, and SEMI-ANN. The default is ANN. |
| PROXY= | Specifies the proxy server that you want to use (if you have trouble connecting without specifying a proxy). If you also need the connect method for a secure connection, use the CONNECT=ON option in addition to the PROXY= option. See the CONNECT= option. |
| SCREEN= | Specifies the screen file that contains a single user-defined screen for viewing CUSIPs |
| START= | Specifies the start date for the selected data range (in `'YYYYMMDD'` format) |
| UNIVERSE= | Specifies the one account or benchmark. Use this instead of the IDS= option. |
| UNIVERSEGROUP= | Default value is EQUITY; for DEBT securities, use UNIVERSEGROUP=DEBT |

## The LIBNAME *libref* SASEXFSD Statement

**LIBNAME** *libref* **SASEXFSD** '*physical-name*' **FACTLET=***fact_factletname options* **;**

The LIBNAME statement assigns a SAS library reference (libref) to the physical path of the directory of FactSet data files where the downloaded FactSet XML data are stored. Because the required '*physical name*' argument specifies the location of the folder where your FactSet XML data reside, it should end in a backslash if you are in a Windows environment and a forward slash if you are in a UNIX environment.

FACTLET=*fact_factletname* specifies the FactSet factlet that you want to use to download your data. Choose one factlet from these possible values: ExtractEconData, ExtractFormulaHistory, ExtractDataSnapshot, ExtractBenchmarkDetail, ExtractOFDBItem, ExtractOFDBUniverse, and ExtractScreenUniverse. (See Table 57.1.)

For example, the following statements access the FactSet database for daily dividend yield data for IBM:

```
LIBNAME myLib SASEXFSD 'physical-name' FACTLET==ExtractFormulaHistory
   IDS='ibm'
   ITEMS='FG_DIV_YLD'
   FREQ=d
   USER='username'
   PASS='password';
```

After the libref is assigned, you can access the data items for the IDs (keys) from the requested factlet.

You can specify the following *options* in the LIBNAME *libref* SASEXFSD statement.

**FACTLET=***fact_factletname*

Each factlet type has its own set of parameters (shown in Table 57.5 in the Factlet Options Table column), allowing flexibility and easy access to FactSet data. For more details about each factlet, refer first to the Factlet Description Section listed in Table 57.5. If you need more information, refer to the Online Assistant, page ID 16948. If the factlet is not listed on that page, then enter the factlet name in the search window of the Online Assistant to retrieve additional information about using the factlet.

**Table 57.5** Summary of Factlet Options

| Factlet Name | Factlet Description Section | Factlet Options Table |
|---|---|---|
| ExtractEconData | "The ExtractEconData Factlet" on page 3904 | Table 57.10 |
| ExtractFormulaHistory | "The ExtractFormulaHistory Factlet" on page 3908 | Table 57.12 |
| ExtractDataSnapshot | "The ExtractDataSnapshot Factlet" on page 3909 | Table 57.13 |
| ExtractBenchmarkDetail | "The ExtractBenchmarkDetail Factlet" on page 3910 | Table 57.15 |
| ExtractOFDBItem | "The ExtractOFDBItem Factlet" on page 3912 | Table 57.16 |
| ExtractOFDUniverse | "The ExtractOFDBUniverse Factlet" on page 3913 | Table 57.17 |
| ExtractScreenUniverse | "The ExtractScreenUniverse Factlet" on page 3914 | Table 57.18 |

**IDS=***fact_ids*

specifies a list of FactSet IDs (entity identifiers or keys) for accessing FactSet OnDemand data. To select more than one ID, list the unique entity identifiers, separated by commas (as shown in the following statements). Examples of FactSet IDs include CUSIPs, tickers, SEDOLs, Quick Code, and CINS (CUSIP International Numbering System). For more information, see Example 57.6 and Example 57.7.

```
LIBNAME myLib sasexfsd 'physical-name'
   ids='IBM,MSFT'
   ITEMS='p_price,p_volume,ca_sales';
```

**UNIVERSE=***fact_uni*

specifies the universe of securities that passes the specified screening criteria. Up to 500 securities can be returned when this option is specified together with the FACTLET=ExtractFormulaHistory option. This limit is due to the US_UNIV function that is used within the ExtractFormulaHistory factlet to fetch the universe. You can also specify this option together with the FACTLET=ExtractDataSnapshot

option, but because the data that are returned as of one specified date, there is no limit on the number of securities that can be returned.

```
LIBNAME myLib sasexfsd 'physical-name'

   universe="URANKX((FS_PARENT_EQUITY=CUSIP AND EC_MKT_CAP(0,'CUR=USD')>10
      AND P_PRICE(0,USD)>5 AND CONTAINS(P_EXCOUNTRY,'UNITED STATES'))=1,
      EC_MKT_CAP(0,'CUR=USD'))<=500S"
   items='p_price(0,-4,M)';
```

**ITEMS='***fact_itemlist***'**

specifies the items and groups of interest for selection based on IDs (keys). Use FactSet's Formula Lookup for a complete list of data items, which is described in the FactSet Online Assistant.

Because the availability of data libraries and their contents are constantly changing, the following tables are included for instructional purposes only. Many other databases are available that are not shown in Table 57.6 to Table 57.9.

**Table 57.6** Some FactSet Data Items

| Data Source | Table Reference | Online Assistant Page ID |
|---|---|---|
| FactSet Fundamentals Data Items | Table 57.7 | Page ID 15099 |
| FactSet Global Formula Library | Also see Online Assistant Sidebar | Page IDs 13299, 16664 |
| FactSet Global Indices Formulas | Table 57.8 | Page ID 14336 |
| Global Constituents Formulas | Table 57.9 | Page ID 15086 |

**Table 57.7** Some FactSet Fundamentals Data Items

| Data Source | Online Assistant Page ID |
|---|---|
| Consolidated Items (FF_) | Page ID 16331 |
| Debt Capital Structure | Page ID 16235 |
| Enhancements to Legacy Formulas | Page ID 16248 |

| Benchmark Constituent Market Value | FG_CONST_MCAP |
| Benchmark Constituent Name | FG_CONST_NAME |
| Benchmark Constituent Price | FG_CONST_PRICE |
| Benchmark Constituent Shares | FG_CONST_SHARES |
| Benchmark Constituent Style Factor | FG_CONST_STYLE_FACTOR |
| Benchmark Constituent Total Return - 1 Day | FG_CONST_TRET_1D |
| Benchmark Constituent Valuation | FG_CONST_VALUATION |
| Benchmark Constituent Weights | FG_CONST_WEIGHT |
| Benchmark Constituents | FG_CONSTITUENTS |

For more information, see the FactSet Online Assistant, page ID 1931. To see each data source's list of available data items, use the search feature of the FactSet Online Assistant. You can open any page in the FactSet Online Assistant by entering the appropriate page ID number in the page ID window, which is located below the search window.

**DATES='***fact_startdate:fact_enddate:fact_freqcode***'**
specifies the start date, end date, and frequency, separated by colons (:). For more information, see the section "Specifying Date Ranges and Frequency Codes" on page 3916. An alternative to using the DATES= option is to use the START=, END=, and FREQ= options.

**DEBUG=ON | OFF**
specifies whether or not to include diagnostic message logging in the SAS log window. This information can be very useful for troubleshooting a problem.

**PERIOD=***fact_period*
specifies the periodic frequencies of the actual data points (observations) in a time series. The valid period parameters are ANN, QTR, SEMI, MON, YTD, YTD_SEMI, LTM, LTM_SEMI, and SEMI-ANN. The default is ANN.

**OUTXML=***fact_xmlfile*
specifies the name of both the XML file (downloaded from the FactSet OnDemand service) and the SAS data set created when the XML data are read into SAS. You can use the OUTXML= option to name your XML data file, which is placed in the current working directory. By default, OUTXML=FAST, which creates a file named FAST1.xml in the current working directory. The SAS data set created when the XML data are read into SAS is placed in the folder specified by the physical path in the LIBNAME libref SASEXFSD statement.

**AUTOMAP=***fact_automap*
specifies whether to overwrite the existing XML map file (AUTOMAP=REPLACE) or whether not to overwrite the existing XML map file (AUTOMAP=REUSE). You can set *fact_automap* to REUSE so that a pre-existing XML map named by the XMLMAP= option is used. You can set *fact_automap* to REPLACE so that the most current XML map generated by the SASEXFSD engine and named by the XMLMAP= option is used.

**XMLMAP=***fact_xmlmapfile*
specifies the fully qualified name of the file where the XML map is automatically stored.

**MAPREF=***fact_xmlmapref*
specifies the fileref to be used for the map assignment.

You can use the MAPREF= and XMLMAP= options to control where the map resides, what you name the map, and how you refer to it with a fileref. You can use the OUTXML= option to name your XML data file. These data are read into SAS and placed in a SAS data set in the folder designated by "physical-name", and you can reference the data by using the myLib libref in your SASEXFSD LIBNAME statement. This is shown in the section "Getting Started: SASEXFSD Interface Engine" on page 3896. The following FILENAME statement is generated by the SASEXFSD interface engine by using the fileref, MyMap, from the MAPREF=MyMap option and from the fully designated file name in the XMLMAP= option:

```
FILENAME MyMap "%sysget(FACTSET)gstart1.map";
```

**FORMAT=***fact_xmlformat*
specifies the SAS XML (SML) format, which is the only format that the SASEXFSD engine supports.

**ORIENTATION=***fact_xmlorient*
specifies the ETI orientation, which is the only orientation that the SASEXFSD engine supports. The ETI orientation means that the data are returned and stored in entity-time-item logical layout.

**PROXY="***fact_proxyserver***"**
specifies which proxy server to use. This option is not required. The specified proxy server is used only when a connection-refused error or a connection-timed-out error occurs. For *fact_proxyserver*, specify the server's HTTP address followed by a colon and the port number, and enclose that string in double quotation marks; for example, PROXY="http://inetgw.unx.sas.com:8118". See also the CONNECT= option.

**CONNECT=ON | OFF**
specifies whether or not to use the connect method along with the PROXY= option. **NOTE:** You must use the PROXY= option and specify your proxy server in addition to the CONNECT=ON option when you want to use the connect method. For more information about a secure connection, see the PROXY= option.

**USERNAME='***fact_username***'**
specifies the FactSet user name that enables you to access the data provided by the FactSet OnDemand service.

**PASS='***fact_password***'**
specifies the password that is paired with the user name to enable you to access the data provided by the FactSet OnDemand service. **NOTE:** These FactSet OnDemand user name and password credentials are different from your FactSet workstation login credentials. A FactSet representative can provide these credentials.

## The ExtractEconData Factlet

The ExtractEconData factlet provides access to a broad array of macroeconomic content, interest rates and yields, country indices, and various exchange rate measures from both the FactSet Economics and the Standardized Economic databases. The ExtractEconData factlet uses the options listed in Table 57.10 to extract Economic data items for a list of country IDs or for no country IDs over time.

The DBSOURCE= option specifies a standardized database source name, such as EWIN_ECON, GI_ECON, OECD_MEI, FDS_ECON, FDS_COM, or the default, a null string, which uses the Standardized Economic data (EWIN_ECON_RGDPR_Y). Use the IDS= option to specify one or more country IDs based on the database source. For the complete list of country IDs that work with the standardized codes for the FactSet Economics database, see Table 57.11.

Use the ITEM= option to specify an FQL item based on the database source. You can also use the ITEM= option with the downloading syntax for Economic Request Codes described in the FactSet Online Assistant, page ID 11794, and shown in Example 57.2. Example 57.2 uses the shorthand FQL syntax in the ITEM= option to retrieve the same time series data items.

The SASEXFSD engine supports retrieval of the following FQL_entities: ECON_EXPR_DATA, SPEC_ID_DATA, FDS_ECON_DATA, EIU_ECON_DATA, CNS_ECON_DATA, EURO_STAT_DATA, IBJ_NIKKO_DATA, IMF_IFS_DATA, NTCS_ECON_DATA, OECD_OTLK_DATA, OECD_MEI_DATA, ONS_ECON_DATA, TCB_BCI_DATA, TCB_CCI_DATA, CEIC_ECON_DATA, and CEIC_CHINA_DATA.

A FactSet representative can provide you with permissions to access the databases that contain the time series data that you are interested in. For an example of using ECON_EXPR_DATA, see Example 57.3. For more information about using ECON_EXPR_DATA and SPEC_ID_DATA, see the section "Downloading Economic Function Codes to Excel" in the FactSet Online Assistant, page ID 12308. You can replace options such as START=, END=, FREQ=, CONV=, DIST=, NFB=, and FUNCTION= by using the corresponding placement of each option's value in the FQL downloading syntax. In this example, ITEM="FDS_ECON_DATA('FRBIPSB50001', -121,-1,m,step,average)" gives the database source name (FDS_ECON), time series name (FRBIPSB50001), start and end dates, monthly frequency, distribution (step), and conversion (average); no-feel-back defaults to 1.

For the complete list of the data series codes available with the standardized FactSet Economics database, see the ExtractEconData appendix, linked in the FactSet Online Assistant, page ID 16948. The data are available at monthly, quarterly, and annual frequencies, as denoted by the _M, _Q, and _Y suffixes in the code.

Use the FREQ= option to specify the frequency of the data, and use the DATES= option to specify a date range for selecting time series data. For more information, see the section “Frequency” in the FactSet Online Assistant, page ID 11794.

You can use the CONV= option to specify CONV=SUM, AVERAGE, AVERAGENP, or none (the default is none).

You can use the DIST= option to specify DIST=STEP (step distribution), EVEN, or none (the default).

You can use the NFB= option to specify your no-feel-back setting (0, 1, or 2) to indicate full feel-back, no feel-back (the default), or feel-back until most recent data point, respectively (do not fill in data past the last available data point).

You can use the FUNCTION= option to apply an economic function to the data values of the time series (such as FUNCTION=ZSCORE). For a list of economic functions, see the FactSet Online Assistant, page ID 12308.

The ORIENTATION= option supports only ETI, which is the default.

**Table 57.10** ExtractEconData Factlet Options

| Option | Description |
|---|---|
| IDS= | Specifies a string array with a list of the country identifiers from the Standardized Economic database |
| ITEMS= | Specifies the economic series mnemonic (for example, US GDP database source [mnemonic] is FDS_ECON[BEANIPAA191RL1@US]) |
| DATES= | Specifies a date string such as `'YYYYMMDD:YYYYMMDD:F'` or relative dates '-1b:-4b:m' |
| START= | Specifies the numeric start date in `'YYYYMMDD'` format |
| END= | Specifies the numeric end date in `'YYYYMMDD'` format |
| FREQ= | Specifies the valid FQL frequencies, such as M, D, W, Q, and Y. Note: For economic request codes, a frequency argument is necessary to retrieve the data. |
| DBSOURCE= | Specifies a standardized database source name, such as EWIN_ECON, GI_ECON, OECD_MEI, FDS_ECON, FDS_COM, or the default, a null string, which uses the Standardized Economic data (EWIN_ECON_RGDPR_Y) |
| CONV= | Specifies the conversion technique for aggregating periods, when a data series of a higher frequency is converted to a lower frequency; for example, you can use this option to convert a quarterly series to an annual series (for example, SUM, AVERAGE, or AVERAGENP, which excludes NAs). |
| DIST= | Specifies the distribution technique for spreading over periods when a data series of a lower frequency is distributed to a higher frequency; for example, you can use it to distribute an annual series to a quarterly series (such as STEP, EVEN, or NONE). |
| NFB= | Specifies the optional "no-feel-back" argument in FQL codes. If you do not specify the NFB= option, the returned data series contains NAs where the data are not available (default is NFB=1). If you want the data to "feel back" over NAs to find the last actual data point and carry these data forward, specify either NFB=0 or NFB=2. |
| FUNCTION= | Adds FQL function property to change data value; for example, FUNCTION=ZSCORE |
| ORIENTATION= | Specifies an optional orientation (default is ETI, entity-time-item) |

## The ExtractFormulaHistory Factlet

The ExtractFormulaHistory factlet is used for extracting one or more items for one security, for an index, or for a list of securities over time. ExtractFormulaHistory uses the FactSet Query Language (FQL). The ExtractFormulaHistory factlet uses the options listed in Table 57.12, such as the IDS= option, which specifies the IDs for one or more securities, or the ISON= and ISONPARAMS= options, which specify an FQL formula that extracts the universe along with any ISON parameters necessary for the ISON code. You can use the START=, END=, and FREQ= options or the DATES= option to specify a date range for selecting time series data. You can select data items by using the ITEMS= option, but only the name/value pairs syntax (not the standard FQL syntax) is supported. The ITEMS= option designates multiple shortcut items or item/statistic combinations. You can use any instance of the Formula Library for the ITEMS= option.

The PERIOD= option is used for FactSet Fundamentals database codes to specify the estimate period of the data that you want to select. The CAL= option enables you to set your calendar in the same way that the PSETCAL function in FQL works. You can specify the CAL= option to be LOCAL, FIVEDAY, FIVEDAYEOM, SEVENDAY, or an exchange code. The list of exchange codes is available in the FactSet Online Assistant, page ID 16610. The ORIENTATION= option is supported only for ETI (entity-time-item), so that your SAS output data set is organized by key entities such as CUSIP or ticker, by date so that observations are kept in time series order, and by item. ETI is the default setting for orientation.

**Table 57.12** ExtractFormulaHistory Factlet Options

| Option | Description |
|---|---|
| IDS= | Specifies one or more securities; for example, IDS=IBM,MSFT,FDS |
| ISON= | Specifies the FQL value that extracts the universe; for example, ISON_SP500 is entered as ISON=SP500, and ISON_MSCI_WORLD(0,1) is written as ISON=MSCI_WORLD. |
| ISONPARAMS= | Specifies the ISON codes that use parameters; for example, ISON_MSCI_WORLD(0,1) is written as ISONPARAMS=0,1. |
| UNIVERSE= | Specifies the universe. |
| DATES= | Specifies a date string such as `'YYYYMMDD:YYYYMMDD:F'` or relative dates -1b:-4b:m |
| START= | Specifies a valid FQL date; START=0 is the default |
| END= | Specifies a valid FQL date; END=0 is the default |
| FREQ= | Specifies a valid FQL frequencies; for example, M, D, Y. See Table 57.20. |
| ITEMS= | Specifies one or more FQL items (only the name/value pair syntax is supported; for example, ff_sales, p_price) |
| PERIOD= | Specifies valid time intervals between the data points (observations) in a time series; for example, ANN, QTR, and SEMI-ANN; PERIOD=ANN is the default. |
| ORIENTATION= | Specifies an optional orientation (default is currently ETI) |
| CAL= | Specifies the calendar setting that replicates the PSETCAL function; for example, LOCAL, FIVEDAY, FIVEDAYEOM, and SEVENDAY, for exchange code CAL=AAM (for a list of exchange codes, see the FactSet Online Assistant, page ID 16610) |

## The ExtractDataSnapshot Factlet

The ExtractDataSnapshot factlet is used for efficiently extracting multiple items as of a single date, for a universe of both equity and fixed income securities. It uses the FactSet Screening Language to extract data for a large universe of securities as of a single date. The ExtractDataSnapshot factlet uses the options listed in Table 57.13, such as the IDS= option, which specifies the IDS for one or more securities, or you can specify fixed securities by using the UNIVERSEGROUP= option. If you want to access only current constituents, use the ISON= option to specify your ISON codes instead of using the IDS= option. If your ISON code uses parameters, then use the ISONPARAMS= option to specify the parameters for the code that you use in your ISON= option. Use DATE=YYYYMMDD to specify the day that your snapshot is for, or use the START=, END=, and FREQ= options for the FQL scalar data item date that you are interested in. Use the ITEMS= option to specify one or more screening items. The SASEXFSD engine does not support the standard screening syntax, so use the name/value pair syntax instead. For example, instead of using ITEMS='FF_SALES(QTR,20110401)', use ITEMS='FF_SALES' PERIOD=QTR REL_DATE=20110401 in your LIBNAME *libref* SASEXFSD statement. Specify the UNIVERSEGROUP= option to choose between the EQUITY group and the DEBT group. The CAL= option enables you to set your calendar in the same way that the PSETCAL function in FQL works. You can specify the CAL= option to be LOCAL, FIVEDAY, FIVEDAYEOM, SEVENDAY, or an exchange code. The list of exchange codes is available in the FactSet Online Assistant, page ID 16610. The ORIENTATION= option is supported only for ETI (entity-time-item), which is also the default.

**Table 57.13** ExtractDataSnapshot Factlet Options

| Option | Description |
|---|---|
| IDS= | Specifies one or more securities; for example, IDS='IBM,MSFT'. Fixed securities are used in conjunction with UNIVERSEGROUP=DEBT (for example, IDS=88579EAE). |
| ISON= | Specifies a screening code that extracts the universe; for example, ISON_SP500 is entered as ISON=SP500, and ISON_MSCI_WORLD(0,1) is entered as ISON=MSCI_WORLD. |
| ISONPARAMS= | Specifies ISON codes that use parameters; for example, ISON_MSCI_WORLD(0,1) is written as ISONPARAMS=0,1. |
| DATE= | Specifies one date in the format `'YYYYMMDD'` (default is 0B, for today's date) |
| START= | Specifies a valid start date; START=0 is the default. |
| END= | Specifies a valid end date; END=0 is the default. |
| FREQ= | Specifies a valid frequency; for example, M, D, Y. See Table 57.20. |
| ITEMS= | Specifies one or more screening items (only the name/value pair syntax is supported) |
| PERIOD= | Specifies a valid time interval between the data points (observations) in a time series; for example, ANN, QTR, SEMI-ANN; PERIOD=ANN is the default. |
| UNIVERSEGROUP= | Specifies the universe group. The default value is EQUITY; for DEBT securities, specify UNIVERSEGROUP=DEBT. |
| ORIENTATION= | Specifies an optional orientation (default is ETI) |
| CAL= | Specifies a calendar setting that replicates the PSETCAL function; for example, LOCAL, FIVEDAY, FIVEDAYEOM, and SEVENDAY, for exchange code CAL=AAM (for a list of exchange codes, refer to the FactSet Online Assistant, page ID 16610) |

## The ExtractBenchmarkDetail Factlet

The ExtractBenchmarkDetail factlet is used for retrieving a more comprehensive overview of the index constituent data for a benchmark, without requiring the additional codes and calculations that are needed with the ExtractFormulaHistory factlet. ExtractBenchmarkDetail uses default output in which the identifiers are sorted in descending order by weight in the index, and each row shows the index ID, company ID, date, ticker, and weight. Any additional items are displayed at the end of each row.

The ExtractBenchmarkDetail factlet uses the options that are listed in Table 57.15, such as the IDS= option, which specifies the IDs for one or more benchmarks (indexes). Use DATES='YYYYMMDD:YYYYMMDD:freq' to specify the range of dates in `'start:end:freq'` format.

You can designate dates in absolute or relative form, as shown in Table 57.14. Absolute dates specify a day in `'MM/DD/YYYY'` format (such as 7/11/1999), a month end in `'MM/YYYY'` format (such as 6/1999), a fiscal quarter end in `'YY/FQ'` or `'YYY/FQ'` format (such as 1999/1F, 2000/3F, or 2001/2F), a calendar quarter end in `'YY/CQ'` or `'YYYY/CQ'` format (such as 1999/1C, 00/3C, or 2001/1C), or a fiscal year end in `'YY'` or `'YYYY'` format (such as 2000, 01, or 1999).

**Table 57.14** ExtractBenchmarkDetail Factlet Relative Date Arguments

| Relative Date Argument | Description |
|---|---|
| D | 0D is the most recent trading day; –1D is one trading day prior. |
| AW | 0AW is the most recent trading day; –1AW is the one actual week (7 days) prior to the most recent trading day. |
| W | 0W is the last day of the most recent trading week (usually Friday); –1W is the last trading day of the prior week. |
| AM | 0AM is the most recent trading day; –1AM is the same day, one actual month prior. |
| M | 0M is the last trading day of the most recent month; –1M is the last trading day of the prior month. |
| AQ | 0AQ is the most recent trading day; –1AQ is the same day 3 months prior. |
| Q | 0Q is the last trading day of the company's most recent fiscal quarter; –1Q is the last day of the prior fiscal quarter. |
| CQ | 0CQ is the last trading day of the most recent calendar quarter (March, June, September, or December); –1CQ is the last trading day of the prior calendar quarter. |
| AY | 0AY is the most recent trading day; –1AY is one actual year (365 days) prior. |
| Y | 0Y is the last trading day of the company's most recent fiscal year; –1Y is the last trading day of the prior fiscal year. |
| CY | 0CY is the last trading day of the most recent calendar year (the last trading day in December); –1CY is the last trading day of the prior calendar year. |

Use the ITEMS= option to specify one or more screening items, such as p_price or ca_sales. The CUTOFF= option specifies the number of holdings to show. The default is to show all instances. The optional MATCHDATE= option is used to limit the output to not repeat the dates that "feel back" to a holiday. The default behavior (no MATCHDATE= option) repeats the dates that "feel back" to a holiday. The MATCHDATE= option is always used with a frequency argument set to B, which indicates business days. Use MATCHDATE=ON for better response time and to limit the large amount of data being returned. The UNIVERSEGROUP= option is necessary only when you specify UNIVERSEGROUP=DEBT. By default, UNIVERSEGROUP=EQUITY.

**Table 57.15** ExtractBenchmarkDetail Factlet Options

| Option | Description |
|---|---|
| IDS= | Specifies one or more benchmarks; for example, IDS=SP50, R.3000 |
| DATES= | Specifies one or more dates entered in `'start:end:freq'` format, ’20101215:20100115:d’ |
| ITEMS= | Specifies one or more screening items (such as ITEMS=’p_price, ca_sales’). FQL items are named with a preceding underscore. |
| CUTOFF= | Specifies an optional number of holdings to show; default (no cutoff) displays all instances. |
| MATCHDATE= | Specifies an optional argument that turns off the default behavior, in which dates are repeated when “feeling back” to a holiday. It is always used with a frequency argument set to B (indicating business days). |
| UNIVERSEGROUP= | Specifies the universe group. The default value is EQUITY. For fixed income indices, specify UNIVERSEGROUP=DEBT. |

## The ExtractOFDBItem Factlet

The ExtractOFDBItem factlet provides access to a list of securities and multiple data items for a range of dates uploaded into a single Open FactSet Database (OFDB). An OFDB is a high-performance multidimensional database system that securely stores proprietary numeric and textual data in FactSet.The ExtractOFDBItem factlet uses the options listed in Table 57.16, such as the OFDB= option, which specifies the OFDB file. Use either the IDS= option, which specifies the IDs for one or more securities, or the ISON= and ISONPARAMS= options, which specify an FQL formula (ISON code) that extracts the universe along with any ISON parameters necessary for the ISON code. Use the ITEMS= option to specify one or more items in the OFDB file. Use the DATES= option to specify a date range in `'YYYYMMDD:YYYYMMDD:freq'` format, or use FQL dates when FQLFLAG=Y (yes). By default, FQLFLAG=N (no). The DATESONLY= option specifies whether only the dates in the OFDB file are reported. By default, DATESONLY=N. The ORIENTATION= option supports only ETI, which is the default.

**Table 57.16** ExtractOFDBItem Factlet Options

| Option | Description |
|---|---|
| OFDB= | Specifies the OFDB file |
| IDS= | Specifies one or more securities; for example, IDS=IBM, GM |
| ISON= | Specifies the FQL value that extracts the universe; for example, ISON_SP500 is entered as ISON=SP500, and ISON_MSCI_WORLD(0,1) is written as ISON=MSCI_WORLD. |
| ISONPARAMS= | Specifies the parameters for the ISON codes that use parameters; for example, ISON_MSCI_WORLD(0,1) is written as ISONPARAMS=0,1. |
| ITEMS= | Specifies one or more data items from the OFDB file |
| DATES= | Specifies dates in the format `'YYYYMMDD:YYYYMMDD:F'` or relative dates in relative format, such as -1b:-4b:m |
| DATE= | Specifies one date in the format `'YYYYMMDD'` (default is 0B, for today's date) |
| DATESONLY= | Specifies that dates are reported from the OFDB file only when the option is set to Y (default is N) |
| FQLFLAG= | Sets dates to use FQL instead of screening; FQLFLAG=N (default) or Y |
| ORIENTATION= | Specifies an optional orientation (default is currently ETI) |

## The ExtractOFDBUniverse Factlet

The ExtractOFDBUniverse factlet uses the options that are listed in Table 57.17 to extract a list of CUSIPs that belong to a single OFDB file or ISON code. Use the OFDB= option to specify a OFDB file, and use the DATE= option to specify the date for showing the list of CUSIPs.

**Table 57.17** ExtractOFDBUniverse Factlet Options

| Option | Description |
|---|---|
| OFDB= | Specifies the OFDB file |
| DATE= | Specifies one date in `'YYYYMMDD'` format only; DATE="" specifies the most recent date. |

## The ExtractScreenUniverse Factlet

The ExtractScreenUniverse factlet is used for extracting a list of CUSIPs stored in a single FactSet screen. On the FactSet workstation, a user can screen for equity and fixed income securities based on specified criteria and store a list of companies by using FactSet Universal Screening for equity or debt securities. The ExtractScreenUniverse factlet uses the options that are listed in Table 57.18 to extract a list of CUSIPs that belong to a single user-defined screen. Use the SCREEN= option to specify a screen file, and use the NAME= option to specify whether or not to make the names of the corresponding securities visible. Specify NAME=Y (yes) to view the security names for each CUSIP in the screen. NAME=N (no) is the default, for which security names are not shown with the CUSIP list. Because screen file names can contain blanks and special characters, enclose the screen file name in single quotation marks:

```
options validvarname=any;

LIBNAME myFast sasexfsd "%sysget(FACTSET)"
    debug=on
    factlet=ExtractScreenUniverse
    screen='factset:1 Week EPS Estimate Revisions - FactSet Consensus'
    name=y
    format=sml
    outXml=sasscrn4
    automap=replace
    mapref=MyMap
    xmlmap="%sysget(FACTSET)sasscrn4.map"
    period=QTR
    user='XXXXXXXXXXXXXXX'
    pass='XXXXXXXXXXXXXXX'
    ;
```

**Table 57.18** ExtractScreenUniverse Factlet Options

| Option | Description |
|---|---|
| SCREEN= | Specifies a screen file |
| NAME= | Specifies whether security names are to be visible. NAME=Y indicates yes to show names; default is N, indicating that no names are shown. |

# Details: SASEXFSD Interface Engine

## FactSet Data and FactSet Sourced Data

The SASEXFSD interface engine enables SAS users to access both FactSet data and FactSet sourced data that are provided by the FactSet OnDemand service. FactSet OnDemand offerings can provide access to many databases. Because the list of available data is constantly changing, Table 57.19 is included for instructional purposes only. Many other data offerings are available that are not shown in Table 57.19.

**Table 57.19** Sample FactSet Data Types

| |
|---|
| Pricing and IPO Data |
| Estimates |
| Broker Research |
| Commodity Benchmarks |
| Equity Benchmarks |
| Fixed Income Benchmarks |
| Mutual Fund/Account Return Data |
| Economic Data |
| Financial News and Events/Corporate Information |
| Quantitative Data |
| Options Data |
| Investment Banking Data |
| Fixed Income Data |
| Deal Data |
| Other Databases |

## SAS Output Data Set

You can use the SAS DATA step to write the selected FactSet data to a SAS data set. This enables you to use SAS software to easily analyze the data. If you specify the name of the output data set in the DATA step, the engine supervisor creates a SAS data set that has the specified name in either the SAS Work library or, if specified, the User library.

The contents of the SAS data set include the BY groups, the date of each observation, and the series name of each series that is read from the FactSet data source.

The SASEXFSD interface engine sorts the IDs into keys or BY groups, so that the time series are sorted in the resulting SAS data set by key (entity identifier such as a ticker), by date (time ID), and by variable (time series item name).

You can use the PRINT and CONTENTS procedures to print your output data set and its contents. Alternatively, you can view your SAS output observations by opening the desired output data set in a SAS Explorer window. You can also use the SQL procedure with your SASEXFSD libref to create a custom view of your data.

## SAS OUTXML File

The SAS XML (SML format) data that are returned from the FactSet OnDemand service are placed in a file named by the OUTXML= option. The SAS XML data are placed in the current working directory. The SAS data set created when the XML data are read into SAS is placed in the location specified by the *physical-name* in the LIBNAME *libref* SASEXFSD statement, which is described in the section "Syntax: SASEXFSD Interface Engine" on page 3898.

## SAS XML Map File

The XML map that is automatically created is assigned the full path name specified by the XMLMAP= option in your LIBNAME *libref* SASEXFSD statement. The XML map file is either reused (not overwritten) if you specify AUTOMAP=REUSE or overwritten by a new map if you specify AUTOMAP=REPLACE. The SASEXFSD interface engine invokes the XMLV2 engine to create the map and to read the data into SAS.

## Specifying Date Ranges and Frequency Codes

When you specify a range of dates for selecting your time series observations, you can specify the range in either absolute or relative dates. The absolute start and end dates are given in `'YYYYMMDD'` format and separated by a colon (:). The frequency is given along with the date range and can be any one of the codes shown in Table 57.20. The code frequency indicates the frequency with which you want to display data. Relative dates are relative to the most recently updated period (0). A minus sign (as in –1) represents the period prior to the most recently updated period. The zero date is determined by the natural frequency of the time series data, so a 0 for monthly data represents the most recent month end. Annual data use –1 to represent the fiscal year prior to the most recently updated fiscal year.

**Table 57.20** FactSet Frequency Codes

| Freq. Code | Description |
|---|---|
| AD | Displays data on an actual daily basis (that is, all days, not just trading days) |
| D | Displays data on a daily basis |
| AW | Displays data weekly, based on the day of the week of the start date |
| W | Displays data weekly, based on the last day of the completed trading week (usually Friday) |
| WTD | For a range item (such as price change), displays the week-to-date value. For other items, displays the latest daily value. For the remainder of the time series, displays data weekly, based on the last day of the completed trading week (usually Friday). |
| AM | Displays data monthly, based on the start date (for example, if the start date is June 16, data are displayed for June 16, May 16, April 16, and so on) |
| M | Displays data monthly, based on the last trading day of the month |
| MTD | For a range item (such as price change), displays the month-to-date value. For other items, displays the latest daily value. For the remainder of the time series, displays data monthly, based on the last trading day of the month. |

**Table 57.20** *continued*

| Freq. Code | Description |
|---|---|
| QTD | For a range item (such as price change), displays the calendar quarter-to-date value. For other items, displays the latest daily value. For the remainder of the time series, displays data quarterly, based on the last trading day of the quarter. |
| CQTD | For a range item (such as price change), displays the calendar quarter-to-date value. For other items, displays the latest daily value. For the remainder of the time series, displays data quarterly, based on the last trading day of the calendar quarter. |
| FQTD | For a range item (such as price change), displays the fiscal quarter-to-date value. For other items, displays the latest daily value. For the remainder of the time series, displays data quarterly, based on the last trading day of the fiscal quarter. |
| AQ | Displays data in three-month periods, based on the start date (for example, if the start date is April 7, data are displayed for April 7, January 7, October 7, July 7, and so on) |
| Q | Displays data quarterly, based on the last trading day of the company's fiscal quarter |
| CQ | Displays data quarterly, based on the last trading day of the calendar quarter (March, June, September, or December) |
| FSA | Displays data semiannually, based on the last trading day of the fiscal semiannual period |
| CSA | Displays data semiannually, based on the last trading day of the calendar semiannual period |
| ASA | Displays data in six-month periods, based on the start date (for example, if the start date is June, data are displayed for June, January, June (prior), January (prior), and so on) |
| YTD | For a range item (such as price change), displays the calendar year-to-date value. For other items, displays the latest daily value. For the remainder of the time series, displays data annually, based on the last trading day of the year. |
| CYTD | For a range item (such as price change), displays the calendar year-to-date value. For other items, displays the latest daily value. For the remainder of the time series, displays data annually, based on the last trading day of the calendar year. |
| FYTD | For a range item (such as price change), displays the fiscal year-to-date value. For other items, displays the latest daily value. For the remainder of the time series, displays data annually, based on the last trading day of the fiscal year. |
| AY | Displays data annually, based on the start date (for example, if the start date is October 31, 1995, data are displayed for October 31, 1995, October 31, 1994, October 31, 1993, and so on) |
| Y | Displays data annually, based on the last trading day of the company's fiscal year |
| CY | Displays data annually, based on the last trading day of the calendar year |

## Specifying Currency Codes

Currency is represented by three-character ISO (International Organization for Standardization) codes, such as USD for US dollars or EUR for euros. For a complete list of currency codes, see Table 57.21 and Table 57.22.

**Table 57.21** ISO Currency Codes

| Currency | ISO Code | Currency | ISO Code |
|---|---|---|---|
| Afghanistan Afghani | AFN | Djibouti Franc | DJF |
| Albanian Lek | ALL | Dominican Rep. Peso | DOP |
| Algerian Dinar | DZD | East Caribbean Dollar | XCD |
| Angolan Kwanza | AOA | East German Ostmark | DDM |
| Argentine Peso | ARS | Ecuador US Dollar | USD |
| Armenia Dram | AMD | Egyptian Pound | EGP |
| Aruban Guilder | AWG | El Salvador Colon | SVC |
| Australian Dollar | AUD | Estonian Euro | EUR |
| Austrian Schilling* | ATS | Ethiopian Birr | ETB |
| Azerbaijan New Manat | AZN | Euro | EUR |
| Bahamas Dollar | BSD | Euro Floating Rate | EUX |
| Bahraini Dinar | BHD | European Currency Unit | XEU |
| Bangladesh Taka | BDT | Falkland Is. Pound | FKP |
| Barbados Dollar | BBD | Fiji Dollar | FJD |

# Examples: SASEXFSD Interface Engine

## Example 57.1: Retrieving Standardized Economic Items for Multiple Countries

This example shows how to use the ExtractEconData factlet to retrieve the standardized government debt values, reflecting debt in billions of dollars at year end for the United States and Greece and using the country identifiers CC_US and CC_GR and the standardized FactSet economic code FDS_ECON_GDP_USD_Y.

```
options validvarname=any;

title 'Retrieve Standardized Economic Items for Multiple Countries (US,GR)';
libname _all_ clear;
libname xfsd sasexfsd "%sysget(FACTSET)"
   debug=on
   factlet=ExtractEconData
   ids='CC_US,CC_GR'
   items='FDS_ECON_GDP_USD_Y'
   dates='-6:-1:y'
   period=QTR
   format=sml
   outXml=fsdex06
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(FACTSET)fsdex06.map"
   orientation=eti
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';

data econStnd; set xfsd.fsdex06; run;
proc print data=econStnd; run;
```

**Output 57.1.1** Standardized Economic Items for Multiple Countries

**Retrieve Standardized Economic Items for Multiple Countries (US,GR)**

| Obs | FQL_Entity | date | fds_econ_gdp_usd_y |
|---|---|---|---|
| 1 | CC_US | 12-31-2006 | 13377.20 |
| 2 | CC_US | 12-31-2007 | 14028.70 |
| 3 | CC_US | 12-31-2008 | 14291.50 |
| 4 | CC_US | 12-31-2009 | 13973.70 |
| 5 | CC_US | 12-31-2010 | 14498.90 |
| 6 | CC_US | 12-31-2011 | 15075.70 |
| 7 | CC_GR | 12-31-2006 | 261.85 |
| 8 | CC_GR | 12-31-2007 | 305.54 |
| 9 | CC_GR | 12-31-2008 | 341.24 |
| 10 | CC_GR | 12-31-2009 | 321.34 |
| 11 | CC_GR | 12-31-2010 | 294.03 |
| 12 | CC_GR | 12-31-2011 | 290.04 |

## Example 57.2: Retrieving Economic Items by Using the FQL Syntax for Function *Z* Score

This example shows how to use the ExtractEconData factlet to retrieve the *Z* score for the GRLM0347861 monthly time series for Greece over the last three years by using the FQL economic download syntax. It is not necessary to use the IDS= option, because all necessary information is contained in the ITEMS= option. The PRINT procedure uses the LABEL option to allow the time series name to be in the column heading in the output. Without the LABEL option, the column heading would be 'ECON_EXPR_DATA'.

```
options validvarname=any;

title 'Retrieve the Z Score Using ECON_EXPR_DATA for the US CFTNCLOI%ALLNQ100CMEF Series';
libname _all_ clear;
libname xfsd sasexfsd "%sysget(FACTSET)"
   debug=on
   factlet=ExtractEconData
   items="ECON_EXPR_DATA('ZSCORE(FDS_ECON[GRLM0347861],
   -5AY,step,average)',0,0/0/-3,m)"
   format=sml
   outXml=fsdecon8z
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(FACTSET)fsdecon8z.map"
   orientation=eti
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';

data FQLeconFunc; set xfsd.fsdecon8z; run;
proc print data=FQLeconFunc(firstobs=1 obs=34) label; run;
```

**Output 57.2.1** *Z* Score Using ECON_EXPR_DATA for the GRLM0347861 Monthly Series for Greece

**Retrieve the Z Score Using ECON_EXPR_DATA for the US CFTNCLOI%ALLNQ100CMEF Series**

| Obs | FQL_Entity | date | ZSCORE(FDS_ECON[GRLM0347861],-5AY,step,average) |
|---|---|---|---|
| 1 | econ_expr_data | 04-30-2010 | -1.34718 |
| 2 | econ_expr_data | 05-28-2010 | -1.33648 |
| 3 | econ_expr_data | 06-30-2010 | -1.42249 |
| 4 | econ_expr_data | 07-30-2010 | -1.32352 |
| 5 | econ_expr_data | 08-31-2010 | -1.28179 |
| 6 | econ_expr_data | 09-30-2010 | -1.21514 |
| 7 | econ_expr_data | 10-29-2010 | -1.01707 |
| 8 | econ_expr_data | 11-30-2010 | -0.95096 |
| 9 | econ_expr_data | 12-31-2010 | -0.76515 |
| 10 | econ_expr_data | 01-31-2011 | -0.70250 |
| 11 | econ_expr_data | 02-28-2011 | -0.54235 |
| 12 | econ_expr_data | 03-31-2011 | -0.46460 |
| 13 | econ_expr_data | 04-29-2011 | -0.54778 |
| 14 | econ_expr_data | 05-31-2011 | -0.38856 |
| 15 | econ_expr_data | 06-30-2011 | -0.51014 |
| 16 | econ_expr_data | 07-29-2011 | -0.40330 |
| 17 | econ_expr_data | 08-31-2011 | -0.03023 |
| 18 | econ_expr_data | 09-30-2011 | -0.20943 |
| 19 | econ_expr_data | 10-31-2011 | -0.06770 |
| 20 | econ_expr_data | 11-30-2011 | 0.48282 |
| 21 | econ_expr_data | 12-30-2011 | 0.49980 |
| 22 | econ_expr_data | 01-31-2012 | 0.68252 |
| 23 | econ_expr_data | 02-29-2012 | 0.82152 |
| 24 | econ_expr_data | 03-30-2012 | 0.84469 |
| 25 | econ_expr_data | 04-30-2012 | 0.81819 |
| 26 | econ_expr_data | 05-31-2012 | 0.88345 |

| 30 | econ_expr_data | 09-28-2012 | 1.45434 |
| 31 | econ_expr_data | 10-31-2012 | 1.43013 |
| 32 | econ_expr_data | 11-30-2012 | 1.69463 |
| 33 | econ_expr_data | 12-31-2012 | 1.59840 |
| 34 | econ_expr_data | 01-31-2013 | . |

## Example 57.3: Using ECON_EXPR_DATA with the FQL Syntax for Function Returns

This example shows how to use the ExtractEconData factlet to retrieve the Returns for the GDPEURNS quarterly time series for Greece over the last 10 years by using the FQL economic download syntax. It is not necessary to use the IDS= option, because the FQL downloading syntax allows '\@@GR' to be appended to the series name in the ITEMS= option. The PRINT procedure uses the LABEL option to allow the time series name to be in the column heading in the output. Without the LABEL option, the column heading would be 'ECON_EXPR_DATA'.

```
options validvarname=any;

title 'Retrieve Returns Using ECON_EXPR_DATA for the GDPEURNS@GR Series';
libname _all_ clear;
   debug=on
   factlet=ExtractEconData
   items="ECON_EXPR_DATA('RETURNS(EURO_STAT[GDPEURNS@GR],-1AQ,4)',0,0/0/-10,q)"
   format=sml
   outXml=fsdecon20
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(FACTSET)fsdecon20.map"
   orientation=eti
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';

data EUROFunc; set xfsd.fsdecon20; run;
proc print data=EUROFunc label; run;
```

**Output 57.3.1** Quarterly Returns of Series GDPEURNS@GR Using ECON_EXPR_DATA for Database Source Name EURO_STAT

**Retrieve Returns Using ECON_EXPR_DATA for the GDPEURNS@GR Series**

| Obs | FQL_Entity | date | RETURNS(EURO_STAT[GDPEURNS@GR],-1AQ,4) |
|---|---|---|---|
| 1 | econ_expr_data | 06-30-2003 | 39.9255 |
| 2 | econ_expr_data | 09-30-2003 | 24.1206 |
| 3 | econ_expr_data | 12-31-2003 | -2.9307 |
| 4 | econ_expr_data | 03-31-2004 | -21.9838 |
| 5 | econ_expr_data | 06-30-2004 | 44.4186 |

## Example 57.4: Using SPEC_ID_DATA with the FQL Economic Download Syntax

This example shows how to use the ExtractEconData factlet and SPEC_ID_DATA to retrieve the WTI-FDS:FG_PRICE daily time series for the last 30 days by using the FQL economic download syntax. For more information about real-time data and specifying identifiers for commodity spot prices, see the FactSet Online Assistant, page ID 16992.

```
options validvarname=any ;

title 'Retrieve WTI-FDS:FG_PRICE Using SPEC_ID_DATA for the Last 30 Days';
libname _all_ clear;
libname xfsd sasexfsd "%sysget(FACTSET)"
   debug=on
   factlet=ExtractEconData
   item="SPEC_ID_DATA('WTI-FDS:FG_PRICE',0,-30,d)"
   format=sml
   outXml=fsdecon14
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(FACTSET)fsdecon14.map"
   orientation=eti
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';

data WTIPrice; set xfsd.fsdecon14; run;
proc print data=WTIPrice; run;
```

**Output 57.4.1** Daily Series Using SPEC_ID_DATA for West Texas Intermediate Crude Oil Spot Price

**Retrieve WTI-FDS:FG_PRICE Using SPEC_ID_DATA for the Last 30 Days**

| Obs | FQL_Entity | date | spec_id_data WTI-FDS:FG_PRICE |
|---|---|---|---|

## Example 57.5: Using Multiple Database Sources with the FQL Syntax

This example shows how to use the ExtractEconData factlet and two database sources, FDS_ECON_DATA and EURO_STAT_DATA, to retrieve two time series for the last 11 months by using the FQL economic download syntax. The database source name is prepended to the time series name to retain the integrity of the name of the database source (dbsource). Only the same frequency and same range of observations for multiple series can be requested concurrently.

```
options validvarname=any;

title 'Retrieve Monthly Data from Two Database Sources: FDS_ECON_DATA and EURO_STAT';
libname _all_ clear;
libname xfsd sasexfsd "%sysget(FACTSET)"
   debug=on
   factlet=ExtractEconData
   items="FDS_ECON_DATA('FRBIPSB50001',-11,-1,M,STEP,AVERAGE,1),
   EURO_STAT_DATA('CONSCONFBAL@EUZ',-11,-1,M)"
   format=sml
   outXml=fsdecon17
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(FACTSET)fsdecon17.map"
   orientation=eti
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';

data TwoSources; set xfsd.fsdecon17; run;
proc print data=TwoSources; run;
```

**Output 57.5.1** Two Monthly Series Using Two Database Sources: FDS_ECON_DATA and EURO_STAT_DATA

**Retrieve Monthly Data from Two Database Sources: FDS_ECON_DATA and EURO_STAT**

| Obs | FQL_ENTITY | date | fds_econ_data FRBIPSB50001 | euro_stat_data CONSCONFBAL@EUZ |
|---|---|---|---|---|
| 1 | fds_econ_data | 04-30-2012 | 96.8572 | -19.7000 |

| 11 | fds_econ_data | 02-28-2013 | 99.0446 | -23.6000 |

## Example 57.6: Retrieving Price Data for One Company

This simple example shows how to use the ExtractFormulaHistory factlet to retrieve price data for one company (in this case IBM).

```
options validvarname=any;

title 'Retrieve Price Data for IBM';
libname _all_ clear;
libname xfsd sasexfsd "%sysget(FACTSET)"
   debug=on
   factlet=ExtractFormulaHistory
   ids='ibm'
   items='p_price'
   dates='20110130:20111231:m'
   format=sml
   outXml=fsdex01
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(FACTSET)fsdex01.map"
   orientation=eti
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';

data recentprice; set xfsd.fsdex01; run;
proc print data=recentprice; run;
```

**Output 57.6.1** Price Data for IBM

**Retrieve Price Data for IBM**

| Obs | FQL_Entity | date | p_price |
|---|---|---|---|
| 1 | ibm | 01-31-2011 | 162.00 |
| 2 | ibm | 02-28-2011 | 161.88 |
| 3 | ibm | 03-31-2011 | 163.07 |
| 4 | ibm | 04-30-2011 | 170.58 |
| 5 | ibm | 05-31-2011 | 168.93 |
| 6 | ibm | 06-30-2011 | 171.55 |
| 7 | ibm | 07-31-2011 | 181.85 |
| 8 | ibm | 08-31-2011 | 171.91 |
| 9 | ibm | 09-30-2011 | 174.87 |
| 10 | ibm | 10-31-2011 | 184.63 |
| 11 | ibm | 11-30-2011 | 188.00 |
| 12 | ibm | 12-31-2011 | 183.88 |

## Example 57.7: Retrieving Price and Sales Data for Multiple Companies

This example shows how to use the ExtractFormulaHistory factlet to retrieve several data items for several companies. The data items are price and sales, and the companies are IBM and FactSet (FDS).

```
options validvarname=any;

title 'Retrieve Price and Sales Data for IBM and FactSet(FDS)';
libname _all_ clear;
libname xfsd sasexfsd "%sysget(FACTSET)"
   debug=on
   factlet=ExtractFormulaHistory
   ids='ibm,fds'
   items='p_price,ff_sales'
   dates='20110130:20110631:m'
   format=sml
   outXml=fsdex02
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(FACTSET)fsdex02.map"
   orientation=eti
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';

data priceSale; set xfsd.fsdex02; run;
proc print data=priceSale; run;
```

**Output 57.7.1** Multiple Data Items for IBM and FactSet

**Retrieve Price and Sales Data for IBM and FactSet(FDS)**

| Obs | FQL_ENTITY | date | p_price | ff_sales |
|---|---|---|---|---|
| 1 | ibm | 01-31-2011 | 162.000 | 99870.00 |
| 2 | ibm | 02-28-2011 | 161.880 | 99870.00 |
| 3 | ibm | 03-31-2011 | 163.070 | 99870.00 |
| 4 | ibm | 04-30-2011 | 170.580 | 99870.00 |
| 5 | ibm | 05-31-2011 | 168.930 | 99870.00 |
| 6 | ibm | 06-30-2011 | 171.550 | 99870.00 |
| 7 | fds | 01-31-2011 | 100.800 | 641.06 |
| 8 | fds | 02-28-2011 | 104.880 | 641.06 |
| 9 | fds | 03-31-2011 | 104.730 | 641.06 |
| 10 | fds | 04-30-2011 | 109.410 | 641.06 |
| 11 | fds | 05-31-2011 | 110.860 | 641.06 |
| 12 | fds | 06-30-2011 | 102.320 | 641.06 |

## Example 57.8: Retrieving Book Value Data for One Company by Using Relative Dates

This example shows how to use the ExtractFormulaHistory factlet to retrieve book value data for one company (in this case Exxon Mobil, or XOM) by using relative dates. The book value represents the proportional common equity divided by outstanding shares at the end of the company's fiscal year. The relative date specifies the date as *n* periods ago based on the frequency (specified or implied); for example, DATES=0:-8:y returns data for the nine years prior to the most recently updated year.

```
options validvarname=any;

title 'Retrieve Book Value Data for Exxon Mobil (XOM) for the Last 9 Years';
libname _all_ clear;
libname xfsd sasexfsd "%sysget(FACTSET)"
   debug=on
   factlet=ExtractFormulaHistory
   ids='xom'
   items='ff_bps'
   dates='0:-8:y'
   format=sml
   outXml=fsdex03
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(FACTSET)fsdex03.map"
   orientation=eti
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';

data bookRelative; set xfsd.fsdex03; run;
proc print data=bookRelative; run;
```

**Output 57.8.1** Book Value Data for Exxon Mobil for the Last 9 Years

**Retrieve Book Value Data for Exxon Mobil (XOM) for the Last 9 Years**

| Obs | FQL_Entity | date | ff_bps |
|---|---|---|---|
| 1 | xom | 12-31-2004 | 15.8969 |
| 2 | xom | 12-31-2005 | 18.1291 |
| 3 | xom | 12-31-2006 | 19.8715 |
| 4 | xom | 12-31-2007 | 22.6239 |
| 5 | xom | 12-31-2008 | 22.7020 |
| 6 | xom | 12-31-2009 | 23.3910 |
| 7 | xom | 12-31-2010 | 29.4917 |
| 8 | xom | 12-31-2011 | 32.6143 |
| 9 | xom | 12-31-2012 | 36.8421 |

## Example 57.9: Retrieving Multiple Screen Items for Multiple Companies

This example shows how to use the ExtractDataSnapshot factlet to extract multiple screen items (price and sales) as of a single date for multiple companies (in this case IBM and Microsoft) for the quarterly estimate period (PERIOD=QTR).

```
options validvarname=any;

title 'Retrieve Multiple Screen Items for Multiple Companies';
libname _all_ clear;
libname xfsd sasexfsd "%sysget(FACTSET)"
   debug=on
   factlet=ExtractDataSnapshot
   ids='ibm,msft'
   items='p_price,ff_sales'
   dates='20110401'
   period=QTR
   format=sml
   outXml=fsdex05
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(FACTSET)fsdex05.map"
   orientation=eti
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';

data snapshot; set xfsd.fsdex05; run;
proc print data=snapshot; run;
```

**Output 57.9.1** Multiple Screen Items for Multiple Companies

**Retrieve Multiple Screen Items for Multiple Companies**

| Obs | FQL_ENTITY | date | p_price | ff_sales |
|---|---|---|---|---|
| 1 | ibm | 04-01-2011 | 164.270 | 24607 |
| 2 | msft | 04-01-2011 | 25.480 | 16428 |

## Example 57.10: Retrieving Data by Using the ISON= and ISONPARAMS= Options

This example shows how to use the ExtractDataSnapshot factlet to retrieve price-to-earnings (PE) data for the quarterly estimate period by using the ISON= and ISONPARAMS= options. For brevity, only a subset of the output (the first 10 CUSIPs) is displayed.

```
options validvarname=any;

title 'Retrieve Price-to-Earnings Data by Using ISON/ISONPARAMS';
libname _all_ clear;
libname xfsd sasexfsd "%sysget(FACTSET)"
   debug=on
   factlet=ExtractDataSnapshot
   ison='sp500'
   isonparams='0,1'
   items='ff_pe'
   dates='20110401'
   period=QTR
   format=sml
   outXml=fsdex10
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(FACTSET)fsdex10.map"
   orientation=eti
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';

data snapIson; set xfsd.fsdex10; run;
proc print data=snapIson(firstobs=1 obs=10); run;
```

**Output 57.10.1** Retrieving Price-to-Earnings Data by Using the ISON= and ISONPARAMS= Options

**Retrieve Price-to-Earnings Data by Using ISON/ISONPARAMS**

| Obs | FQL_Entity | date | ff_pe |
|---|---|---|---|
| 1 | 17290810 | 04-01-2011 | 18.1419 |
| 2 | 41308610 | 04-01-2011 | 13.2635 |
| 3 | 80589M10 | 04-01-2011 | 13.3007 |
| 4 | 50242410 | 04-01-2011 | 9.5995 |
| 5 | 91301710 | 04-01-2011 | 17.2053 |
| 6 | 97665710 | 04-01-2011 | 14.5238 |
| 7 | 00130H10 | 04-01-2011 | . |
| 8 | 31190010 | 04-01-2011 | 33.0765 |
| 9 | 20911510 | 04-01-2011 | 13.5979 |
| 10 | 53983010 | 04-01-2011 | 10.0212 |

## Example 57.11: Retrieving Benchmark Data by Using the CUTOFF= Option

This example shows how to use the ExtractBenchmarkDetail factlet to retrieve the holdings for the Standard & Poor's (S&P) 500 (ID='sp50') and display the P_PRICE data that correspond to each holding. For brevity, only a subset of the output (the first 10 holdings) is displayed.

```
options validvarname=any;

title 'Retrieve Benchmark Data for Top Ten Holdings, CUTOFF=10';
libname _all_ clear;
libname fsd sasexfsd "%sysget(FACTSET)"
   debug=on
   factlet=ExtractBenchmarkDetail
   ids='sp50'
   items='p_price,proper_name'
   dates='20130320'
   cutoff=10
   format=sml
   outXml=fsdex12
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(FACTSET)fsdex12.map"
   orientation=eti
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';

data bench;
   set fsd.fsdex12;
run;
proc print
   data=bench;
run;
```

The CUTOFF= option limits the output to the number of holdings that are specified. This example uses CUTOFF=10 to print the top 10 holdings. If you omit the CUTOFF= option, all 500 holdings are reported.

**Output 57.11.1** Retrieving Benchmark Data for Top 10 Holdings in the S&P 500 Index

**Retrieve Benchmark Data for Top Ten Holdings, CUTOFF=10**

| Obs | FQL_ENTITY | date | SECURITY_ID | Weight | p_price | proper_name |
|---|---|---|---|---|---|---|
| 1 | SP50 | . | 41308610 | . | 44.4800 | Harman International Industries Inc. |
| 2 | SP50 | . | 80589M10 | . | 49.5100 | SCANA Corp. |
| 3 | SP50 | . | 50242410 | . | 81.2100 | L-3 Communications Holdings Inc. |
| 4 | SP50 | . | 91301710 | . | 93.4500 | United Technologies Corp. |
| 5 | SP50 | . | 97665710 | . | 41.4400 | Wisconsin Energy Corp. |
| 6 | SP50 | . | 00130H10 | . | 12.6800 | AES Corp. |
| 7 | SP50 | . | 31190010 | . | 51.4700 | Fastenal Co. |
| 8 | SP50 | . | 20911510 | . | 59.1600 | Consolidated Edison Inc. |
| 9 | SP50 | . | 53983010 | . | 92.2400 | Lockheed Martin Corp. |
| 10 | SP50 | 12-31-2000 | 17290810 | . | 43.8800 | Cintas Corp. |

## Example 57.12: Retrieving Benchmark Data by Using the MATCHDATE= Option

This example shows how to use the ExtractBenchmarkDetail factlet to retrieve data from the Prices database for the Russell 1000 constituents (R.1000).

```
options validvarname=any;

title 'Retrieve Benchmark Data for R.1000 with MATCHDATE=ON';
libname _all_ clear;
libname fsd sasexfsd "%sysget(FACTSET)"
   debug=on
   factlet=ExtractBenchmarkDetail
   ids='r.1000'
   items='p_price'
   dates='20120118:20120113:b'
   matchDate=on
   format=sml
   outXml=fsdex13
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(FACTSET)fsdex13.map"
   orientation=eti
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';

data benchmatch;
   set fsd.fsdex13;
run;
proc print
   data=benchmatch(firstobs=1 obs=50);
run;
```

If the frequency argument were not set to B (indicating business days) and the MATCHDATE= option were not turned on, the output would contain repetitive dates because of feel-back, resulting in unnecessarily lengthy output.

**Output 57.12.1** Retrieving Benchmark Data for the Russell 1000 Index by Using the MATCHDATE=ON Option

**Retrieve Benchmark Data for R.1000 with MATCHDATE=ON**

| Obs | FQL_ENTITY | date | SECURITY_ID | Weight | p_price |

## Example 57.13: Retrieving Multiple Items for Multiple Companies from an OFDB File

This example shows how to use the ExtractOFDBItem factlet to retrieve the uploaded share and price data for IBM and Microsoft from an OFDB file named SASTESTING for an absolute date range, starting February 27, 2012, and ending February 28, 2012, with a monthly frequency.

```
options validvarname=any;

title 'Retrieve Shares and Price Data for IBM and MSFT from an OFDB File';
libname _all_ clear;
libname xfsd sasexfsd "%sysget(FACTSET)"
   debug=on
   factlet=ExtractOFDBItem
   ofdb='SASTESTING.OFDB'
   ids='ibm,msft'
   items='shares,price'
   dates='20120227:20120228:d'
   period=QTR
   format=sml
   outXml=fsdex07
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(FACTSET)fsdex07.map"
   orientation=eti
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';

data shareOFDB; set xfsd.fsdex07; run;
proc print data=shareOFDB; run;
```

**Output 57.13.1** Multiple Items for Multiple Companies from an OFDB File

**Retrieve Shares and Price Data for IBM and MSFT from an OFDB File**

| Obs | FQL_ENTITY | date | ofdb_shares | ofdb_price |
|---|---|---|---|---|
| 1 | ibm | 02-27-2012 | 1178.60 | 1.000 |
| 2 | ibm | 02-28-2012 | 1178.60 | 197.980 |
| 3 | msft | 02-27-2012 | 8412.20 | 1.000 |
| 4 | msft | 02-28-2012 | 8412.20 | 31.870 |

## Example 57.14: Retrieving a List of Securities from an OFDB File

This example shows how to use the ExtractOFDBUniverse factlet to retrieve a list of securities that belong to a single OFDB file named SASTESTING for February 27, 2012. For brevity, only a subset of the output (the first 15 securities) is displayed.

```
options validvarname=any;

title 'Retrieve List of Securities Belonging to a Single OFDB File';
libname _all_ clear;
libname xfsd sasexfsd "%sysget(FACTSET)"
   debug=on
   factlet=ExtractOFDBUniverse
   ofdb='SASTESTING.OFDB'
   dates='20120227'
   format=sml
   outXml=fsdex08
   automap=replace
   mapref=MyMap
   xmlmap="%sysget(FACTSET)fsdex08.map"
   user='XXXXXXXXXXXXXXX'
   pass='XXXXXXXXXXXXXXX';

data ofdbUniv; set xfsd.fsdex08; run;
proc print data=ofdbUniv(firstobs=1 obs=15); run;
```

**Output 57.14.1** List of Securities from a Single OFDB File

**Retrieve List of Securities Belonging to a Single OFDB File**

# Time Series Forecasting System

# Chapter 58
# Overview of the Time Series Forecasting System

**Contents**

Introduction . . . . . 3943
Using the Time Series Forecasting System . . . . . 3944
SAS Software Products Needed . . . . . 3945

## Introduction

The Time Series Forecasting system forecasts future values of time series variables by extrapolating trends and patterns in the past values of the series or by extrapolating the effect of other variables on the series. The system provides convenient point-and-click windows to control the time series analysis and forecasting tools of SAS/ETS software.

You can use the system in a fully automatic mode, or you can use the system's diagnostic features and time series modeling tools interactively to develop forecasting models customized to best predict your time series. The system provides both graphical and statistical features to help you choose the best forecasting method for each series.

The following is a brief summary of the features of the Time Series Forecasting system. You can use the system in the following ways:

- use a wide variety of forecasting methods, including several kinds of exponential smoothing models, Winters method, and ARIMA (Box-Jenkins) models. You can also produce forecasts by combining the forecasts from several models.
- use predictor variables in forecasting models. Forecasting models can include time trend curves, regressors, intervention effects (dummy variables), adjustments you specify, and dynamic regression (transfer function) models.
- view plots of the data, predicted versus actual values, prediction errors, and forecasts with confidence limits, as well as autocorrelations and results of white noise and stationarity tests. Any of these plots can be zoomed and can represent raw or transformed series.
- use hold-out samples to select the best forecasting method
- compare goodness-of-fit measures for any two forecasting models side by side or list all models sorted by a particular fit statistic

- view the predictions and errors for each model in a spreadsheet or compare the fit of any two models in a spreadsheet
- examine the fitted parameters of each forecasting model and their statistical significance
- control the automatic model selection process: the set of forecasting models considered, the goodness-of-fit measure used to select the best model, and the time period used to fit and evaluate models
- customize the system by adding forecasting models for the automatic model selection process and for point-and-click manual selection
- save your work in a project catalog
- print an audit trail of the forecasting process
- show source statements for PROC ARIMA code
- save and print system output including spreadsheets and graphs

## Using the Time Series Forecasting System

Chapters starting from Chapter 59, "Getting Started with Time Series Forecasting," through Chapter 63, "Using Predictor Variables," contain a series of example sessions that show the major features of the system. Chapters from Chapter 64, "Command Reference," through Chapter 66, "Forecasting Process Details," serve as reference and provide more details about how the system operates. The reference chapters contain a complete list of system features.

To get started using the Time Series Forecasting system, it is a good idea to work through a few of the example sessions. Start with Chapter 59, "Getting Started with Time Series Forecasting," and use the system to reproduce the steps shown in the examples. Continue with the other chapters when you feel comfortable using the system.

The example sessions make use of time series data sets contained in the SASHELP library: air, citimon, citiqtr, citiyr, citiwk, citiday, gnp, retail, usecon, and workers. You can use these data sets to work through the example sessions or to experiment further with the system.

Once you are familiar with how the system operates, start working with your own data to build your own forecasting models. When you have questions, consult the reference chapters mentioned above for more information about particular features.

The Time Series Forecasting system forecasts *time series*, that is, variables that consist of ordered observations taken at regular intervals over time. Since the Time Series Forecasting system is a part of the SAS software system, time series values must be stored as variables in a SAS data set or data view, with the observations representing the time periods. The data can also be stored in an external spreadsheet or data base if you license SAS/ACCESS software.

The Time Series Forecasting System chapters refer to *series* and *variables*. Since time series are stored as variables in SAS data sets or data views, these terms are used interchangeably. However, the term *series* is preferred when attention is focused on the sequence of data values, and the term *variable* is preferred when attention is focused on the data set.

## SAS Software Products Needed

The Time Series Forecasting system is part of SAS/ETS software. To use it, you must have a license for SAS/ETS. To use the graphical display features of the system, you must also license SAS/GRAPH software.

This chapter outlines the forecasting process and introduces the major windows of the system through three example sessions.

The first example, beginning with the section "The Time Series Forecasting Window" on page 3948, shows how to use the system for fully automated forecasting of a set of time series. This example also introduces the system's features for viewing data and forecasts through tables and interactive graphs. It also shows how to save and restore forecasting work in SAS catalogs.

The second example, beginning with the section "Develop Models Window" on page 3971, introduces the features for developing the best forecasting models for individual time series. The chapter concludes with an example showing how to create dating variables for your data in the form expected by the system.

After working through the examples in this chapter, you should be able to do the following:

- select a data set of time series to work with and specify its periodicity and time ID variable
- use the automatic forecasting model selection feature to create forecasting models for the variables in a data set
- produce and save forecasts of variables in a data set
- examine your data and forecasts as tables of values and through interactive graphs
- save and restore your forecasting models by using project files in a SAS catalog and edit project information
- use some of the model development features to fit and select forecasting models for individual time series variables

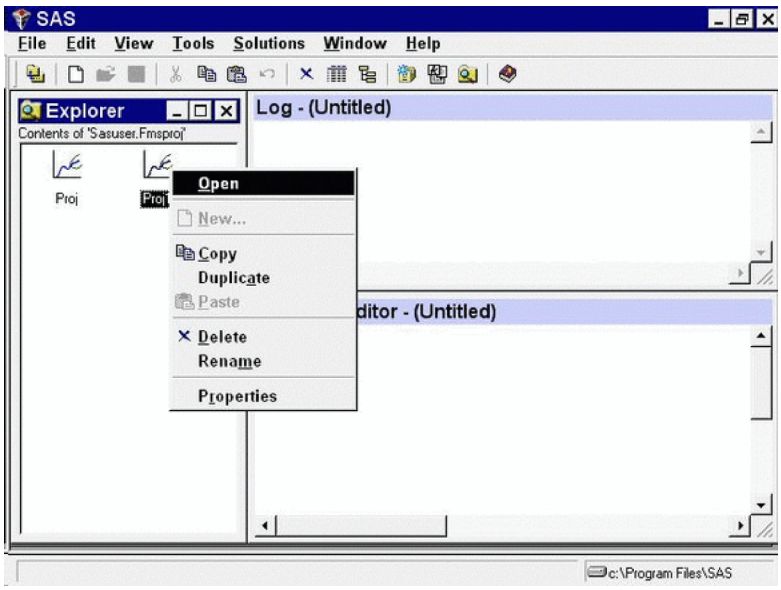
This chapter introduces these topics and helps you get started using the system. Later chapters present these topics in greater detail and document more advanced features and options.

## The Time Series Forecasting Window

There are several ways to get to the Time Series Forecasting System. If you prefer to use commands, invoke the system by entering `forecast` on the command line. You can optionally specify additional information on the command line; for more information, see Chapter 64, "Command Reference."

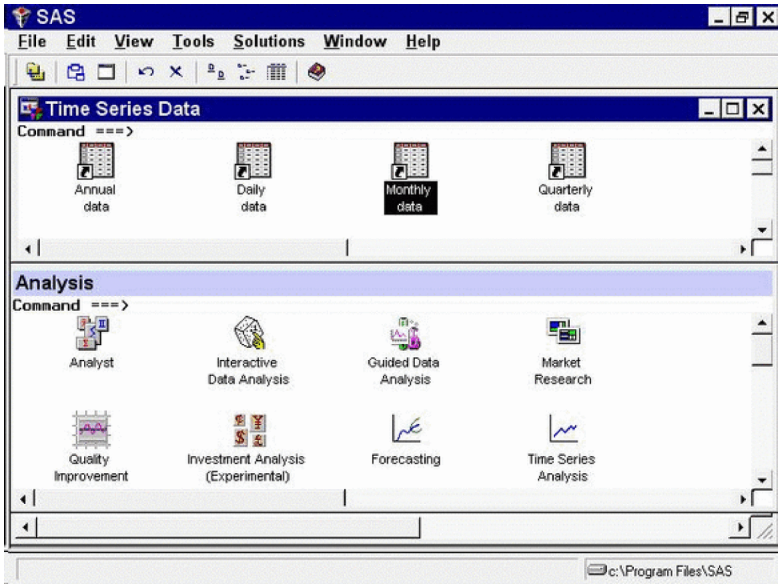
If you are using the SAS windowing environment with pull-down menus, select the Solutions menu from the menu bar, select the Analysis item, and then select `Time Series Forecasting System`. You can invoke the Forecasting System from the SAS Explorer window by opening an existing forecasting project. By default these projects are stored in the FMSPROJ catalog in the SASUSER library. Select SASUSER in the Explorer to display its contents. Then select FMSPROJ. This catalog is created the first time you use the Forecasting System. If you have saved projects, they appear in the Explorer with the forecasting graph icon, as shown in Figure 59.1. Double-click one of the projects, or select it with the right mouse button and then select Open from the pop-up menu, as shown in the figure. This opens the Forecasting System and opens the selected project.

**Figure 59.1** Opening a Project from the Explorer



To invoke the Forecasting System in the SAS desktop environment, select the Solutions menu from the menu bar, select `Desktop`, and then open the Analysis folder. You can run the Time Series Forecasting System or the Time Series Viewer directly, or you can drag and drop. Figure 59.2 illustrates dragging a data set (known as a table in the Desktop environment) and dropping it on the Forecasting icon. In this example, the tables reside in a user-defined folder called *Time Series Data*.

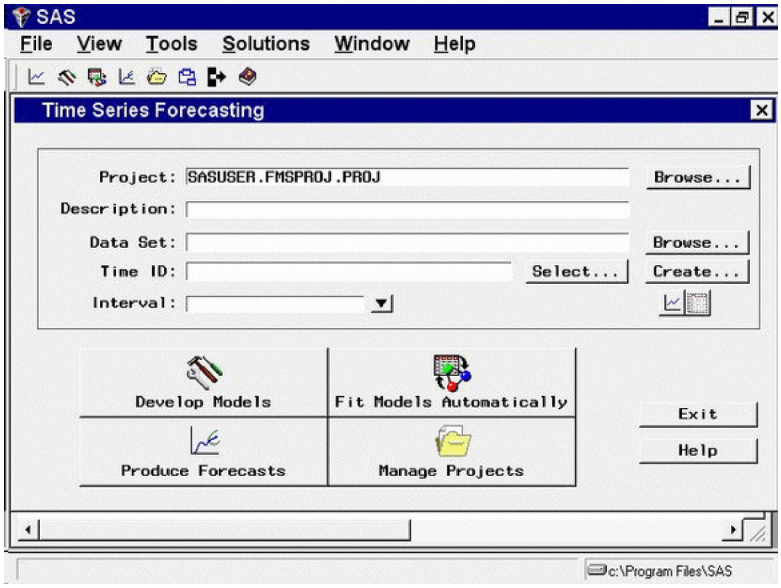
**Figure 59.2** Drag and Drop on the SAS Desktop



If you are using SAS/ASSIST software, click the Planning button and then select `Forecasting` from the pop-up menu.

Any of these methods takes you to the Time Series Forecasting window, as shown in Figure 59.3.

**Figure 59.3** Time Series Forecasting Window



At the top of the window is a data selection area for specifying a project file and the input data set containing historical data (the known past values) for the time series variables that you want to forecast. This area also contains buttons for opening viewers to explore your input data either graphically, one series at a time, or as a table, one data set at a time.

The Project and Description fields are used to specify a project file for saving and restoring forecasting models created by the system. Using project files is discussed later, and these fields are ignored for now.

The lower part of the window contains six buttons:

`Develop Models`
: opens the Develop Models window, which you use to develop and fit forecasting models interactively for individual time series.

`Fit Models Automatically`
: opens the Automatic Model Fitting window, which you use to search automatically for the best forecasting model for multiple series in the input data set.

`Produce Forecasts`
: opens the Produce Forecasts window, which you use to compute forecasts for all the variables in the input data set for which forecasting models have been fit.

`Manage Projects`
: opens the Manage Forecasting Project window, which lists the time series for which you have fit forecasting models. You can drill down on a series to see the models that have been fit. You can delete series or models from the project, re-evaluate or refit models, and explore models and forecasts graphically or in tabular form.

`Exit`
: exits the Forecasting System.

`Help`
: displays information about the Forecasting System.

# Outline of the Forecasting Process

The examples shown in the following sections illustrate the basic process you use with the Forecasting System.

## Specify the Input Data Set

Suppose you have a number of *time series*, variables recorded over time, for which you want to forecast future values. The past values of these time series are stored as variables in a SAS data set or data view. The observations of this data set correspond to regular time periods, such as days, weeks, or months. The first step in the forecasting process is to tell the system to use this data set by setting the Data Set field.

If your time series are not in a SAS data set, you must provide a way for the SAS System to access the data. You can use SAS features to read your data into a SAS data set; see *SAS Programmers Guide: Essentials*. You can use a SAS/ACCESS product to establish a view of data in a database management system; refer to SAS/ACCESS documentation. You can use PROC SQL to create a SAS data view. You can use PROC DATASOURCE to read data from files supplied by supported data vendors; for more information, see Chapter 13, "The DATASOURCE Procedure."

## Provide a Valid Time ID Variable

To use the Forecasting System, your data set must be dated: the data set must contain a *time ID variable* that gives the date of each observation. The time ID variable must represent the observation dates with *SAS date values* or with *SAS datetime values* (for hourly data or other frequencies less than a day), or you can use a simple time index.

When SAS date values are used, the ID variable contains dates within the time periods corresponding to the observations. For example, for monthly data, the values for the time ID variable can be the date of the first day of the month corresponding to each observation, or the time ID variable can contain the date of the last day in the month. (Any date within the period serves as the time ID for the observation.)

If your data set already contains a valid time ID variable with SAS date or datetime values, the next step is to specify this time ID variable in the Time ID field. If the time ID variable is named DATE, the system fills in the Time ID field automatically.

If your data set does not contain a time ID, you must add a valid time ID variable before beginning the forecasting process. The Forecasting System provides features that make this easy to do. For more information, see Chapter 60, "Creating Time ID Variables."

## Select and Fit a Forecasting Model for Each Series

If you are using the automated model selection feature, the system performs this step for you and chooses a forecasting model for each series automatically. All you need to do is click the Fit Models Automatically button and then select the variables to fit models for.

If you want more control over forecasting model selection, you can click the Develop Models button, select the series you want to forecast, and use the Develop Models window to specify a forecasting model. As part of this process, you can use the Time Series Viewer and Model Viewer graphical tools. Once you have selected a model for the first series, you can select a different series to work with and repeat the model development process until you have created forecasting models for all the series you want to forecast.

The system provides many features to help you choose the best forecasting model for each series. The features of the Develop Models window and graphical viewer tools are introduced in later sections.

## Produce the Forecasts

Once a forecasting model has been fit for each series, click the Produce Forecasts button and use the Produce Forecasts window to compute forecast values and store them in a SAS data set.

## Save Your Work

If you want only a single forecast, your task is now complete. But you might want to produce updated forecasts later, as more data becomes available. In this case, you want to save the forecasting models you have created, so that you do not need to repeat the model selection and fitting process.

To save your work, fill in the Project field with the name of a SAS catalog member in which the system will store the model information when you exit the system. Later, you will select the same catalog member name when you first enter the Forecasting System, and the model information will be reloaded.

Note that any number of people can work with the same project file. If you are working on a forecasting project as part of a team, you should take care to avoid conflicting updates to the project file by different team members.

## Summary

This is the basic outline of how the Forecasting System works. The system offers many other features and options that you might need to use (for example, the time range of the data used to fit models and how far into the future to forecast). These options will become apparent as you work with the Forecasting System.

As an introductory example, the following sections use the Automatic Model Fitting and Produce Forecasts windows to perform automated forecasting of the series in an example data set.

# The Input Data Set

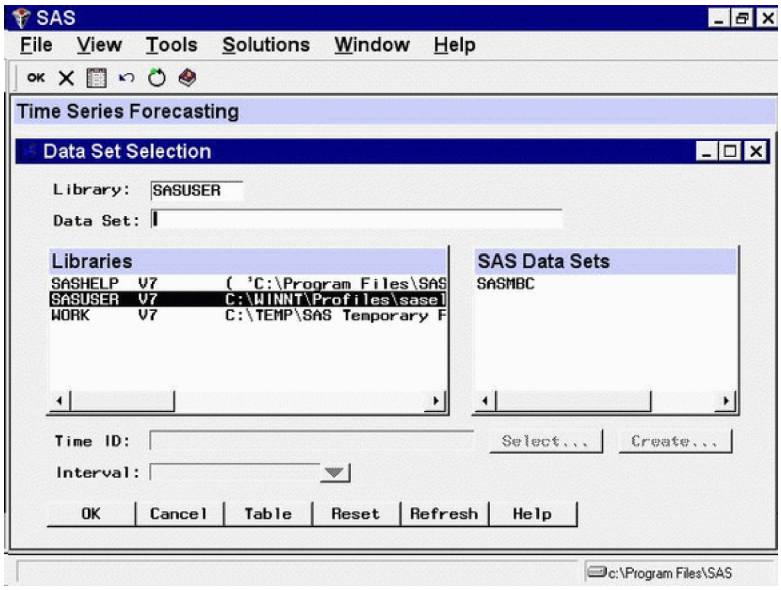
As the first step, you must specify the input data set.

The Data Set field in the Time Series Forecasting window gives the name of the input data set containing the time series to forecast. Initially, this field is blank. You can specify the input data set by typing the data set name in this field. Alternatively, you can click the Browse button at the right of the Data Set field to select the data set from a list, as shown in the following section.

## The Data Set Selection Window

Click the Browse button to the right of the Data Set field. This opens the Data Set Selection window, as shown in Figure 59.4.

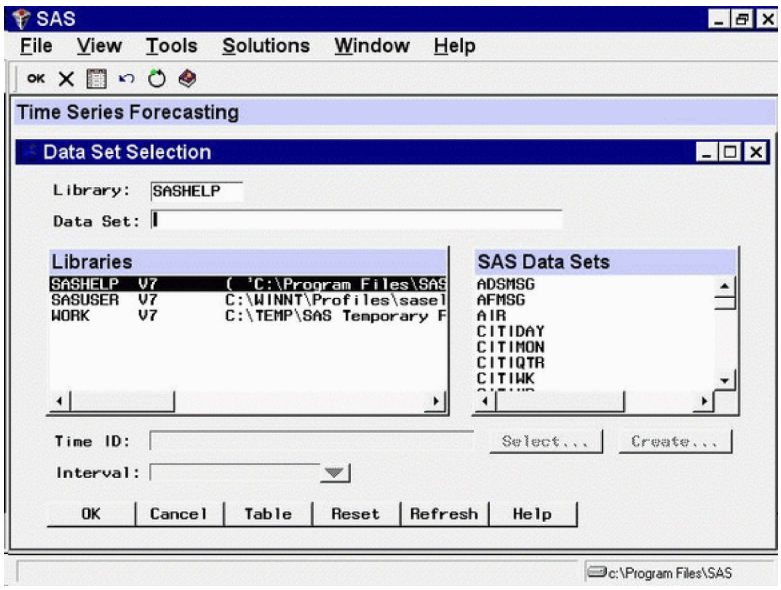
**Figure 59.4** Data Set Selection Window



The `Libraries` list shows the SAS librefs that are currently allocated in your SAS session. Initially, the SASUSER library is selected, and the `SAS Data Sets` list shows the data sets available in your SASUSER library.

In the `Libraries` list, select the row that starts with SASHELP. The Data Set Selection window now lists the data sets in the SASHELP library, as shown in Figure 59.5.

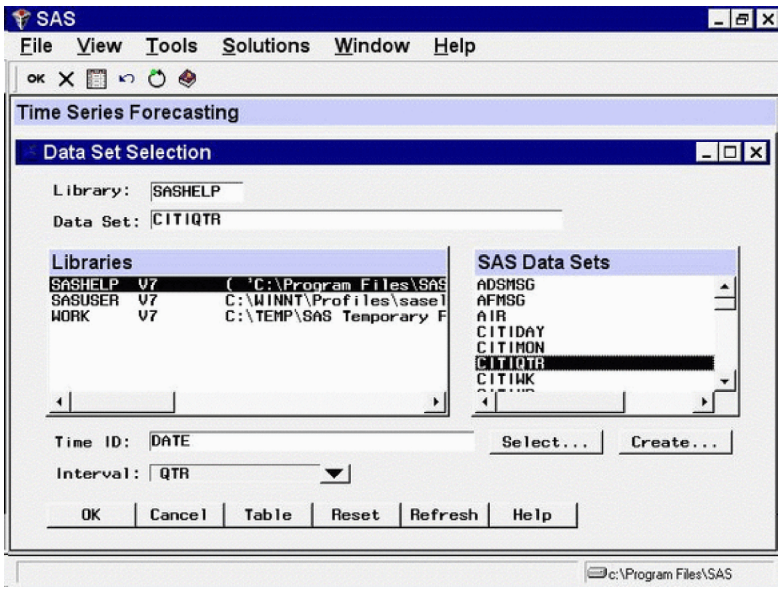
**Figure 59.5** SASHELP Library



Use the vertical scroll bar on the `SAS Data Sets` list to scroll down the list until the data set CITIQTR appears. Then select the CITIQTR row. This selects the data set SASHELP.CITIQTR as the input data set.

Figure 59.6 shows the Data Set Selection window after selection of CITIQTR from the SAS Data Sets list.

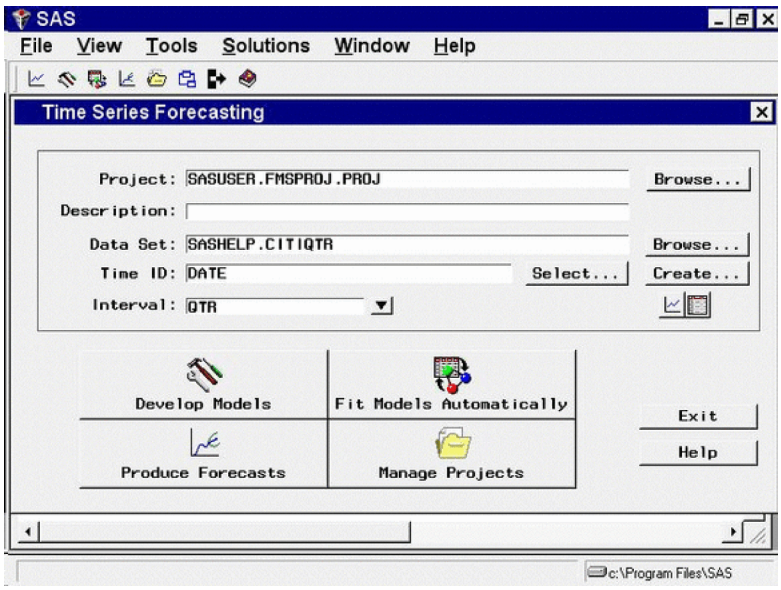
**Figure 59.6** CITIQTR Data Set Selected



Note that the Time ID field is now set to DATE and the Interval field is set to QTR. These fields are explained in the following section.

Now click the OK button to complete selection of the CITIQTR data set. This closes the Data Set Selection window and returns you to the Time Series Forecasting window, as shown in Figure 59.7.

**Figure 59.7** Time Series Forecasting Window



## Time Series Data Sets, ID Variables, and Time Intervals

Before you continue with the example, it is worthwhile to consider how the system determined the values for the Time ID and Interval fields in the Data Set Selection window.

The Forecasting System requires that the input data set contain time series observations, with one observation for each time period. The observations must be sorted in increasing time order, and there must be no gaps in the sequence of observations. The time period of each observation must be identified by an ID variable, which is shown in the Time ID field.

If the data set contains a variable named DATE, TIME, or DATETIME, the system assumes that this variable is the SAS date or datetime valued ID variable, and the Time ID field is filled in automatically. The time ID variable for the SASHELP.CITIQTR data set is named DATE, and therefore the system sets the Time ID field to DATE.

If the time ID variable for a data set is not named DATE, TIME, or DATETIME, you must specify the time ID variable name. You can specify the time ID variable either by typing the ID variable name in the Time ID field or by clicking the Select button.

If your data set does not contain a time ID variable with SAS date values, you can add a time ID variable using one of the windows described in Chapter 60, "Creating Time ID Variables."

Once the time ID variable is known, the Forecasting System examines the ID values to determine the time interval between observations. The data set SASHELP.CITIQTR contains quarterly observations. Therefore, the system determined that the data have a quarterly interval, and set the Interval field to QTR.

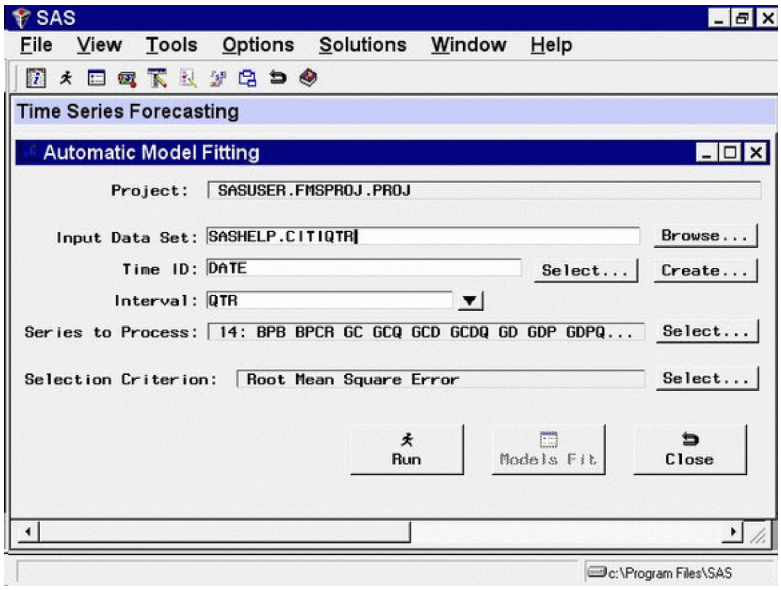
If the system cannot determine the data frequency from the values of the time ID variable, you must specify the time interval between observations. You can specify the time interval by using the `Interval` combo box. In addition to the interval names provided in the pop-up list, you can type in more complex interval names to specify an interval that is a multiple of other intervals or that has date values in the middle of the interval (such as monthly data with time ID values falling on the 10th day of the month).

For more information about time intervals, SAS date values, and ID variables for time series data sets, see Chapter 4, "Working with Time Series Data," and Chapter 5, "Date Intervals, Formats, and Functions."

## Automatic Model Fitting Window

Before you can produce forecasts, you must fit forecasting models to the time series. Click the Fit Models Automatically button. This opens the Automatic Model Fitting window, as shown in Figure 59.8.

**Figure 59.8** Automatic Model Fitting Window

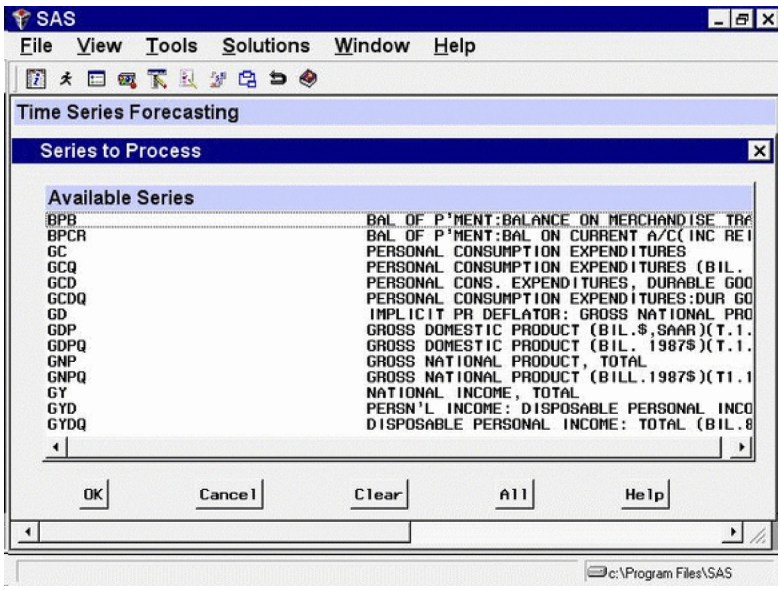


The first part of the Automatic Model Fitting window confirms the project file name and the input data set name.

The Series to Process field shows the number and lists the names of the variables in the input data set to which the Automatic Model Fitting process will be applied. By default, all numeric variables (except the time ID variable) are processed. However, you can specify that models be generated for only a select subset of these variables.

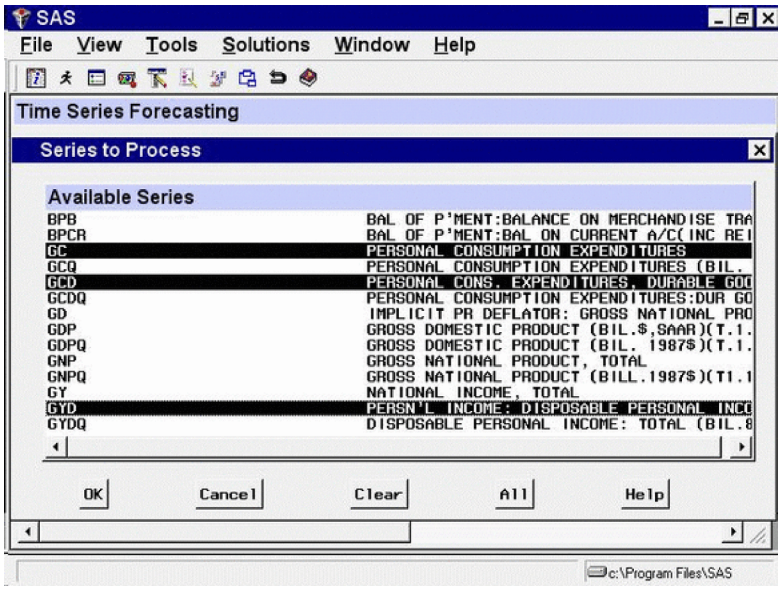
Click the Select button to the right of the Series to Process field. This opens the Series to Process window, as shown in Figure 59.9.

**Figure 59.9** Series to Process Window



Use the mouse and the CTRL key to select the personal consumption expenditures series (GC), the personal consumption expenditures for durable goods series (GCD), and the disposable personal income series (GYD), as shown in Figure 59.10. (Remember to hold down the CTRL key as you make the selections; otherwise, selecting a second series will deselect the first.)

**Figure 59.10** Selecting Series for Automatic Model Fitting



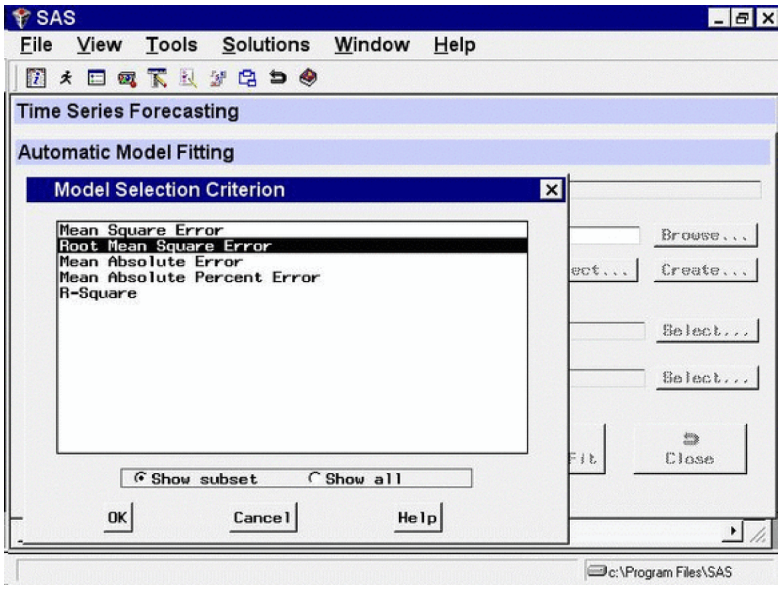
Now click the OK button. This returns you to the Automatic Model Fitting window. The Series to Process field now shows the selected variables.

The Selection Criterion field shows the goodness-of-fit measure that the Forecasting System will use to select the best fitting model for each series. By default, the selection criterion is the root mean squared error. To

illustrate how you can control the selection criterion, this example uses the mean absolute percent error to select the best fitting models.

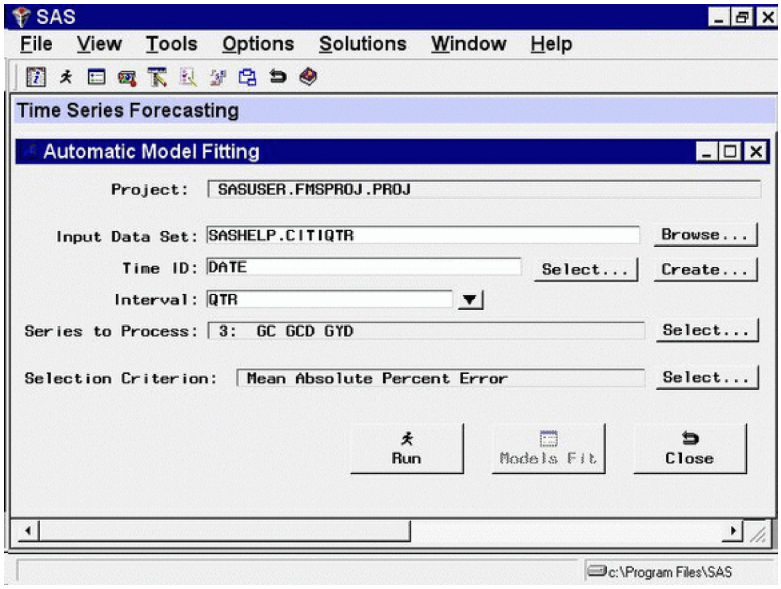
Click the Select button to the right of the Selection Criterion field. This opens a list of statistics of fit, as shown in Figure 59.11.

**Figure 59.11** Choosing the Model Selection Criterion



Select *Mean Absolute Percent Error* and then click the OK button. The Automatic Model Fitting window now appears as shown in Figure 59.12.

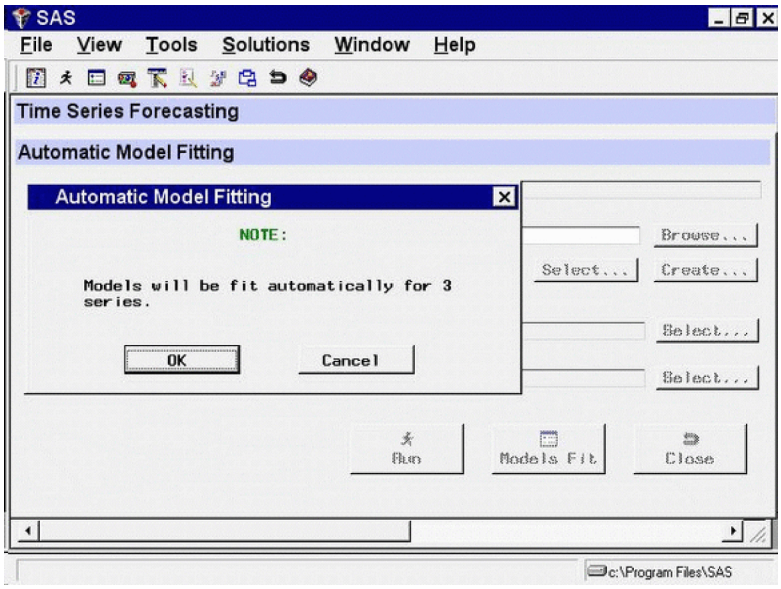
**Figure 59.12** Automatic Model Fitting Window



Now that all the options are set appropriately, click the Run button.

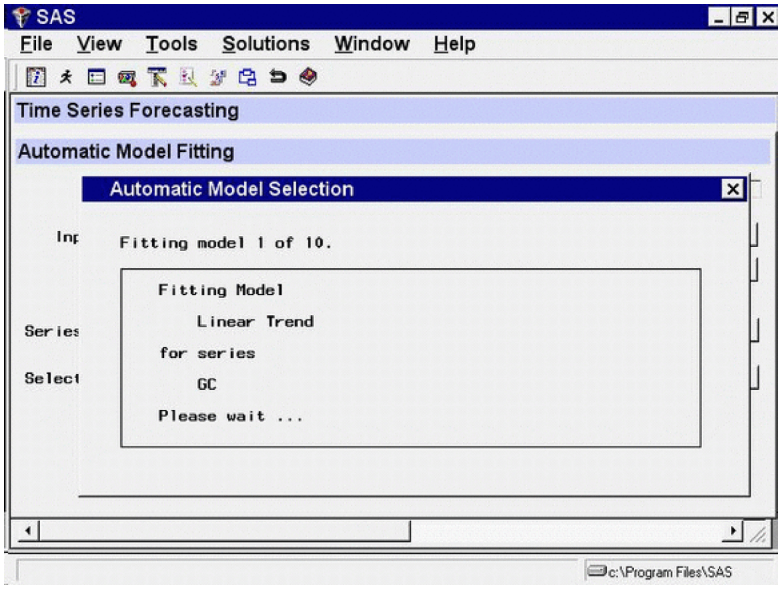
The Forecasting System now displays a notice, shown in Figure 59.13, confirming that models will be fit for three series using the automatic forecasting model search feature. This prompt is displayed because it is possible to fit models for a large number of series at once, which might take a lot of time. So the system gives you a chance to cancel if you accidentally ask to fit models for more series than you intended. Click the OK button.

**Figure 59.13** Automatic Model Fitting Note



The system now fits several forecasting models to each of the three series you selected. While the models are being fit, the Forecasting System displays notices indicating what it is doing so that you can observe its progress, as shown in Figure 59.14.

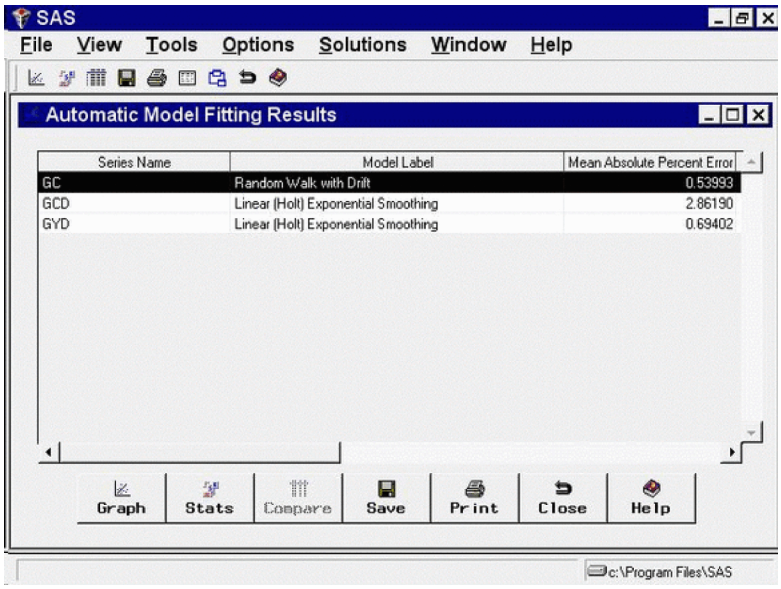
**Figure 59.14** "Working" Notice



For each series, the system saves the model that produces the smallest mean absolute percent error. You can have the system save all the models fit by selecting `Automatic Fit` from the Options menu.

After the Automatic Model Fitting process has completed, the results are displayed in the Automatic Model Fitting Results window, as shown in Figure 59.15.

**Figure 59.15** Automatic Model Fitting Results



This resizable window shows the list of series names and descriptive labels for the forecasting models chosen for them, as well as the values of the model selection criterion and other statistics of fit. Click the Close button.

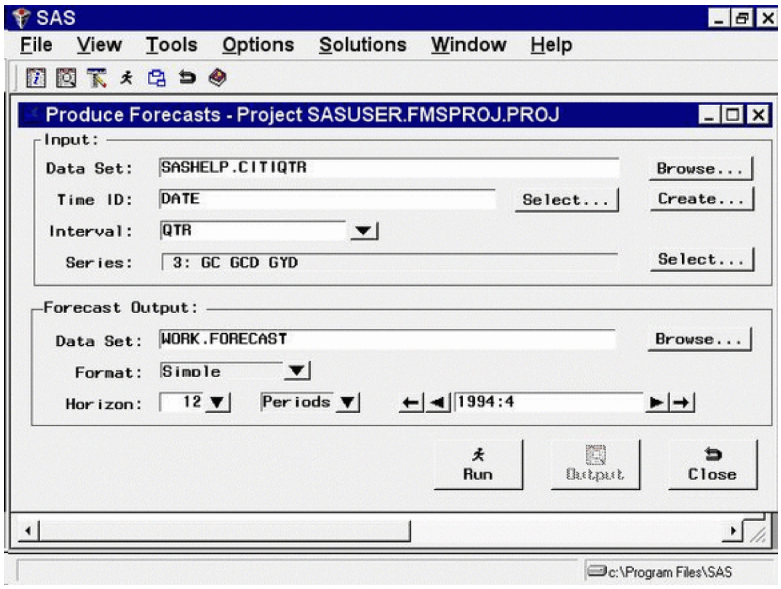
This returns you to the Automatic Model Fitting window. You can now fit models for other series in this data set or change to a different data set and fit models for series in the new data set.

Click the Close button to return to the Time Series Forecasting window.

# Produce Forecasts Window

Now that you have forecasting models for these three series, you are ready to produce forecasts. Click the Produce Forecasts button. This opens the Produce Forecasts window, as shown in Figure 59.16.

**Figure 59.16** Produce Forecasts Window

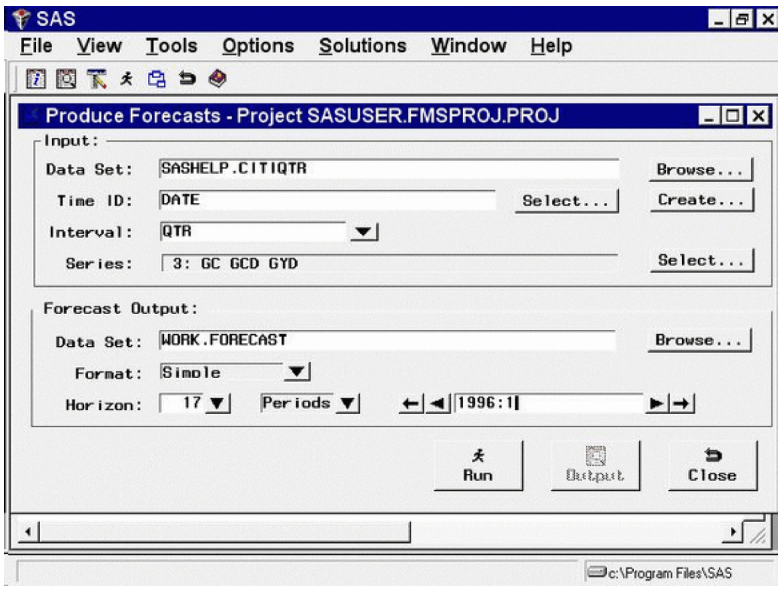


The Produce Forecasts window shows the input data set information and indicates the variables in the input data set for which forecasting models exist. Forecasts will be produced for these series. If you want to produce forecasts for only some of these series, use the Select button at the right of the Series field to select the series to forecast. The Data Set field in the `Forecast Output` box contains the name of the SAS data set in which the system will store the forecasts. The default output data set is WORK.FORECAST.

You can set the forecast horizon by using the controls on the line labeled `Horizon`. The default horizon is 12 periods. You can change it by specifying the number of periods, number of years, or the date of the last forecast period. Position the cursor in the date field and change the forecast ending date to 1 January 1996 by typing `jan1996` and pressing the ENTER key.

The window now appears as shown in Figure 59.17.

**Figure 59.17** Produce Forecasts Window



Now click the Run button to produce the forecasts. The system indicates that the forecasts have been stored in the output data set. Select `OK` to dismiss the notice.

## The Forecast Data Set

The Forecasting System can save the forecasts to a SAS data set in three different formats. Depending on your needs, you might find one of these output formats more convenient. The output data set format is controlled by the `Format` combo box. You can select the following output formats. The simple format is the default.

`Simple` The data set contains time ID variables and the forecast variables, and it contains one observation per time period. Observations for earlier time periods contain actual values copied from the input data set; later observations contain the forecasts.

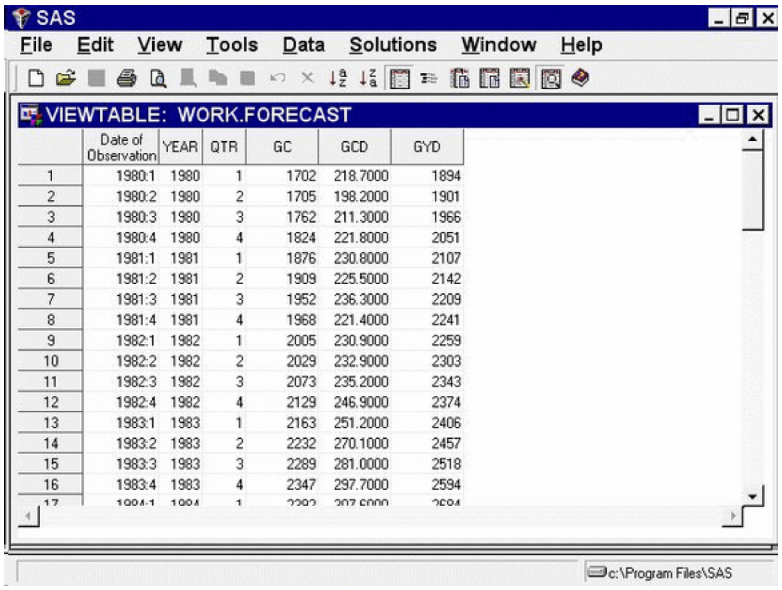
`Interleaved` The data set contains time ID variables, the variable TYPE, and the forecast variables. There are several observations per time period, with the meaning of each observation identified by the TYPE variable.

`Concatenated` The data set contains the variable SERIES, time ID variables, and the variables ACTUAL, PREDICT, ERROR, UPPER, LOWER, and STD. There is one observation per time period per forecast series. The variable SERIES contains the name of the forecast series, and the data set is sorted by SERIES and DATE.

## Simple Format Forecast Data Set

To see the simple format forecast data set that the system created, click the Output button. This opens a VIEWTABLE window to display the data set, as shown in Figure 59.18.

**Figure 59.18** Forecast Data Set—Simple Format



| | Date of Observation | YEAR | QTR | GC | GCD | GYD |
|---|---|---|---|---|---|---|
| 1 | 1980:1 | 1980 | 1 | 1702 | 218.7000 | 1894 |
| 2 | 1980:2 | 1980 | 2 | 1705 | 198.2000 | 1901 |
| 3 | 1980:3 | 1980 | 3 | 1762 | 211.3000 | 1966 |
| 4 | 1980:4 | 1980 | 4 | 1824 | 221.8000 | 2051 |
| 5 | 1981:1 | 1981 | 1 | 1876 | 230.8000 | 2107 |
| 6 | 1981:2 | 1981 | 2 | 1909 | 225.5000 | 2142 |
| 7 | 1981:3 | 1981 | 3 | 1952 | 236.3000 | 2209 |
| 8 | 1981:4 | 1981 | 4 | 1968 | 221.4000 | 2241 |
| 9 | 1982:1 | 1982 | 1 | 2005 | 230.9000 | 2259 |
| 10 | 1982:2 | 1982 | 2 | 2029 | 232.9000 | 2303 |
| 11 | 1982:3 | 1982 | 3 | 2073 | 235.2000 | 2343 |
| 12 | 1982:4 | 1982 | 4 | 2129 | 246.9000 | 2374 |
| 13 | 1983:1 | 1983 | 1 | 2163 | 251.2000 | 2406 |
| 14 | 1983:2 | 1983 | 2 | 2232 | 270.1000 | 2457 |
| 15 | 1983:3 | 1983 | 3 | 2289 | 281.0000 | 2518 |
| 16 | 1983:4 | 1983 | 4 | 2347 | 297.7000 | 2594 |

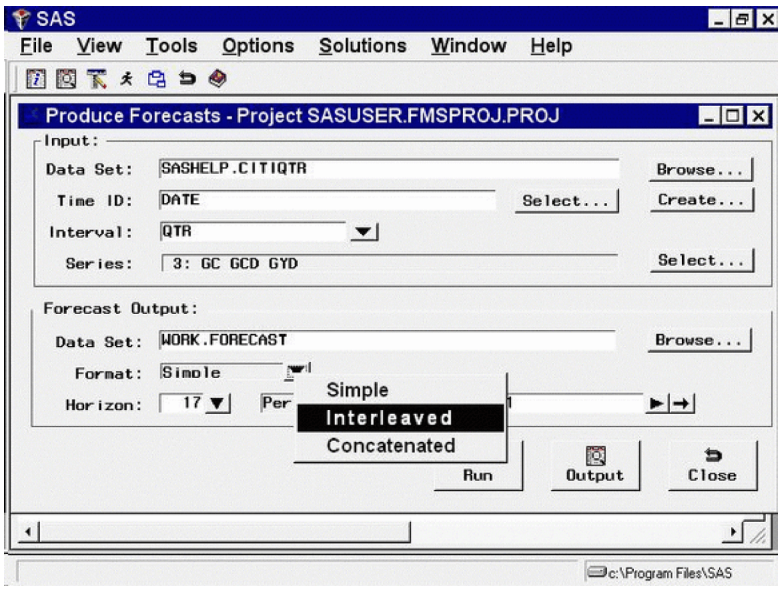
Figure 59.18 shows the default simple format. This form of the forecast data set contains time ID variables and the variables that you forecast. The forecast variables contain actual values or predicted values, depending on whether the date of the observation is within the range of data supplied in the input data set.

Select `File` and `Close` to close the VIEWTABLE window.

## Interleaved Format Forecast Data Set

From the Produce Forecasts window, use the list to select the `Interleaved` format, as shown in Figure 59.19.

**Figure 59.19** Forecast Data Set Options

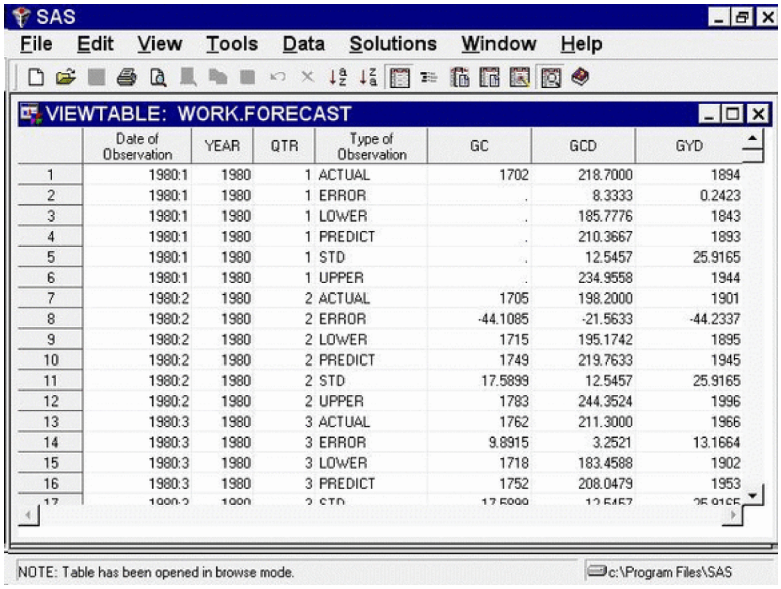


Now click the Run button again. The system presents a warning notice reminding you that the data set WORK.FORECAST already exists and asking if you want to replace it. Select `Replace`.

The forecasts are stored in the data set WORK.FORECAST again, this time in the *Interleaved* format. Dismiss the notice that the forecast was stored.

Now click the Output button again. This opens a VIEWTABLE window to display the data set, as shown in Figure 59.20.

**Figure 59.20** Forecast Data Set—Interleaved Format



| | Date of Observation | YEAR | QTR | Type of Observation | GC | GCD | GYD |
|---|---|---|---|---|---|---|---|
| 1 | 1980:1 | 1980 | 1 | ACTUAL | 1702 | 218.7000 | 1894 |
| 2 | 1980:1 | 1980 | 1 | ERROR | . | 8.3333 | 0.2423 |
| 3 | 1980:1 | 1980 | 1 | LOWER | . | 185.7776 | 1843 |
| 4 | 1980:1 | 1980 | 1 | PREDICT | . | 210.3667 | 1893 |
| 5 | 1980:1 | 1980 | 1 | STD | . | 12.5457 | 25.9165 |
| 6 | 1980:1 | 1980 | 1 | UPPER | . | 234.9558 | 1944 |
| 7 | 1980:2 | 1980 | 2 | ACTUAL | 1705 | 198.2000 | 1901 |
| 8 | 1980:2 | 1980 | 2 | ERROR | -44.1085 | -21.5633 | -44.2337 |
| 9 | 1980:2 | 1980 | 2 | LOWER | 1715 | 195.1742 | 1895 |
| 10 | 1980:2 | 1980 | 2 | PREDICT | 1749 | 219.7633 | 1945 |
| 11 | 1980:2 | 1980 | 2 | STD | 17.5899 | 12.5457 | 25.9165 |
| 12 | 1980:2 | 1980 | 2 | UPPER | 1783 | 244.3524 | 1996 |
| 13 | 1980:3 | 1980 | 3 | ACTUAL | 1762 | 211.3000 | 1966 |
| 14 | 1980:3 | 1980 | 3 | ERROR | 9.8915 | 3.2521 | 13.1664 |
| 15 | 1980:3 | 1980 | 3 | LOWER | 1718 | 183.4588 | 1902 |
| 16 | 1980:3 | 1980 | 3 | PREDICT | 1752 | 208.0479 | 1953 |

In the interleaved format, there are several output observations for each input observation, identified by the TYPE variable. The values of the forecast variables for observations with different TYPE values are as

follows:

| | |
|---|---|
| `ACTUAL` | actual values copied from the input data set |
| `ERROR` | the difference between the actual and predicted values |
| `LOWER` | the lower confidence limits |
| `PREDICT` | the predicted values from the forecasting model These are within-sample, one-step-ahead predictions for observations within the historical period, or multistep predictions for observations within the forecast period |
| `STD` | the estimated standard deviations of the prediction errors |
| `UPPER` | the upper confidence limits |

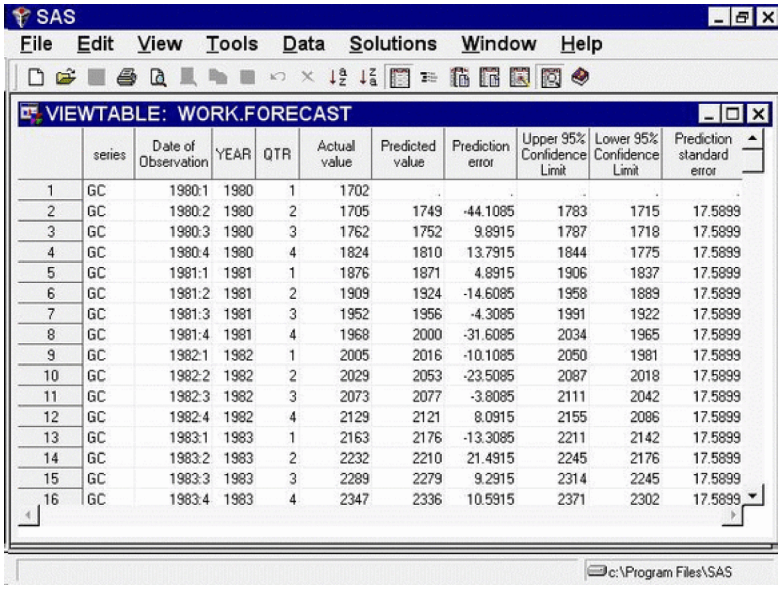
Select `File` and `Close` to close the VIEWTABLE window.

## Concatenated Format Forecast Data Set

Use the list to select the `Concatenated` format. Create the forecast data set again, and then click the Output button.

The VIEWTABLE window showing the concatenated format of the forecast data set appears, as shown in Figure 59.21.

**Figure 59.21** Forecast Data Set—Concatenated Format



| | series | Date of Observation | YEAR | QTR | Actual value | Predicted value | Prediction error | Upper 95% Confidence Limit | Lower 95% Confidence Limit | Prediction standard error |
|---|---|---|---|---|---|---|---|---|---|---|
| 1 | GC | 1980:1 | 1980 | 1 | 1702 | . | . | . | . | . |
| 2 | GC | 1980:2 | 1980 | 2 | 1705 | 1749 | -44.1085 | 1783 | 1715 | 17.5899 |
| 3 | GC | 1980:3 | 1980 | 3 | 1762 | 1752 | 9.8915 | 1787 | 1718 | 17.5899 |
| 4 | GC | 1980:4 | 1980 | 4 | 1824 | 1810 | 13.7915 | 1844 | 1775 | 17.5899 |
| 5 | GC | 1981:1 | 1981 | 1 | 1876 | 1871 | 4.8915 | 1906 | 1837 | 17.5899 |
| 6 | GC | 1981:2 | 1981 | 2 | 1909 | 1924 | -14.6085 | 1958 | 1889 | 17.5899 |
| 7 | GC | 1981:3 | 1981 | 3 | 1952 | 1956 | -4.3085 | 1991 | 1922 | 17.5899 |
| 8 | GC | 1981:4 | 1981 | 4 | 1968 | 2000 | -31.6085 | 2034 | 1965 | 17.5899 |
| 9 | GC | 1982:1 | 1982 | 1 | 2005 | 2016 | -10.1085 | 2050 | 1981 | 17.5899 |
| 10 | GC | 1982:2 | 1982 | 2 | 2029 | 2053 | -23.5085 | 2087 | 2018 | 17.5899 |
| 11 | GC | 1982:3 | 1982 | 3 | 2073 | 2077 | -3.8085 | 2111 | 2042 | 17.5899 |
| 12 | GC | 1982:4 | 1982 | 4 | 2129 | 2121 | 8.0915 | 2155 | 2086 | 17.5899 |
| 13 | GC | 1983:1 | 1983 | 1 | 2163 | 2176 | -13.3085 | 2211 | 2142 | 17.5899 |
| 14 | GC | 1983:2 | 1983 | 2 | 2232 | 2210 | 21.4915 | 2245 | 2176 | 17.5899 |
| 15 | GC | 1983:3 | 1983 | 3 | 2289 | 2279 | 9.2915 | 2314 | 2245 | 17.5899 |
| 16 | GC | 1983:4 | 1983 | 4 | 2347 | 2336 | 10.5915 | 2371 | 2302 | 17.5899 |

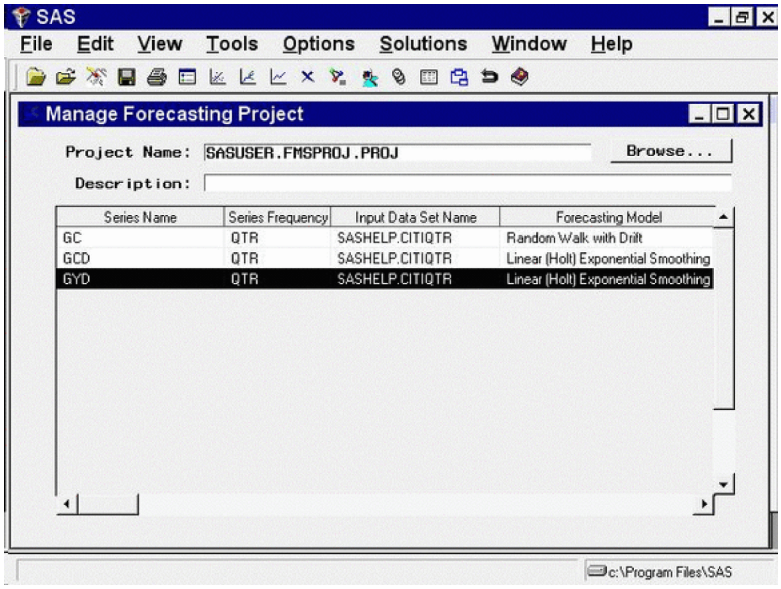
This completes the example of how to use the Produce Forecasts window. Select `File` and `Close` to close the VIEWTABLE window. Click the Close button to return to the Time Series Forecasting window.

## Forecasting Projects

The system collects all the forecasting models you create, together with the options you set, into a package called a *forecasting project*. You can save this information in a SAS catalog entry and restore your work in later forecasting sessions. You can store any number of forecasting projects under different catalog entry names.

To see how this works, click the Manage Projects button. This opens the Manage Forecasting Project window, as shown in Figure 59.22.

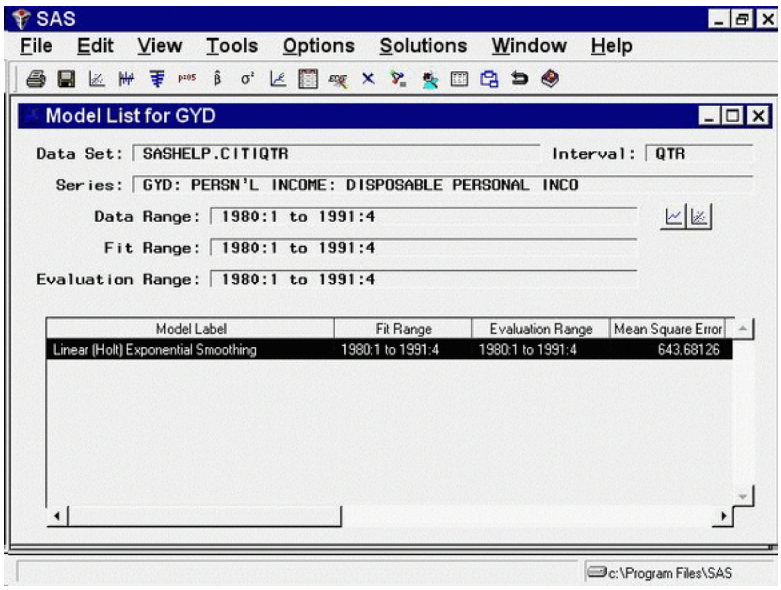
**Figure 59.22** Manage Forecasting Project Window



The table in this window lists the series for which forecasting models have been fit, and it shows for each series the forecasting model used to produce the forecasts. This window provides several features that allow you to manage the information in your forecasting project.

You can select a row of the table to drill down to the list of models fit to the series. Select the GYD row of the table, either by double-clicking with the mouse or by clicking once to highlight the table row and then selecting `List Models` from the toolbar or from the Tools menu. This opens the Model List window for this series, as shown in Figure 59.23.

**Figure 59.23** Model List Window



Because the Automatic Model Fitting process kept only the best fitting model, only one model appears in the model list. You can fit and retain any number of models for each series, and all the models fit and kept will appear in the series' model list.

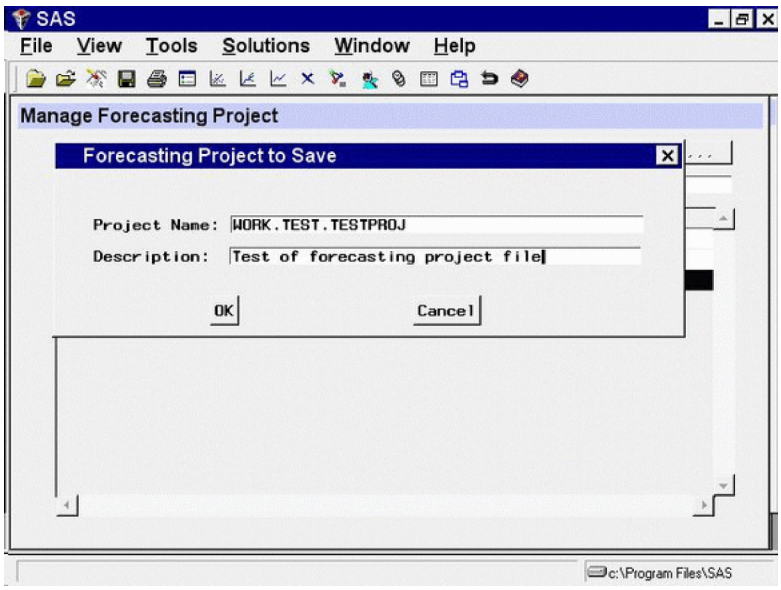
Select `Close` from the toolbar or from the File menu to return to the Manage Forecasting Project window.

## Saving and Restoring Project Information

To illustrate how you can save your work between sessions, in this section you will exit and then re-enter the Forecasting System.

From the Manage Forecasting Project window, select `File` and `Save as`. This opens the Forecasting Project to Save window. In the Project Name field, type the name WORK.TEST.TESTPROJ. In the Description field, type "Test of forecasting project file." The window should now appear as shown in Figure 59.24.

**Figure 59.24** Project to Save Name and Description



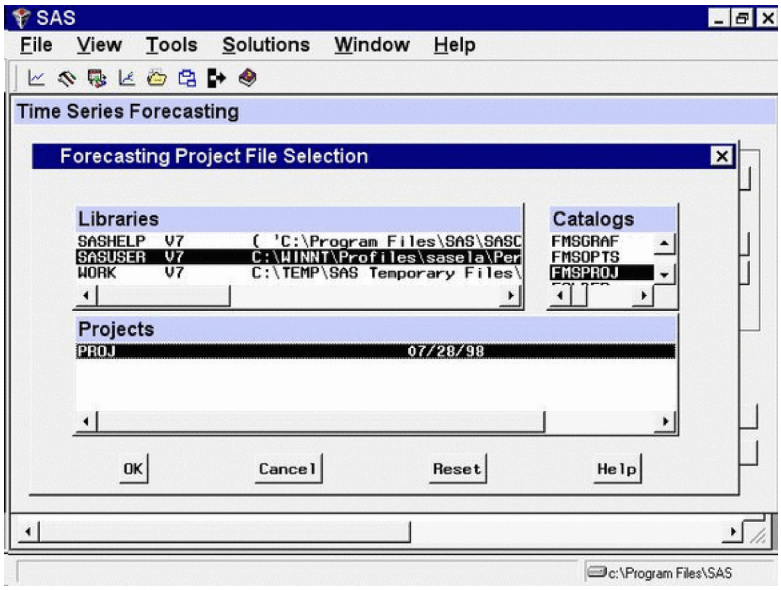
Click the OK button. This returns you to the Project Management window and displays a message indicating that the project was saved.

Select `Close` from the toolbar or from the File menu to return to the Time Series Forecasting window. Now click the Exit button. The system asks if you are sure you want to exit the system; select `Yes`. The forecasting application now terminates.

Open the forecasting application again. A new project name is displayed by default.

Now restore the forecasting project you saved previously. Click the Browse button to the right of the Project field. This opens the Forecasting Project File Selection window, as shown in Figure 59.25.

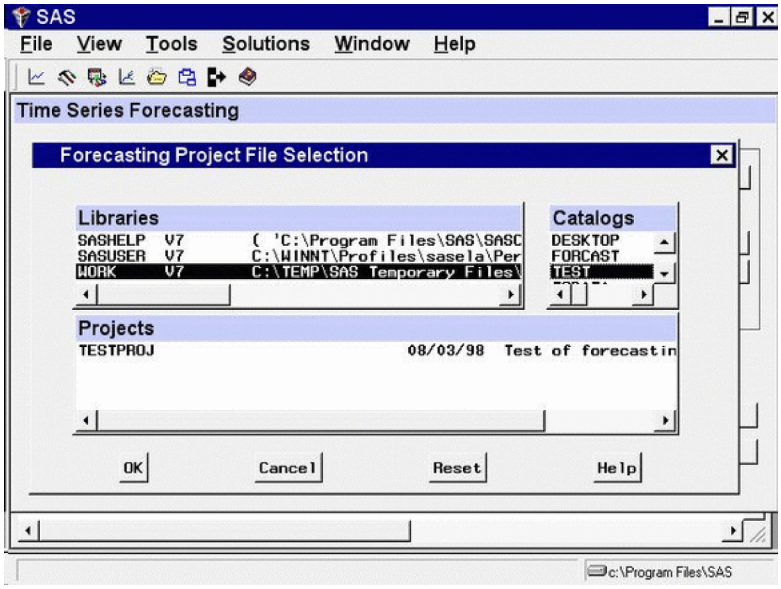
**Figure 59.25** Forecasting Project File Selection Window



Select the WORK library from the Libraries list. The Catalogs list now shows all the SAS catalogs in the WORK library.

Select the TEST catalog. The Projects list now shows the list of forecasting projects in the catalog TEST. So far, you have created only one project file, TESTPROJ; so TESTPROJ is the only entry in the Projects list, as shown in Figure 59.26.

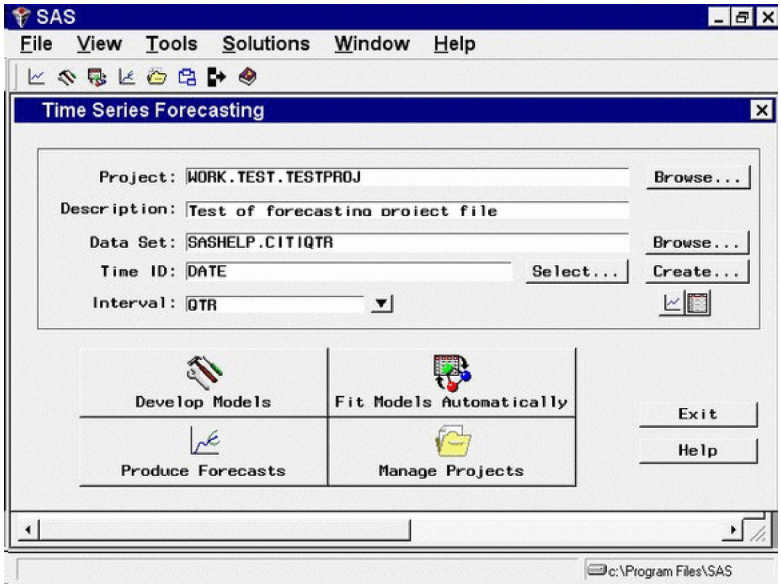
**Figure 59.26** Forecasting Projects List



Select TESTPROJ from the Projects list and then click the OK button. This returns you to the Time Series Forecasting window.

The system loads the project information you saved in TESTPROJ and displays a message indicating this. The Project field is now set to WORK.TEST.TESTPROJ, and the description is the description you previously gave to TESTPROJ, as shown in Figure 59.27.

**Figure 59.27** Time Series Forecasting Window after Loading Project



If you now click the Manage Projects button, you will see the list of series and forecasting models you created in the previous forecasting session.

## Sharing Projects

If you plan to work with others on a forecasting project, you might need to consider how project information can be shared. The series, models, and results of your project are stored in a forecasting project (FMSPROJ) catalog entry in the location you specify, as illustrated in the previous section. You need only read access to the catalog to work with it, but you must have write access to save the project. Multiple users cannot open a project for update at the same time, but they can do so at different times if they all have write access to the catalog where it is stored.

Project options settings such as the *model selection criterion* and *number of models to keep* are stored in an SLIST catalog entry in the SASUSER or TSFSUSER library. Write access to this catalog is required. If you have only read access to the SASUSER library, you can use the -RSASUSER option when starting SAS. You will be prompted for a location for the TSFSUSER library, if it is not already assigned. If you want to use TSFSUSER routinely, assign it before you start the Time Series Forecasting System. Select New from the SAS Explorer file menu. In the New Library window, type TSFSUSER for the name. Click the Browse button and select the directory or folder you want to use. Turn on the *enable at startup* option so this library will be assigned automatically in subsequent sessions.

The SASUSER library is typically used for private settings saved by individual users. This is the default location for project options. If a work group shares a single options catalog (SASUSER or TSFSUSER points to the same location for all users), then only one user can use the system at a time.

# Develop Models Window

In the first forecasting example, you used the Automatic Model Fitting window to fit and select the forecasting model for each series automatically. In addition to this automatic forecasting process, you can also work with time series one at a time to fit forecasting models and apply your own judgment to choose the best forecasting model for each series.

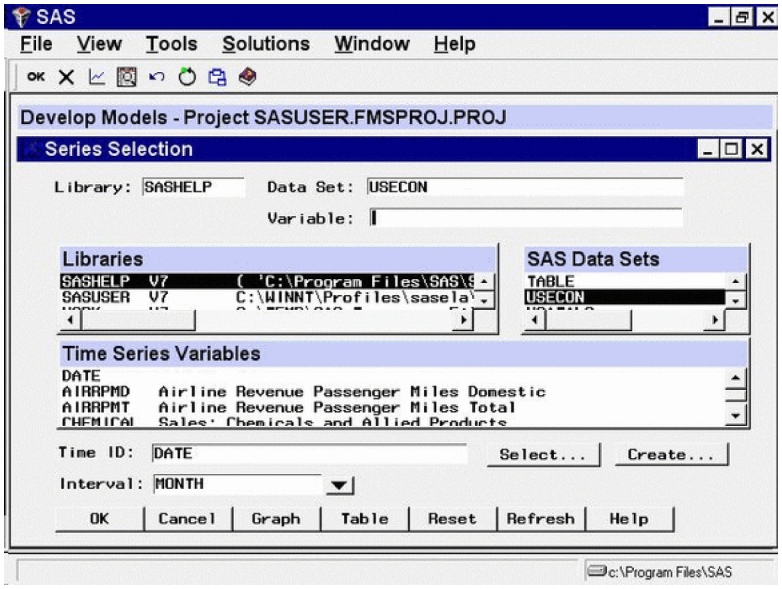
Using the Automatic Model Fitting feature, the system acts like a "black box." This section goes inside the black box to look at the kinds of forecasting methods that the system provides and introduces some of the tools the system offers to help you find the best forecasting model.

## Introduction

From the Time Series Forecasting window, click the Browse button to the right of the Data Set field to open the Data Set Selection window. Select the USECON data set from the SASHELP library. This data set contains monthly data on the U.S. economy.

Click OK to close the selection window. Now click the Develop Models button. This opens the Series Selection window, as shown in Figure 59.28. You can enlarge this window for easier viewing of lists of data sets and series.

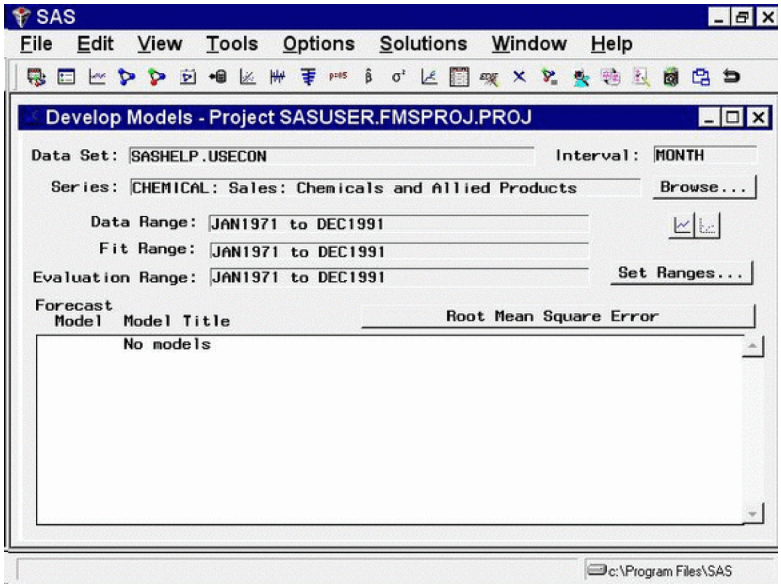
**Figure 59.28** Series Selection Window



Select the series CHEMICAL: Sales of Chemicals and Allied Products, and then click the OK button.

This opens the Develop Models window, as shown in Figure 59.29.

**Figure 59.29** Develop Models Window



The Data Set, Interval, and Series fields in the upper part of the Develop Models window indicate the series with which you are currently working. You can change the settings of these fields by clicking the Browse button.

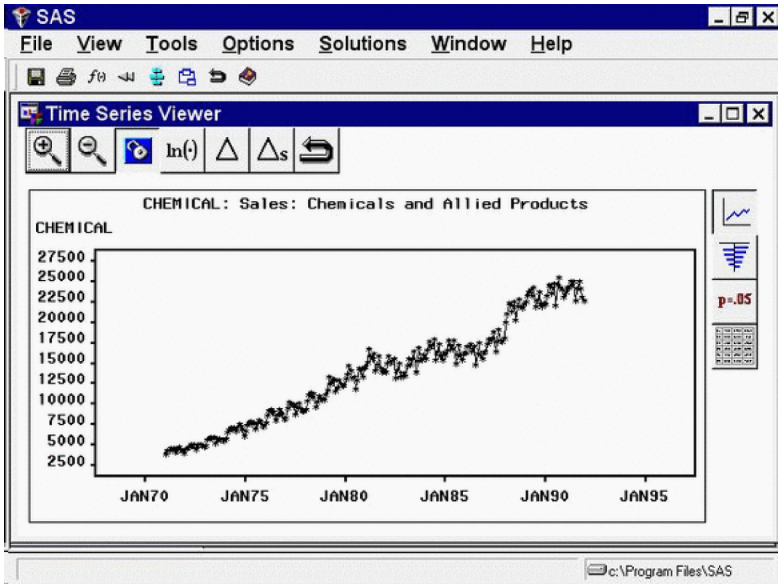
The Data Range, Fit Range, and Evaluation Range fields show the time period over which data are available for the current series, and what parts of that time period are used to fit forecasting models to the series and to evaluate how well the models fit the data. You can change the settings of these fields by clicking the Set Ranges button.

The bottom part of the Develop Models window consists of a table of forecasting models fit to the series. Initially, the list is empty, as indicated by the message "No models." You can fit any number of forecasting models to each series and designate which one you want to use to produce forecasts.

Graphical tools are available for exploring time series and fitted models. The two icons below the Browse button access the Time Series Viewer and the Model Viewer.

Select the left icon. This opens the Time Series Viewer window, as shown in Figure 59.30.

**Figure 59.30** Chemical and Allied Product Series



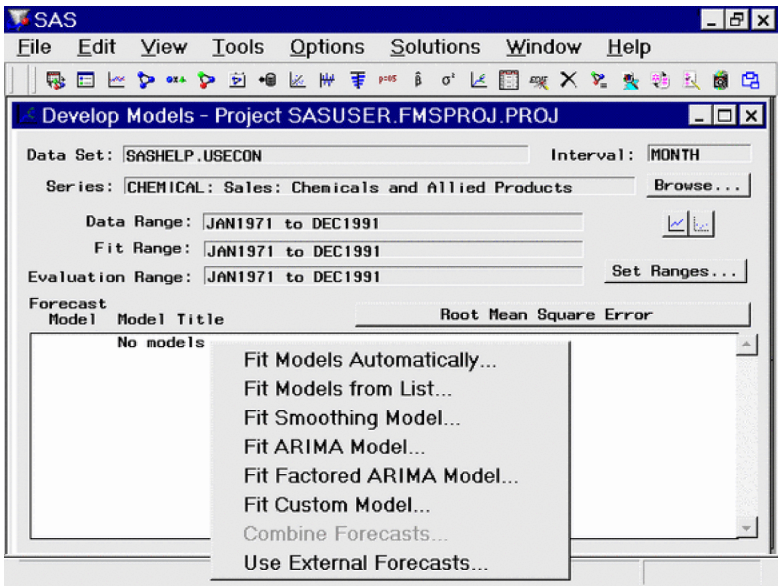
The Time Series Viewer displays a plot of the CHEMICAL series. The Time Series Viewer offers many useful features, which are explored in later sections.

The Time Series Viewer appears in a separate resizable window. You can switch back and forth between the Time Series Viewer window and other windows. For now, return to the Develop Models window. You can close the Time Series Viewer window or leave it open. (To close the Time Series Viewer window, select `Close` from the toolbar or from the File menu.)

## Fitting Models

To open a menu of model fitting choices, select `Edit` from the menu bar and then select `Fit Model`, or select `Fit Models from List` in the toolbar, or simply select a blank line in the table as shown in Figure 59.31.

**Figure 59.31** Menu of Model Fitting Choices



The Forecasting System provides several ways to specify forecasting models. The eight choices given by the menu shown in Figure 59.31 are as follows:

`Fit Models Automatically`
: performs for the current series the same automatic model selection process that the Automatic Model Fitting window applies to a set of series.

`Fit Models from List`
: presents a list of commonly used forecasting models for convenient point-and-click selection.

`Fit Smoothing Model`
: displays the Smoothing Model Specification window, which enables you to specify several kinds of exponential smoothing and Winters method forecasting models.

`Fit ARIMA Model`
: displays the ARIMA Model Specification window, which enables you to specify many kinds of autoregressive integrated moving average (ARIMA) models, including seasonal ARIMA models and ARIMA models with regressors, transfer functions, and other predictors.

`Fit Factored ARIMA Model`
: displays the Factored ARIMA Model Specification window, which enables you to specify more general ARIMA models, including subset models and models with unusual and/or multiple seasonal cycles. It also supports regressors, transfer functions, and other predictors.

`Fit Custom Model`
: displays the Custom Model Specification window, which enables you to construct a forecasting model by specifying separate options for transforming the data, modeling the trend, modeling seasonality, modeling autocorrelation of the errors, and modeling the effect of regressors and other independent predictors.

`Combine Forecasts`
: displays the Forecast Combination Model Specification window, which enables you to specify models that produce forecasts by combining, or averaging, the forecasts from other models. (This option is not available unless you have fit at least two models.)

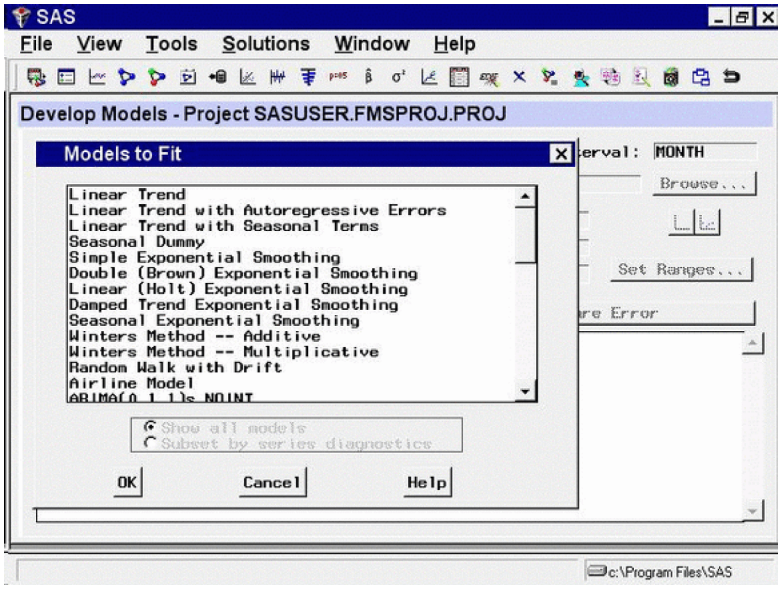
`Use External Forecasts`
: displays the External Forecast Model Specification window, which enables you to use judgmental or externally produced forecasts that have been saved in a separate series in the data set.

All of the forecasting models used by the system are ultimately specified through one of the four windows: Smoothing Method Specification, ARIMA Model Specification, Factored ARIMA Model Specification, or Custom Model Specification. You can specify the same models with either the ARIMA Model Specification window or the Custom Model Specification window, but the Custom Model Specification window can provide a more natural way to specify models for those who are less familiar with the Box-Jenkins style of time series model specification.

The Automatic Model feature, the Models to Fit window, and the Forecast Combination Model Specification window all deal with lists of forecasting models previously defined through the Smoothing Model, ARIMA Model, or Custom Model specification windows. These windows are discussed in detail in later sections.

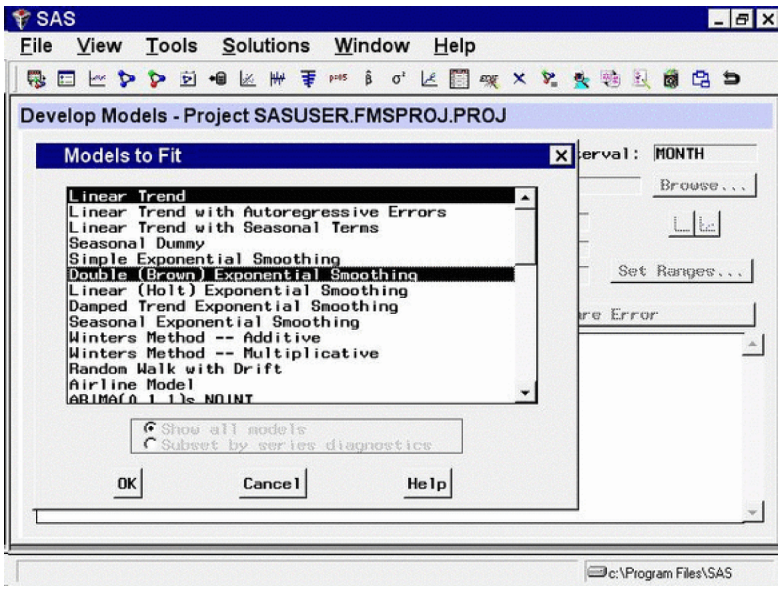
To get started using the Develop Models window, select the Fit Models from List item from the menu shown in Figure 59.31. This opens the Models to Fit window, as shown in Figure 59.32.

**Figure 59.32** Models to Fit Window



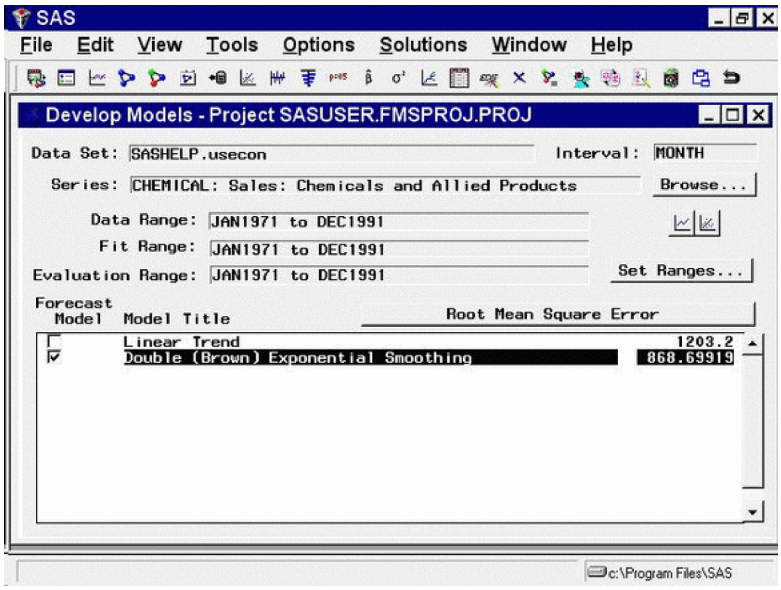
You can select several models to fit at once by holding down the CTRL key as you make the selections. Select `Linear Trend` and `Double (Brown) Exponential Smoothing`, as shown in Figure 59.33, and then click the OK button.

**Figure 59.33** Selecting Models to Fit



The system fits the two models you selected. After the models are fit, the labels of the two models and their goodness-of-fit statistic are added to the model table, as shown in Figure 59.34.

**Figure 59.34** Fitted Models List



## Model List and Statistics of Fit

In the model list, the Model Title column shows the descriptive labels for the two fitted models, in this case Linear Trend and Double Exponential Smoothing.

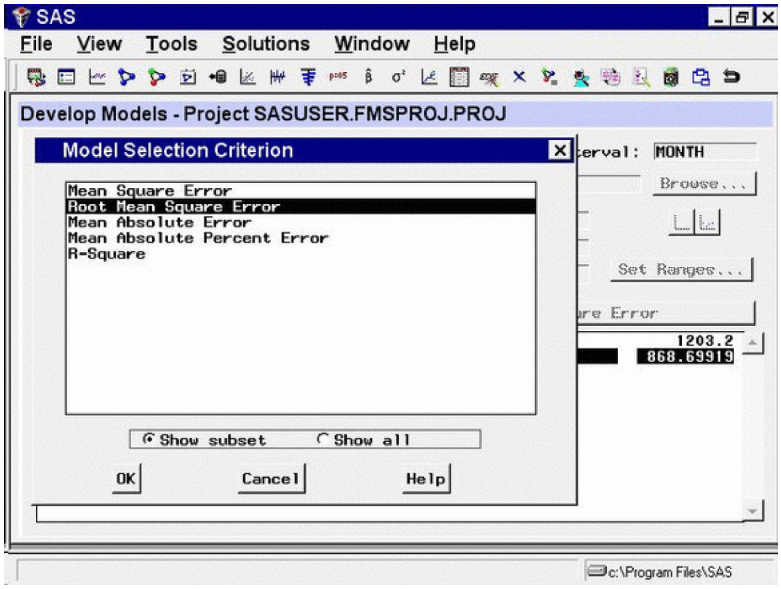
The column labeled Root Mean Square Error (or labeled Mean Absolute Percent Error if you continued from the example in the previous section) shows the goodness-of-fit criterion used to decide which model fits better. By default, the criterion used is the root mean square error, but you can choose a different measure of fit. The linear trend model has a root mean square error of 1203, while the double exponential smoothing model fits better, with a RMSE of only 869.

The left column labeled Forecast Model consists of check boxes that indicate which one of the models in the list has been selected as the model to use to produce the forecasts for the series. When new models are fit and added to the model list, the system sets the Forecast Model flags to designate the one model with the best fit—as measured by the selected goodness-of-fit statistic—as the forecast model. (In the case of ties, the first model with the best fit is selected.)

Because the Double Exponential Smoothing model has the smaller RMSE of the two models in the list, its Forecast Model check box is set. If you would rather produce forecasts by using the Linear Trend model, choose it by selecting the corresponding check box in the Forecast Model column.

To use a different goodness-of-fit criterion, click the button with the current criterion name on it (Root Mean Square Error or Mean Absolute Percent Error). This opens the Model Selection Criterion window, as shown in Figure 59.35.

**Figure 59.35** Model Selection Criterion Window

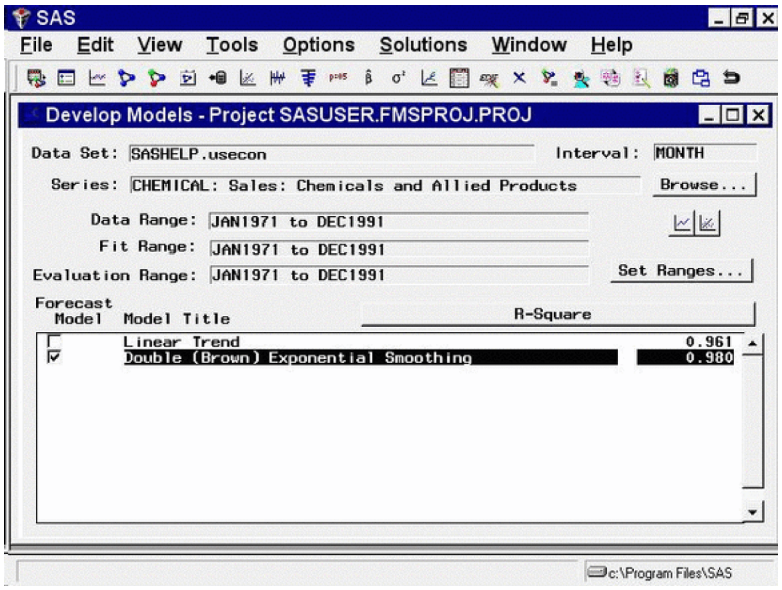


The system provides many measures of fit that you can use as the model selection criterion. To avoid confusion, only the most popular of the available fit statistics are shown in this window by default. To display the complete list, you can select the `Show all` option. You can control the subset of statistics listed in this window through the Statistics of Fit item in the Options menu on the Develop Models window.

Initially, Root Mean Square Error is selected. Select R-Square and then click the OK button. This changes

the fit statistic displayed in the model list, as shown in Figure 59.36.

**Figure 59.36** Model List with R-Square Statistics

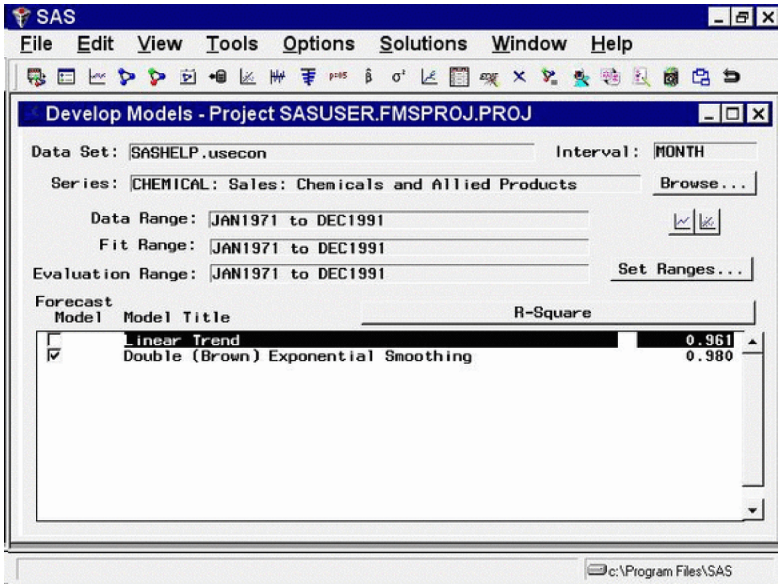


Now that you have fit some models to the series, you can use the Model Viewer button to take a closer look at the predictions of these models.

## Model Viewer

In the Develop Models window, select the row in the table containing the Linear Trend model so that this model is highlighted. The model list should now appear as shown in Figure 59.37.

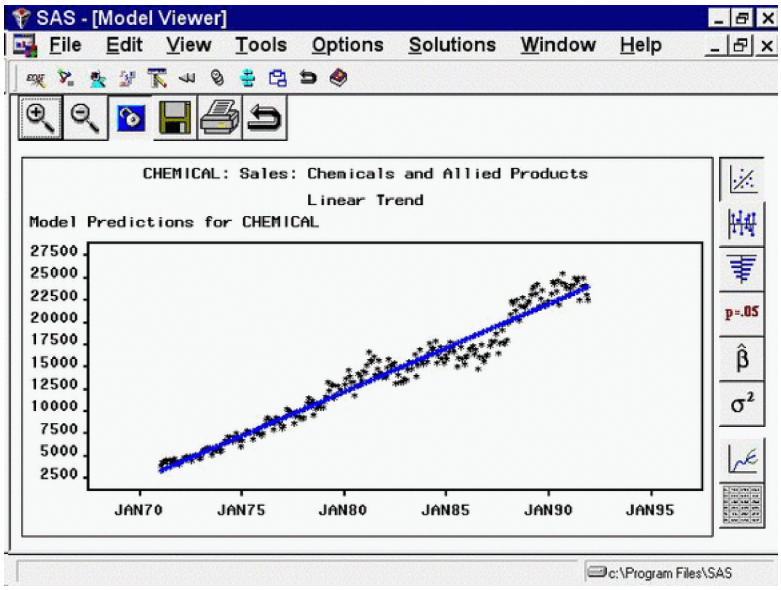
**Figure 59.37** Selecting a Model to View



Note that the Linear Trend model is now highlighted, but the Forecast Model column still shows the Double Exponential Smoothing model as the model chosen to produce the final forecasts for the series. Selecting a model in the list means that this is the model that menu items such as `View Model`, `Delete`, `Edit`, and `Refit` will act upon. Choosing a model by selecting its check box in the Forecast Model column means that this model will be used by the Produce Forecasts process to generate forecasts.

Now open the Model Viewer by selecting the right-hand icon under the Browse button, or by selecting `Model Predictions` in the toolbar or from the View menu. The Model Viewer displays the Linear Trend model, as shown in Figure 59.38.

**Figure 59.38** Model Viewer: Actual and Predicted Values Plot

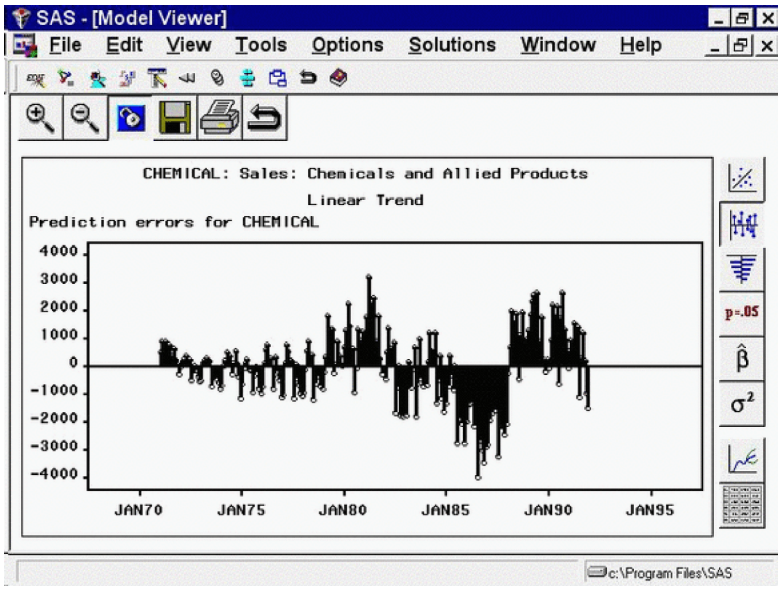


This graph shows the linear trend line representing the model predicted values together with a plot of the actual data values, which fluctuate about the trend line.

## Prediction Error Plots

Select the second icon from the top in the vertical toolbar in the Model Viewer window. This switches the Viewer to display a plot of the model prediction errors (actual data values minus the predicted values), as shown in Figure 59.39.

**Figure 59.39** Model Viewer: Prediction Errors Plot

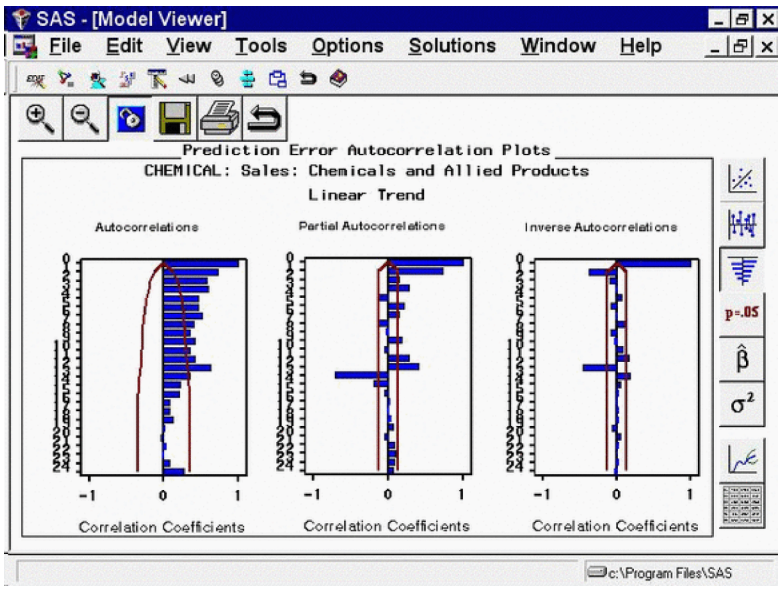


If the model being viewed includes a transformation, prediction errors are defined as the difference between the transformed series actual values and model predictions. You can choose to graph instead the difference between the untransformed series values and untransformed model predictions, which are called *model residuals*. You can also graph normalized prediction errors or normalized model residuals. Use the Residual Plot Options submenu under the Options menu.

## Autocorrelation Plots

Select the third icon from the top in the vertical toolbar. This switches the Viewer to display a plot of autocorrelations of the model prediction errors at different lags, as shown in Figure 59.40. Autocorrelations, partial autocorrelations, and inverse autocorrelations are displayed, with lines overlaid at plus and minus two standard errors. You can switch the graphs so that the bars represent significance probabilities by selecting the Correlation Probabilities item on the toolbar or from the View menu. For more information about the meaning and use of autocorrelation plots, see Chapter 8, "The ARIMA Procedure."

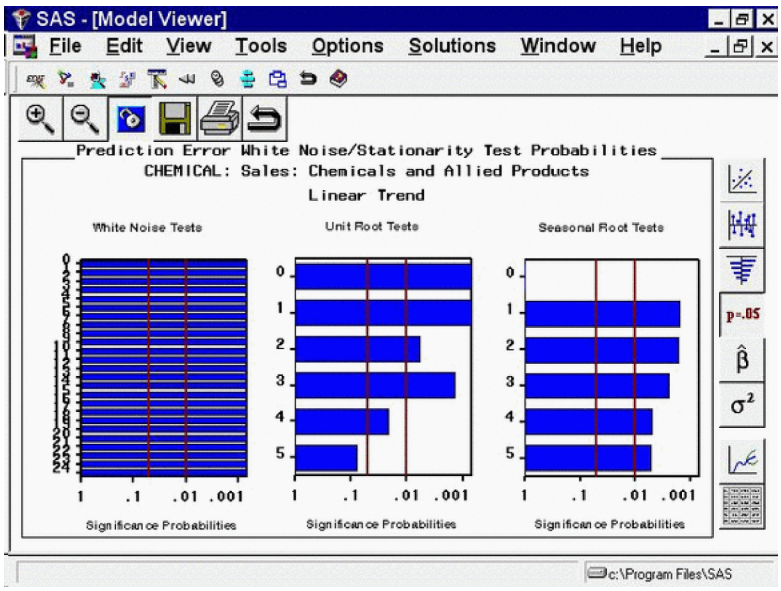
**Figure 59.40** Model Viewer: Autocorrelations Plot



## White Noise and Stationarity Plots

Select the fourth icon from the top in the vertical toolbar. This switches the Viewer to display a plot of white noise and stationarity tests on the model prediction errors, as shown in Figure 59.41.

**Figure 59.41** Model Viewer: White Noise and Stationarity Plot



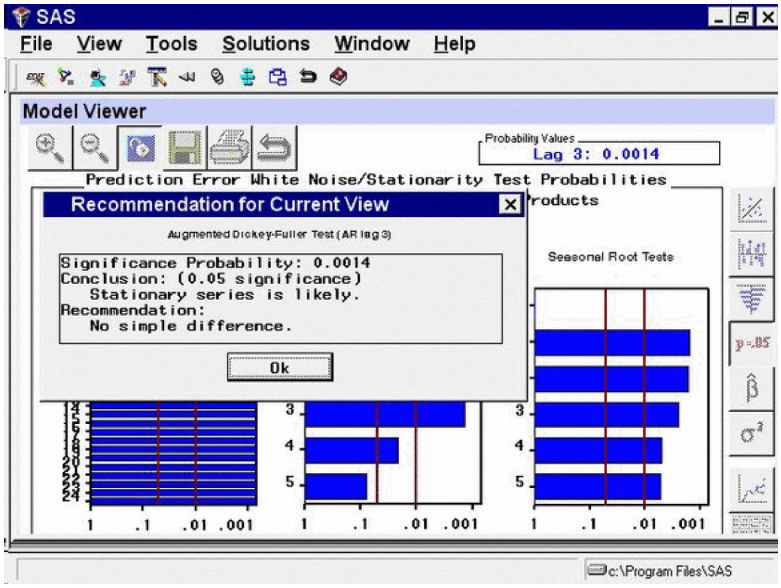
The white noise test bar chart shows significance probabilities of the Ljung-Box chi square statistic. Each bar shows the probability computed on autocorrelations up to the given lag. Longer bars favor rejection of the null hypothesis that the prediction errors represent white noise. In this example, they are all significant

beyond the 0.001 probability level, so that you reject the null hypothesis. In other words, the high level of significance at all lags makes it clear that the linear trend model is inadequate for this series.

The second bar chart shows significance probabilities of the augmented Dickey-Fuller test for unit roots. For example, the bar at lag three indicates a probability of 0.0014, so that you reject the null hypothesis that the series is nonstationary. The third bar chart is similar to the second except that it represents the seasonal lags. Since this series has a yearly seasonal cycle, the bars represent yearly intervals.

You can select any of the bars to display an interpretation. Select the fourth bar of the middle chart. This displays the `Recommendation for Current View`, as shown in Figure 59.42. This window gives an interpretation of the test represented by the bar that was selected; it is significant, therefore a stationary series is likely. It also gives a recommendation: You do not need to perform a simple difference to make the series stationary.

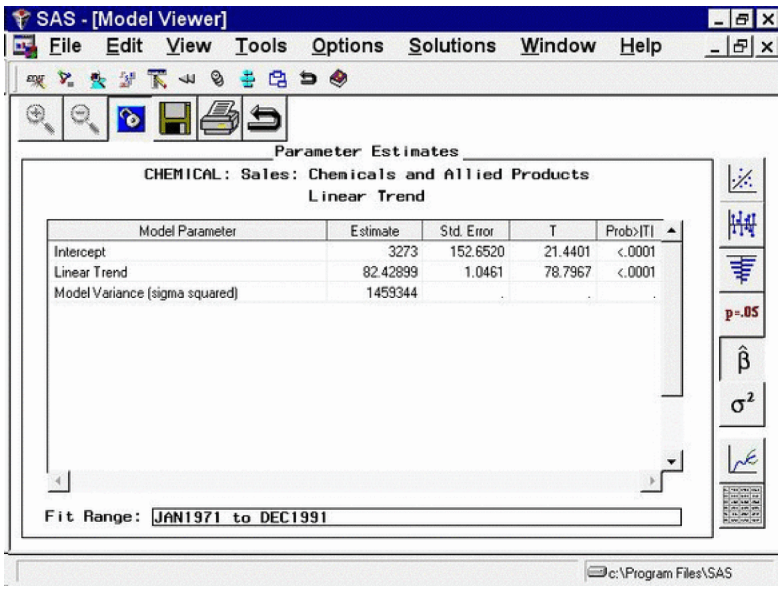
**Figure 59.42** Model Viewer: Recommendation for Current View



## Parameter Estimates Table

Select the fifth icon from the top in the vertical toolbar to the right of the graph. This switches the Viewer to display a table of parameter estimates for the fitted model, as shown in Figure 59.43.

**Figure 59.43** Model Viewer: Parameter Estimates Table

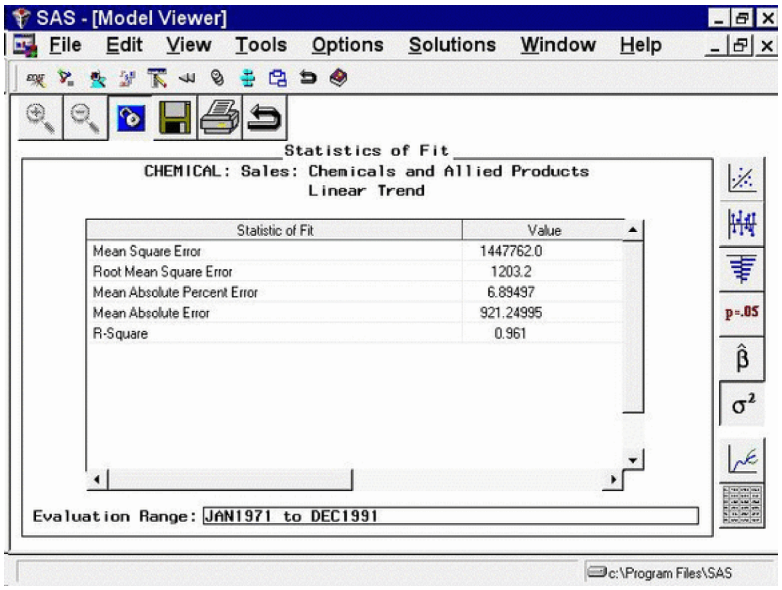


For the linear trend model, the parameters are the intercept and slope coefficients. The table shows the values of the fitted coefficients together with standard errors and *t* tests for the statistical significance of the estimates. The model residual variance is also shown.

## Statistics of Fit Table

Select the sixth icon from the top in the vertical toolbar to the right of the table. This switches the Viewer to display a table of statistics of fit computed from the model prediction errors, as shown in Figure 59.44. The list of statistics displayed is controlled by selecting `Statistics of Fit` from the Options menu.

**Figure 59.44** Model Viewer: Statistics of Fit Table



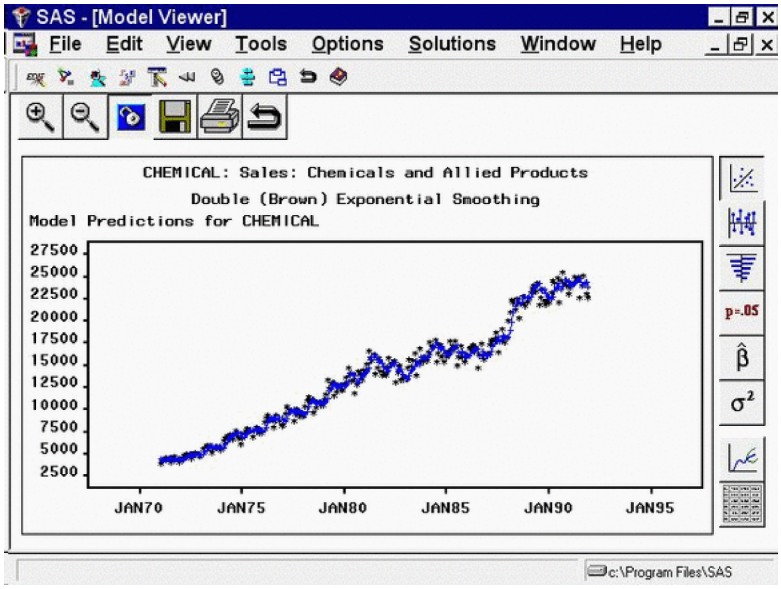
## Changing to a Different Model

Select the first icon in the vertical toolbar to the right of the table to return the display to the predicted and actual values plots (Figure 59.38).

Now return to the Develop Models window, but do not close the Model Viewer window. You can use the Next Viewer icon in the toolbar or your system's window manager controls to switch windows. You can resize the windows to make them both visible.

Select the Double Exponential Smoothing model so that this line of the model list is highlighted. The Model Viewer window is now updated to display a plot of the predicted values for the Double Exponential Smoothing model, as shown in Figure 59.45. The Model Viewer is automatically updated to display the currently selected model, unless you specify `Unlink` (the third icon in the window's horizontal toolbar).

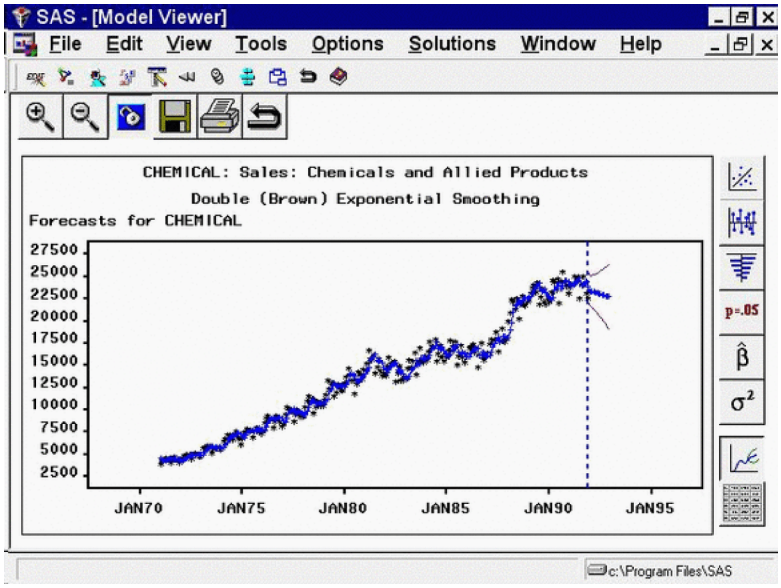
**Figure 59.45** Model Viewer Plot for Exponential Smoothing Model



## Forecasts and Confidence Limits Plots

Select the seventh icon from the top in the vertical toolbar to the right of the graph. This switches the Viewer to display a plot of forecast values and confidence limits, together with actual values and one-step-ahead within-sample predictions, as shown in Figure 59.46.

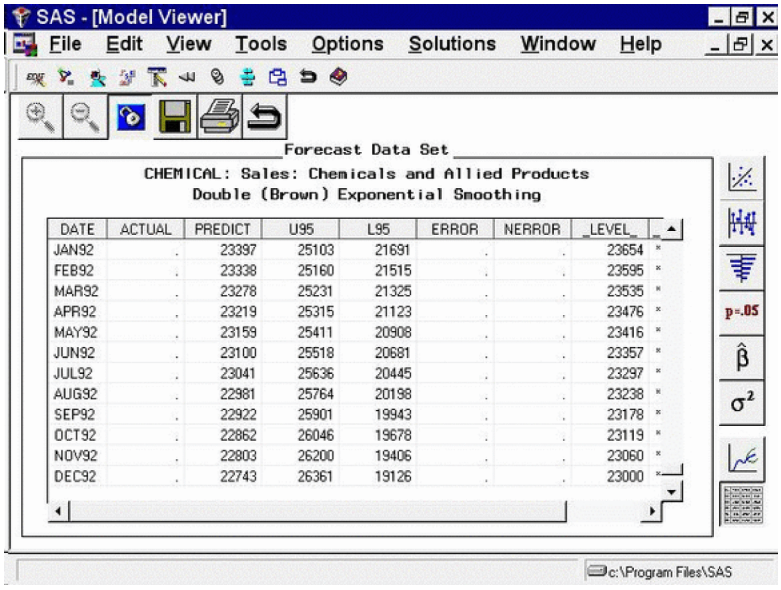
**Figure 59.46** Model Viewer: Forecasts and Confidence Limits



## Data Table

Select the last icon at the bottom of the vertical toolbar to the right of the graph. This switches the Viewer to display the forecast data set as a table, as shown in Figure 59.47.

**Figure 59.47** Model Viewer: Forecast Data Table



To view the full data set, use the vertical and horizontal scroll bars on the data table or enlarge the window.

## Closing the Model Viewer

Other features of the Model Viewer and Develop Models window are discussed later in this book. For now, close the Model Viewer window and return to the Time Series Forecasting window.

To close the Model Viewer window, select `Close` from the window's horizontal toolbar or from the File menu.

# Chapter 60
# Creating Time ID Variables

**Contents**

Creating a Time ID Value from a Starting Date and Frequency . . . . . 3987
Using Observation Numbers as the Time ID . . . . . 3990
Creating a Time ID from Other Dating Variables . . . . . 3992

The Forecasting System requires that the input data set contain a time ID variable. If the data you want to forecast are not in this form, you can use features of the Forecasting System to help you add time ID variables to your data set. This chapter shows examples of how to use these features.

## Creating a Time ID Value from a Starting Date and Frequency

As a first example of adding a time ID variable, use the SAS data set created by the following statements. (Or use your own data set if you prefer.)

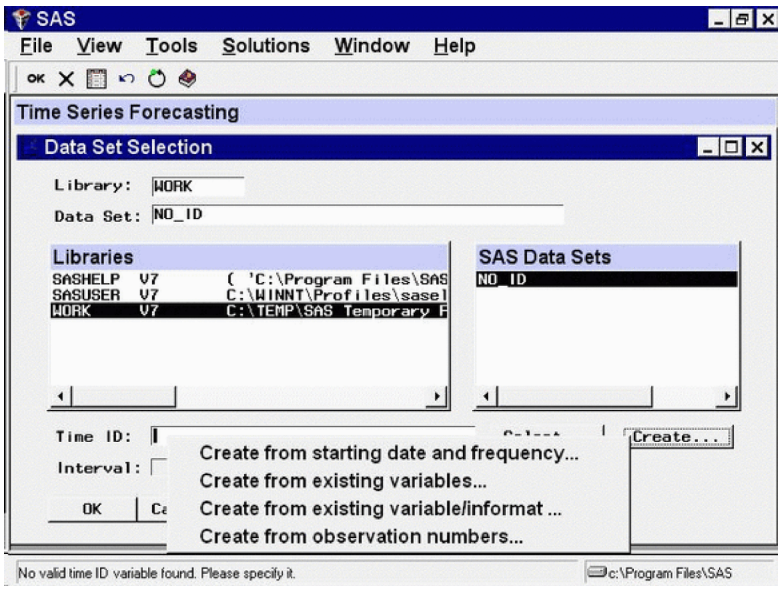
```
data no_id;
   input y @@;
datalines;
  10 15 20 25 30 35 40 45
  50 55 60 65 70 75 80 85
run;
```

Submit these SAS statements to create the data set NO_ID. This data set contains the single variable Y. Assume that Y is a quarterly series and starts in the first quarter of 1991.

In the Time Series Forecasting window, use the Browse button to the right of the `Data set` field to bring up the Data Set Selection window. Select the WORK library, and then select the NO_ID data set.

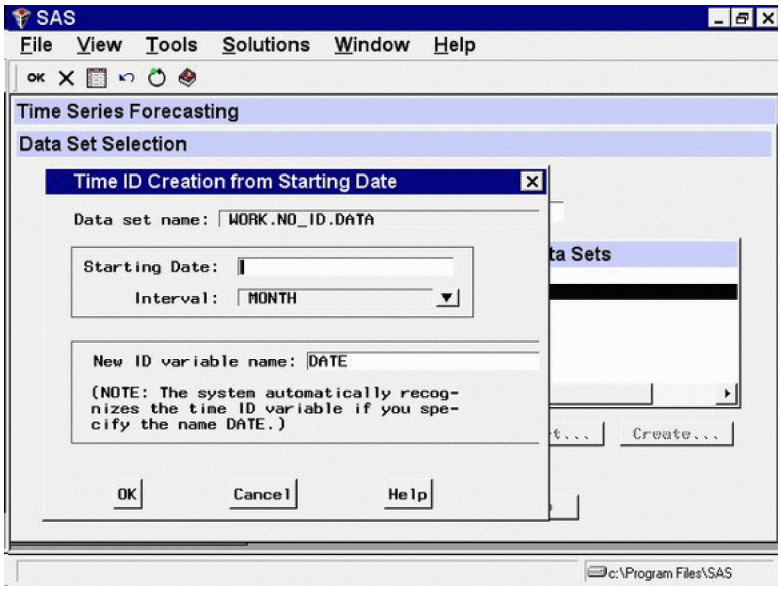
You must create a time ID variable for the data set. Click the Create button to the right of the Time ID field. This opens a menu of choices for creating the time ID variable, as shown in Figure 60.1.

**Figure 60.1** Time ID Creation Pop-up Menu



Select the first choice, `Create from starting date and frequency`. This opens the Time ID Creation from Starting Date window shown in Figure 60.2.

**Figure 60.2** Time ID Creation from Starting Date Window



Enter the starting date, 1991:1, in the `Starting Date` field.

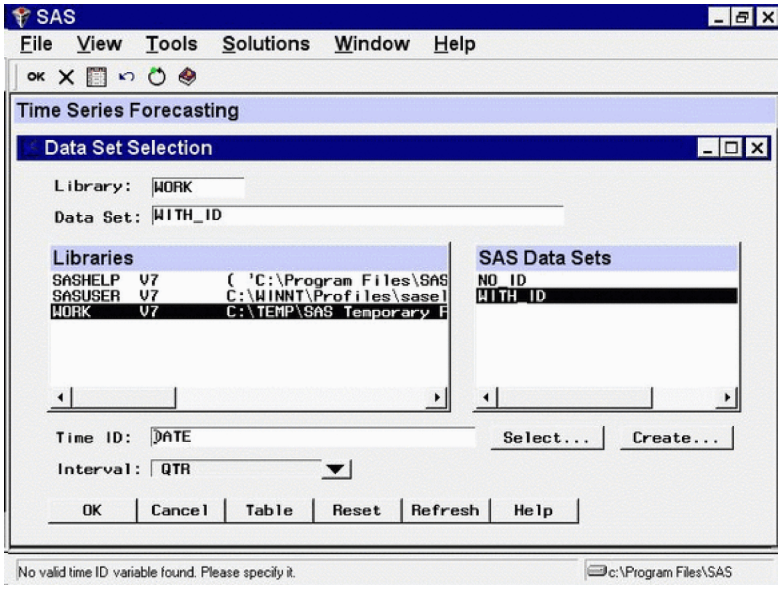
Select the `Interval` list arrow and select QTR. The Interval value QTR means that the time interval between successive observations is a quarter of a year; that is, the data frequency is quarterly.

Now select the `OK` button. The system prompts you for the name of the new data set. If you want to create a new copy of the input data set with the DATE variable added, enter a name for the new data set. If you want

to replace the NO_ID data set with the new copy containing DATE, just select the `OK` button without changing the name.

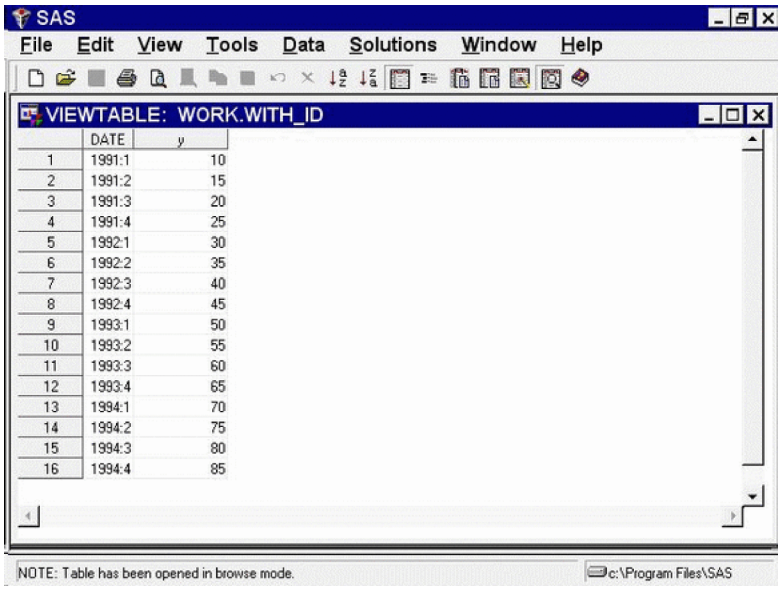
For this example, change the `New name` field to WITH_ID and select the `OK` button. The data set WITH_ID is created containing the series Y from NO_ID and the added ID variable DATE. The system returns to the Data Set Selection window, which now appears as shown in Figure 60.3.

**Figure 60.3** Data Set Selection Window after Creating Time ID



Select the `Table` button to see the new data set WITH_ID. This opens a VIEWTABLE window for the data set WITH_ID, as shown in Figure 60.4. Select `File` and `Close` to close the VIEWTABLE window.

**Figure 60.4** Viewtable Display of Data Set with Time ID Added



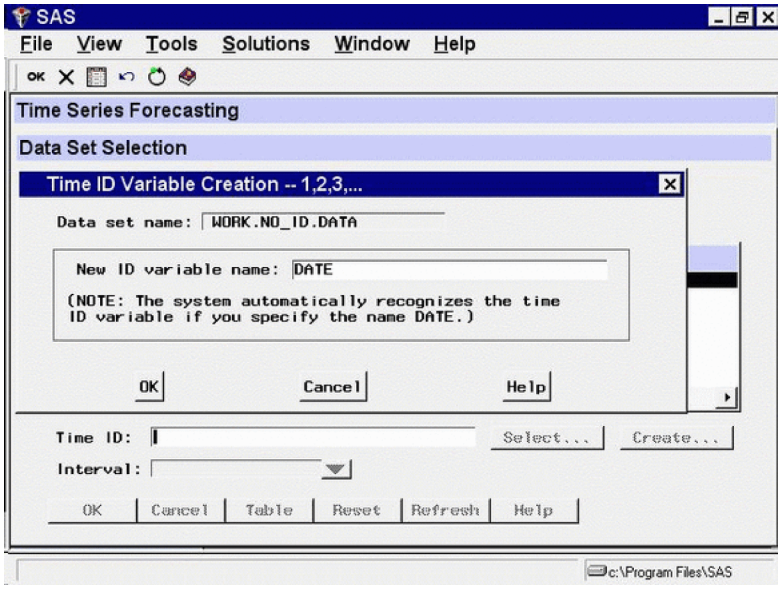
| | DATE | y |
|---|---|---|
| 1 | 1991:1 | 10 |
| 2 | 1991:2 | 15 |
| 3 | 1991:3 | 20 |
| 4 | 1991:4 | 25 |
| 5 | 1992:1 | 30 |
| 6 | 1992:2 | 35 |
| 7 | 1992:3 | 40 |
| 8 | 1992:4 | 45 |
| 9 | 1993:1 | 50 |
| 10 | 1993:2 | 55 |
| 11 | 1993:3 | 60 |
| 12 | 1993:4 | 65 |
| 13 | 1994:1 | 70 |
| 14 | 1994:2 | 75 |
| 15 | 1994:3 | 80 |
| 16 | 1994:4 | 85 |

## Using Observation Numbers as the Time ID

Normally, the time ID variable contains date values. If you do not want to have dates associated with your forecasts, you can also use observation numbers as time ID variables. However, you still must have an ID variable. This can be illustrated by adding an observation index time ID variable to the data set NO_ID.

In the Data Set Selection window, select the data set NO_ID again. Select the Create button to the right of the `Time ID` field. Select the fourth choice, `Create from observation numbers`. This opens the Time ID Variable Creation window shown in Figure 60.5.

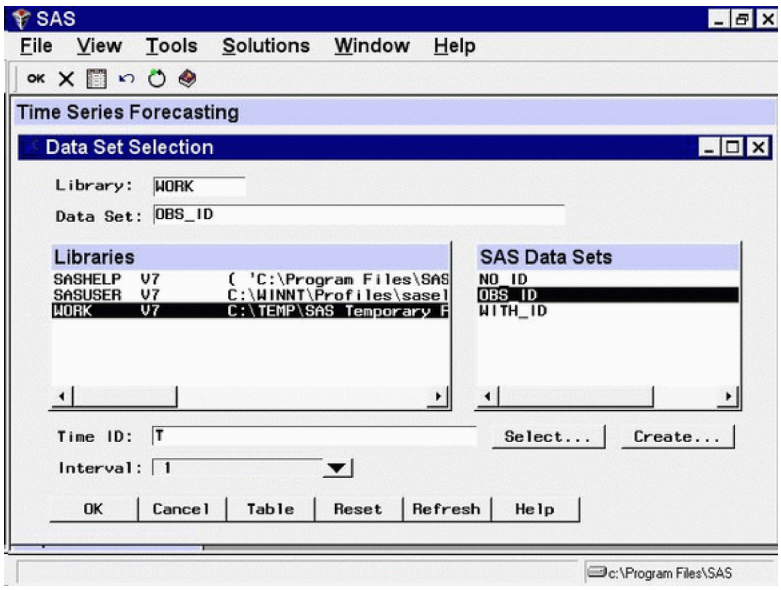
**Figure 60.5** Create Time ID Variable Window



Select the `OK` button. This opens the New Data Set Name window. Enter “OBS_ID” in the `New data set name` field. Enter “T” in the `New ID variable name` field.

Now select the `OK` button. The new data set OBS_ID is created, and the system returns to the Data Set Selection window, which now appears as shown in Figure 60.6.

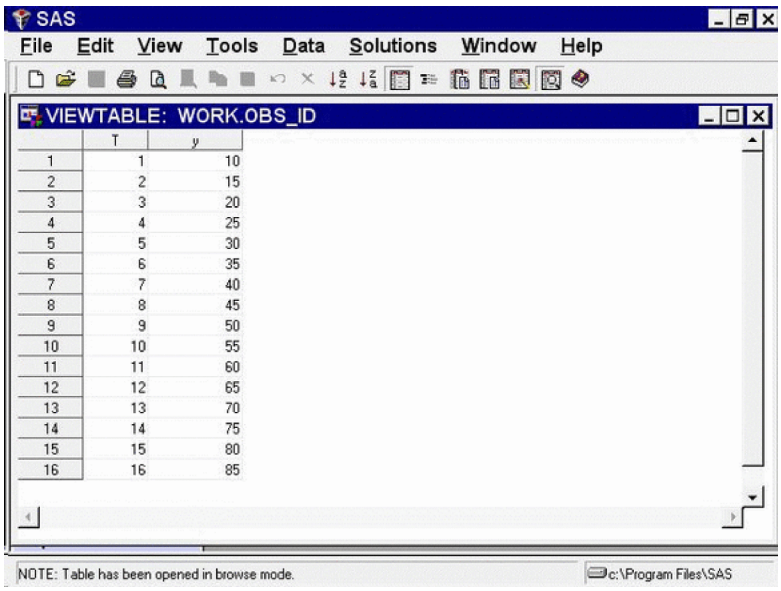
**Figure 60.6** Data Set Selection Window after Creating Time ID



The `Interval` field for OBS_ID has the value '1'. This means that the values of the time ID variable T increment by one between successive observations.

Select the `Table` button to look at the OBS_ID data set, as shown in Figure 60.7.

**Figure 60.7** VIEWTABLE of Data Set with Observation Index ID



Select `File` and `Close` to close the VIEWTABLE window. Select the `OK` button from the Data Set Selection window to return to the Time Series Forecasting window.

## Creating a Time ID from Other Dating Variables

Your data set might contain ID variables that date the observations in a different way than the SAS date valued ID variable expected by the forecasting system. For example, for monthly data, the data set might contain the ID variables YEAR and MONTH, which together date the observations.

In these cases, you can use the Forecasting System's Create Time ID features to compute a time ID variable with SAS date values from the existing dating variables. As an example of this, use the SAS data set read in by the following SAS statements:

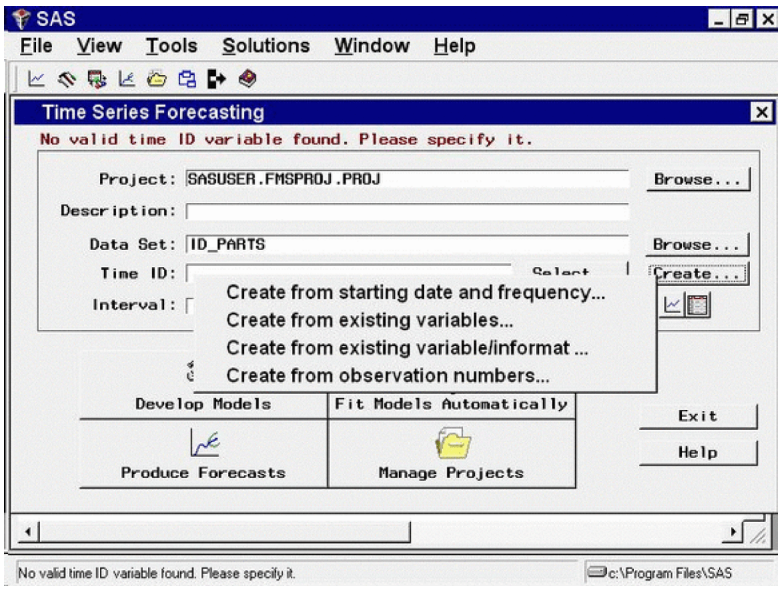
```
data id_parts;
   input yr qtr y;
datalines;
 91 1 10
 91 2 15
 91 3 20
 91 4 25
 92 1 30
 92 2 35
 92 3 40
 92 4 45
 93 1 50
 93 2 55
 93 3 60
 93 4 65
 94 1 70
 94 2 75
 94 3 80
 94 4 85
run;
```

Submit these SAS statements to create the data set ID_PARTS. This data set contains the three variables YR, QTR, and Y. YR and QTR are ID variables that together date the observations, but each variable provides only part of the date information. Because the forecasting system requires a single dating variable containing SAS date values, you need to combine YR and QTR to create a single variable DATE.

Type "ID_PARTS" in the `Data Set` field and press the ENTER key. (You could also use the Browse button to open the Data Set Selection window, as in the previous example, and complete this example from there.)

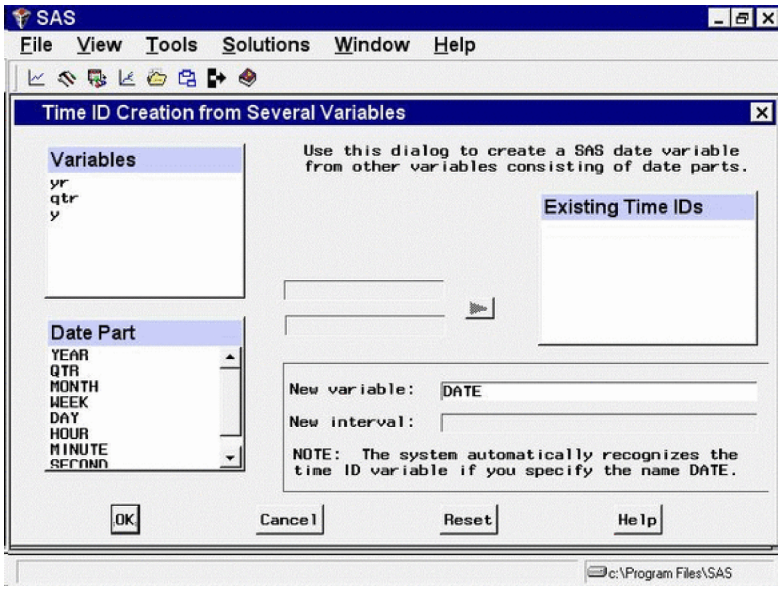
Select the Create button at the right of the `Time ID` field. This opens the menu of Create Time ID choices, as shown in Figure 60.8.

**Figure 60.8** Adding a Time ID Variable



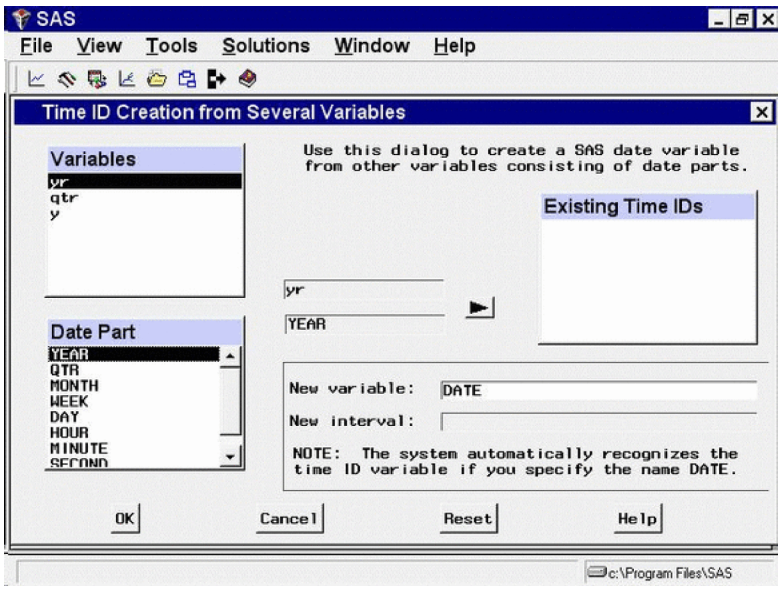
Select the second choice, `Create from existing variables`. This opens the window shown in Figure 60.9.

**Figure 60.9** Creating a Time ID Variable from Date Parts



In the `Variables` list, select YR. In the `Date Part` list, select YEAR as shown in Figure 60.10.

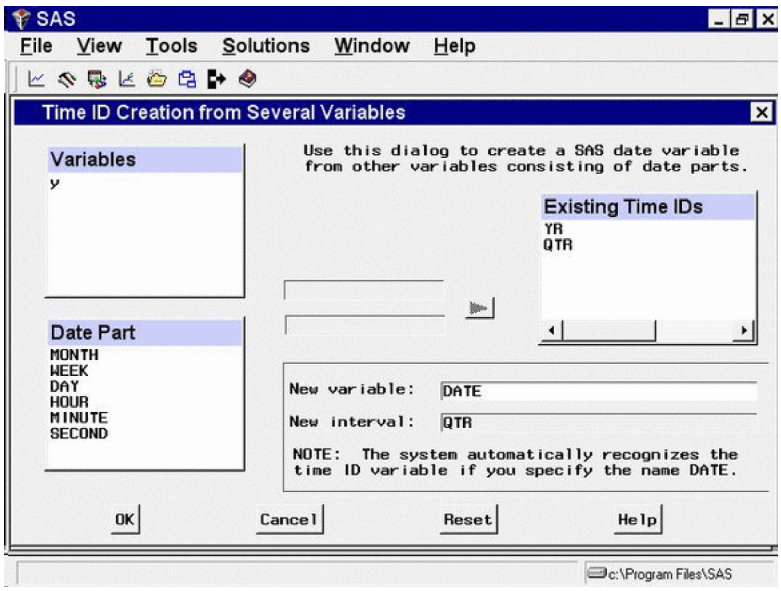
**Figure 60.10** Specifying the ID Variable for Years



Now click the right-pointing arrow button. The variable YR and the part code YEAR are added to the `Existing Time IDs` list.

Next select QTR from the `Variables` list, select QTR from the `Date Part` list, and click the arrow button. This adds the variable QTR and the part code QTR to the `Existing Time IDs` list, as shown in Figure 60.11.

**Figure 60.11** Creating a Time ID Variable from Date Parts



Now select the `OK` button. This opens the New Data Set Name window. Change the `New data set name` field to NEWDATE, and then select the `OK` button.

The data set NEWDATE is created, and the system returns to the Time Series Forecasting window with NEWDATE as the selected Data Set. The Time ID field is set to DATE, and the Interval field is set to QTR.

# Chapter 61
# Specifying Forecasting Models

**Contents**

Series Diagnostics . . . . . 3995
Models to Fit Window . . . . . 3998
Automatic Model Selection . . . . . 4000
Smoothing Model Specification Window . . . . . 4002
ARIMA Model Specification Window . . . . . 4004
Factored ARIMA Model Specification Window . . . . . 4006
Custom Model Specification Window . . . . . 4009
Editing the Model Selection List . . . . . 4013
Forecast Combination Model Specification Window . . . . . 4016
Incorporating Forecasts from Other Sources . . . . . 4018

This chapter explores the tools available through the Develop Models window for investigating the properties of time series and for specifying and fitting models. The first section shows you how to diagnose time series properties in order to determine the class of models appropriate for forecasting series with such properties. Later sections show you how to specify and fit different kinds of forecasting models.

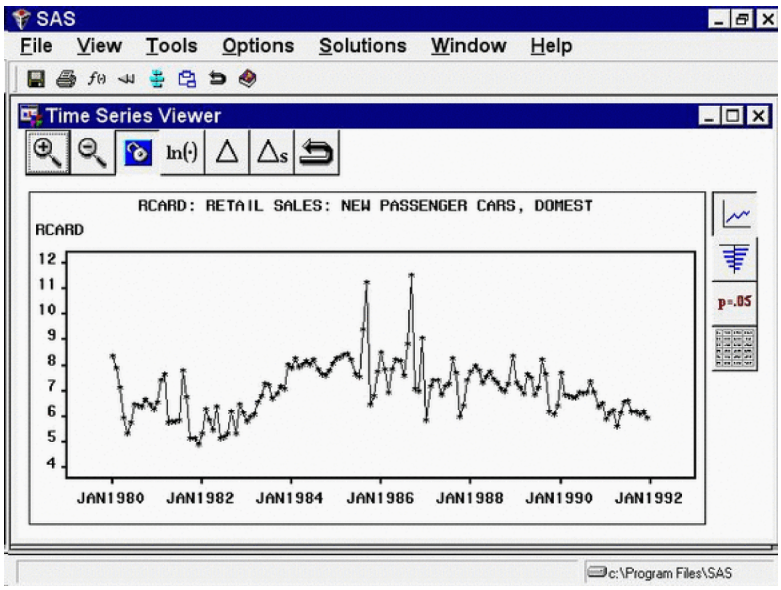
## Series Diagnostics

The series diagnostics tool helps you determine the kinds of forecasting models that are appropriate for the data series so that you can limit the search for the best forecasting model. The series diagnostics address these three questions: Is a log transformation needed to stabilize the variance? Is a time trend present in the data? Is there a seasonal pattern to the data?

The automatic model fitting process, which you used in the previous chapter through the Automatic Model Fitting window, performs series diagnostics and selects trial models from a list according to the results. You can also look at the diagnostic information and make your own decisions as to the kinds of models appropriate for the series. The following example illustrates the series diagnostics features.

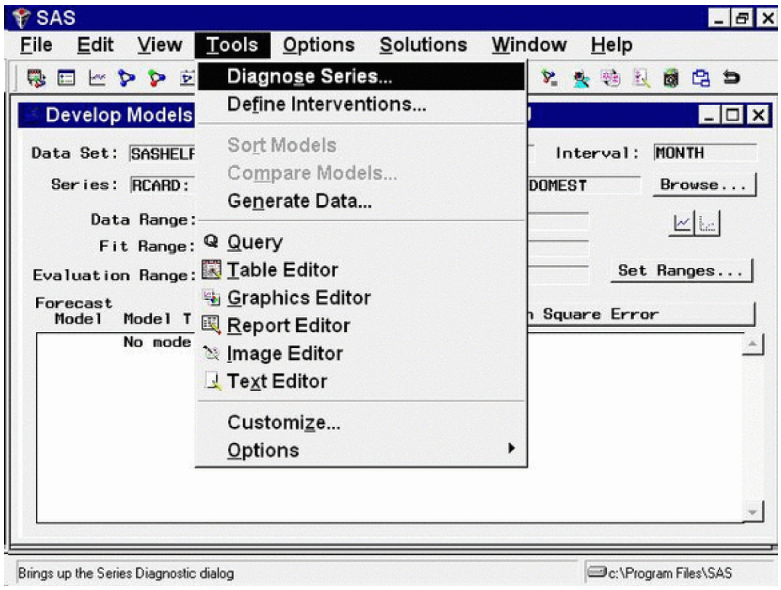
Select “Develop Models” from the Time Series Forecasting window. Select the library SASHELP, the data set CITIMON, and the series RCARD. This series represents domestic retail sales of passenger cars. To look at this series, select “View Series” from the Develop Models window. This opens the Time Series Viewer window, as shown in Figure 61.1.

**Figure 61.1** Automobile Sales Series



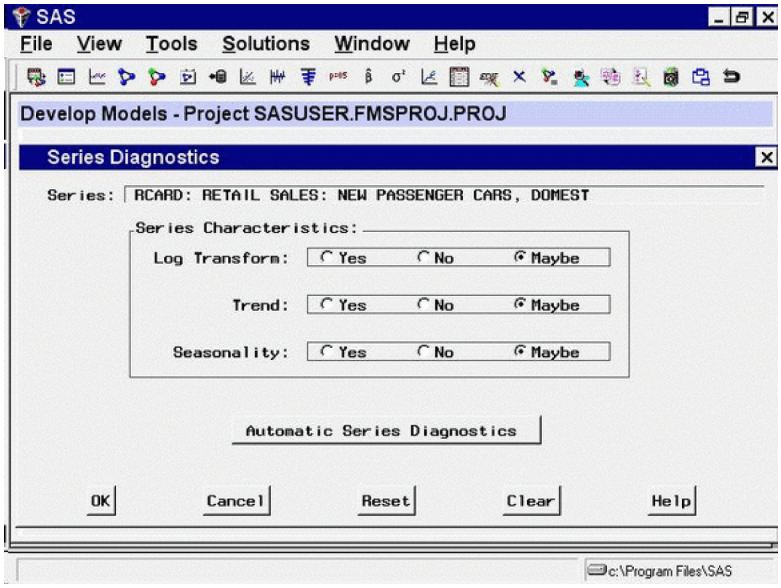
Select "Diagnose Series" from the Tools menu. You can do this from the Develop Models window or from the Time Series Viewer window. Figure 61.2 shows this from the Develop Models window.

**Figure 61.2** Selecting Series Diagnostics



This opens the Series Diagnostics window, as shown in Figure 61.3.

**Figure 61.3** Series Diagnostics Window



Each of the three series characteristics—need for log transformation, presence of a trend, and seasonality—has a set of options for `Yes`, `No`, and `Maybe`. `Yes` indicates that the series has the characteristic and that forecasting models fit to the series should be able to model and predict this behavior. `No` indicates that you do not need to consider forecasting models designed to predict series with this characteristic. `Maybe` indicates that models with and without the characteristic should be considered. Initially, all these values are set to `Maybe`.

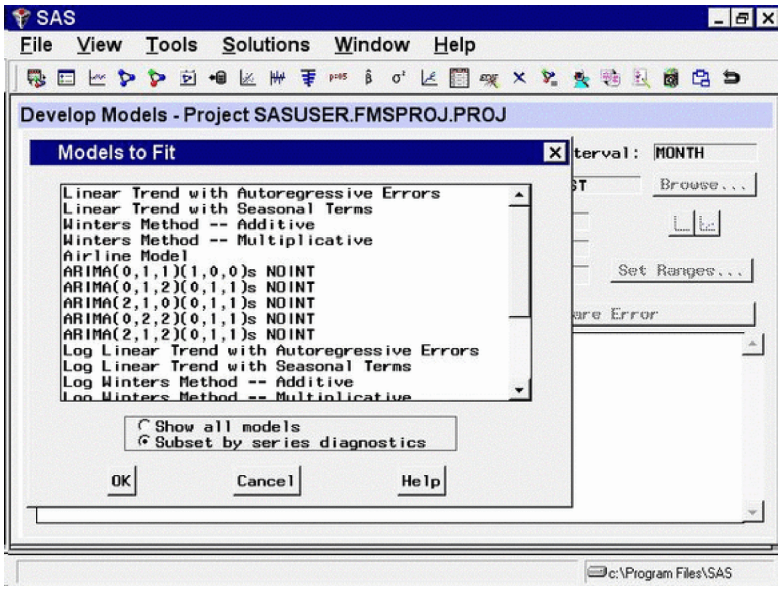
To have the system diagnose the series characteristics, click the Automatic Series Diagnostics button. This runs the diagnostic routines described in Chapter 66, "Forecasting Process Details," and sets the options according to the results. In this example, `Trend` and `Seasonality` are changed from `Maybe` to `Yes`, while `Log Transform` remains set to `Maybe`.

These diagnostic criteria affect the models displayed when you use the Models to Fit window or the Automatic Model Selection model-fitting options described in the following section. You can set the criteria manually, according to your judgment, by selecting any of the options, whether you have used the Automatic Series Diagnostics button or not. For this exercise, leave them as set by the automatic diagnostics. Click the OK button to close the Series Diagnostics window.

## Models to Fit Window

As you saw in the previous chapter, you can select models from a list. Invoke the Models to Fit window by clicking the middle of the table and selecting "Fit Models from List" from the menu. This can also be selected from the toolbar or the Fit Model submenu of the Edit menu. The Models to Fit window comes up, as shown in Figure 61.4.

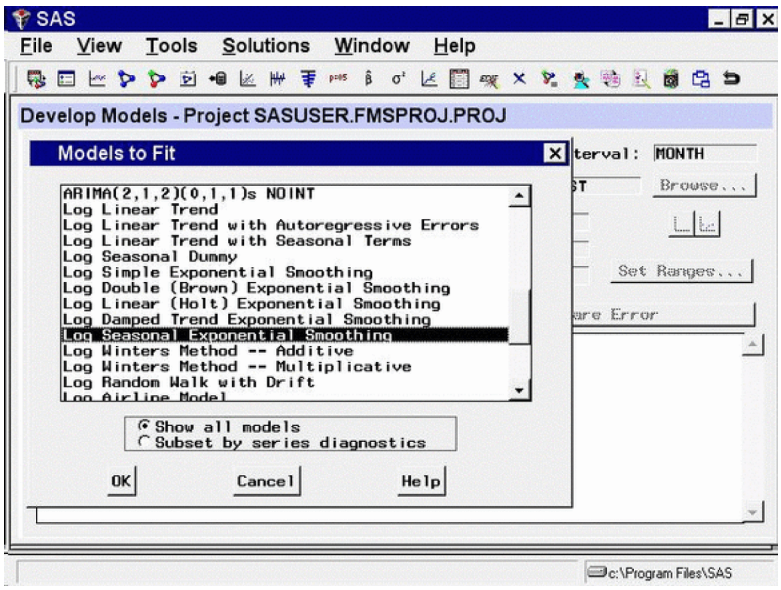
**Figure 61.4** Models to Fit Window



Since you have performed series diagnostics, the models shown are the subset that fits the diagnostic criteria.

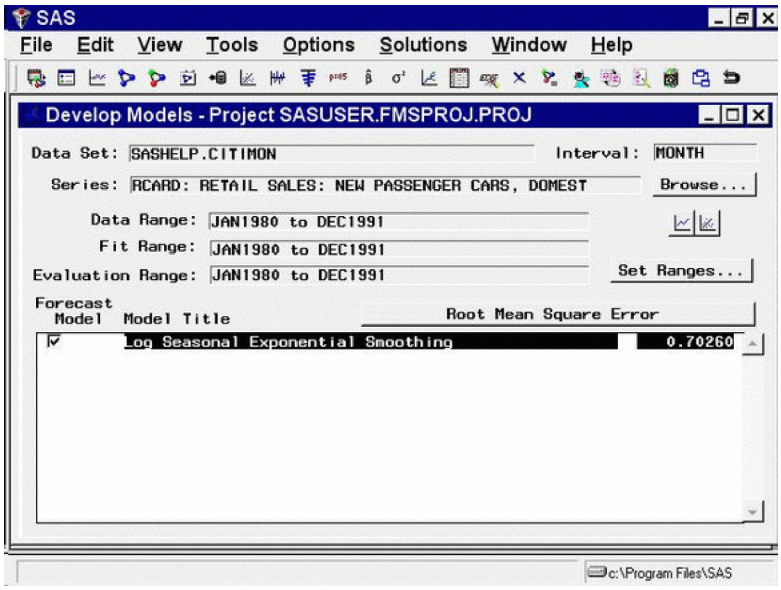
Suppose you want to consider models other than those in this subset because you are undecided about including a trend in the model. Select the Show all models option. Now the entire model selection list is shown. Scroll through the list until you find `Log Seasonal Exponential Smoothing`, as shown in Figure 61.5.

**Figure 61.5** Selecting a Model from List



This is a nontrended model, which seems a good candidate. Select this model, and then click the OK button. The model is fit to the series and then appears in the table with the value of the selected fit criterion, as shown in Figure 61.6.

**Figure 61.6** Develop Models Window Showing Model Fit



You can edit the model list that appears in the Models to Fit window by selecting “Options” and “Model Selection List” from the menu bar or by selecting the Edit Model List toolbar icon. You can then delete models you are not interested in from the default list and add models using any of the model specification methods described in this chapter. When you save your project, the edited model selection list is saved in the project file. In this way, you can use the Select from List item and the Automatic Model Selection item to select models from a customized search set.

## Automatic Model Selection

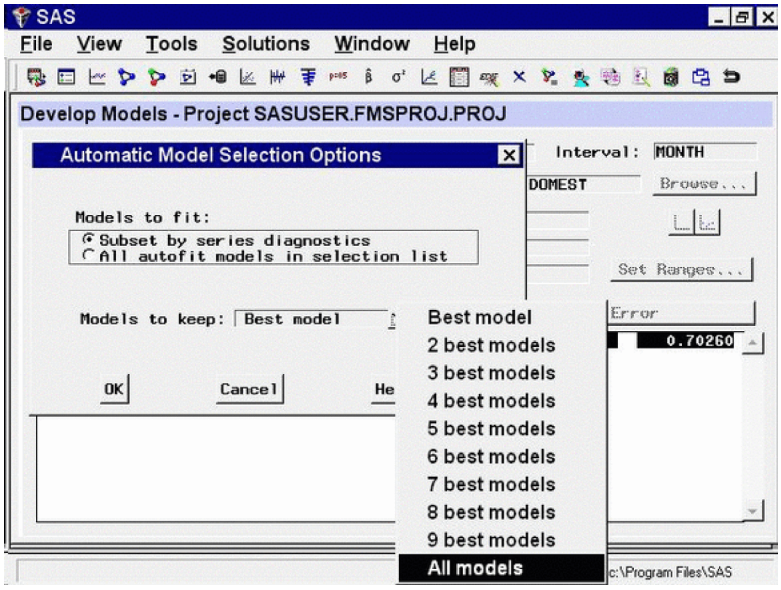
Automatic model selection is equivalent to choosing Select from List, as you did in the preceding section, fitting all the models in the subset list and then deleting all except the best fitting of the models. If series diagnostics have not yet been done, they are performed automatically to determine the model subset to fit. If you set the series diagnostics for log, trend, or seasonal criteria manually using the radio buttons, these choices are honored by the automatic fitting process.

Using automatic selection, the system does not pause to warn you of model fitting errors, such as failure of the estimates to converge (you can track these using the audit trail feature).

By default, only the best fitting model is kept. However, you can control the number of automatically fit models retained in the Develop Models list, and the following example shows how to do this.

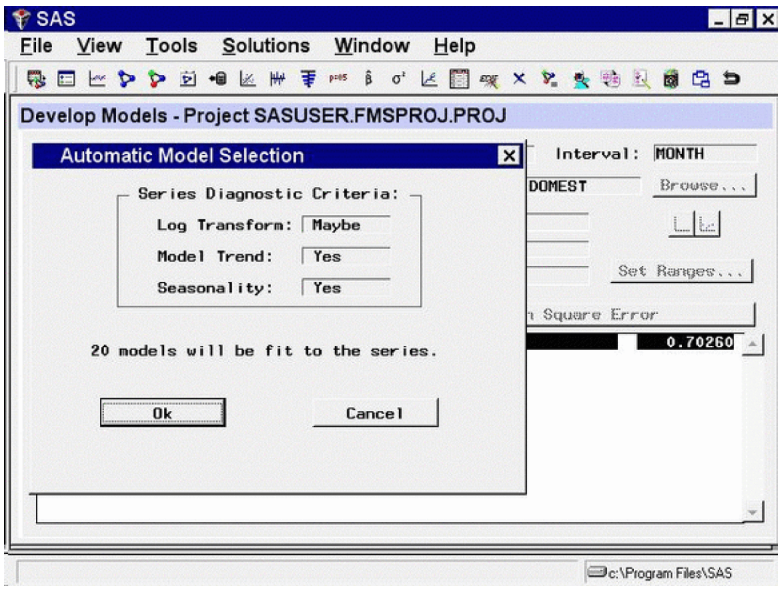
From the menu bar, select "Options" and "Automatic Fit." This opens the Automatic Model Selection Options window. Click the `Models to Keep` list arrow, and select "All models," as shown in Figure 61.7. Now click OK.

**Figure 61.7** Selecting Number of Automatic Fit Models to Keep



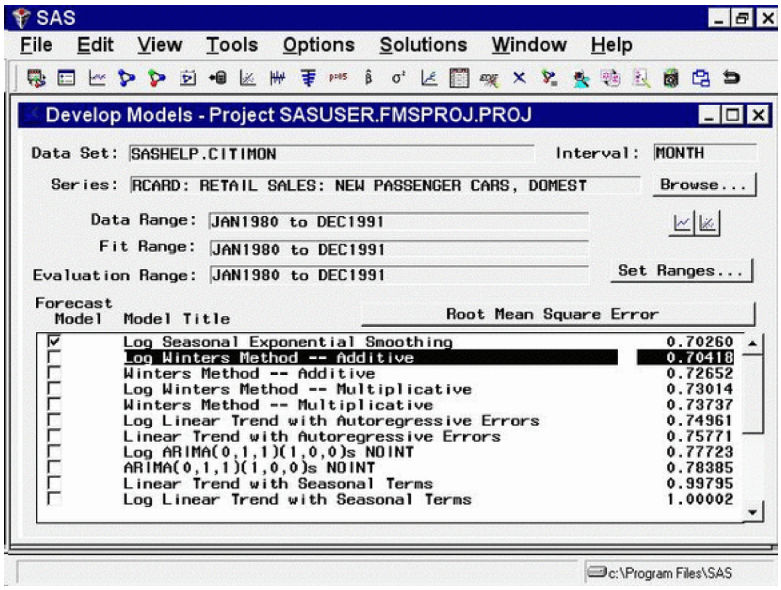
Next, select "Fit Models Automatically" by clicking the middle of the table or using the toolbar or Edit menu. The Automatic Model Selection window appears, showing the diagnostic criteria in effect and the number of models to be fit, as shown in Figure 61.8.

**Figure 61.8** Automatic Model Selection Window



Click the OK button. After the models have been fit, all of them appear in the table, in addition to the model which you fit earlier, as shown in Figure 61.9.

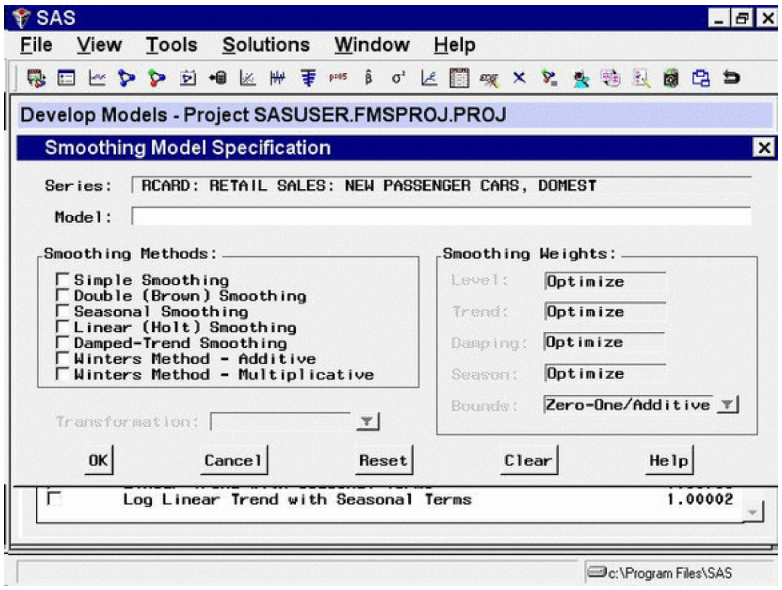
**Figure 61.9** Automatically Fit Models



# Smoothing Model Specification Window

To fit exponential smoothing and Winters models not already provided in the Models to Fit window, select "Fit Smoothing Model" from the pop-up menu or toolbar or select "Smoothing Model" from the Fit Model submenu of the Edit menu. This opens the Smoothing Model Specification window, as shown in Figure 61.10.

**Figure 61.10** Smoothing Model Specification Window



The Smoothing Model Specification window consists of several parts. At the top is the series name and a field for the label of the model you are specifying. The model label is filled in with an automatically generated label as you specify options. You can type over the automatic label with your own label for the model. To restore the automatic label, enter a blank label.

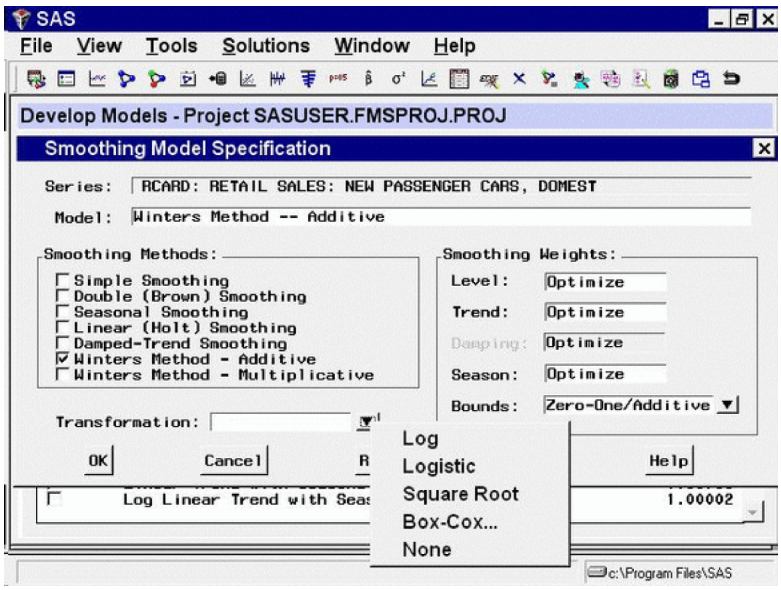
The `Smoothing Methods` box lists the different methods available. Below the `Smoothing Methods` box is the Transformation field, which is used to apply the smoothing method to transformed series values.

The `Smoothing Weights` box specifies how the smoothing weights are determined. By default, the smoothing weights are automatically set to optimize the fit of the model to the data. For more information about how the smoothing weights are fit, see Chapter 66, "Forecasting Process Details."

Under smoothing methods, select "Winters Method – Additive." Notice the smoothing weights box to the right. The third item, `Damping`, is grayed out, while the other items, `Level`, `Trend`, and `Season`, show the word `Optimize`. This tells you that these three smoothing weights are applicable to the smoothing method that you selected and that the system is currently set to optimize these weights for you.

Next, specify a transformation using the `Transformation` list. A menu of transformation choices pops up, as shown in Figure 61.11.

**Figure 61.11** Transformation Options

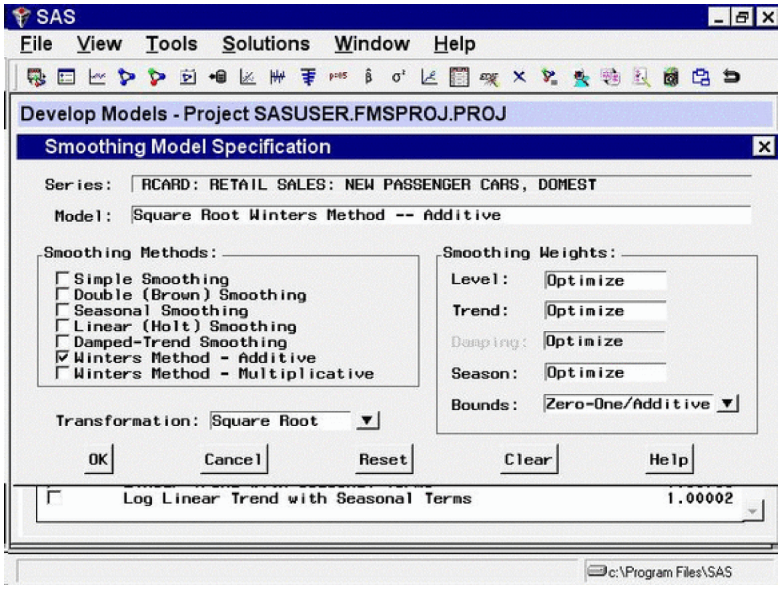


You can specify a logarithmic, logistic, square root, or Box-Cox transformation. For this example, select "Square Root" from the list. The Transformation field is now set to Square Root.

This means that the system will first take the square roots of the series values, apply the additive version of the Winters method to the square root series, and then produce the predictions for the original series by squaring the Winters method predictions (and multiplying by a variance factor if the Mean Prediction option is set in the Forecast Options window). For more information about predictions from transformed models, see Chapter 66, "Forecasting Process Details."

The Smoothing Model Specification window should now appear as shown in Figure 61.12. Click the OK button to fit the model. The model is added to the table of fitted models in the Develop Models window.

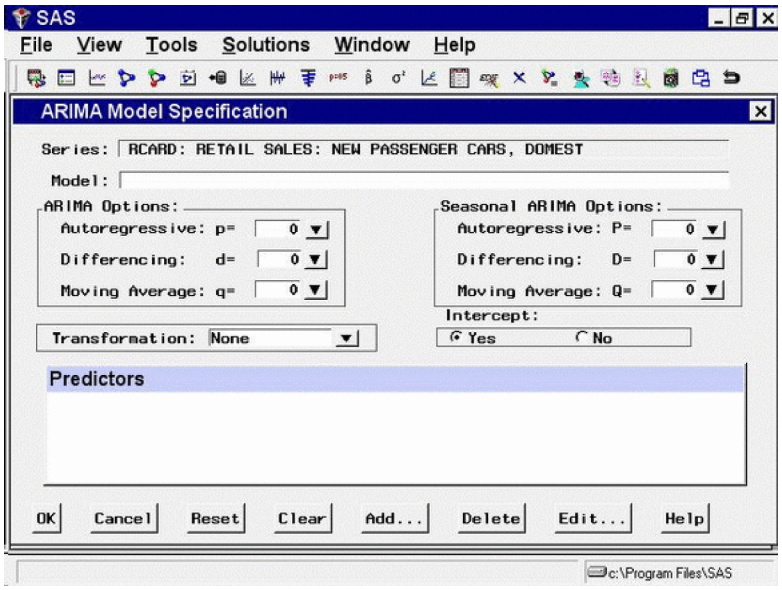
**Figure 61.12** Winter's Method Applied to Square Root Series



# ARIMA Model Specification Window

To fit ARIMA or Box-Jenkins models not already provided in the Models to Fit window, select the ARIMA model item from the pop-up menu, toolbar, or Edit menu. This opens the ARIMA Model Specification window, as shown in Figure 61.13.

**Figure 61.13** ARIMA Model Specification Window



This ARIMA Model Specification window is structured according to the Box and Jenkins approach to time series modeling. You can specify the same time series models with the Custom Model Specification window and the ARIMA Model Specification window, but the windows are structured differently, and you may find one more convenient than the other.

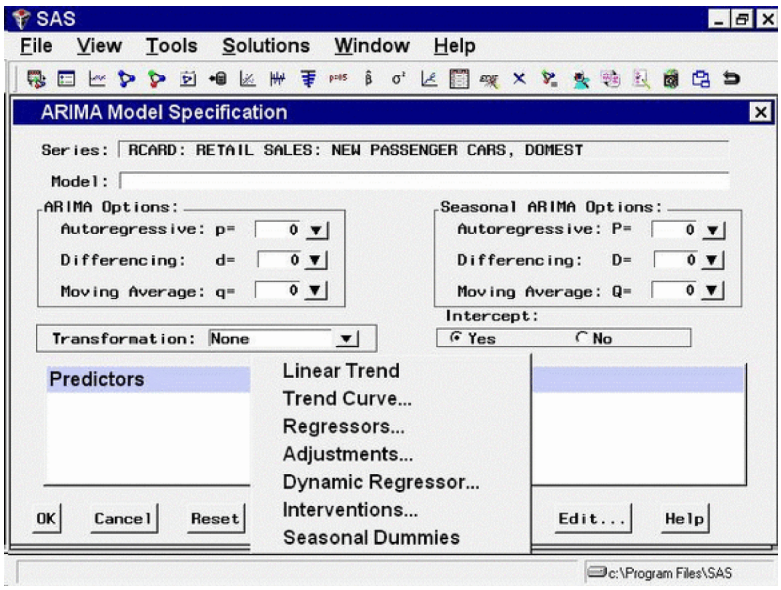
At the top of the ARIMA Model Specification window is the name and label of the series and the label of the model you are specifying. The model label is filled in with an automatically generated label as you specify options. You can type over the automatic label with your own label for the model. To restore the automatic label, enter a blank label.

Using the ARIMA Model Specification window, you can specify autoregressive (p), differencing (d), and moving average (q) orders for both simple and seasonal factors. You can specify transformations with the `Transformation` list. You can also specify whether an intercept is included in the ARIMA model.

In addition to specifying seasonal and nonseasonal ARIMA processes, you can also specify predictor variables and other terms as inputs to the model. ARIMA models with inputs are sometimes called ARIMAX models or Box-Tiao models. Another term for this kind of model is *dynamic regression*.

In the lower part of the ARIMA Model Specification window is the list of *predictors* to the model (initially empty). You can specify predictors by using the Add button. This opens a menu of different kinds of independent effects, as shown in Figure 61.14.

**Figure 61.14** Add Predictors Menu



The kinds of predictor effects allowed include time trends, regressors, adjustments, dynamic regression (transfer functions), intervention effects, and seasonal dummy variables. How to use different kinds of predictors is explained in Chapter 63, "Using Predictor Variables."

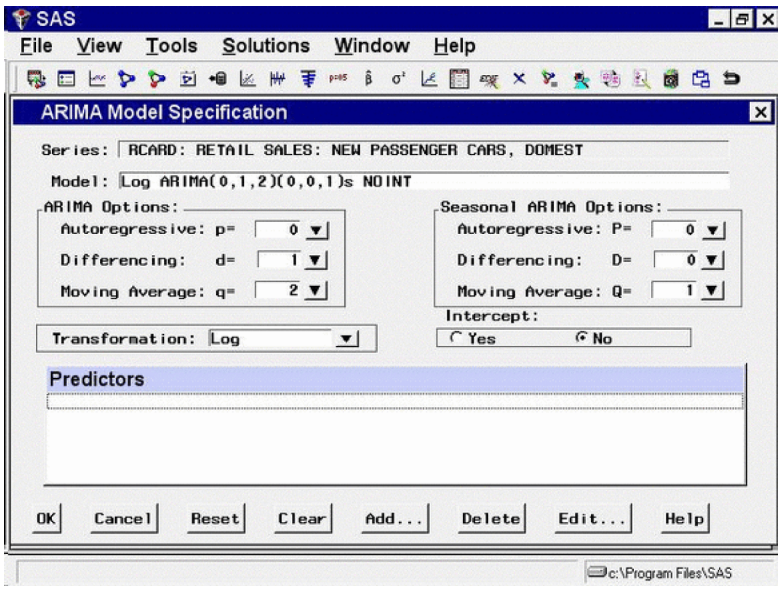
As an example, in the `ARIMA Options` box, set the order of differencing `d` to `1` and the moving average order `q` to `2`. You can either type in these values or click the arrows and select the values from pop-up lists.

These selections specify an ARIMA(0,1,2) or IMA(1,2) model. (For more information about the notation used for ARIMA models, see Chapter 8, "The ARIMA Procedure.") Notice that the model label at the top is now `IMA(1,2) NOINT`, meaning that the data are differenced once and a second-order moving-average term is included with no intercept.

In the `Seasonal ARIMA Options` box, set the seasonal moving-average order `Q` to `1`. This adds a first-order moving-average term at the seasonal (12 month) lag. Finally, select "Log" in the Transformation combo box.

The model label is now `Log ARIMA(0,1,2)(0,0,1)s NOINT`, and the window appears as shown in Figure 61.15.

**Figure 61.15** Log ARIMA(0,1,2)(0,0,1)s Specified

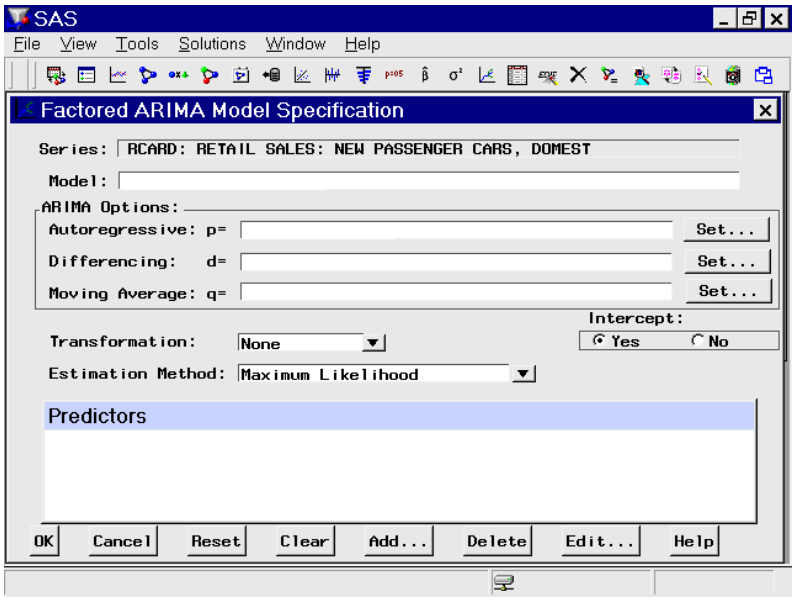


Click the OK button to fit the model. The model is fit and added to the Develop Models table.

## Factored ARIMA Model Specification Window

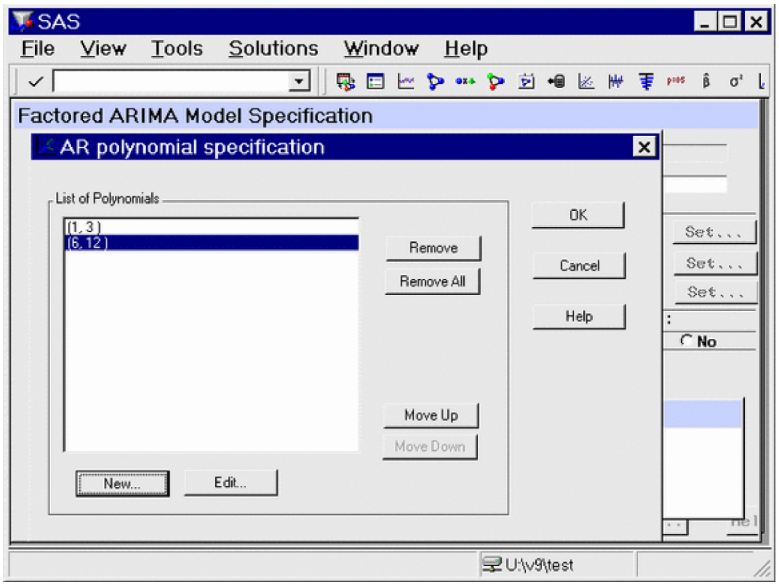
To fit a factored ARIMA model, select the Factored ARIMA model item from the pop-up menu, toolbar, or Edit menu. This brings up the Factored ARIMA Model Specification window, shown in Figure 61.16.

**Figure 61.16** Factored ARIMA Model Specification Window



The Factored ARIMA Model Specification window is similar to the ARIMA Model Specification window and has the same features, but it uses a more general specification of the autoregressive (p), differencing (d), and moving-average (q) terms. To specify these terms, click the corresponding Set button, as shown in Figure 61.16. For example, to specify autoregressive terms, click the first Set button. This opens the AR Polynomial Specification Window, shown in Figure 61.17.

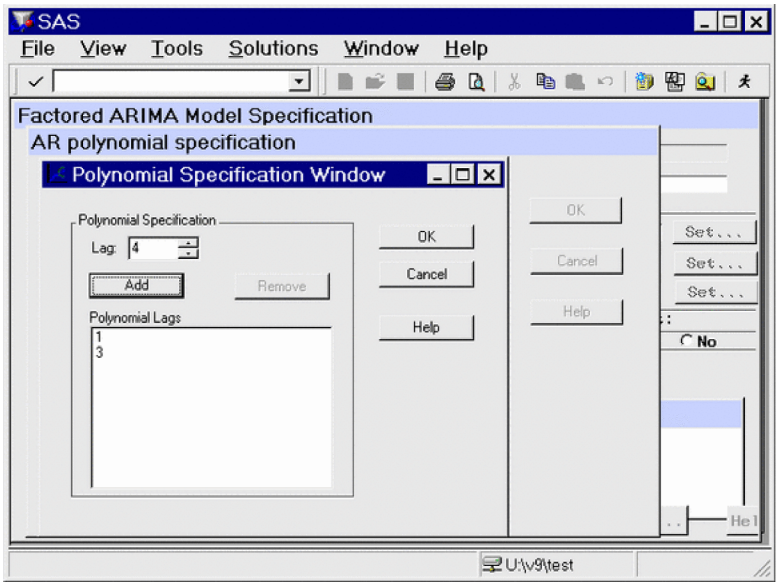
**Figure 61.17** AR Polynomial Specification Window



To add AR polynomial terms, click the New button. This opens the Polynomial Specification Window, shown in Figure 61.18. Specify the first lag you want to include by using the `Lag` spin box, then click the Add button. Repeat this process, adding each lag you want to include in the current list. All lags must be specified. For example, if you add only lag 3, the model contains only lag 3, not 1 through 3.

As an example, add lags 1 and 3, then click the OK button. The AR Polynomial Specification Window now shows (1,3) in the list of polynomials. Now select "New" again. Add lags 6 and 12 and click "OK". Now the AR Polynomial Specification Window shows (1,3) and (6,12) as shown in Figure 61.17. Select "OK" to close this window. The Factored ARIMA Model Specification Window now shows the factored model `p=(1,3)(6,12)`. Use the same technique to specify the q terms, or moving-average part of the model. There is no limit to the number of lags or the number of factors you can include in the model.

**Figure 61.18** Polynomial Specification Window



To specify differencing lags, click the middle Set button to open the Differencing Specification window. Specify lags using the spin box and add them to the list with the Add button. When you click "OK" to close the window, the differencing lags appear after `d=` in the Factored ARIMA Specification Window, within a single pair of parentheses.

You can use the Factored ARIMA Model Specification Window to specify any model that you can specify with the ARIMA Model and Custom Model windows, but the notation is more similar to that of the ARIMA procedure (see Chapter 8, "The ARIMA Procedure"). Consider as an example the classic Airline model fit to the International Airline Travel series, `SASHELP.AIR`. This is a factored model with one moving-average term at lag one and one moving-average term at the seasonal lag, with first-order differencing at the simple and seasonal lags. Using the ARIMA Model Specification Window, you specify the value 1 for the q and d terms and also for the Q and D terms, which represent the seasonal lags. For monthly data, the seasonal lags represent lag 12, since a yearly seasonal cycle is assumed.

By contrast, the Factored ARIMA Model Specification Window makes no assumptions about seasonal cycles. The Airline model is written as `IMA d=(1,12) q=(1)(12) NOINT`. To specify the differencing terms, add the values 1 and 12 in the Differencing Specification Window and click OK. Then select "New" in the MA Polynomial Specification Window, add the value 1, and select OK. To add the factored term, select "New" again, add the value 12, and click OK. Remember to select "No" in the Intercept radio box, since it is not selected by default. Click OK to close the Factored ARIMA Model Specification Window and fit the model.

You can show that the results are the same as they are when you specify the model by using the ARIMA Model Specification Window and when you select Airline Model from the default model list. If you are familiar with the ARIMA Procedure (Chapter 8, "The ARIMA Procedure"), you might want to turn on the `Show Source Statements` option before fitting the model, then examine the procedure source statements in the log window after fitting the model.

The strength of the Factored ARIMA Specification approach lies in its ability to construct unusual ARIMA models, such as the following:

Subset models
: These are models of order n, where fewer than n lags are specified. For example, an AR order 3 model might include lags 1 and 3 but not lag 2.

Unusual seasonal cycles
: For example, a monthly series might cycle two or four times per year instead of just once.

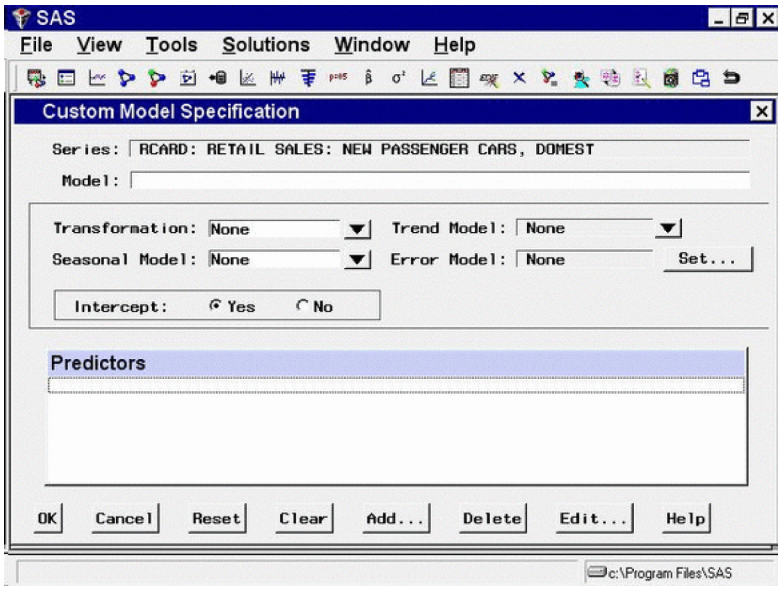
Multiple cycles
: For example, a daily sales series might peak on a certain day each week and also once a year at the Christmas season. Given sufficient data, you can fit a three-factor model, such as `IMA d=(1) q=(1)(7)(365)`.

Models with high order lags take longer to fit and often fail to converge. To save time, select the Conditional Least Squares or Unconditional Least Squares estimation method (see Figure 61.16). Once you have narrowed down the list of candidate models, change to the Maximum Likelihood estimation method.

## Custom Model Specification Window

To fit a custom time series model not already provided in the Models to Fit window, select the Custom Model item from the pop-up menu, toolbar, or Edit menu. This opens the Custom Model Specification window, as shown in Figure 61.19.

**Figure 61.19** Custom Model Specification Window



You can specify the same time series models with the Custom Model Specification window and the ARIMA Model Specification window, but the windows are structured differently, and you might find one more convenient than the other.

At the top of the Custom Model Specification window is the name and label of the series and the label of the model you are specifying. The model label is filled in with an automatically generated label as you specify

options. You can type over the automatic label with your own label for the model. To restore the automatic label, enter a blank label.

The middle part of the Custom Model Specification window consists of four fields: `Transformation`, `Trend Model`, `Seasonal Model`, and `Error Model`. These fields allow you to specify the model in four parts. Each part specifies how a different aspect of the pattern of the time series is modeled and predicted.

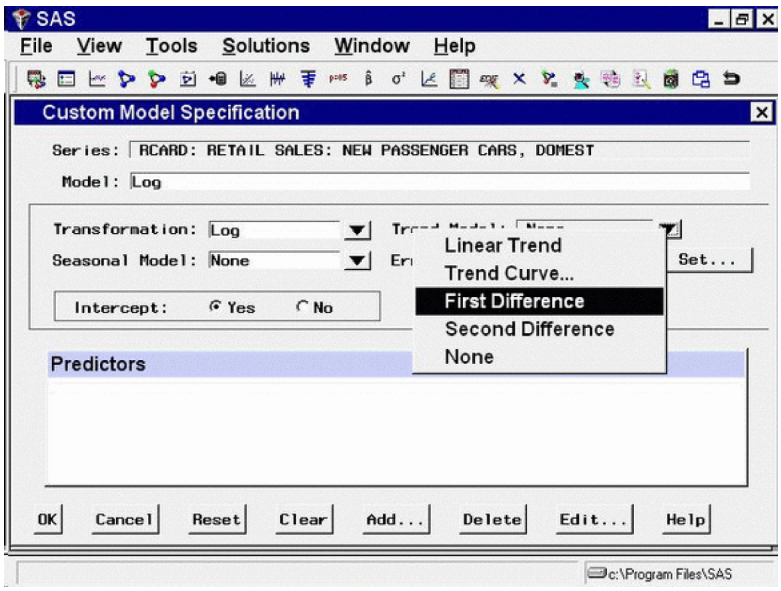
The `Predictors` list at the bottom of the Custom Model Specification window allows you to include different kinds of predictor variables in the forecasting model. The Predictors feature for the Custom Model Specification window is like the Predictors feature for the ARIMA Model Specification window, except that time trend predictors are provided through the Trend Model field and seasonal dummy variable predictors are provided through the Seasonal Model field.

To illustrate how to use the Custom Model Specification window, the following example specifies the same model you fit by using the ARIMA Model Specification window.

First, specify the data transformation to use. Select "Log" using the Transformation combo box.

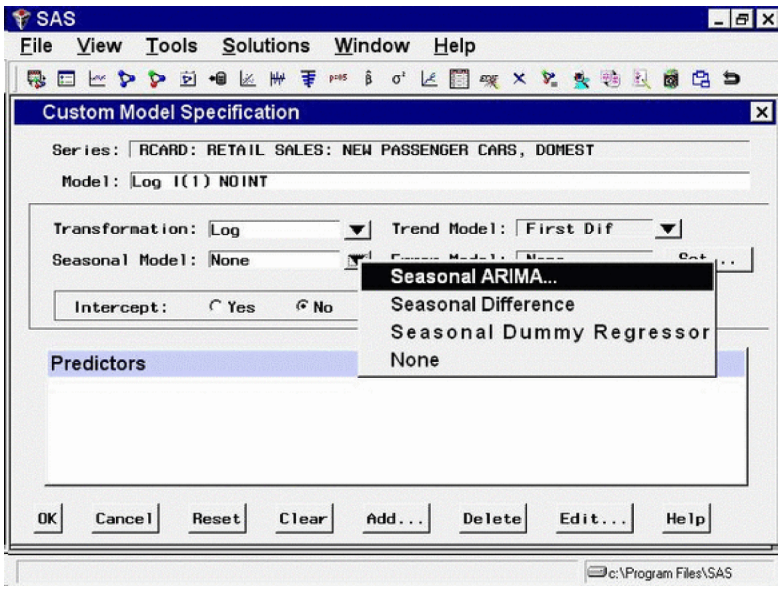
Second, specify how to model the trend in the series. Select `First Difference` in the `Trend Model` combo box, as shown in Figure 61.20.

**Figure 61.20** Trend Model Options



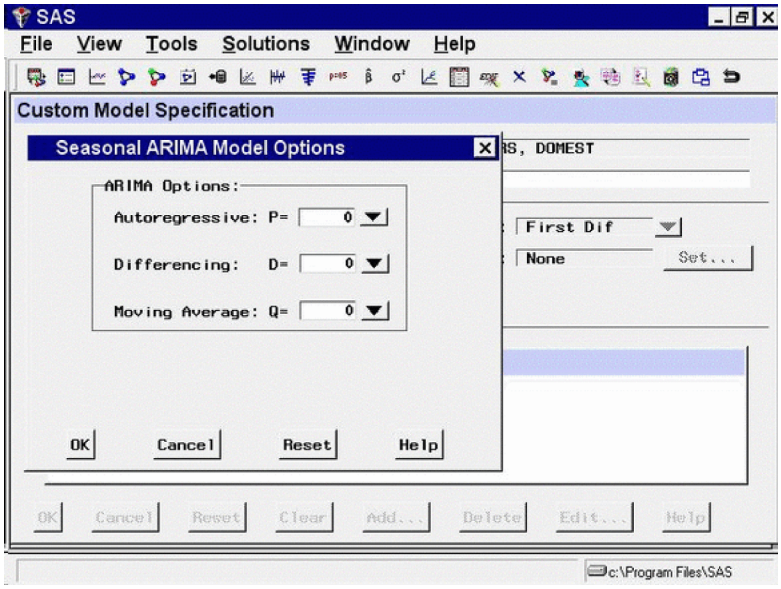
Next, specify how to model the seasonal pattern in the series. Select "Seasonal ARIMA" in the Seasonal Model combo box, as shown in Figure 61.21.

**Figure 61.21** Seasonal Model Options



This opens the Seasonal ARIMA Model Options window, as shown in Figure 61.22.

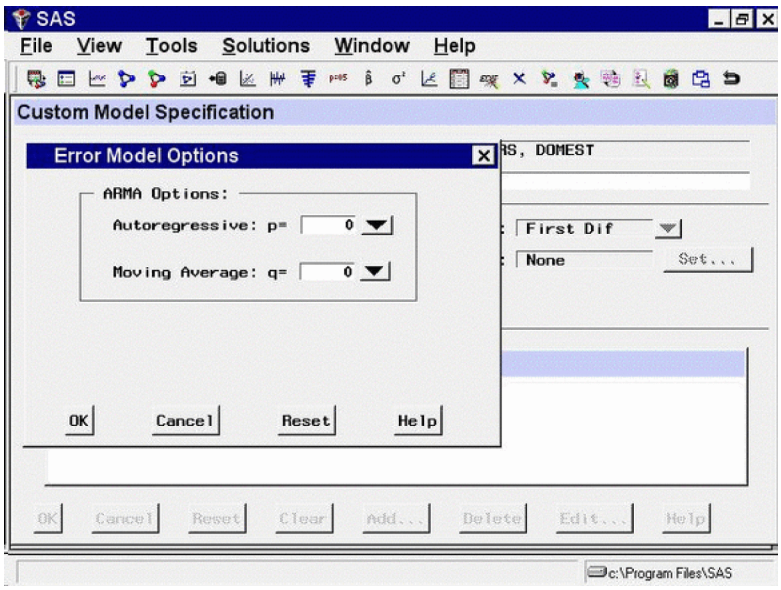
**Figure 61.22** Seasonal ARIMA Model Options



Specify a first-order seasonal moving-average term by typing `1` or by selecting "1" from the Moving Average: Q= combo box pop-up menu, and then click the OK button.

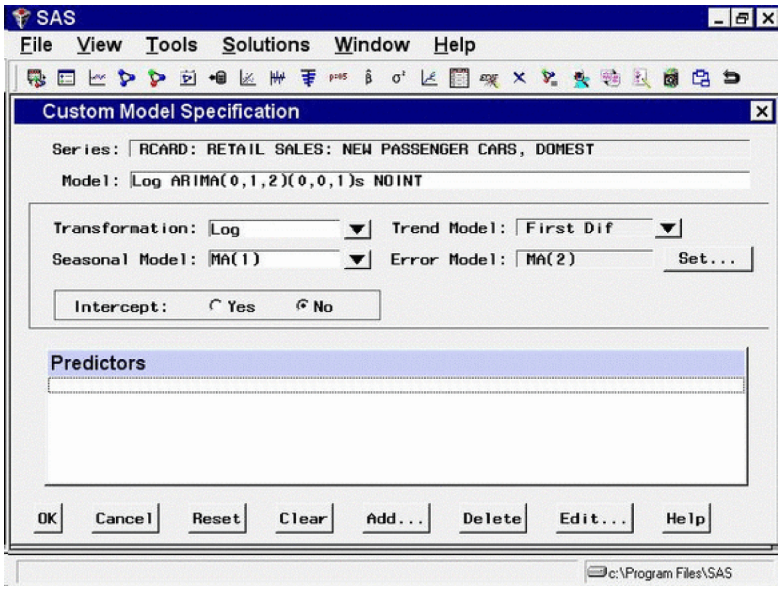
Finally, specify how to model the autocorrelation pattern in the model prediction errors. Click the Set button to the right of the Error Model field. This opens the Error Model Options window, as shown in Figure 61.23. This window allows you to specify an ARMA error process. Set the Moving Average order `q` to `2`, and then click the OK button.

**Figure 61.23** Error Model Options



The Custom Model Specification window should now appear as shown in Figure 61.24. The model label at the top of the Custom Model Specification window should now read `Log ARIMA(0,1,2)(0,0,1)s NOINT`, just as it did when you used the ARIMA Model Specification window.

**Figure 61.24** Log ARIMA(0,1,2)(0,0,1)s Specified



Now that you have seen how the Custom Model Specification window works, click "Cancel" to exit the window without fitting the model. This should return you to the Develop Models window.

# Editing the Model Selection List

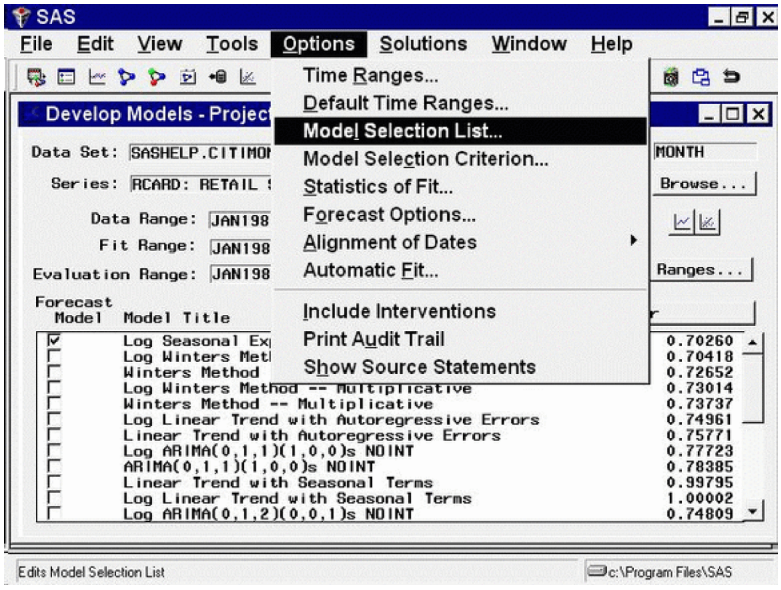
Now that you know how to specify new models that are not included in the system default model selection list, you can edit the model selection list to add models that you expect to use in the future or to delete models that you do not expect to use. When you save the forecasting project to a SAS catalog, the edited model selection list is saved with the project file, and the list is restored when you load the project.

There are two reasons why you would add a model to the model selection list. First, by adding the model to the list, you can fit the model to different time series by selecting it through the `Fit Models from List` action. You do not need to specify the model again every time you use it.

Second, once the model is added to the model selection list, it is available to the automatic model selection process. The model is then considered automatically whenever you use the automatic model selection feature for any series.

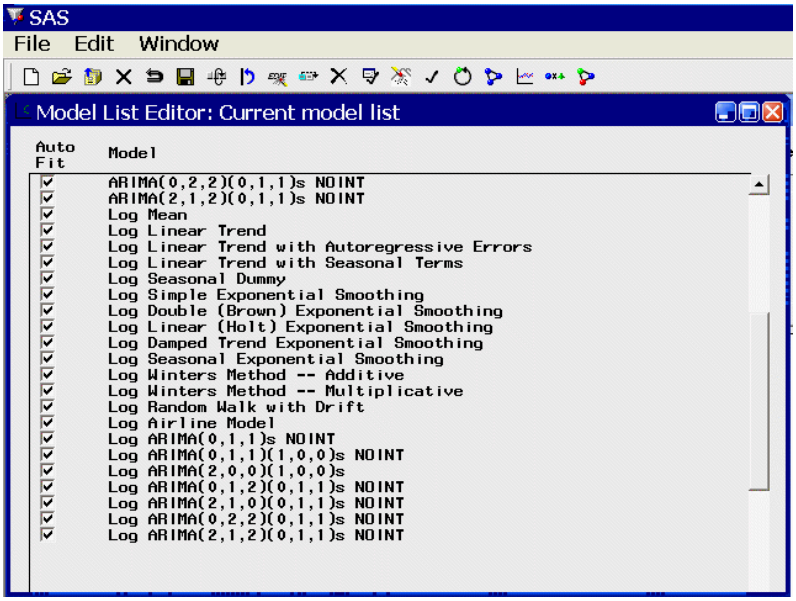
To edit the model selection list, select "Model Selection List" from the Options menu as shown in Figure 61.25, or select the Edit Model List toolbar icon.

**Figure 61.25** Model Selection List Option



This selection brings up the Model Selection List editor window, as shown in Figure 61.26. This window consists of the model selection list and an "Auto Fit" column, which controls for each model whether the model is included in the list of models used by the automatic model selection process.

**Figure 61.26** Model Selection List Window

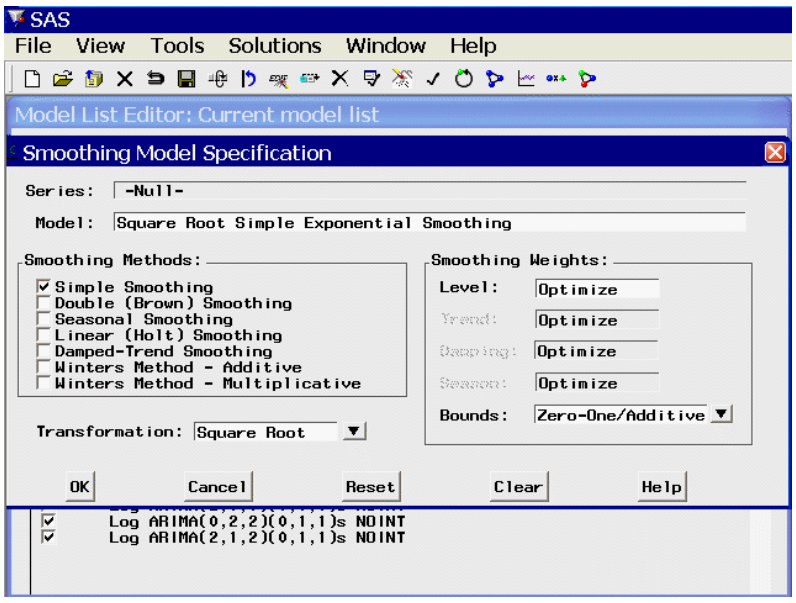


To add a model to the list, select "Add Model" from the Edit menu and then select "Smoothing Model," "ARIMA Model," "Factored ARIMA Model," or "Custom Model" from the submenu. Alternatively, click the corresponding icon on the toolbar.

As an example, select "Smoothing Model." This brings up the Smoothing Model Specification window. Note that the series name is "-Null-." This means that you are not specifying a model to be fit to a particular series, but are specifying a model to be added to the selection list for later reference.

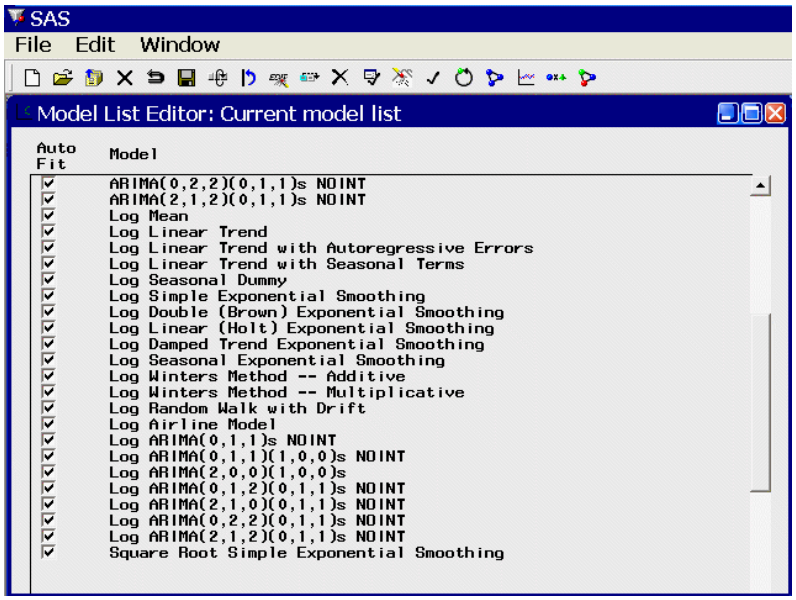
Specify a smoothing model. For example, select "Simple Smoothing" and then select the Square Root transformation. The window appears as shown in Figure 61.27.

**Figure 61.27** Adding a Model Specification



Click the OK button to add the model to the end of the model selection list and return you to the Model Selection List window, as shown in Figure 61.28. You can now select the Fit Models from List model-fitting option to use the edited selection list.

**Figure 61.28** Model Added to Selection List



If you want to delete one or more models from the list, select the model labels to highlight them in the list. Click a second time to clear a selected model. Then select "Delete" from the Edit pull-down menu, or the corresponding toolbar icon. As an example, delete the `Square Root Simple Exponential Smoothing` model that you just added.

The Model Selection List editor window gives you a lot of flexibility for managing multiple model lists, as explained in the section "Model Selection List Editor Window" on page 4125. For example, you can create your own model lists from scratch or modify or combine previously saved model lists and those provided with the software, and you can save them and designate one as the default for future projects.

Now select "Close" from the File menu (or the Close icon) to close the Model Selection List editor window.

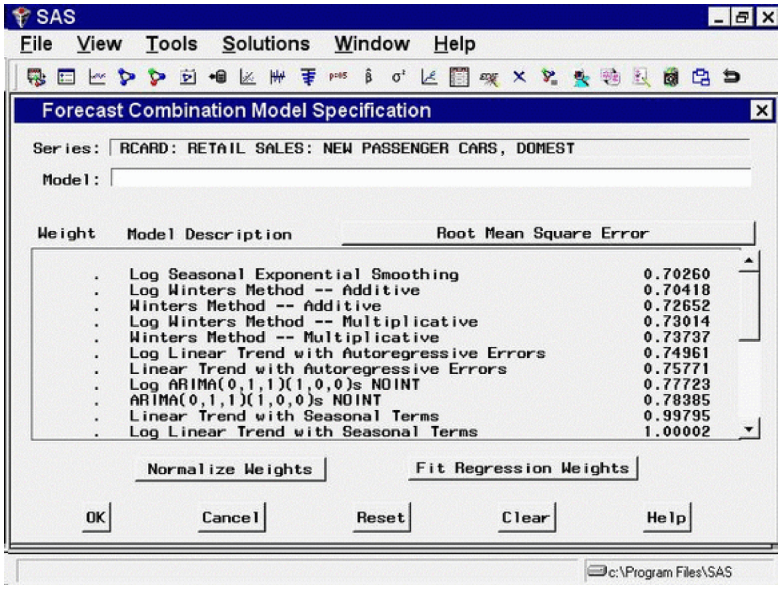
## Forecast Combination Model Specification Window

Once you have fit several forecasting models to a series, you face the question of which model to use to produce the final forecasts. One possible answer is to combine or average the forecasts from several models. Combining the predictions from several different forecasting methods is a popular approach to forecasting.

The way that you produce forecast combinations with the Time Series Forecasting System is to use the Forecast Combination Model Specification window to specify a new forecasting model that performs the averaging of forecasts from the models you want to combine. This new model is added to the list of fitted models just like other models. You can then use the Model Viewer window features and Model Fit Comparison window features to examine the fit of the combined model.

To specify a forecast combination model, select "Combine Forecasts" from the pop-up menu or toolbar, or select "Edit" and "Fit Model" from the menu bar. This brings up the Forecast Combination Model Specification window, as shown in Figure 61.29.

**Figure 61.29** Forecast Combination Window



At the top of the Forecast Combination window is the name and label of the series and the label of the model you are specifying. The model label is filled in with an automatically generated label as you specify options. You can type over the automatic label with your own label for the model. To restore the automatic label, enter a blank label.

The middle part of the Forecast Combination window consists of the list of models that you have fit to the series. This table shows the label and goodness-of-fit measure for each model and the combining weight assigned to the model.

The `Weight` column controls how much weight is given to each model in the combined forecasts. A missing weight means that the model is not used. Initially, all the models have missing weight values.

You can enter the weight values you want to use in the `Weight` column. Alternatively, you can select models from the Model Description column, and weight values for the models you select are set automatically. To

remove a model from the combination, select it again. This resets its weight value to missing.

At the bottom of the Forecast Combination window are two buttons: `Normalize Weights` and `Fit Regression Weights`. The Normalize Weights button adjusts the nonmissing weight values so that they sum to one. The Fit Regression Weights button uses linear regression to compute the weight values that produce the combination of model predictions with the best fit to the series.

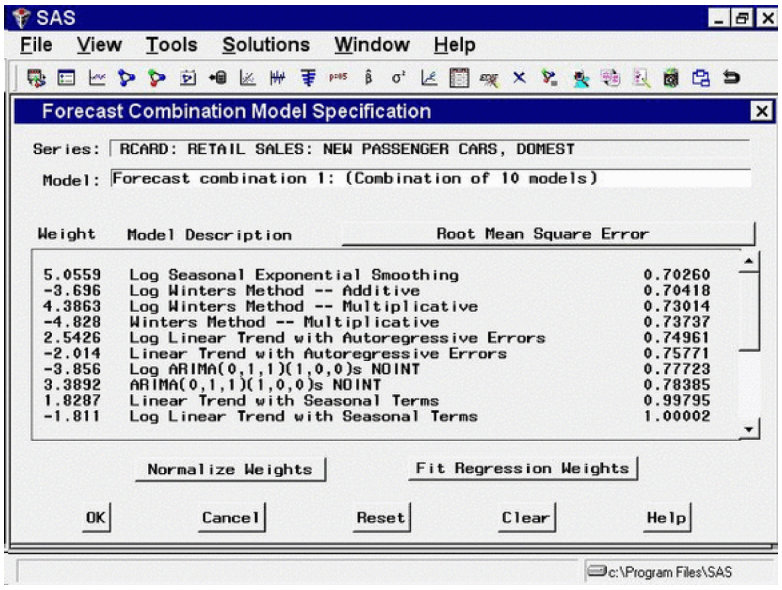
If no models are selected, the Fit Regression Weights button fits weights for all the models in the list. You can compute regression weights for only some of the models by first selecting the models you want to combine and then selecting Fit Regression Weights. In this case, only the nonmissing Weight values are replaced with regression weights.

As an example of how to combine forecasting models, select all the models in the list. After you have finished selecting the models, all the models in the list should now have equal weight values, which implies a simple average of the forecasts.

Now click the Fit Regression Weights button. The system performs a linear regression of the series on the predictions from the models with nonmissing weight values and replaces the weight values with the estimated regression coefficients. These are the combining weights that produce the smallest mean square prediction error within the sample.

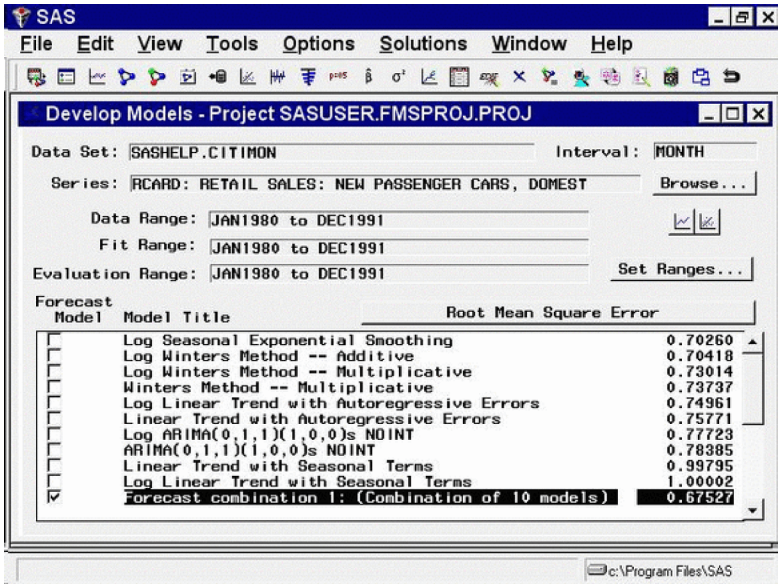
The Forecast Combination window should now appear as shown in Figure 61.30. (Note that some of the regression weight values are negative.)

**Figure 61.30** Combining Models



Click the OK button to fit the combined model. Now the Develop Models window shows this model to be the best fitting according to the root mean square error, as shown in Figure 61.31.

**Figure 61.31** Develop Models Window Showing All Models Fit



Notice that the combined model has a smaller root mean square error than any one of the models included in the combination. The confidence limits for forecast combinations are produced by taking a weighted average of the mean square prediction errors for the component forecasts, ignoring the covariance between the prediction errors.

## Incorporating Forecasts from Other Sources

You might have forecasts from other sources that you want to include in the forecasting process. Examples of other forecasts you might want to use are "best guess" forecasts based on personal judgments, forecasts produced by government agencies or commercial forecasting services, planning scenarios, and reference or "base line" projections. Because such forecasts are produced externally to the Time Series Forecasting System, they are referred to as external forecasts.

You can include external forecasts in combination models to produce compromise forecasts that split the difference between the external forecast and forecasting models that you fit. You can use external forecasts to compare them to the forecasts from models that are fit by the system.

To include external forecasts in the Time Series Forecasting process, you must first supply the external forecast as a variable in the input data set. You then specify a special kind of forecasting "model" whose predictions are identical to the external forecast recorded in the data set.

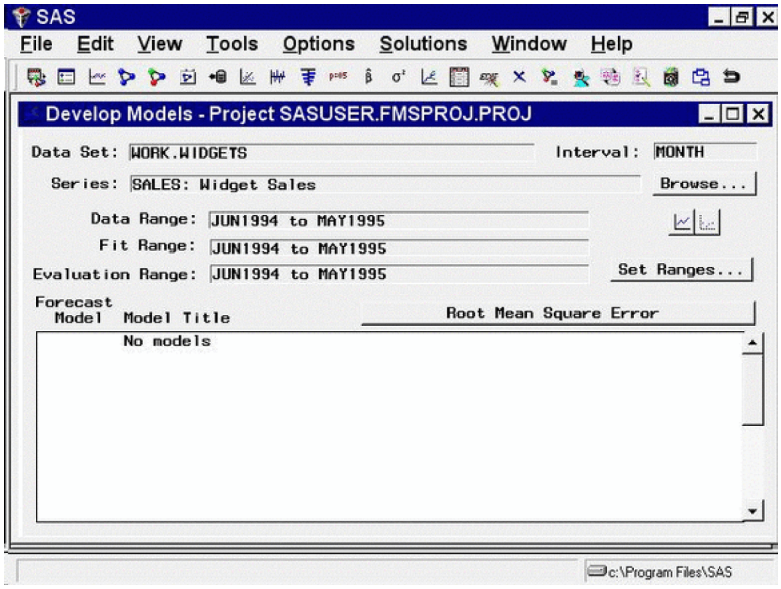
As an example, suppose you have 12 months of sales data and five months of sales forecasts based on a consensus opinion of the sales staff. The following statements create a SAS data set containing made-up numbers for this situation.

```
data widgets;
   input date monyy5. sales staff;
   format date monyy5.;
```

```
   label sales = "Widget Sales"
         staff = "Sales Staff Consensus Forecast";
   datalines;
jun94  142.1    .
jul94  139.6    .
aug94  145.0    .
sep94  150.2    .
oct94  151.1    .
nov94  154.3    .
dec94  158.7    .
jan95  155.9    .
feb95  159.2    .
mar95  160.8    .
apr95  162.0    .
may95  163.3    .
jun95     .  166.
jul95     .  168.
aug95     .  170.
sep95     .  171.
oct95     .  177.
run;
```

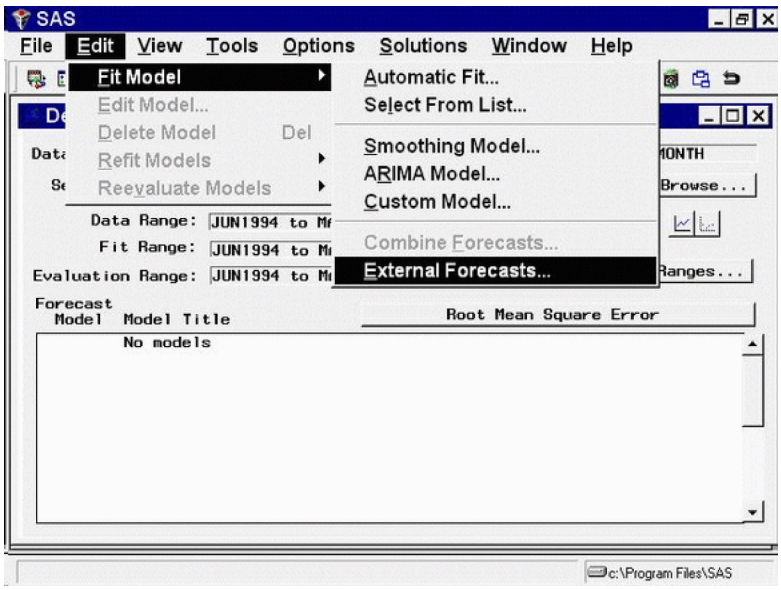
Submit the preceding statements in the SAS Program Editor window. From the Time Series Forecasting window, select "Develop Models." In the Series Selection window, select the data set WORK.WIDGETS and the variable SALES. The Develop Models window should now appear as shown in Figure 61.32.

**Figure 61.32** Develop Models Window



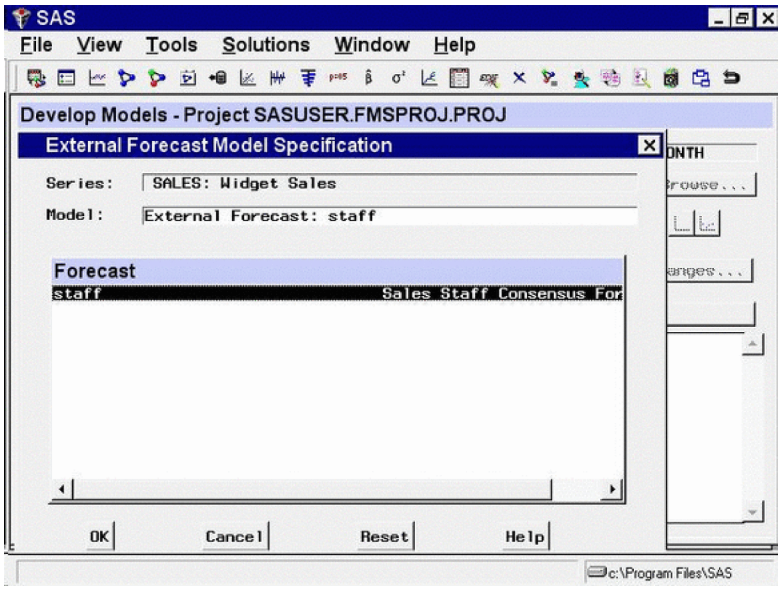
Now select "Edit," "Fit Model," and "External Forecasts" from the menu bar of the Develop Models window, as shown in Figure 61.33, or the `Use External Forecasts` toolbar icon.

**Figure 61.33** Adding a Model for an External Forecast Series



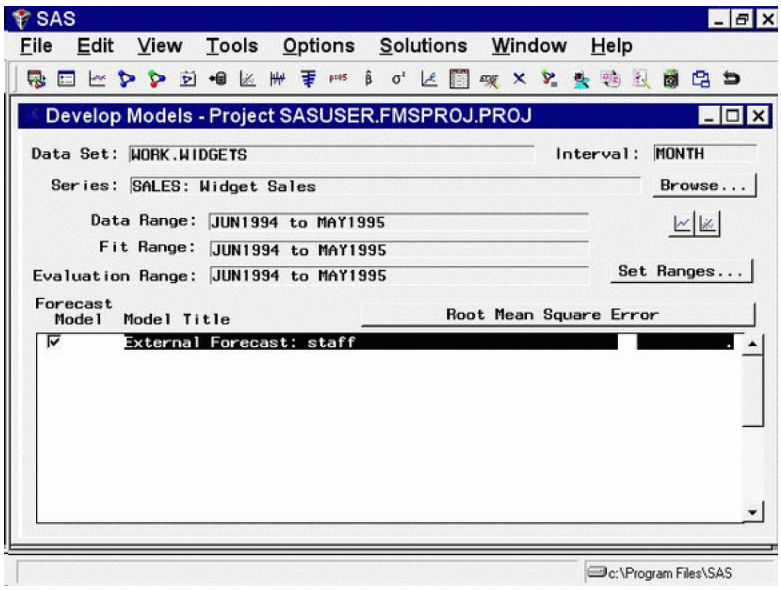
This selection opens the External Forecast Model Specification window. Select the STAFF variable as shown in Figure 61.34.

**Figure 61.34** External Forecast Series Selected



Select the OK button. The external forecast model is now "fit" and added to the Develop Models list, as shown in Figure 61.35.

**Figure 61.35** Model for External Forecast



You can now use this model for comparison with the predictions from other forecasting models that you fit, or you can include it in a forecast combination model.

Note that no fitting is actually performed for an external forecast model. The predictions of the external forecast model are simply the values of the external forecast series read from the input data set. The goodness-of-fit statistics for such models will depend on the values that the external forecast series contains for observations within the period of fit. In this case, no STAFF values are given for past periods, and therefore the fit statistics for the model are missing.

Using Hold-out Samples . . . . . 4035

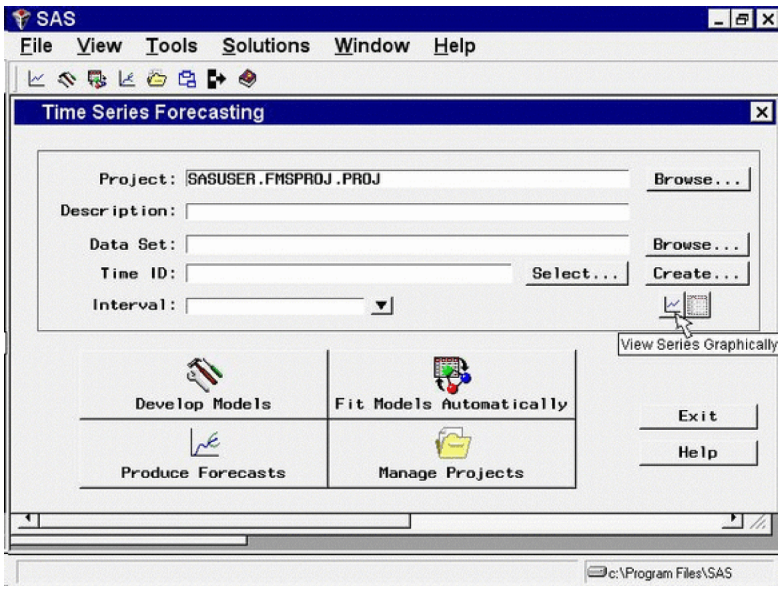
The Time Series Forecasting System provides a variety of tools for identifying potential forecasting models and for choosing the best fitting model. It allows you to decide how much control you want to have over the process, from a hands-on approach to one that is completely automated. This chapter begins with an exploration of the tools available through the Series Viewer and Model Viewer. It presents an example of identifying models graphically and exercising your knowledge of model properties. The remainder of the chapter shows you how to compare models by using a variety of statistics and by controlling the fit and evaluation time ranges. It concludes by showing you how to refit existing models and how to compare models using hold-out samples.

## Time Series Viewer Features

The `Time Series Viewer` is a graphical tool for viewing and analyzing time series. It can be used separately from the `Time Series Forecasting System` by using the TSVIEW command or by selecting `Time Series Viewer` from the `Analysis` pull-down menu under `Solutions`.

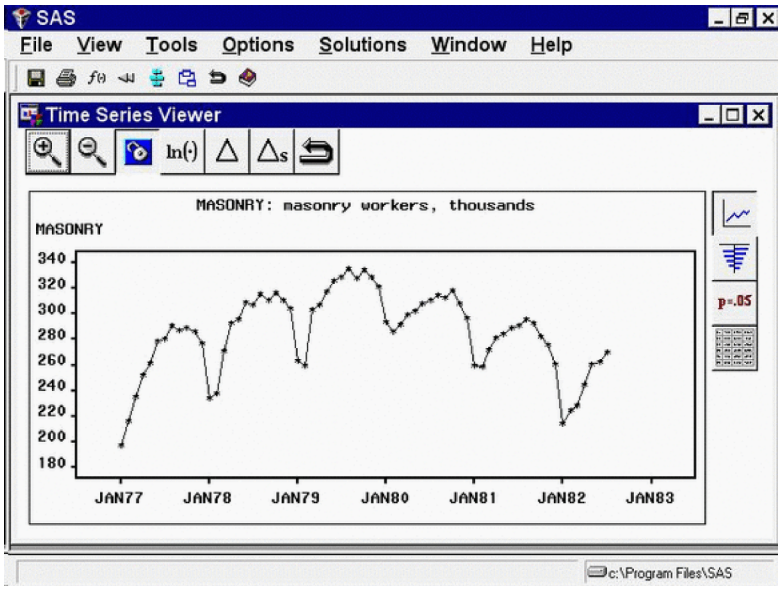
In this chapter you will use the Time Series Viewer to examine plots of your series before fitting models. Begin this example by invoking the Forecasting system and clicking the `View Series Graphically` button, as shown in Figure 62.1, or the `View Series` toolbar icon.

**Figure 62.1** Invoking the Time Series Viewer



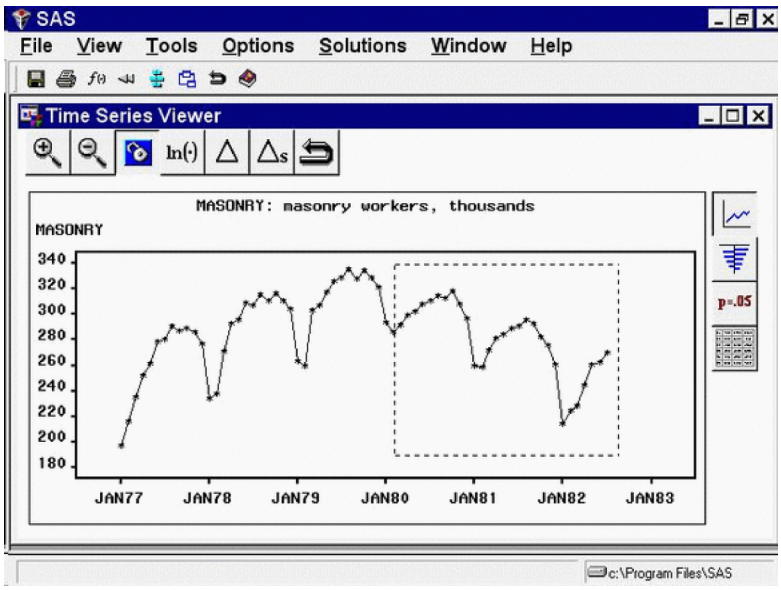
From the Series Selection window, select SASHELP as the library, WORKERS as the data set, and MASONRY as the time series, and then click the `Graph` button. The Time Series Viewer displays a plot of the series, as shown in Figure 62.2.

**Figure 62.2** Series Plot



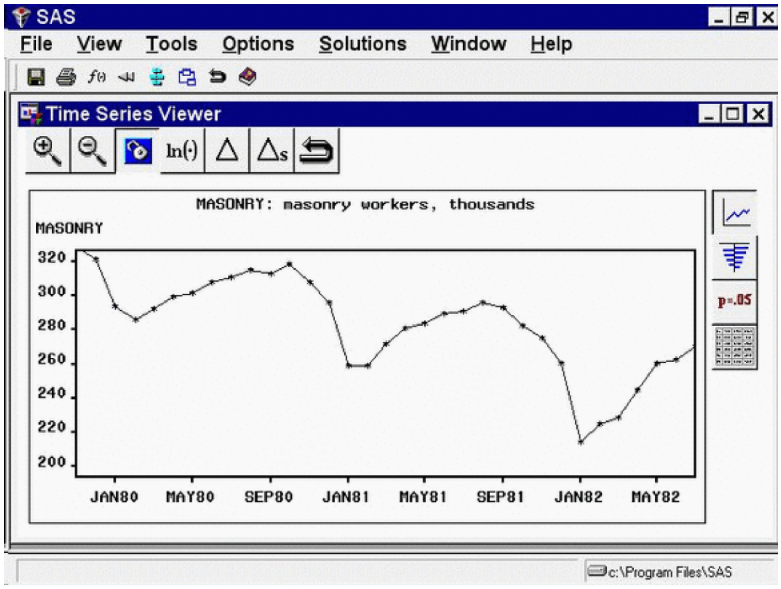
Select the Zoom In icon, the first one on the window's horizontal toolbar. Notice that the mouse pointer changes shape and that "Note: Click on a corner of the region, then drag to the other corner" appears on the message line. Outline an area, as shown in Figure 62.3, by clicking the mouse at the upper-left corner, holding the button down, dragging to the lower-right corner, and releasing the button.

**Figure 62.3** Selecting an Area for Zoom



The zoomed plot should appear as shown in Figure 62.4.

**Figure 62.4** Zoomed Plot



You can repeat the process to zoom in still further. To return to the previous view, select the Zoom Out icon, the second icon on the window's horizontal toolbar.

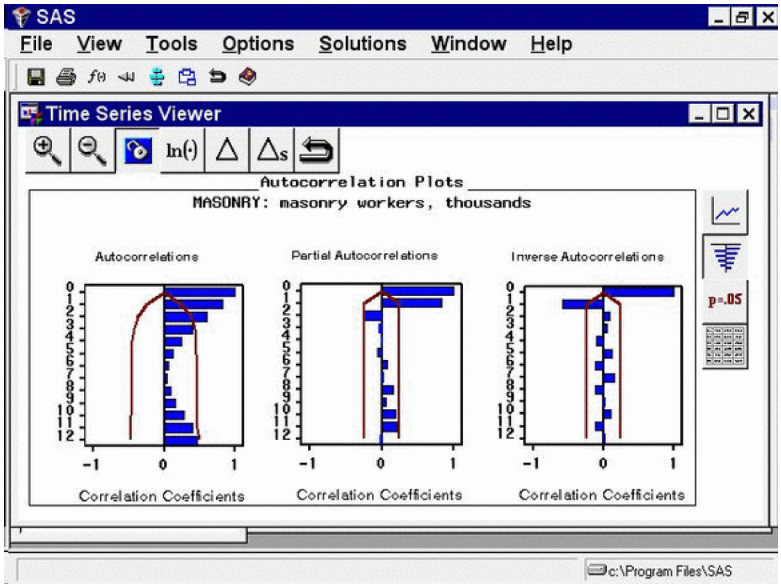
The third icon on the horizontal toolbar is used to link or unlink the viewer window. By default, the viewer is linked, meaning that it is automatically updated to reflect selection of a different time series. To see this, return to the Series Selection window by clicking on it or using the Window menu or `Next Viewer` toolbar icon. Select the Electric series in the `Time Series Variables` list box. Notice that the Time Series Viewer window is updated to show a plot of the ELECTRIC series. Select the `Link/Unlink` icon if you prefer to

unlink the viewer so that it is not automatically updated in this way. Successive selections toggle between the linked and unlinked state. A note on the message line informs you of the state of the Time Series Viewer window.

When a Time Series Viewer window is linked, selecting `View Series` again makes the linked Viewer window active. When no Time Series Viewer window is linked, selecting `View Series` opens an additional Time Series Viewer window. You can bring up as many Time Series Viewer windows as you want.

Having seen the plot in Figure 62.2, you might suspect that the series is nonstationary and seasonal. You can gain further insight into this by examining the sample autocorrelation function (ACF), partial autocorrelation function (PACF), and inverse autocorrelation function (IACF) plots. To switch the display to the autocorrelation plots, select the second icon from the top on the vertical toolbar at the right side of the Time Series Viewer. The plot appears as shown in Figure 62.5.

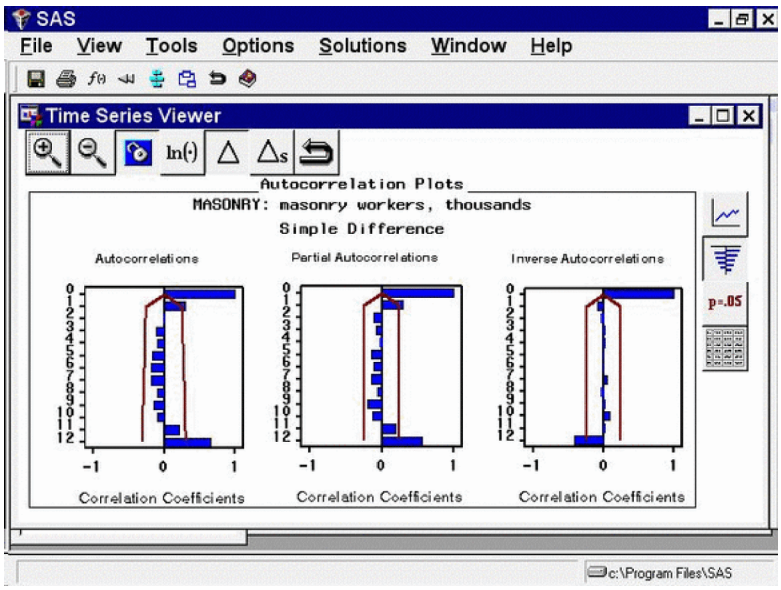
**Figure 62.5** Sample Autocorrelation Plots



Each bar represents the value of the correlation coefficient at the given lag. The overlaid lines represent confidence limits computed at plus and minus two standard errors. You can switch the graphs to show significance probabilities by selecting `Correlation Probabilities` under the `Options` pull-down menu, or by selecting the `Toggle ACF Probabilities` toolbar icon.

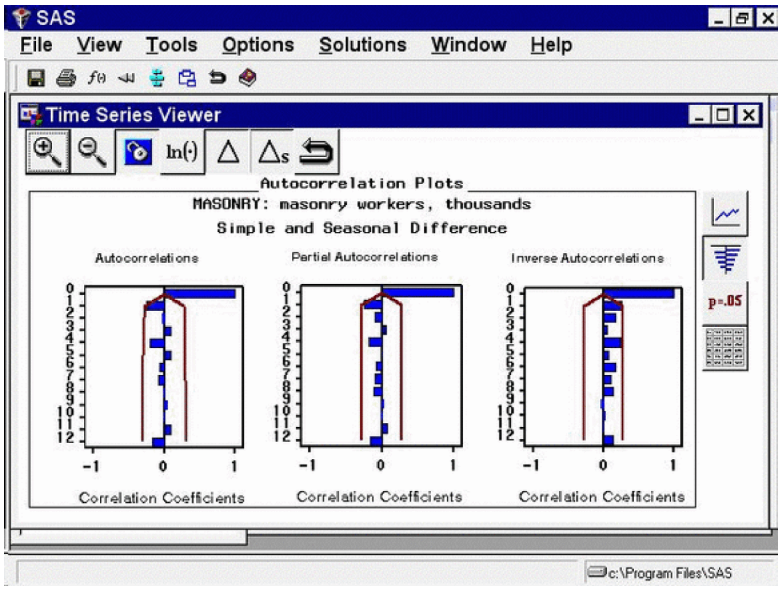
The slow decline of the ACF suggests that first differencing might be warranted. To see the effect of first differencing, select the simple difference icon, the fifth icon from the left on the window's horizontal toolbar. The plot now appears as shown in Figure 62.6.

**Figure 62.6** ACF Plots with First Difference Applied



Since the ACF still displays slow decline at seasonal lags, seasonal differencing is appropriate (in addition to the first differencing already applied). Select the `Seasonal Difference` icon, the sixth icon from the left on the horizontal toolbar. The plot now appears as shown in Figure 62.7.

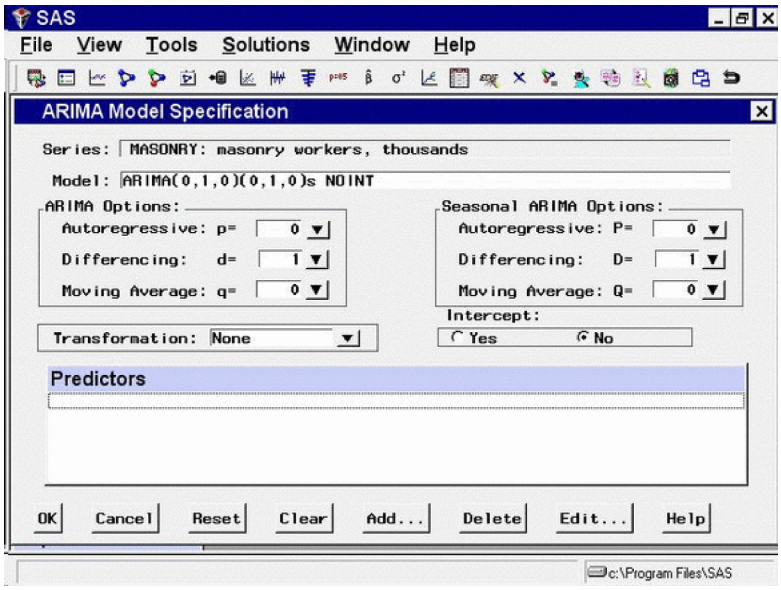
**Figure 62.7** ACF Plot with Simple and Seasonal Differencing



## Model Viewer Prediction Error Analysis

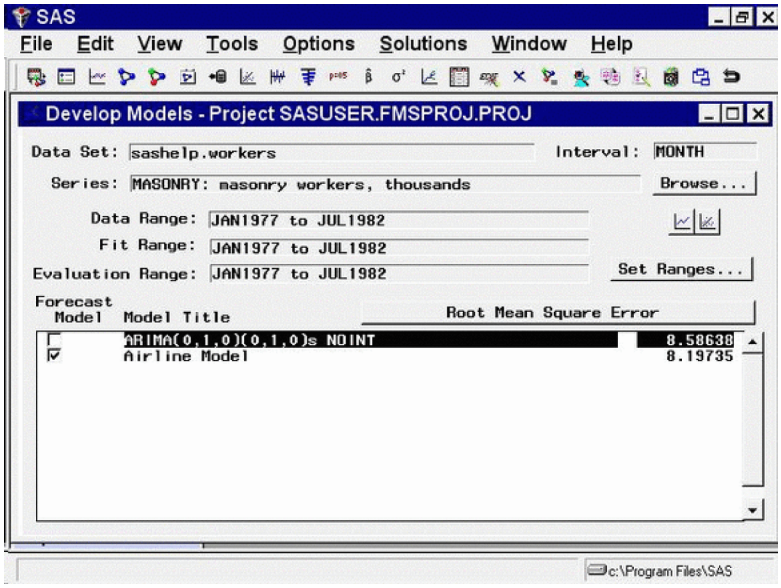
Leave the Time Series Viewer open for the remainder of this exercise. Drag it out of the way or push it to the background so that you can return to the Time Series Forecasting window. Select `Develop Models`, then click an empty part of the table to bring up the pop-up menu, and select `Fit ARIMA Model`. Define the ARIMA(0,1,0)(0,1,0)s model by selecting `1` for Differencing under ARIMA Options, `1` for Differencing under Seasonal ARIMA Options, and `No` for `Intercept`, as shown in Figure 62.8.

**Figure 62.8** Specifying the ARIMA(0,1,0)(0,1,0)s Model



When you click the `OK` button, the model is fit and you are returned to the Develop Models window. Click on an empty part of the table and choose `Fit Models from List` from the pop-up menu. Select `Airline Model` from the window. (Airline Model is a common name for the ARIMA(0,1,1)(0,1,1)s model, which is often used for seasonal data with a linear trend.) Click the `OK` button. Once the model has been fit, the table shows the two models and their root mean square errors. Notice that the Airline Model provides only a slight improvement over the differencing model, ARIMA(0,1,0)(0,1,0)s. Select the first row to highlight the differencing model, as shown in Figure 62.9.

**Figure 62.9** Selecting a Model

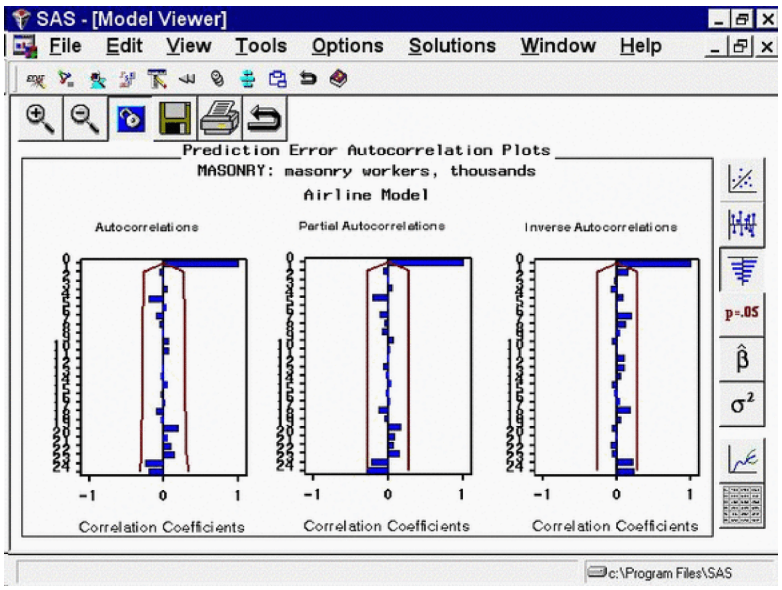


Now click the `View Selected Model Graphically` button, below the `Browse` button at the right side of the Develop Models window. The `Model Viewer` window appears, showing the actual data and model predictions for the MASONRY series. (Note that predicted values are missing for the first 13 observations due to simple and seasonal differencing.)

To examine the ACF plot for the model prediction errors, select the third icon from the top on the vertical toolbar. For this model, the prediction error ACF is the same as the ACF of the original data with first differencing and seasonal differencing applied. This differencing is apparent if you bring the Time Series Viewer back into view for comparison.

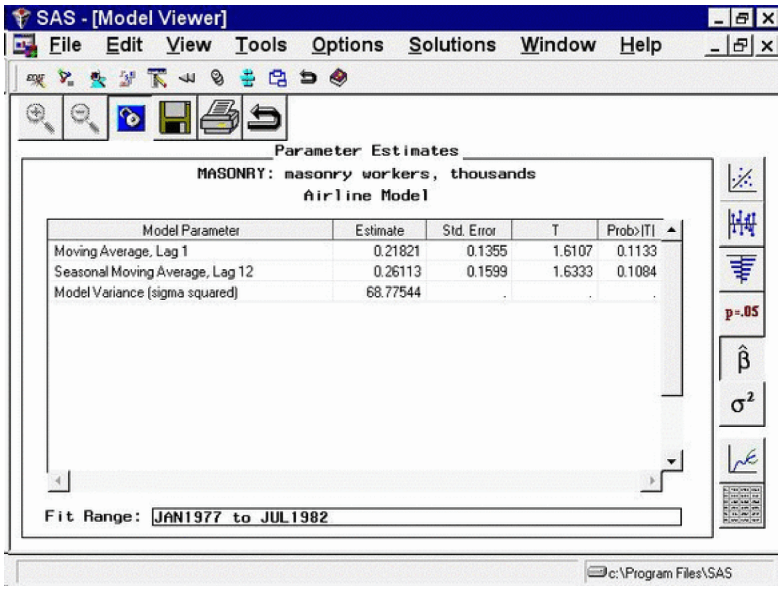
Return to the Develop Models Window by clicking on it or using the window pull-down menu or the Next Viewer toolbar icon. Select the second row of the table in the Develop Models window to highlight the Airline Model. The Model Viewer is automatically updated to show the prediction error ACF of the newly selected model, as shown in Figure 62.10.

**Figure 62.10** Prediction Error ACF Plot for the Airline Model



Another helpful tool available within the Model Viewer is the parameter estimates table. Select the fifth icon from the top of the vertical toolbar. The table gives the parameter estimates for the two moving-average terms in the Airline Model, as well as the model residual variance, as shown in Figure 62.11.

**Figure 62.11** Parameter Estimates for the Airline Model



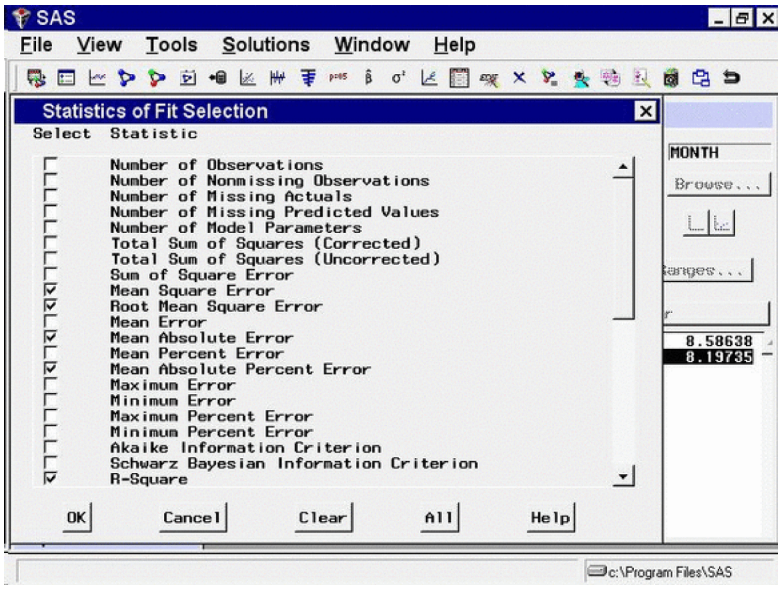
You can adjust the column widths in the table by dragging the vertical borders of the column titles with the mouse. Notice that neither of the parameter estimates is significantly different from zero at the 0.05 level of significance, since `Prob>|t|` is greater than 0.05. This suggests that the Airline Model should be discarded in favor of the more parsimonious differencing model, which has no parameters to estimate.

# The Model Selection Criterion

Return to the Develop Models window (Figure 62.9) and notice the Root Mean Square Error button at the right side of the table banner. This is the model selection criterion—the statistic used by the system to select the best fitting model. So far in this example you have fit two models and have left the default criterion, root mean square error (RMSE), in effect. Because the Airline Model has the smaller value of this criterion and because smaller values of the RMSE indicate better fit, the system has chosen this model as the forecasting model, indicated by the check box in the `Forecast Model` column.

The statistics available as model selection criteria are a subset of the statistics available for informational purposes. To access the entire set, select `Options` from the menu bar, and then select `Statistics of Fit`. The `Statistics of Fit Selection` window appears, as shown in Figure 62.12.

**Figure 62.12** Statistics of Fit



By default, five of the more well known statistics are selected. You can select and deselect statistics by clicking the check boxes in the left column. For this exercise, select `All`, and notice that all the check boxes become checked. Click the `OK` button to close the window. Now if you choose `Statistics of Fit` in the `Model Viewer` window, all of the statistics will be shown for the selected model.

To change the model selection criterion, click the `Root Mean Square Error` button or select `Options` from the menu bar and then select `Model Selection Criterion`. Notice that most of the statistics of fit are shown, but those which are not relevant to model selection, such as number of observations, are not shown. Select `Schwarz Bayesian Information Criterion` and click `OK`. Since this statistic puts a high penalty on models with larger numbers of parameters, the ARIMA(0,1,0)(0,1,0)s model comes out with the better fit.

Notice that changing the selection criterion does not automatically select the model that is best according to that criterion. You can always choose the model you want to use for forecasts by selecting its check box in the `Forecast Model` column.

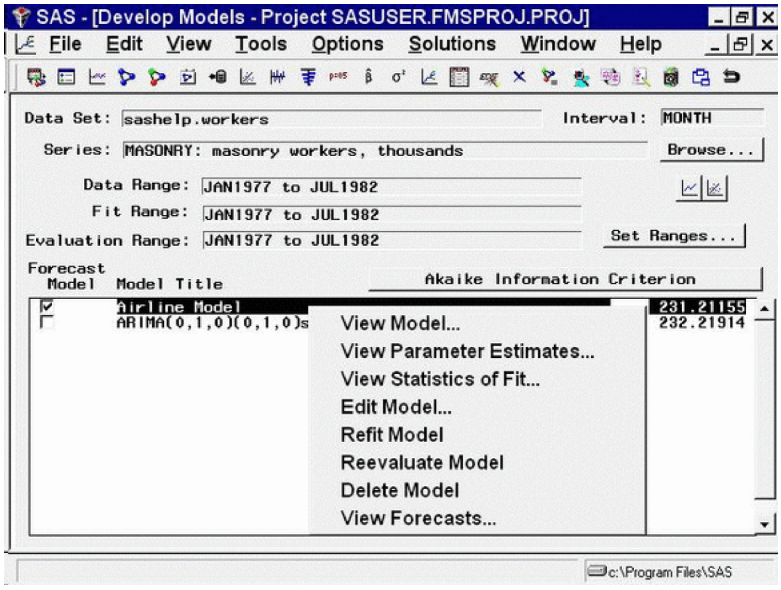
Now bring up the Model Selection Criterion window again and select `Akaike Information Criterion`. This statistic puts a lesser penalty on number of parameters, and the Airline Model comes out as the better fitting model.

## Sorting and Selecting Models

Select `Sort Models` on the `Tools` menu or from the toolbar. This sorts the current list of fitted models by the current selection criterion. Although some selection criteria assign larger values to better fitting models (for example, R-square) while others assign smaller values to better fitting models, `Sort Models` always orders models with the best fitting model—in this case, the Airline Model—at the top of the list.

When you select a model in the table, its name and criterion value become highlighted, and actions that apply to that model become available. If your system supports a right mouse button, you can click it to invoke a pop-up menu, as shown in Figure 62.13.

**Figure 62.13** Right Mouse Button Pop-up Menu



Whether or not you have a right mouse button, the same choices are available under `Edit` and `View` from the menu bar. If the model viewer has been invoked, it is automatically updated to show the selected model, unless you have unlinked the viewer by using the `Link/Unlink` toolbar button.

Select the highlighted model in the table again. Notice that it is no longer highlighted. When no models are highlighted, the right mouse button pop-up menu changes, and items on the menu bar that apply to a selected model become unavailable. For example, you can choose `Edit` from the menu bar, but you can't choose the `Edit Model` or `Delete Model` selections unless you have highlighted a model in the table.

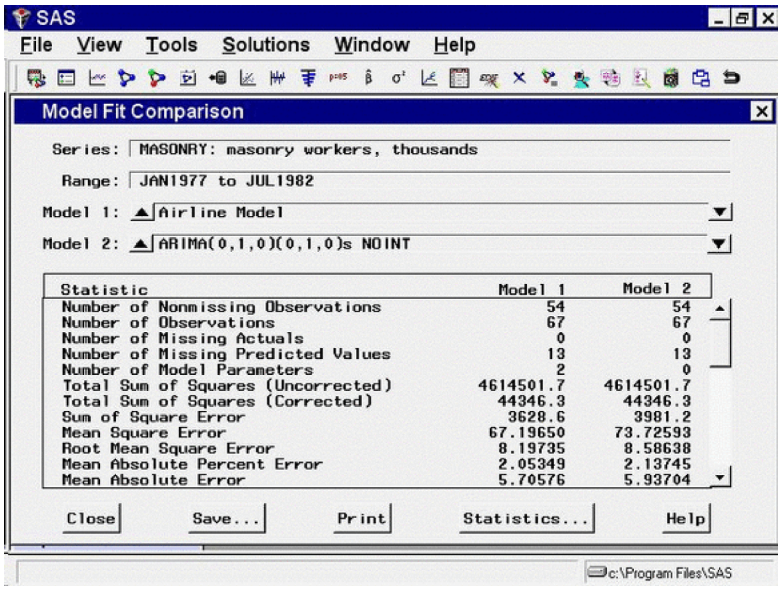
When you select the check box in the `Forecast Model` column of the table, the model in that row becomes the forecasting model. This is the model that will be used the next time forecasts are generated by choosing `View Forecasts` or by using the `Produce Forecasts` window. Note that this forecasting model flag is automatically set when you use `Fit Automatic Model` or when you fit an individual model that fits better,

using the current selection criterion, than the current forecasting model.

## Comparing Models

Select `Tools` and `Compare Models` from the menu bar. This displays the `Model Fit Comparison` table, as shown in Figure 62.14.

**Figure 62.14** Model Comparison Window



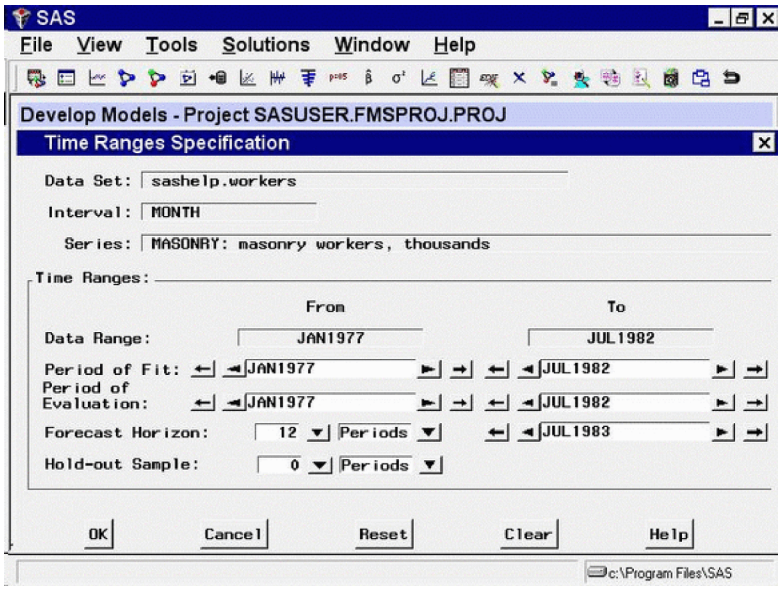
The two models you have fit are shown as `Model 1` and `Model 2`. When there are more than two models, you can bring any two of them into the table by selecting the up and down arrows. In this way, it is easy to do pairwise comparisons on any number of models, looking at as many statistics of fit as you like. Since you previously chose to display all statistics of fit, all of them are shown in the comparison table. Use the vertical scroll bar to move through the list.

After you have examined the model comparison table, click the `Close` button to return to the Develop Models window.

## Controlling the Period of Evaluation and Fit

Notice the three time ranges shown on the Develop Models window (Figure 62.9). The data range shows the beginning and ending dates of the MASONRY time series. The period of fit shows the beginning and ending dates of data used to fit the models. The period of evaluation shows the beginning and ending dates of data used to compute statistics of fit. By default, the fit and evaluate ranges are the same as the data range. To change these ranges, click the `Set Ranges` button, or select `Options` and `Time Ranges` from the menu bar. This brings up the `Time Ranges Specification` window, as shown in Figure 62.15.

**Figure 62.15** Time Ranges Specification Window



For this example, suppose the early data in the series is unreliable, and you want to use the range June 1978 to the latest available for both model fitting and model evaluation. You can either type JUN1978 in the `From` column for `Period of Fit` and `Period of Evaluation`, or you can advance these dates by clicking the right pointing arrows. The outer arrow advances the date by a large amount (in this case, by a year), and the inner arrow advances it by a single period (in this case, by a month). Once you have changed the `Period of Fit` and the `Period of Evaluation` to JUN1978 in the `From` column, click the `OK` button to return to the `Develop Models` window. Notice that these time ranges are updated at the top of the window, but the models already fit have not been affected. Your changes to the time ranges affect *subsequently fit* models.

## Refitting and Reevaluating Models

If you fit the ARIMA(0,1,0)(0,1,0)s and Airline models again in the same way as before, they will be added to the model list, with the same names but with different values of the model selection criterion. Parameter estimates will be different, due to the new fit range, and statistics of fit will be different, due to the new evaluation range.

For this exercise, instead of specifying the models again, refit the existing models by selecting `Edit` from the menu bar and then selecting `Refit Models` and `All Models`. After the models have been refit, you should see the same two models listed in the table but with slightly different values for the selection criterion. The ARIMA (0,1,0)(0,1,0)s and Airline models have now been fit to the MASONRY series by using data from June 1978 to July 1982, since this is the period of fit you specified. The statistics of fit have been computed for the period of evaluation, which was the same as the period of fit. If you had specified a period of evaluation different from the period of fit, the statistics would have been computed accordingly.

In practice, another common reason for refitting models is the availability of new data. For example, when data for a new month become available for a monthly series, you might add them to the input data set, then invoke the forecasting system, open the project containing models fit previously, and refit the models prior to generating new forecasts. Unless you specify the period of fit and period of evaluation in the `Time Ranges Specification` window, they default to the full data range of the series found in the input data set at the time of refitting.

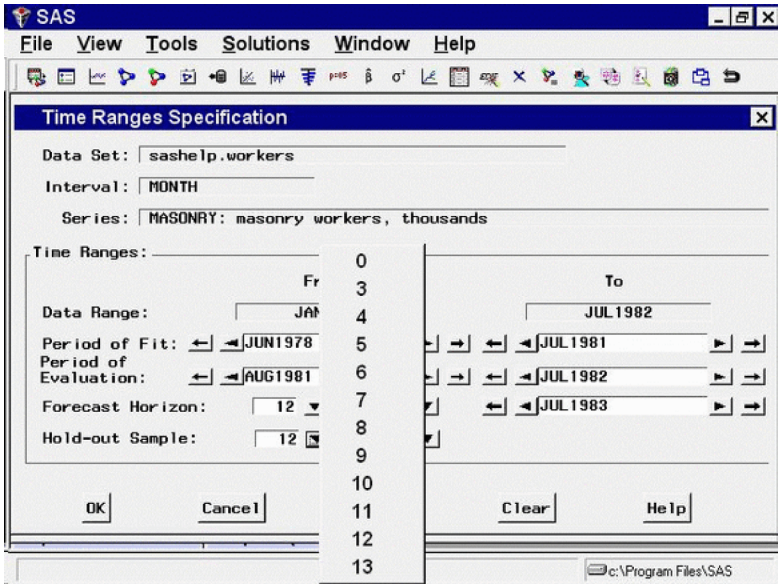
If you prefer to apply previously fit models to revised data without refitting, use `Reevaluate Models` instead of `Refit Models`. This recomputes the statistics of fit by using the current evaluation range, but does not re-estimate the model parameters.

## Using Hold-out Samples

One important application of model fitting where the period of fit is different from the period of evaluation is the use of hold-out samples. With this technique of model evaluation, the period of fit ends at a time point before the end of the data series, and the remainder of the data are held out as a nonoverlapping period of evaluation. With respect to the period of fit, the hold-out sample is a period in the future, used to compare the forecasting accuracy of models fit to past data.

For this exercise, use a hold-out sample of 12 months. Bring up the `Time Ranges Specification` window again by clicking the `Set Ranges` button. Set `Hold-out Sample` to 12 using the combo box, as shown in Figure 62.16. You can also type in a value. To specify a hold-out sample period in different units, you can use the `Periods` combo box. In this case, it allows you to select years as the unit, instead of periods.

**Figure 62.16** Specifying the Hold-out Sample Size



Notice that setting the hold-out sample to 12 automatically sets the fit range to JUN1978–JUL1981 and the evaluation range to AUG1981–JUL1982. If you had set the period of fit and period of evaluation to these ranges, the hold-out sample would have been automatically set to 12 periods.

Click the `OK` button to return to the `Develop Models` window. Now refit the models again. Select `Tools` and `Compare Models` to compare the models now that they have been fit to the period June 1978 through July 1981 and evaluated for the hold-out sample period August 1981 through July 1982. Note that the fit statistics for the hold-out sample are based on one-step-ahead forecasts. (See the section "Statistics of Fit" in Chapter 66, "Forecasting Process Details.")

As shown in Figure 62.17, the ARIMA (0,1,0)(0,1,0)s model now seems to provide a better fit to the data than does the Airline model. It should be noted that the results can be quite different if you choose a different size hold-out sample.

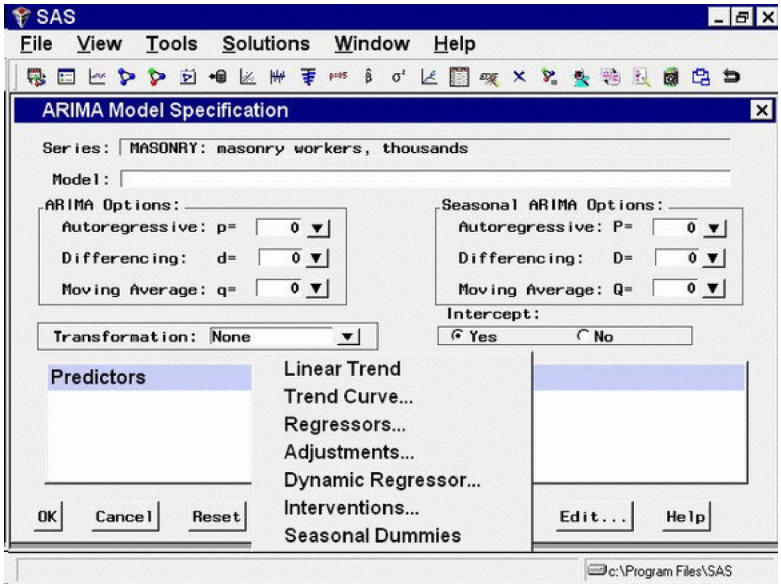
Forecasting models predict the future values of a series by using two sources of information: the past values of the series and the values of other time series variables. Other variables used to predict a series are called *predictor variables*.

Predictor variables that are used to predict the dependent series can be variables in the input data set, such as regressors and adjustment variables, or they can be special variables computed by the system as functions of time, such as trend curves, intervention variables, and seasonal dummies.

You can specify seven different types of predictors in forecasting models by using the ARIMA Model or Custom Model Specification windows. You cannot specify predictor variables with the Smoothing Model Specification window.

Figure 63.1 shows the menu of options for adding predictors to an ARIMA model that is opened by clicking the `Add` button. The Add menu for the Custom Model Specification menu is similar.

**Figure 63.1** Add Predictors Menu



These types of predictors are as follows:

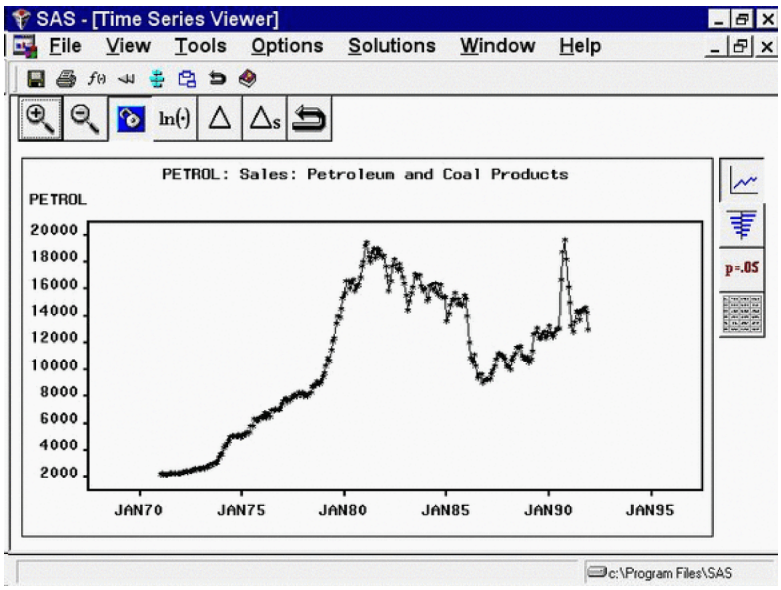
| | |
|---|---|
| Linear Trend | adds a variable that indexes time as a predictor series. A straight line time trend is fit to the series by regression when you specify a linear trend. |
| Trend Curve | provides a menu of various functions of time that you can add to the model to fit nonlinear time trends. The Linear Trend option is a special case of the Trend Curve option for which the trend curve is a straight line. |
| Regressors | allows you to predict the series by regressing it on other variables in the data set. |
| Adjustments | allows you to specify other variables in the data set that supply adjustments to the forecast. |
| Dynamic Regressor | allows you to select a predictor variable from the input data set and specify a complex model for the way that the predictor variable affects the dependent series. |
| Interventions | allows you to model the effect of special events that "intervene" to change the pattern of the dependent series. Examples of intervention effects are strikes, tax increases, and special sales promotions. |
| Seasonal Dummies | adds seasonal indicator or "dummy" variables as regressors to model seasonal effects. |

You can add any number of predictors to a forecasting model, and you can combine predictor variables with other model options.

The following sections explain these seven kinds of predictors in greater detail and provide examples of their use. The examples illustrate these different kinds of predictors by using series in the SASHELP.USECON data set.

Click the `Develop Models` button in the main window. Select the data set SASHELP.USECON, and select the series PETROL. Then click the `View Series Graphically` button in the Develop Models window. The plot of the example series PETROL appears as shown in Figure 63.2.

**Figure 63.2** Sales of Petroleum and Coal

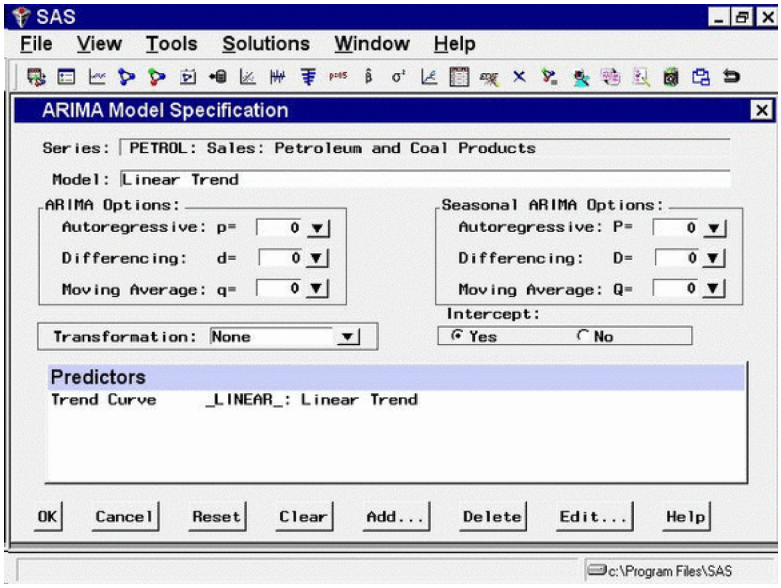


## Linear Trend

From the Develop Models window, select `Fit ARIMA Model`. In the ARIMA Model Specification window, click `Add` and then select `Linear Trend` from the menu (shown in Figure 63.1).

A linear trend is added to the Predictors list, as shown in Figure 63.3.

**Figure 63.3** Linear Trend Predictor Specified



The description for the linear trend item shown in the Predictors list has the following meaning. The first

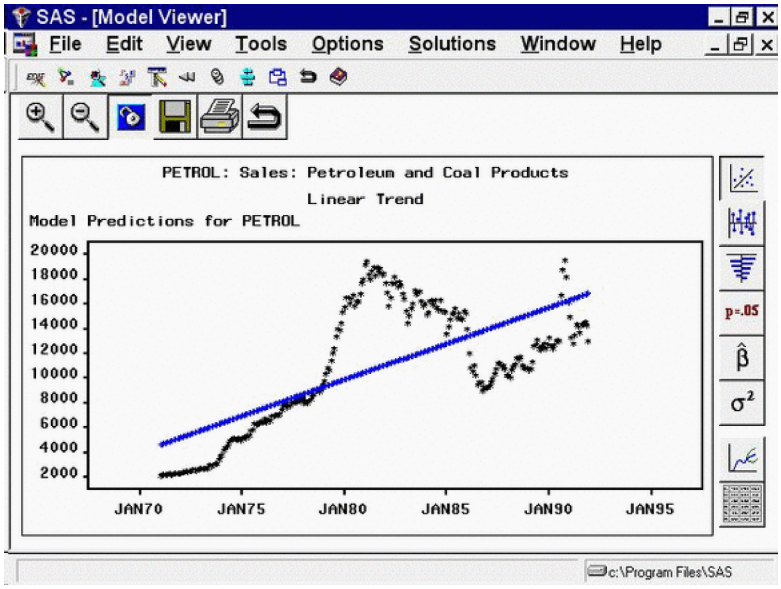
part of the description, Trend Curve, describes the type of predictor. The second part, _LINEAR_, gives the variable name of the predictor series. In this case, the variable is a time index that the system computes. This variable is included in the output forecast data set. The final part, Linear Trend, describes the predictor.

Notice that the model you have specified consists only of the time index regressor _LINEAR_ and an intercept. Although this window is normally used to specify ARIMA models, in this case no ARIMA model options are specified, and the model is a simple regression on time.

Click the `OK` button. The Linear Trend model is fit and added to the model list in the Develop Models window.

Now open the Model Viewer by using the `View Model Graphically` icon or the `Model Predictions` item under the `View` pull-down menu or toolbar. This displays a plot of the model predictions and actual series values, as shown in Figure 63.4. The predicted values lie along the least squares trend line.

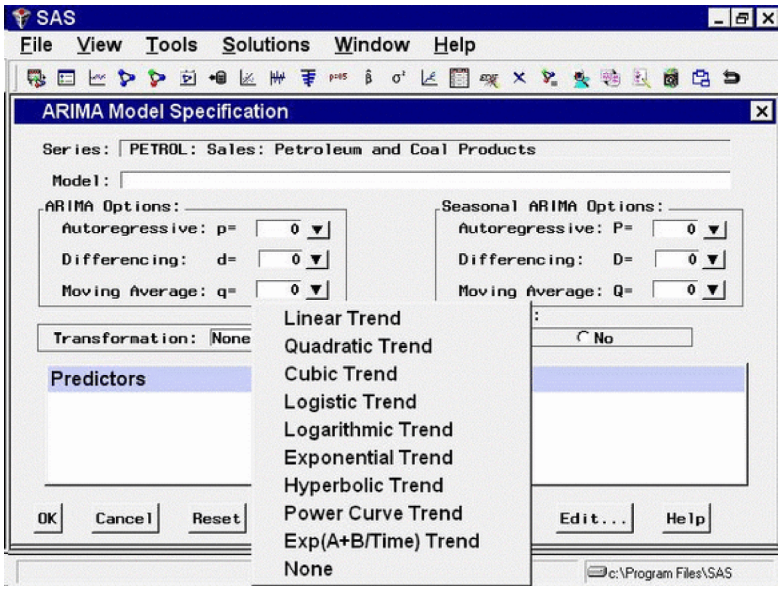
**Figure 63.4** Linear Trend Model



# Time Trend Curves

From the Develop Models window, select `Fit ARIMA Model`. In the ARIMA Model Specification window, click `Add` and then select `Trend Curve` from the menu (shown in Figure 63.1). A menu of different kinds of trend curves is displayed, as shown in Figure 63.5.

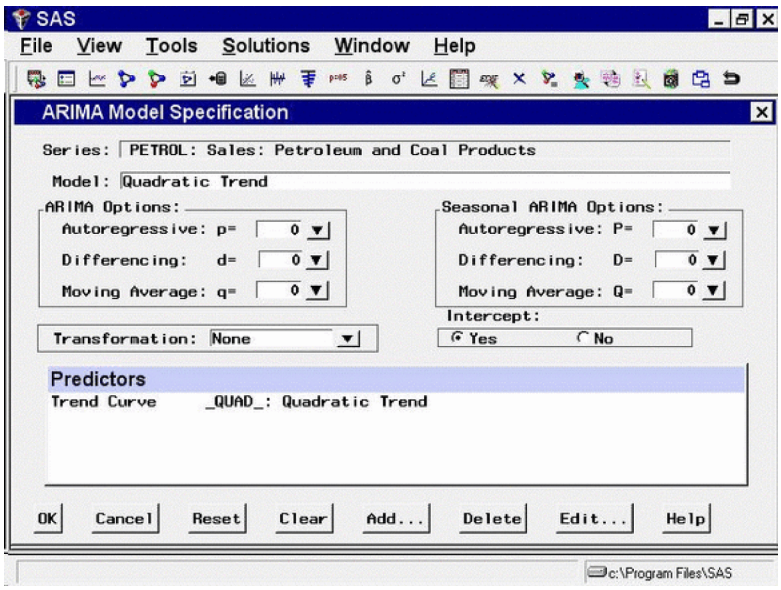
**Figure 63.5** Time Trend Curves Menu



These trend curves work in a similar way as the Linear Trend option (which is a special case of a trend curve and one of the choices on the menu), but with the Trend Curve menu you have a choice of various nonlinear time trends.

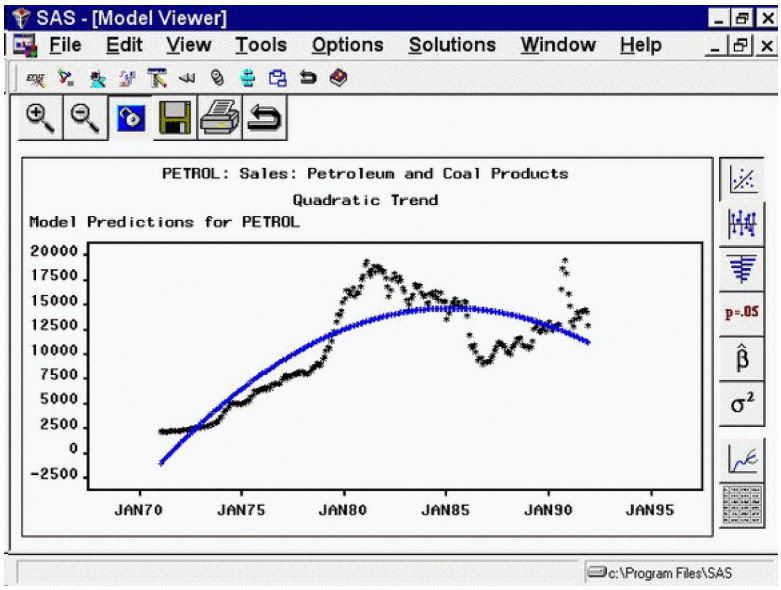
Select `Quadratic Trend`. This adds a quadratic time trend to the Predictors list, as shown in Figure 63.6.

**Figure 63.6** Quadratic Trend Specified



Now click the OK button. The quadratic trend model is fit and added to the list of models in the Develop Models window. The Model Viewer displays a plot of the quadratic trend model, as shown in Figure 63.7.

**Figure 63.7** Quadratic Trend Model



This curve does not fit the PETROL series very well, but the View Model plot illustrates how time trend models work. You might want to experiment with different trend models to see what the different trend curves look like.

Some of the trend curves require transforming the dependent series. When you specify one of these curves, a notice is displayed reminding you that a transformation is needed, and the Transformation field is automatically filled in. Therefore, you cannot control the Transformation specification when some kinds of

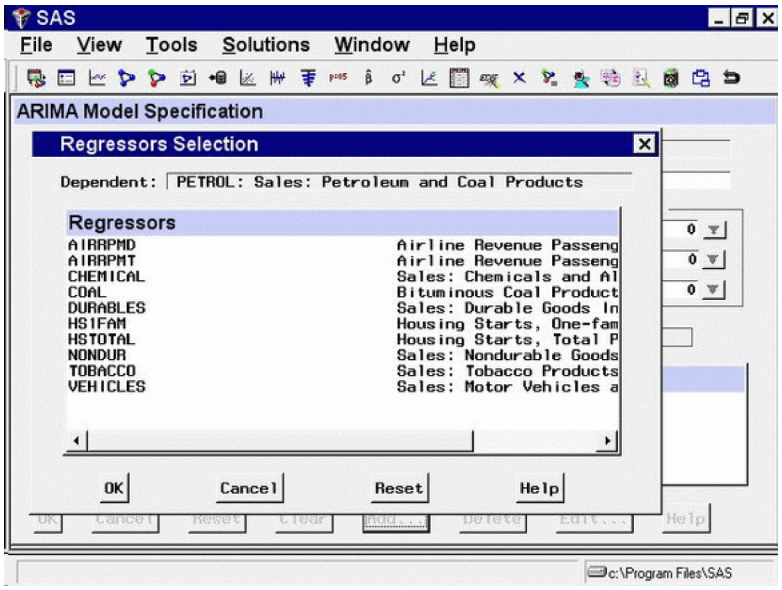
trend curves are specified.

For more information about the different trend curves, see the section "Time Trend Curves" on page 4043 in Chapter 66, "Forecasting Process Details."

## Regressors

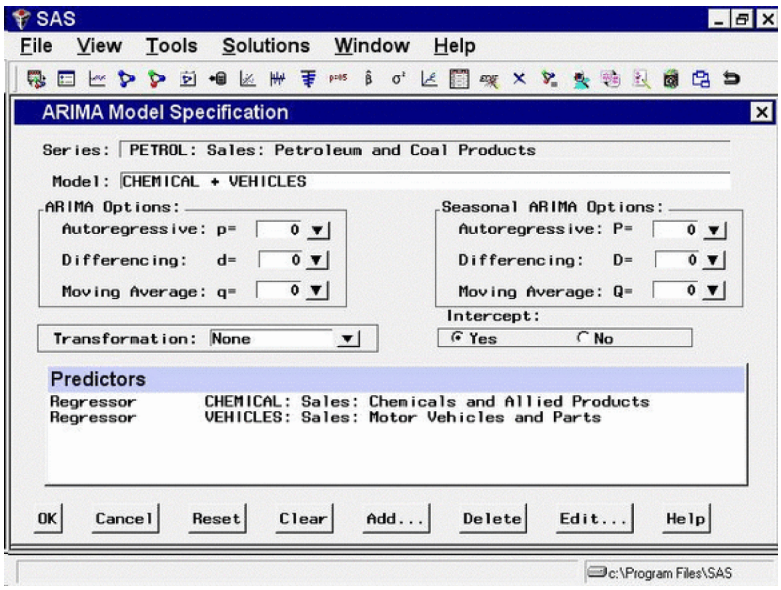
From the Develop Models window, select `Fit ARIMA Model`. In the ARIMA Model Specification window, click `Add` and then select `Regressors` from the menu (shown in Figure 63.1). This displays the `Regressors Selection` window, as shown in Figure 63.8. This window allows you to select any number of other series in the input data set as regressors to predict the dependent series.

**Figure 63.8** Regressors Selection Window



For this example, select `CHEMICAL, Sales: Chemicals and Allied Products`, and `VEHICLES, Sales: Motor Vehicles and Parts`. (Note: You do not need to use the CTRL key when selecting more than one regressor.) Then click the `OK` button. The two variables you selected are added to the Predictors list as regressor type predictors, as shown in Figure 63.9.

**Figure 63.9** Regressors Selected

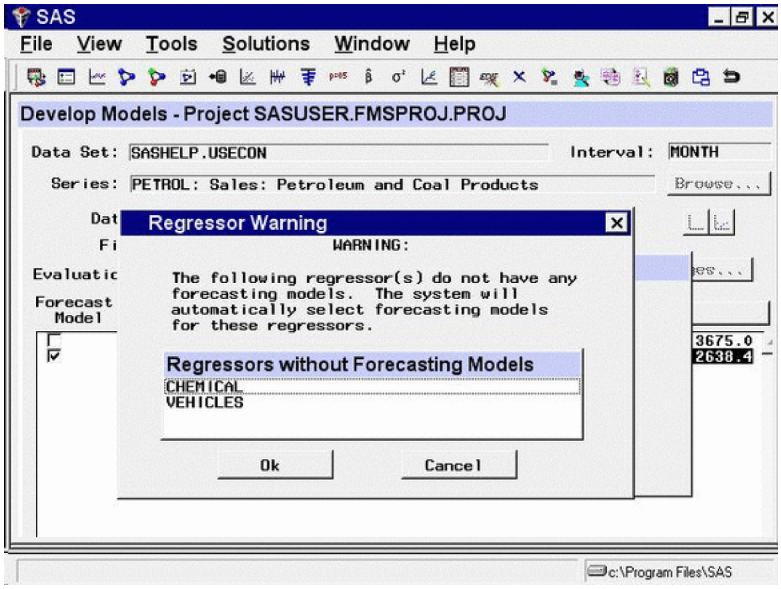


You must have forecasts of the future values of the regressor variables in order to use them as predictors. To do this, you can specify a forecasting model for each regressor, have the system automatically select forecasting models for the regressors, or supply predicted future values for the regressors in the input data set.

Even if you have supplied future values for a regressor variable, the system requires a forecasting model for the regressor. Future values that you supply in the input data set take precedence over predicted values from the regressor's forecasting model when the system computes the forecasts for the dependent series.

Click the OK button. The system starts to fit the regression model but then stops and displays a warning that the regressors that you selected do not have forecasting models, as shown in Figure 63.10.

**Figure 63.10** Regressors Needing Models Warning



If you want the system to create forecasting models automatically for the regressor variables by using the automatic model selection process, click the `OK` button. If not, you can click the `Cancel` button to abort fitting the regression model.

For this example, click the `OK` button. The system now performs the automatic model selection process for CHEMICAL and VEHICLES. The selected forecasting models for CHEMICAL and VEHICLES are added to the model lists for those series. If you switch the current time series in the Develop Models window to CHEMICAL or VEHICLES, you will see the model that the system selected for that series.

Once forecasting models have been fit for all regressors, the system proceeds to fit the regression model for PETROL. The fitted regression model is added to the model list displayed in the Develop Models window.

## Adjustments

An *adjustment* predictor is a variable in the input data set that is used to adjust the forecast values produced by the forecasting model. Unlike a regressor, an adjustment variable does not have a regression coefficient. No model fitting is performed for adjustments. Nonmissing values of the adjustment series are simply added to the model prediction for the corresponding period. Missing adjustment values are ignored. If you supply adjustment values for observations within the period of fit, the adjustment values are subtracted from the actual values, and the model is fit to these adjusted values.

To add adjustments, click `Add` and then select `Adjustments` from the pop-up menu (shown in Figure 63.1). This displays the `Adjustments Selection` window. The Adjustments Selection window functions the same as the Regressor Selection window (which is shown in Figure 63.8). You can select any number of adjustment variables as predictors.

Unlike regressors, adjustments do not require forecasting models for the adjustment variables. If a variable that is used as an adjustment does have a forecasting model fit to it, the adjustment variable's forecasting model is ignored when the variable is used as an adjustment.

You can use forecast adjustments to account for expected future events that have no precedent in the past and so cannot be modeled by regression. For example, suppose you are trying to forecast the sales of a product, and you know that a special promotional campaign for the product is planned during part of the period you want to forecast. If such sales promotion programs have been frequent in the past, then you can record the past and expected future level of promotional efforts in a variable in the data set and use that variable as a regressor in the forecasting model.

However, if this is the first sales promotion of its kind for this product, you have no way to estimate the effect of the promotion from past data. In this case, the best you can do is to make an educated guess at the effect the promotion will have and add that guess to what your forecasting model would predict in the absence of the special sales campaign.

Adjustments are also useful for making judgmental alterations to forecasts. For example, suppose you have produced forecast sales data for the next 12 months. Your supervisor believes that the forecasts are too optimistic near the end and asks you to prepare a forecast graph in which the numbers that you have forecast are reduced by 1000 in the last three months. You can accomplish this task by editing the input data set so that it contains observations for the actual data range of sales plus 12 additional observations for the forecast period, and a new variable called, for example, ADJUSTMENT. The variable ADJUSTMENT contains the value 1000 for the last three observations and is missing for all other observations. You fit the same

model previously selected for forecasting by using the ARIMA Model Specification or Custom Model Specification window, but with an adjustment added that uses the variable ADJUSTMENT. Now when you graph the forecasts by using the Model Viewer, the last three periods of the forecast are reduced by 1000. The confidence limits are unchanged, which helps draw attention to the fact that the adjustments to the forecast deviate from what would be expected statistically.

## Dynamic Regressor

Selecting Dynamic Regressor from the Add Predictors menu (shown in Figure 63.1) allows you to specify a complex time series model of the way that a predictor variable influences the series that you are forecasting.

When you specify a predictor variable as a simple regressor, only the current period value of the predictor effects the forecast for the period. By specifying the predictor with the Dynamic Regression option, you can use past values of the predictor series, and you can model effects that take place gradually.

Dynamic regression models are an advanced feature that you are unlikely to find useful unless you have studied the theory of statistical time series analysis. You might want to skip this section if you are not trained in time series modeling.

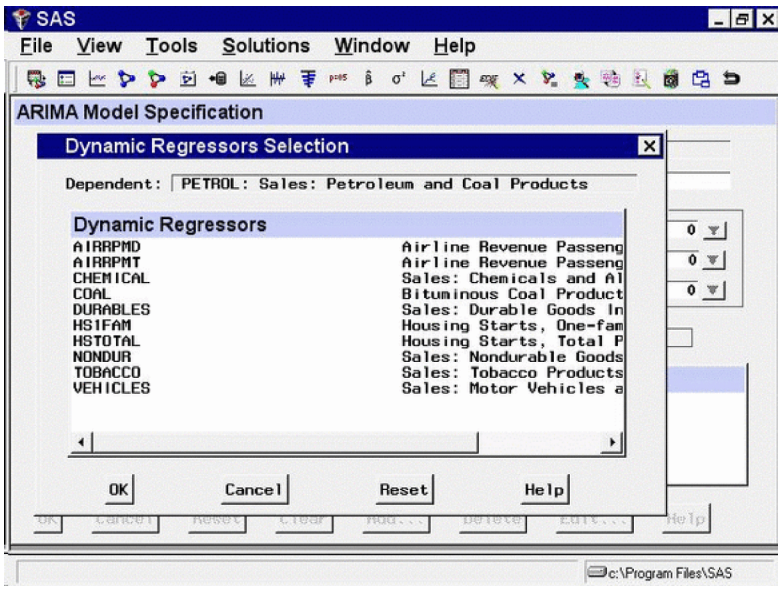
The term *dynamic regression* was introduced by Pankratz (1991) and refers to what Box and Jenkins (1976) named *transfer function models*. In dynamic regression, you have a time series model, similar to an ARIMA model, that predicts how changes in the predictor series affect the dependent series over time.

The dynamic regression model relates the predictor variable to the expected value of the dependent series in the same way that an ARIMA model relates the fluctuations of the dependent series about its conditional mean to the random error term (which is also called the innovation series). For more information about dynamic regression or transfer function, see Pankratz (1991); Box and Jenkins (1976). See also Chapter 8, "The ARIMA Procedure."

From the Develop Models window, select Fit ARIMA Model. In the ARIMA Model Specification window, click Add and then select Linear Trend from the menu (shown in Figure 63.1).

Now click Add and select Dynamic Regressor. This displays the Dynamic Regressors Selection window, as shown in Figure 63.11.

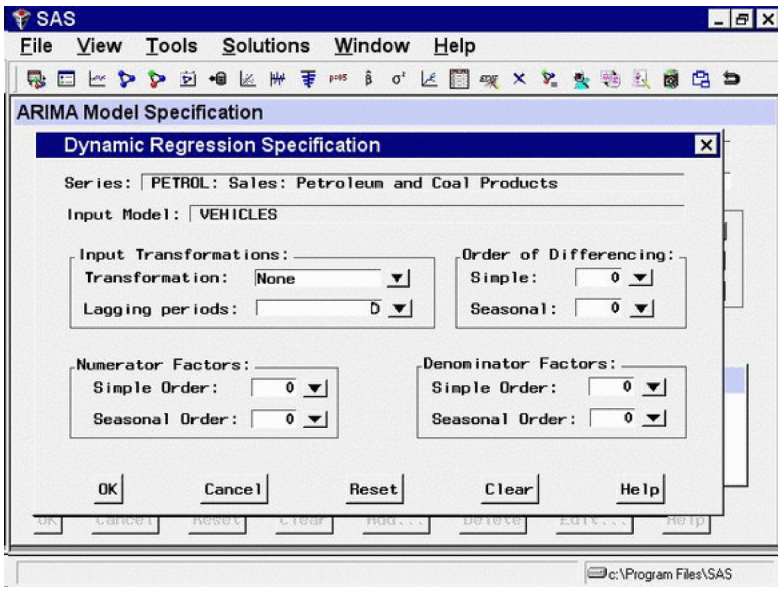
**Figure 63.11** Dynamic Regressors Selection Window



You can select only one predictor series when specifying a dynamic regression model. For this example, select `VEHICLES, Sales: Motor Vehicles and Parts`. Then click the `OK` button.

This displays the `Dynamic Regression Specification` window, as shown in Figure 63.12.

**Figure 63.12** Dynamic Regression Specification Window



This window consists of four parts. The `Input Transformations` fields enable you to transform or lag the predictor variable. For example, you might use the lagged logarithm of the variable as the predictor series.

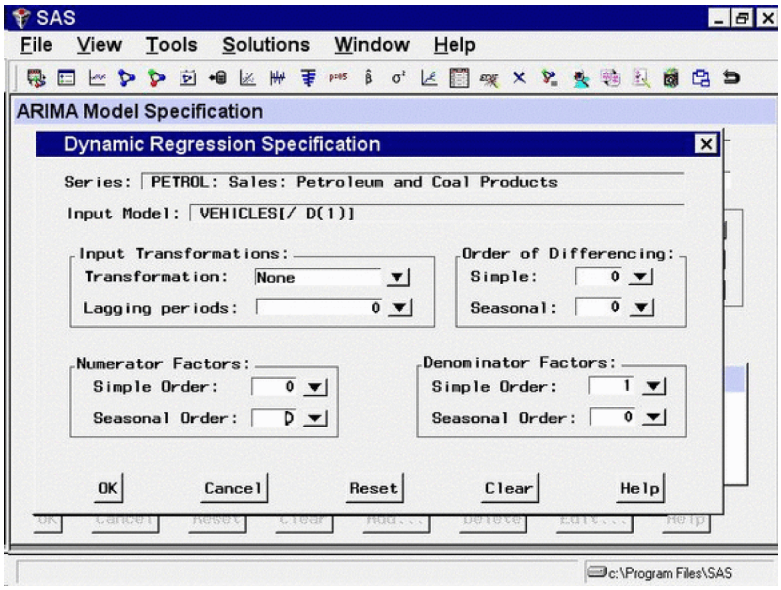
The `Order of Differencing` fields enable you to specify simple and seasonal differencing of the predictor series. For example, you might use changes in the predictor variable instead of the variable itself as the predictor series.

The Numerator Factors and Denominator Factors fields enable you to specify the orders of simple and seasonal numerator and denominator factors of the transfer function.

Simple regression is a special case of dynamic regression in which the dynamic regression model consists of only a single regression coefficient for the current value of the predictor series. If you click the OK button without specifying any options in the Dynamic Regression Specification window, a simple regressor will be added to the model.

For this example, use the Simple Order combo box for Denominator Factors and set its value to 1. The window now appears as shown in Figure 63.13.

**Figure 63.13** Distributed Lag Regression Specified

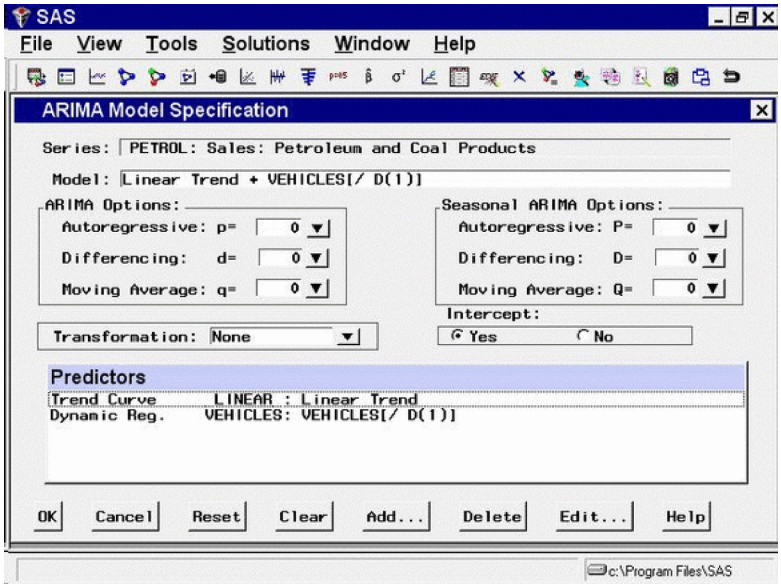


This model is equivalent to regression on an exponentially weighted infinite distributed lag of VEHICLES (in the same way an MA(1) model is equivalent to single exponential smoothing).

Click the OK button to add the dynamic regressor to the model predictors list.

In the ARIMA Model Specification window, the Predictors list should now contain two items, a linear trend and a dynamic regressor for VEHICLES, as shown in Figure 63.14.

**Figure 63.14** Dynamic Regression Model



This model is a multiple regression of PETROL on a time trend variable and an infinite distributed lag of VEHICLES. Click the `OK` button to fit the model.

As with simple regressors, if VEHICLES does not already have a forecasting model, an automatic model selection process is performed to find a forecasting model for VEHICLES before the dynamic regression model for PETROL is fit.

## Interventions

An *intervention* is a special indicator variable, computed automatically by the system, that identifies time periods affected by unusual events that influence or intervene in the normal path of the time series you are forecasting. When you add an intervention predictor, the indicator variable of the intervention is used as a regressor, and the impact of the intervention event is estimated by regression analysis.

To add an intervention to the Predictors list, you must use the Intervention Specification window to specify the time or times that the intervening event took place and to specify the type of intervention. You can add interventions either through the `Interventions` item of the `Add` action or by selecting `Tools` from the menu bar and then selecting `Define Interventions`.

Intervention specifications are associated with the series. You can specify any number of interventions for each series, and once you define interventions you can select them for inclusion in forecasting models. If you select the `Include Interventions` option in the `Options` menu, any interventions that you have previously specified for a series are automatically added as predictors to forecasting models for the series.

From the Develop Models window, invoke the series viewer by selecting the `View Series Graphically` icon or `Series` under the `View` menu. This displays the Time Series Viewer, as was shown in Figure 63.2.

Note that the trend in the PETROL series shows several clear changes in direction. The upward trend in the first part of the series reverses in 1981. There is a sharp drop in the series towards the end of 1985, after

which the trend is again upwardly sloped. Finally, in 1991 the series takes a sharp upward excursion but quickly returns to the trend line.

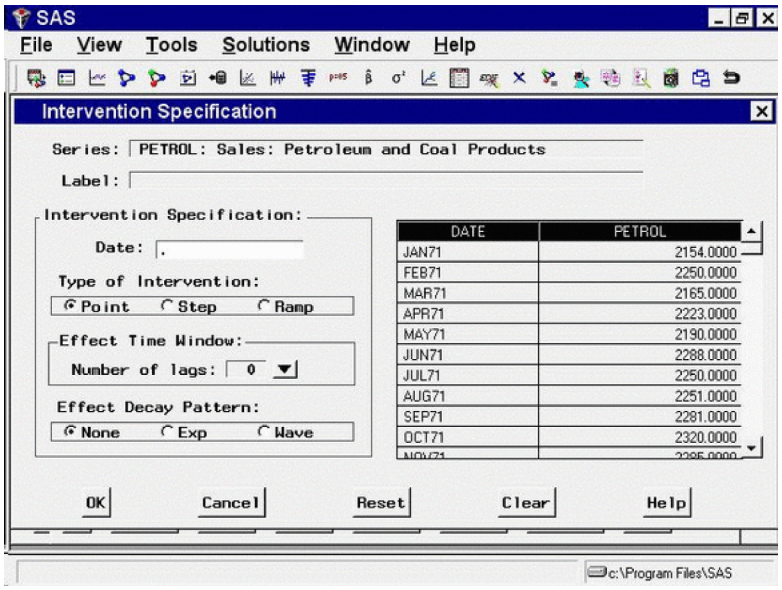
You might have no idea what events caused these changes in the trend of the series, but you can use these patterns to illustrate the use of intervention predictors. To do this, you fit a linear trend model to the series, but modify that trend line by adding intervention effects to model the changes in trend you observe in the series plot.

## The Intervention Specification Window

From the Develop Models window, select `Fit ARIMA` model. In the ARIMA Model Specification window, click `Add` and then select `Linear Trend` from the menu (shown in Figure 63.1).

Select `Add` again and then select `Interventions`. If you have any interventions already defined for the series, this selection displays the `Interventions for Series` window. However, since you have not previously defined any interventions, this list is empty. Therefore, the system assumes that you want to add an intervention and displays the `Intervention Specification` window instead, as shown in Figure 63.15.

**Figure 63.15** Interventions Specification Window



The top of the Intervention Specification window shows the current series and the label for the new intervention (initially blank). At the right side of the window is a scrollable table showing the values of the series. This table helps you locate the dates of the events you want to model.

At the left of the window is an area titled `Intervention Specification` that contains the options for defining the intervention predictor. The `Date` field specifies the time that the intervention occurs. You can type a date value in the `Date` field, or you can set the Date value by selecting a row from the table of series values at the right side of the window.

The area titled `Type of Intervention` controls the kind of indicator variable constructed to model the intervention effect. You can specify the following kinds of interventions:

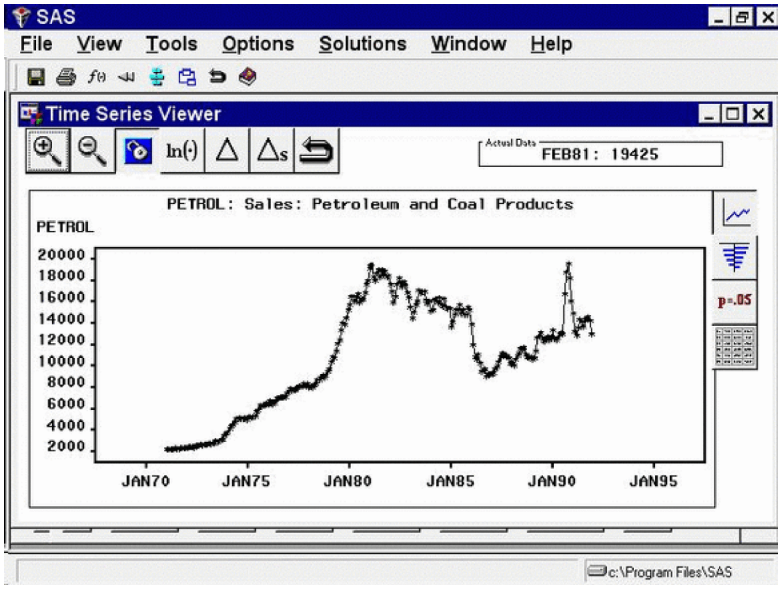
| | |
|---|---|
| Point | is used to indicate an event that occurs in a single time period. An example of a point event is a strike that shuts down production for part of a time period. The value of the intervention's indicator variable is zero except for the date specified. |
| Step | is used to indicate a continuing event that changes the level of the series. An example of a step event is a change in the law, such as a tax rate increase. The value of the intervention's indicator variable is zero before the date specified and 1 thereafter. |
| Ramp | is used to indicate a continuing event that changes the trend of the series. The value of the intervention's indicator variable is zero before the date specified, and it increases linearly with time thereafter. |

The areas titled `Effect Time Window` and `Effect Decay Pattern` specify how to model the effect that the intervention has on the dependent series. These options are not used for simple interventions, they will be discussed later in this chapter.

## Specifying a Trend Change Intervention

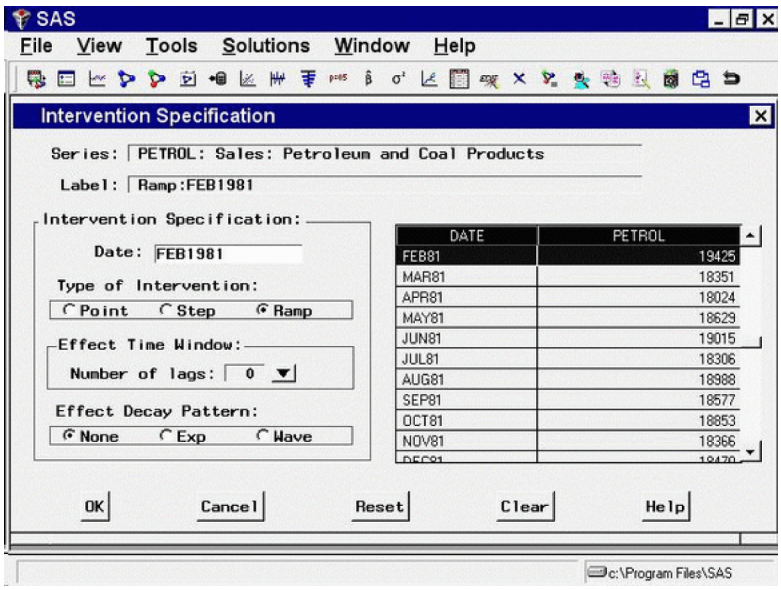
In the Time Series Viewer window position the mouse over the highest point in 1981 and select the point. This displays the data value, 19425, and date, February 1981, of that point in the upper-right corner of the Time Series Viewer, as shown in Figure 63.16.

**Figure 63.16** Identifying the Turning Point



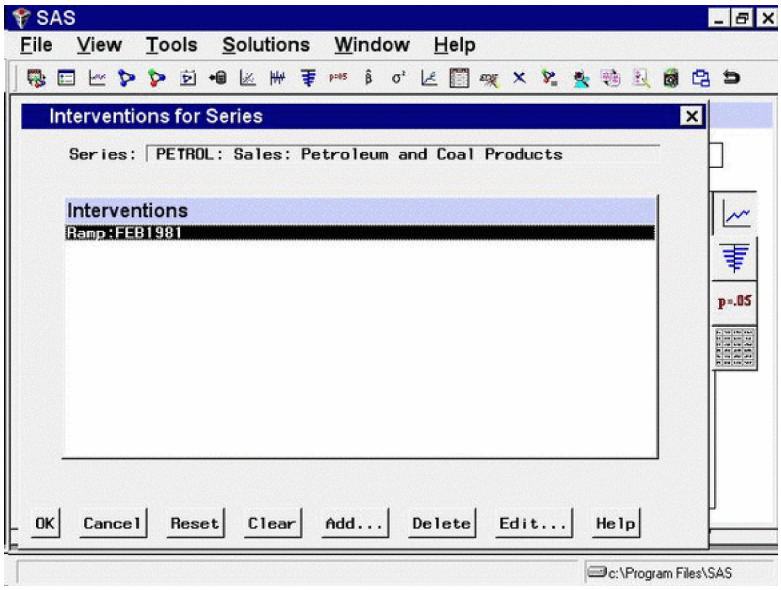
Now that you know the date that the trend reversal occurred, enter that date in the `Date` field of the Intervention Specification window. Select `Ramp` as the type of intervention. The window should now appear as shown in Figure 63.17.

**Figure 63.17** Ramp Intervention Specified



Click the `OK` button. This adds the intervention to the list of interventions for the PETROL series, and returns you to the `Interventions for Series` window, as shown in Figure 63.18.

**Figure 63.18** Interventions for Series Window



This window allows you to select interventions for inclusion in the forecasting model. Since you need to define other interventions, click the `Add` button. This returns you to the Intervention Specification window (shown in Figure 63.15).

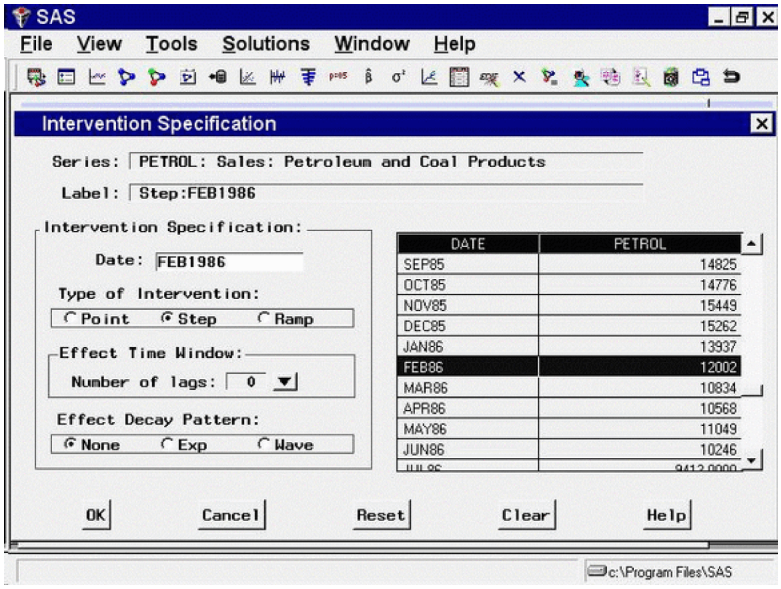
## Specifying a Level Change Intervention

Now add an intervention to account for the drop in the series in late 1985. You can locate the date of this event by selecting points in the Time Series Viewer plot or by scrolling through the data values table in the Interventions Specification window. Use the latter method so that you can see how this works.

Scrolling through the table, you see that the drop was from 15262 in December 1985, to 13937 in January 1986, to 12002 in February, to 10834 in March. Since the drop took place over several periods, you could use another ramp type intervention. However, this example represents the drop as a sudden event by using a step intervention and uses February 1986 as the approximate time of the drop.

Select the table row for February 1986 to set the `Date` field. Select `Step` as the intervention type. The window should now appear as shown in Figure 63.19.

**Figure 63.19** Step Intervention Specified



Click the `OK` button to add this intervention to the list for the series.

Since the trend reverses again after the drop, add a ramp intervention for the same date as the step intervention. Click `Add` from the Interventions for Series window. Enter FEB86 in the `Date` field, select `Ramp`, and then click the `OK` button.

## Modeling Complex Intervention Effects

You have now defined three interventions to model the changes in trend and level. The excursion near the end of the series remains to be dealt with.

Click `Add` in the Interventions for Series window. Scroll through the data values and select the date on which the excursion began, August 1990. Leave the intervention type as Point.

The pattern of the series from August 1990 through January 1991 is more complex than a simple shift in level or trend. For this pattern, you need a complex intervention model for an event that causes a sharp rise followed by a rapid return to the previous trend line. To specify this model, use the `Effect Time Window` and `Effect Decay Rate` options.

The `Effect Time Window` option controls the number of lags of the intervention's indicator variable used to model the effect of the intervention on the dependent series. For a simple intervention, the number of lags is zero, which means that the effect of the intervention is modeled by fitting a single regression coefficient to the intervention's indicator variable.

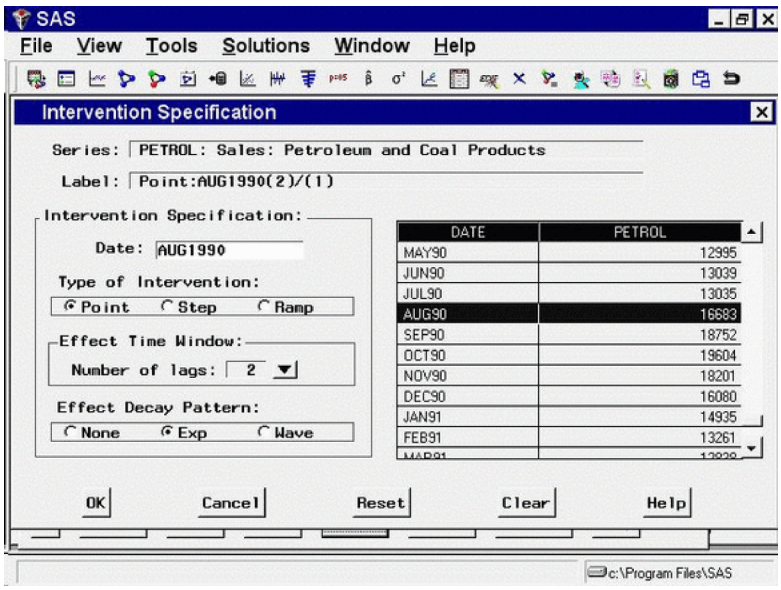
When you set the number of lags greater than zero, regression coefficients are fit to lags of the indicator variable. This allows you to model interventions whose effects take place gradually, or to model rebound effects. For example, severe weather might reduce production during one period but cause an increase in production in the following period as producers struggle to catch up. You could model this by using a point intervention with an effect time window of 1 lag. This would fit two coefficients for the intervention, one for the immediate effect and one for the delayed effect.

The `Effect Decay Pattern` option controls how the effect of the intervention dissipates over time. `None` specifies that there is no gradual decay: for point interventions, the effect ends immediately; for step and ramp interventions, the effect continues indefinitely. `Exp` specifies that the effect declines at an exponential rate. `Wave` specifies that the effect declines like an exponentially damped sine wave (or as the sum of two exponentials, depending on the fit to the data).

If you are familiar with time series analysis, these options might be clearer if you note that together the Effect Time Window and Effect Decay Pattern options define the numerator and denominator orders of a transfer function or dynamic regression model for the indicator variable of the intervention. For more information, see the section "Dynamic Regressor" on page 4048.

For this example, select 2 lags as the value of the Event Time Window option, and select `Exp` as the Effect Decay Pattern option. The window should now appear as shown in Figure 63.20.

**Figure 63.20** Complex Intervention Model

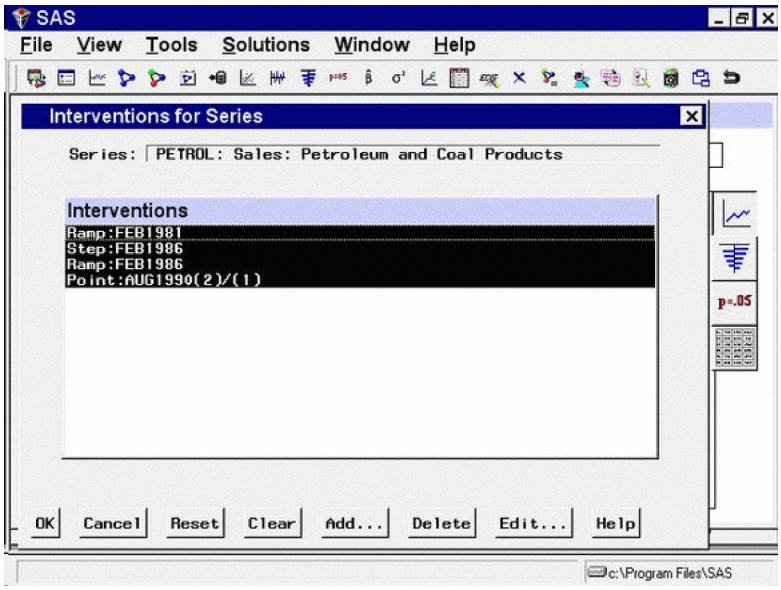


Click the OK button to add the intervention to the list.

## Fitting the Intervention Model

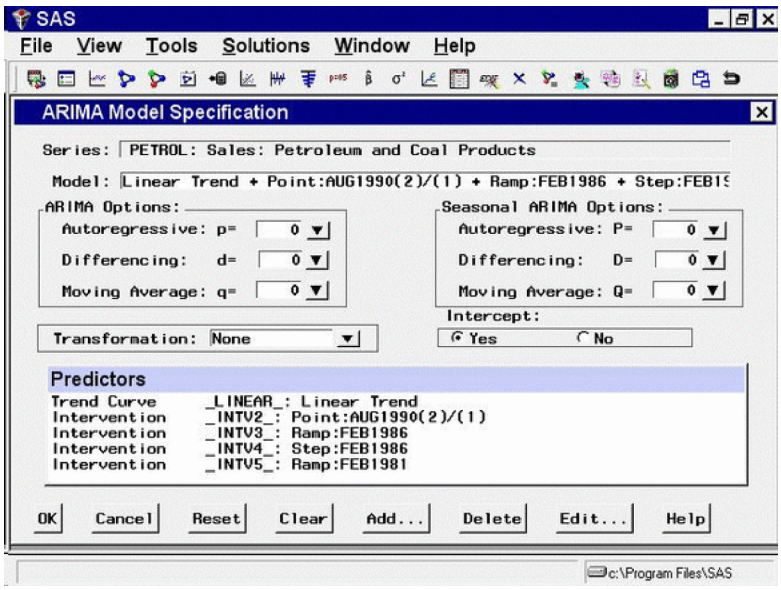
The Interventions for Series window now contains definitions for four intervention predictors. Select all four interventions, as shown in Figure 63.21.

**Figure 63.21** Interventions for Series Window



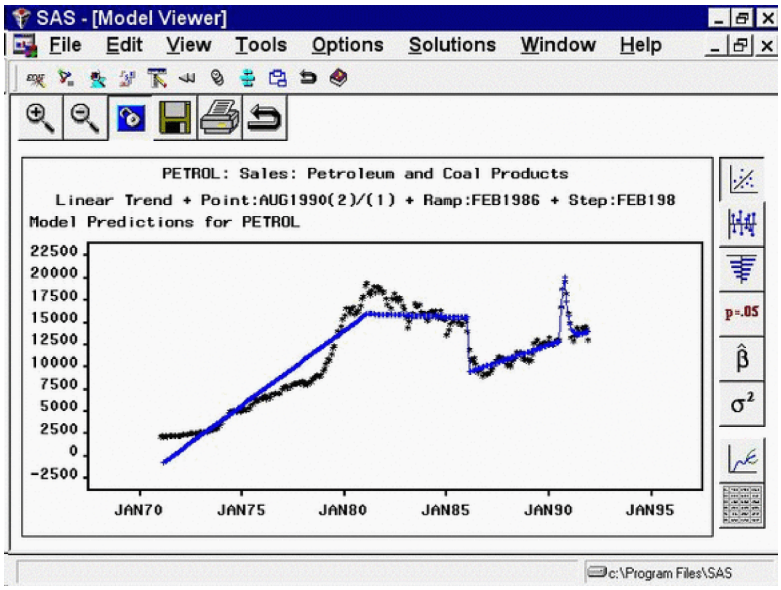
Click the OK button. This returns you to the ARIMA Model Specification window, which now lists items in the Predictors list, as shown in Figure 63.22.

**Figure 63.22** Linear Trend with Interventions Specified



Click the OK button to fit this model. After the model is fit, bring up the Model Viewer. You will see a plot of the model predictions, as shown in Figure 63.23.

**Figure 63.23** Linear Trend with Interventions Model



You can use the Zoom In feature to take a closer look at how the complex intervention effect fits the excursion in the series starting in August 1990.

## Limitations of Intervention Predictors

Note that the model you have just fit is intended only to illustrate the specification of interventions. It is not intended as an example of good forecasting practice.

The use of continuing (step and ramp type) interventions as predictors has some limitations that you should consider. If you model a change in trend with a simple ramp intervention, then the trend in the data before the date of the intervention has no influence on the forecasts. Likewise, when you use a step intervention, the average level of the series before the intervention has no influence on the forecasts.

Only the final trend and level at the end of the series are extrapolated into the forecast period. If a linear trend is the only pattern of interest, then instead of specifying step or ramp interventions, it would be simpler to adjust the period of fit so that the model ignores the data before the final trend or level change.

Step and ramp interventions are valuable when there are other patterns in the data—such as seasonality, autocorrelated errors, and error variance—that are stable across the changes in level or trend. Step and ramp interventions enable you to fit seasonal and error autocorrelation patterns to the whole series while fitting the trend only to the latter part of the series.

Point interventions are a useful tool for dealing with outliers in the data. A point intervention will fit the series value at the specified date exactly, and it has the effect of removing that point from the analysis. When you specify an effect time window, a point intervention will exactly fit as many additional points as the number of lags specified.

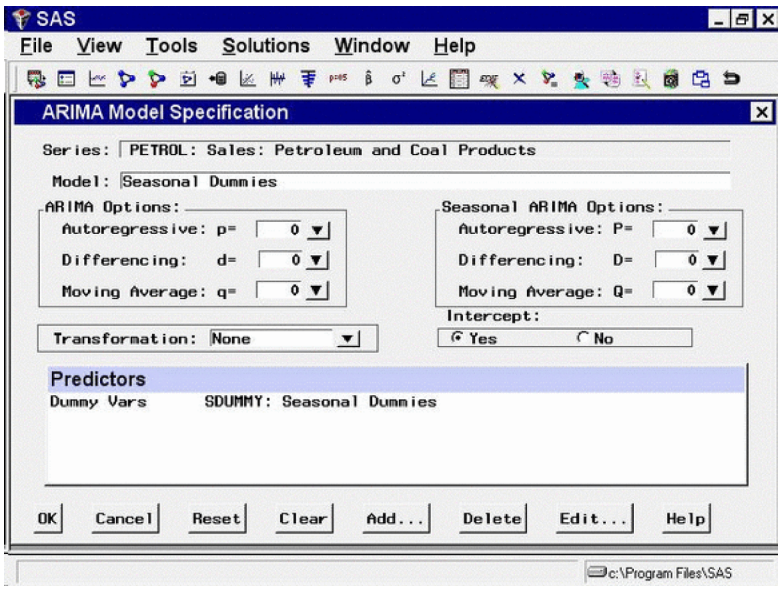
# Seasonal Dummies

A *Seasonal Dummies* predictor is a special feature that adds to the model seasonal indicator or "dummy" variables to serve as regressors for seasonal effects.

From the Develop Models window, select `Fit ARIMA Model`. In the ARIMA Model Specification window, click `Add` and then select `Seasonal Dummies` from the menu (shown in Figure 63.1).

A Seasonal Dummies input is added to the Predictors list, as shown in Figure 63.24.

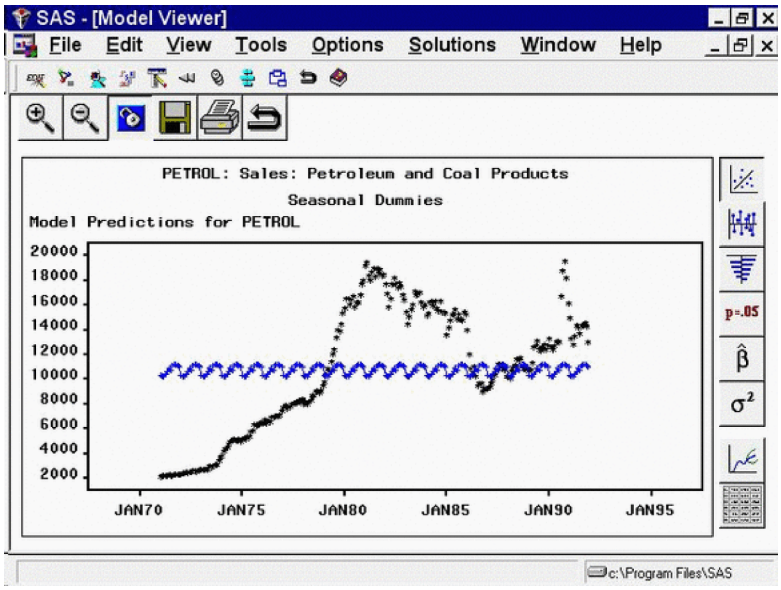
**Figure 63.24** Seasonal Dummies Specified



Click the OK button. A model consisting of an intercept and 11 seasonal dummy variables is fit and added to the model list in the Develop Models window. This is effectively a mean model with a separate mean for each month.

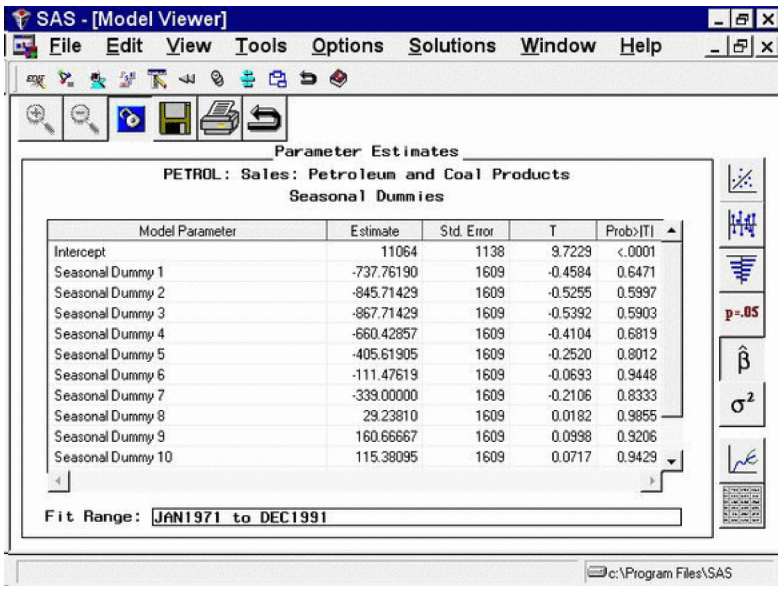
Now return to the Model Viewer, which displays a plot of the model predictions and actual series values, as shown in Figure 63.25. This is obviously a poor model for this series, but it serves to illustrate how seasonal dummy variables work.

**Figure 63.25** Seasonal Dummies Model



Now select the parameter estimates icon, the fifth from the top on the vertical toolbar. This displays the `Parameter Estimates` table, as shown in Figure 63.26.

**Figure 63.26** Parameter Estimates for Seasonal Dummies Model



Since the data for this example are monthly, the Seasonal Dummies option added 11 seasonal dummy variables. These include a dummy regressor variable that is 1.0 for January and 0 for other months, a regressor that is 1.0 only for February, and so forth through November.

Because the model includes an intercept, no dummy variable is added for December. The December effect is measured by the intercept, while the effect of other seasons is measured by the difference between the intercept and the estimated regression coefficient for the season's dummy variable.

The same principle applies for other data frequencies: the "Seasonal Dummy 1" parameter always refers to the first period in the seasonal cycle; and, when an intercept is present in the model, there is no seasonal dummy parameter for the last period in the seasonal cycle.

## TSVIEW Command and Macro

The TSVIEW command invokes the Time Series Viewer. This is a component of the Time Series Forecasting System that can also be used as a standalone graphical viewer for any time series data set or view. For more information, see the section "Time Series Viewer Window" in Chapter 65, "Window Reference."

The TSVIEW command must be specified from the command line or an SCL program. If you need to submit from the program editor, use the %TSVIEW macro instead. You can use the macro within a DATA step program, but you must submit it within the SAS windowing environment.

If the TSVIEW command or %TSVIEW macro is issued without arguments, the Series Selection window appears to enable you to select an input data set and series. This is equivalent to selecting "Time Series Viewer" from the Analysis submenu of the Solutions menu. By specifying the DATA= and VAR= arguments, you can bring up the Time Series Viewer window directly. The ID= and INTERVAL= arguments are useful when the system cannot determine them automatically from the data.

### Syntax

The TSVIEW command has the following form:

**TSVIEW** *[options]* **;**

The %TSVIEW macro has the following form:

**%TSVIEW** *[*(*option, . . . , option*)*]* **;**

The following options can be specified for the command and the macro:

**DATA=***data-set-name*
specifies the name of the SAS data set containing the input data.

**VAR=***time-series-variable-name*
specifies the series variable name. It must be a numeric variable contained in the data set.

**ID=***time-id-variable-name*
specifies the time ID variable name for the data set. If the ID= option is not specified, the system attempts to locate the variables named DATE, DATETIME, and TIME in the data set specified by the DATA= option.

**INTERVAL=***interval-name*
specifies the time ID interval between observations in the data set.

## Examples

### TSVIEW Command

```
tsview data=sashelp.air var=air
tsview data=dept.prod var=units id=period interval=qtr
```

### %TSVIEW Macro

```
%tsview( data=sashelp.air, var=air);
%tsview( data=dept.prod, var=units, id=period, interval=qtr);
```

# FORECAST Command and Macro

The FORECAST command invokes the Time Series Forecasting System. The command must be specified from the command line or an SCL program. If you need to submit from the program editor, use the %FORECAST macro instead. You can use the macro within a data step program, but you must submit it within the SAS windowing environment.

If the FORECAST command or %FORECAST macro is issued without arguments, the Time Series Forecasting window appears. This is equivalent to selecting "Time Series Forecasting System" from the `Analysis` submenu of the Solutions menu.

Using the arguments, it is possible to do the following:

- Bring up the system with information already filled into some of the fields.
- Bring up the system starting at a different window than the default Time Series Forecasting window.
- Run the system in unattended mode so that a task such as creating a forecast data set is accomplished without any user interaction. By submitting such commands repeatedly from a SAS/AF or SAS/EIS application, it is possible to do "batch" processing for many data sets or BY-group processing for many subsets of a data set. You can create a project in unattended mode and later open it for inspection

interactively. You can also create a project interactively in order to set options, fit a model, or edit the list of models, and then use this project later in unattended mode.

The `Forecast Command Builder`, a point-and-click SAS/AF application, makes it easy to specify, run, save, and rerun forecasting jobs by using the FORECAST command. To use it, enter the following on the command line (not the program editor):

```
%FCB
```

or

```
AF C=SASHELP.FORCAST.FORCCMD.FRAME.
```

## Syntax

The FORECAST command has the following form:

**FORECAST** *[options]* **;**

The %FORECAST macro has the following form:

**%FORECAST** *[***(***option, . . . , option***)***]* **;**

The following options can be specified for the command and the macro.

**PROJECT=***project-name*
specifies the name of the SAS catalog entry in which forecasting models and other results are stored and from which previously stored results are loaded into the forecasting system.

**DATA=***data-set-name*
specifies the name of the SAS data set containing the input data.

**VAR=***time-series-variable-name*
specifies the series variable name. It must be a numeric variable contained in the data set.

**ID=***time-id-variable-name*
specifies the time ID variable name for the data set. If the ID= option is not specified, the system attempts to locate the variables named DATE, DATETIME, and TIME in the data set specified by the DATA= option. However, it is recommended that you specify the time ID variable whenever you are using the ENTRY= argument.

**INTERVAL=***interval-name*
specifies the time ID interval between observations in the data set. Commonly used intervals are `year`, `semiyear`, `qtr`, `month`, `semimonth`, `week`, `weekday`, `day`, `hour`, `minute`, and `second`. For information about more complex interval specifications, see Chapter 5, "Date Intervals, Formats, and Functions." If the INTERVAL= option is not specified, the system attempts to determine the interval based on the time ID variable. However, it is recommended that you specify the interval whenever you are using the ENTRY= argument.

**STAT=***statistic*
specifies the name of the goodness-of-fit statistic to be used as the model selection criterion. The default is RMSE. You can specify the following *statistics*:

| | |
|---|---|
| **SSE** | specifies the sum of square error. |
| **MSE** | specifies the mean square error. |
| **RMSE** | specifies the root mean square error. |
| **MAE** | specifies the mean absolute error. |
| **MAPE** | specifies the mean absolute percent error. |
| **AIC** | specifies Akaike's information criterion. |
| **SBC** | specifies the Schwarz Bayesian information criterion. |
| **RSQUARE** | specifies the R-square. |
| **AJDRSQ** | specifies the adjusted R-square. |
| **RWRSQ** | specifies the random walk R-square. |
| **ARSQ** | specifies Amemiya's adjusted R-square. |
| **APC** | specifies Amemiya's prediction criterion. |

**CLIMIT=***integer*
specifies the level of the confidence limits to be computed for the forecast. This integer represents a percentage; for example, 925 indicates 92.5% confidence limits. The default is 95—that is, 95% confidence limits.

**HORIZON=***integer*
specifies the number of periods into the future for which forecasts are computed. The default is 12 periods. The maximum is 9999.

**ENTRY=***name*
specifies the name of an entry point into the system. You can specify the following *names*:

| | |
|---|---|
| **MAIN** | starts the system at the Time Series Forecasting window (default). |
| **DEVMOD** | starts the system at the Develop Models window. |
| **VIEWMOD** | starts the system at the Model Viewer window. Specify a project that contains a forecasting model by using the PROJECT= option. If a project containing a model is not specified, the message "No forecasting model to view" appears. |
| **VIEWSER** | starts the system at the Time Series Viewer window. |
| **AUTOFIT** | runs the system in unattended mode, fitting a forecasting model automatically and saving it in a project. If PROJECT= is not specified, the default project name SASUSER.FMSPROJ.PROJ is used. |
| **FORECAST** | runs the system in unattended mode to generate a forecast data set. The name of this data set is specified by the OUT= parameter. If OUT= is not specified, a window appears to prompt for the name and label of the output data set. If PROJECT= is not specified, the default project name SASUSER.FMSPROJ.PROJ is used. If the project does not exist or does not contain a forecasting model for the specified |

series, automatic model fitting is performed and the forecast is computed by using the automatically selected model. If the project exists and contains a forecasting model for the specified series, the forecast is computed by using this model. If the series covers a different time range than it did when the project was created, use the REFIT or REEVAL keyword to reset the time ranges.

**OUT=***argument*

specifies one or two-level name of a SAS data set in which forecasts are saved. Use in conjunction with ENTRY=FORECAST. If omitted, the system prompts for the name of the forecast data set.

**KEEP=***argument*

specifies the number of models to keep in the project when automatic model fitting is performed. This corresponds to `Models to Keep` in the Automatic Model Selection Options window. A value greater than 9 indicates that all models are kept. The default is 1.

**DIAG=YES | NO**

specifies which models to search with regard to series diagnostics. DIAG=YES causes the automatic model selection process to search only over those models that are consistent with the series diagnostics. DIAG=NO causes the automatic model selection process to search over all models in the selection list, without regard for the series diagnostics. This corresponds to `Models to Fit` in the Automatic Model Selection Options window. The default is YES.

**REFIT=***keyword*

(for macro usage) refits a previously saved forecasting model by using the current fit range; that is, it reestimates the model parameters. Refitting also causes the model to be reevaluated (statistics of fit recomputed), and it causes the time ranges to be reset if the data range has changed (for example, if new observations have been added to the series). This keyword has no effect if you do not use the PROJECT= argument to reference an existing project containing a forecasting model. Use the REFIT keyword if you have added new data to the input series and you want to refit the forecasting model and update the forecast by using the new time ranges. Be sure to use the same project, data set, and series names that you used previously.

**REEVAL=***keyword*

(for macro usage) reevaluates a previously saved forecasting model by using the current evaluation range; that is, it recomputes the statistics of fit. Reevaluating also causes the time ranges to be reset if the data range has changed (for example, if new observations have been added to the series). It does not refit the model parameters. This keyword has no effect if you also specify REFIT, or if you do not use the PROJECT= argument to reference an existing project containing a forecasting model. Use the REEVAL keyword if you have added new data to the input series and want to update your forecast by using a previously fit forecasting model and the same project, data set, and series names that you used previously.

## Examples

### FORECAST Command

The following command opens the Time Series Forecasting window with the data set name and series name filled in. The time ID variable is also filled in since the data set contains the variable DATE. The interval is filled in because the system recognizes that the observations are monthly.

```
forecast data=sashelp.air var=air
```

The following command opens the Time Series Forecasting window with the project, data set name, series, time ID, and interval fields filled in, assuming that the project SAMPROJ was previously saved either interactively or by using unattended mode as depicted below. Previously fit models appear when the Develop Models or Manage Projects window is opened.

```
forecast project=samproj
```

The following command runs the system in unattended mode, fitting a model automatically, storing it in the project SAMPROJ in the default catalog SASUSER.FMSPROJ, and placing the forecasts in the data set WORK.SAMPOUT:

```
forecast data=sashelp.workers var=electric id=date interval=month
project=samproj entry=forecast out=sampout
```

The following command assumes that a new month's data have been added to the data set from the previous example and that an updated forecast is needed that uses the previously fit model. Time ranges are automatically updated to include the new data since the REEVAL keyword is included. Substitute REFIT for REEVAL if you want the system to reestimate the model parameters.

```
forecast data=sashelp.workers var=electric id=date interval=month
project=samproj entry=forecast out=sampout reeval
```

The following command opens the model viewer with the project created in the previous example and with 99% confidence limits in the forecast graph:

```
forecast data=sashelp.workers var=electric id=date interval=month
project=samproj entry=viewmod climit=99
```

The final example illustrates using unattended mode with an existing project that has been defined interactively. In this example, the goal is to add a model to the model selection list, to specify that all models in that list be fit, and that all models which are fit successfully be retained.

First open the Time Series Forecasting window and specify a new project name, WORKPROJ. Then select `Develop Models`, choosing SASHELP.WORKERS as the data set and MASONRY as the series. Now select "Model Selection List" from the Options menu. In the Model Selection List window, click `Actions`, then `Add`, and then `ARIMA Model`. Define the model `ARIMA(0,1,0)(0,1,0)s NOINT` by setting the differencing value to 1 under both `ARIMA Options` and `Seasonal ARIMA Options`. Click `OK` to save the model and `OK` to close the Model Selection List window. Now select "Automatic Fit" from the Options menu. In the Automatic Model Selection Options window, select "All autofit models in selection list" in the Models to fit radio box, select "All models" from the `Models to keep` combo box, and then click `OK` to close the window. Select "Save Project" from the File menu, and then close the Develop Models window and the Time Series Forecasting window. You now have a project with a new model added to the selection list, options set for automatic model fitting, and one series selected but no models fit.

Now enter the following command:

```
forecast data=sashelp.workers var=electric id=date interval=month
project=workproj entry=forecast out=workforc
```

The system runs in unattended mode to update the project and create the forecast data set WORKFORC. Check the messages in the Log window to find out if the run was successful and which model was selected for forecasting. To see the forecast data set, issue the command `viewtable WORKFORC`. To see the contents of the project, open the Time Series Forecasting window, open the project WORKPROJ, and select "Manage Projects." You will see that the variable ELECTRIC was added to the project and has a forecasting model. Select this row in the table and then select `List Models` from the Tools menu. You will see that all of the models in the selection list which fit successfully are there, including the new model you added to the selection list.

## %FORECAST Macro

This example demonstrates the use of the %FORECAST macro to start the Time Series Forecasting System from a SAS program submitted from the Editor window. The SQL procedure is used to create a view of a subset of a products data set. Then the %FORECAST macro is used to produce forecasts.

```
proc sql;
   create view selprod as
   select * from products
   where type eq 'A'
   order by date;
run;

%forecast(data=selprod, var=amount, id=date, interval=day,
     entry=forecast, out=typea, project=proda, refit= );
```

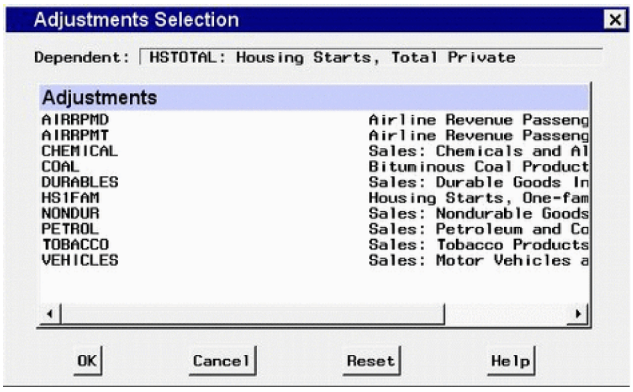
# Overview

This chapter provides a reference to the various windows of the Time Series Forecasting System. The windows are presented in alphabetical order by name. Each section describes the purpose of the window, how to open it, its controls, fields, and menus. For windows that have their own menus, there is a description of each menu item under the heading "Menu Bar." These windows also have a toolbar with icons that duplicate the more commonly used menu items. Each icon has a *screen tip*: a brief description that appears when you hover the mouse pointer over the icon. If you don't see the screen tips, open the SAS Preferences window, under the Options submenu of the Tools menu. Select the View tab and make sure the "Screen tips" check box is checked.

# Adjustments Selection Window

Use the Adjustments Selection window to select input variables for use as adjustments to the forecasts and add them to the Predictors list. Invoke this window from the pop-up menu that appears when you click the Add button in the ARIMA Model Specification window or Custom Model Specification window. For more information, see the "Adjustments" section in Chapter 63, "Using Predictor Variables."



## Controls and Fields

`Dependent`
: is the name and variable label of the current series.

`Adjustments`
: is a table that lists the names and labels in the input data set available for selection as adjustments. The variables you select are highlighted. Selecting a highlighted row again deselects that variable.

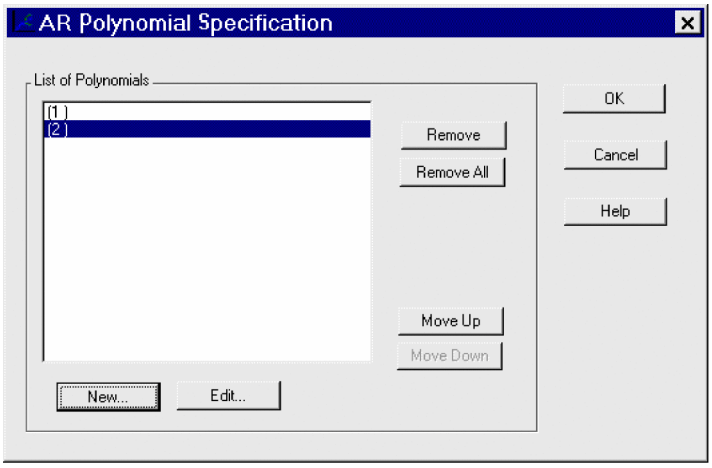
`OK`
: closes the Adjustments Selection window and adds the selected variables as adjustments in the model.

`Cancel`
: closes the window without adding any adjustments.

`Reset`
: resets all selections to their initial values upon entry to the window.

# AR/MA Polynomial Specification Window

Use these windows to specify the autoregressive and moving-average terms in a factored ARIMA model. Access the AR Polynomial Specification window from the Set button next to the Autoregressive term in the Factored ARIMA Model Specification window. Access the MA Polynomial Specification window from the Set button next to the Moving Average term.



## Controls and Fields

`List of Polynomials`

lists the polynomials that have been specified. Each polynomial is represented by a comma-delimited list of lag values enclosed in parentheses.

`New`
: opens the Polynomial Specification window to add a new polynomial to the model.

`Edit`
: opens the Polynomial Specification window to edit a polynomial that has been selected. If no polynomial is selected, this button is unavailable.

`Remove`
: removes a selected polynomial from the list. If none are selected, this button is unavailable.

`Remove All`
: clears the list of polynomials.

`Move Up`
: moves a selected polynomial up one position in the list. If no polynomial is selected, or the first one is selected, this button is unavailable.

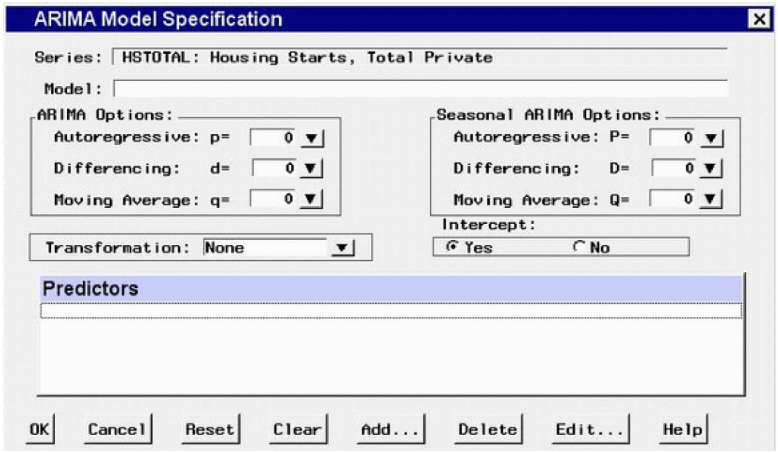
`Move Down`
: moves a selected polynomial down one position in the list. If no polynomial is selected, or the last one is selected, this button is unavailable.

OK
: closes the window and returns the specified list of polynomials to the Factored ARIMA Model Specification window.

Cancel
: closes the window and discards any changes made to the list of polynomials.

# ARIMA Model Specification Window

Use the ARIMA Model Specification window to specify and fit an ARIMA model with or without predictor effects as inputs. Access it from the Develop Models menu, where it is invoked from the Fit Model item under Edit on the menu bar, or from the pop-up menu when you click an empty area of the model table.



## Controls and Fields

Series
: is the name and variable label of the current series.

Model
: is a descriptive label for the model that you specify. You can type a label in this field or allow the system to provide a label. If you leave the label blank, a label is generated automatically based on the options you specify.

ARIMA Options
: specify the orders of the ARIMA model. You can either type in a value or click the arrow to select from a list.

  Autoregressive
  : defines the order of the autoregressive part of the model.

  Differencing
  : defines the order of simple differencing—for example, first difference or second difference.

  Moving Average
  : defines the order of the moving-average part of the model.

`Seasonal ARIMA Options`
specifies the orders of the seasonal part of the ARIMA model. You can either type in a value or click the arrow to select from a list.

`Autoregressive`
defines the order of the seasonal autoregressive part of the model.

`Differencing`
defines the order of seasonal differencing—for example, first difference or second difference at the seasonal lags.

`Moving Average`
defines the order of the seasonal moving-average part of the model.

`Transformation`
defines the series transformation for the model. When a transformation is specified, the ARIMA model is fit to the transformed series, and forecasts are produced by applying the inverse transformation to the ARIMA model predictions. The available transformations are `Log`, `Logistic`, `Square Root`, `Box-Cox`, and `None`.

`Intercept`
specifies whether a mean or intercept parameter is included in the ARIMA model. By default, the Intercept option is set to No when the model includes differencing and Yes when there is no differencing.

`Predictors`
lists the predictor effects included as inputs in the model.

`OK`
closes the ARIMA Model Specification window and fits the model.

`Cancel`
closes the ARIMA Model Specification window without fitting the model. Any options you specified are lost.

`Reset`
resets all options to their initial values upon entry to the ARIMA Model Specification window. This might be useful when editing an existing model specification; otherwise, Reset has the same function as Clear.

`Clear`
resets all options to their default values.

`Add`
opens a menu of types of predictors to add to the Predictors list.

`Delete`
deletes the selected (highlighted) entry from the Predictors list.

`Edit`
edits the selected (highlighted) entry in the Predictors list.

## Mouse Button Actions

You can select or deselect entries in the Predictors list by clicking them. The selected (highlighted) predictor effect is acted on by the Delete and Edit buttons. Double-clicking on a predictor in the list invokes an appropriate edit action for that predictor.

If you right-click an entry in the Predictors list, the system displays the following menu of actions that encompass the features of the Add, Delete, and Edit buttons.

`Add Linear Trend`
: adds a Linear Trend item to the Predictors list.

`Add Trend Curve`
: opens a menu of different time trend curves and adds the curve you select to the Predictors list. Certain trend curve specifications also set the Transformation field.

`Add Regressors`
: opens the Regressors Selection window to enable you to select other series in the input data set as regressors to predict the dependent series and add them to the Predictors list.

`Add Adjustments`
: opens the Adjustments Selection window to enable you to select other series in the input data set for use as adjustments to the forecasts and add them to the Predictors list.

`Add Dynamic Regressor`
: opens the Dynamic Regressor Selection window to enable you to select a series in the input data set as a predictor of the dependent series and also specify a transfer function model for the effect of the predictor series.

`Add Interventions`
: opens the Interventions for Series window to enable you to define and select intervention effects and add them to the Predictors list.

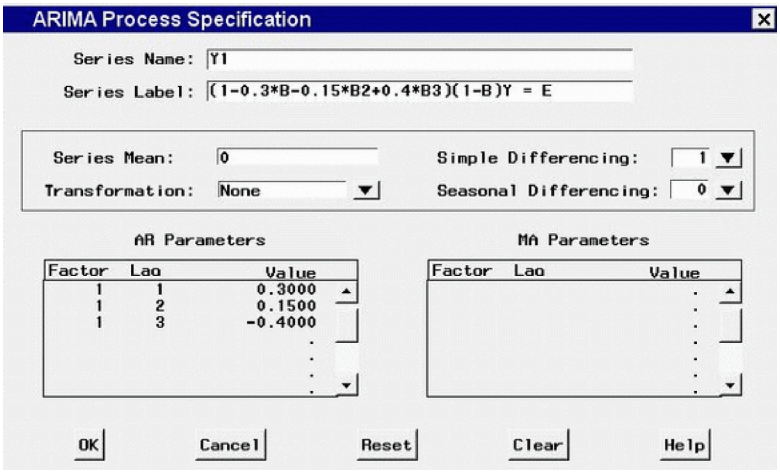
`Add Seasonal Dummies`
: adds a Seasonal Dummies predictor item to the Predictors list.

`Edit Predictor`
: edits the selected (highlighted) entry in the Predictors list.

`Delete Predictors`
: deletes the selected (highlighted) entry from the Predictors list.

# ARIMA Process Specification Window

Use the ARIMA Process Specification window to define ARIMA processes for simulation. Invoke this window from the Add Series button in the Time Series Simulation window.



## Controls and Fields

`Series Name`
: is the variable name for the series to be simulated.

`Series Label`
: is the variable label for the series to be simulated.

`Series Mean`
: is the mean of the simulated series.

`Transformation`
: defines the series transformation.

`Simple Differencing`
: is the order of simple differencing for the series.

`Seasonal Differencing`
: is the order of seasonal differencing for the series.

`AR Parameters`
: is a table of autoregressive terms for the simulated ARIMA process. Enter a value for Factor, Lag, and Value for each term of the AR part of the process you want to simulate. For a non-factored AR model, make the Factor values the same for all terms. For a factored AR model, use different Factor values to group the terms into the factors.

`MA Parameters`
: is a table of moving-average terms for the simulated ARIMA process. Enter a value for Factor, Lag, and Value for each term of the MA part of the process you want to simulate. For a non-factored MA model, make the Factor values the same for all terms. For a factored MA model, use different Factor values to group the terms into the factors.

`OK`
closes the ARIMA Process Specification window and adds the specified process to the Series to Generate list in the Time Series Simulation window.

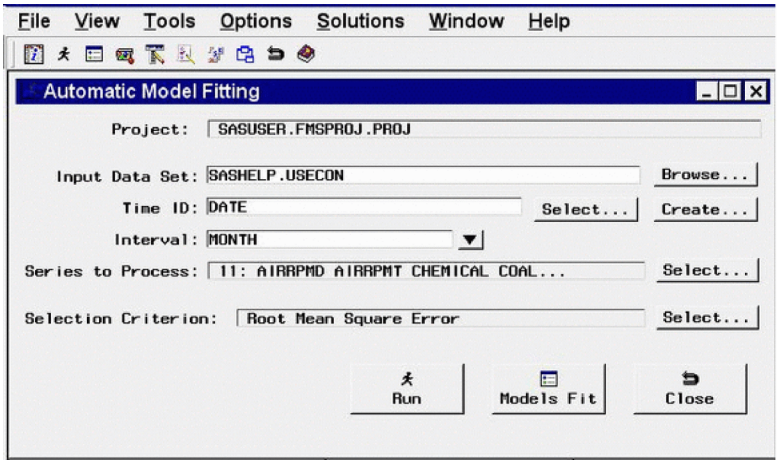
`Cancel`
closes the window without adding to the Series to Generate list. Any options you specified are lost.

`Reset`
resets all the fields to their initial values upon entry to the window.

`Clear`
resets all the fields to their default values.

# Automatic Model Fitting Window

Use the Automatic Model Fitting window to perform automatic model selection on all series or selected series in an input data set. Invoke this window by using the Fit Models Automatically button in the Time Series Forecasting window. Note that you can also perform automatic model fitting, one series at a time, from the Develop Models window.



## Controls and Fields

`Project`
is the name of the SAS catalog entry in which the results of the model search process are stored.

`Input Data Set`
is the name of the current input data set. You can type in a one-level or two-level data set name here.

`Browse` button
opens the Data Set Selection window for selecting an input data set.

`Time ID`
is the name of the ID variable for the input data set. You can type in the variable name here or use the Select or Create button.

time ID `Select` button
opens the Time ID Variable Specification window.

time ID `Create` button
opens a menu of choices of methods for creating a time ID variable for the input data set. Use this feature if the input data set does not already contain a valid time ID variable.

`Interval`
is the time interval between observations (data frequency) in the current input data set. You can type in an interval name or select one by using the combo box pop-up menu.

`Series to Process`
indicates the number and names of time series variables for which forecasting model selection will be applied.

Series to Process `Select` button
opens the Series to Process window to let you select the series for which you want to fit models.

`Selection Criterion`
shows the goodness-of-fit statistic that will be used to determine the best fitting model for each series.

Selection Criterion `Select` button
opens the Model Selection Criterion window to enable you to select the goodness-of-fit statistic that will be used to determine the best fitting model for each series.

`Run` button
begins the automatic model fitting process.

`Models Fit` button
opens the Automatic Model Fitting Results window to display the models fit during the current invocation of the Automatic Model Fitting window. The results appear automatically when model fitting is complete, but this button enables you to redisplay the results window.

`Close` button
closes the Automatic Model Fitting window.

## Menu Bar

`File`

`Import Data`
is available if you license SAS/ACCESS software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or database to a SAS data set for use in the Time Series Forecasting System.

`Export Data`
is available if you license SAS/ACCESS software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or database.

`Print Setup`
opens the Print Setup window, which allows you to access your operating system print setup.

`Close`
closes the Automatic Model Fitting window.

`View`

`Input Data Set`
opens a Viewtable window to browse the current input data set.

`Models Fit`
opens Automatic Model Fitting Results window to show the forecasting models fit during the current invocation of the Automatic Model Fitting window. This has the same function as the Models Fit button.

`Tools`

`Fit Models`
performs the automatic model selection process for the selected series. This has the same function as the Run button.

`Options`

`Default Time Ranges`
opens the Default Time Ranges window to enable you to control how the system sets the time ranges for series.

`Model Selection List`
opens the Model Selection List editor window. Use this action to control the forecasting models considered by the automatic model selection process and displayed in the Models to Fit window.

`Model Selection Criterion`
opens the Model Selection Criterion window, which presents a list of goodness-of-fit statistics and enables you to select the fit statistic that is displayed in the table and used by the automatic model selection process to determine the best fitting model. This has the same function as the Selection Criterion Select button.

`Statistics of Fit`
opens the Statistics of Fit Selection window, which presents a list of statistics that the system can display. Use this action to customize the list of statistics shown in the Statistics of Fit table and available for selection from the Model Selection Criterion menu.

`Forecast Options`
opens the Forecast Options window, which enables you to control the widths of forecast confidence limits and control the kind of predicted values computed for models that include series transformations.

`Forecast Data Set`
See the section "Produce Forecasts Window" on page 4136.

`Alignment of Dates`

`Beginning`
aligns dates that the system generates to identify forecast observations in output data sets to the beginning of the time intervals.

Middle
aligns dates that the system generates to identify forecast observations in output data sets to the midpoints of the time intervals.

End
aligns dates that the system generates to identify forecast observations in output data sets to the end of the time intervals.

Automatic Fit
opens the Automatic Model Selection Options window, which enables you to control the number of models retained by the automatic model selection process and whether the models considered for automatic selection are subset according to the series diagnostics.

Tool Bar Type

Image Only
displays the toolbar items as icons without text.

Label Only
displays the toolbar items as text without icon images.

Both
displays the toolbar items with both text and icon images.

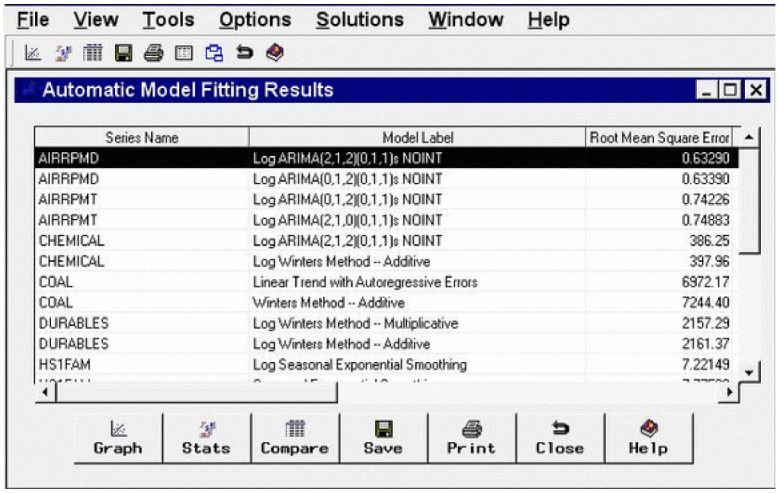
Include Interventions
controls whether intervention effects defined for the current series are automatically added as predictors to the models considered by the automatic selection process. A check mark or filled check box next to this item indicates that the option is turned on.

Print Audit Trail
prints to the SAS log information about the models fit by the system. A check mark or filled check box next to this item indicates that the audit option is turned on.

Show Source Statements
controls whether SAS statements submitted by the forecasting system are printed in the SAS log. When the Show Source Statements option is selected, the system sets the SAS system option SOURCE before submitting SAS statements; otherwise, the system uses the NOSOURCE option. Note that only some of the functions performed by the forecasting system are accomplished by submitting SAS statements. A check mark or filled check box next to this item indicates that the option is turned on.

# Automatic Model Fitting Results Window

This resizable window displays the models fit by the most recent invocation of the Automatic Model Fitting window. It appears automatically after Automatic Model Fitting runs, and can be opened repeatedly from that window by using the Models Fit button or by selecting Models Fit from the View menu. Once you exit the Automatic Model Fitting window, the Automatic Model Fitting Results window cannot be opened again until you fit additional models by using Automatic Model Fitting.



## Table Contents

The results table displays the series name in the first column and the model label in the second column. If you have chosen to retain more than one model by using the Automatic Model Selection Options window, more than one row appears in the table for each series; that is, there is a row for each model fit. If you have already fit models to the same series before invoking the Automatic Model Fitting window, those models do not appear here, since the Automatic Model Fitting Results window is intended to show the results of the current operation of Automatic Model Fitting. To see all models that have been fit, use the Manage Projects window.

The third column of the table shows the values of the current model selection criterion statistic. Additional columns show the values of other fit statistics. The set of statistics shown are selectable by using the Statistics of Fit Selection window.

The table can be sorted by any column other than Series Name by clicking on the column heading.

### Controls and Fields

`Graph`
: opens the Model Viewer window on the model currently selected in the table.

`Stats`
: opens the Statistics of Fit Selection window. This controls the set of goodness-of-fit statistics displayed in the table and in other parts of the Time Series Forecasting System.

`Compare`
opens the Model Fit Comparison window for the series currently selected in the table. This button is unavailable if the currently selected row in the table represents a series for which fewer than two models have been fit.

`Save`
opens an output data set dialog box, enabling you to specify a SAS data set to which the contents of the table are saved. Note that this operation saves what you see in the table. If you want to save the models themselves for use in a future session, use the Manage Projects window.

`Print`
prints the contents of the table.

`Close`
closes the window and returns to the Automatic Model Fitting window.

## Menu Bar

`File`

`Save`
opens an output data set dialog box, enabling you to specify a SAS data set to which the contents of the table are saved. This has the same function as the Save button.

`Print`
prints the contents of the table. This has the same function as the Print button.

`Import Data`
is available if you license SAS/ACCESS software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or data base to a SAS data set for use in the Time Series Forecasting System.

`Export Data`
is available if you license SAS/ACCESS software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or database.

`Print Setup`
opens the Print Setup window, which allows you to access your operating system print setup.

`Close`
closes the window and returns to the Automatic Model Fitting window.

`View`

`Model Predictions`
opens the Model Viewer to display a predicted and actual plot for the currently highlighted model.

`Prediction Errors`
opens the Model Viewer to display the prediction errors for the currently highlighted model.

`Prediction Error Autocorrelations`
opens the Model Viewer to display the prediction error autocorrelations, partial autocorrelations, and inverse autocorrelations for the currently highlighted model.

`Prediction Error Tests`
: opens the Model Viewer to display graphs of white noise and stationarity tests on the prediction errors of the currently highlighted model.

`Parameter Estimates`
: opens the Model Viewer to display the parameter estimates table for the currently highlighted model.

`Statistics of Fit`
: opens the Model Viewer window to display goodness-of-fit statistics for the currently highlighted model.

`Forecast Graph`
: opens the Model Viewer to graph the forecasts for the currently highlighted model.

`Forecast Table`
: opens the Model Viewer to display forecasts for the currently highlighted model in a table.

`Tools`

`Compare Models`
: opens the Model Fit Comparison window to display fit statistics for selected pairs of forecasting models. This item is unavailable until you select a series in the table for which the automatic model fitting run selected two or more models.

`Options`

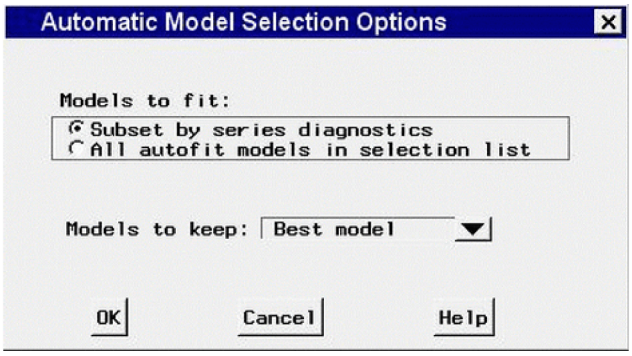
`Statistics of Fit`
: opens the Statistics of Fit Selection window. This is the same as the Stats button.

`Column Labels`
: selects long or short column labels for the table. Long column labels are used by default.

`ID Columns`
: freezes or unfreezes the series and model columns. By default they are frozen so that they remain visible when you scroll the table horizontally to view other columns.

# Automatic Model Selection Options Window

Use the Automatic Model Selection Options window to control the automatic selection process. This window is available from the Automatic Fit item of the Options menu in the Develop Models window, Automatic Model Fitting window, and Produce Forecasts window.



## Controls and Fields

`Models to fit`

`Subset by series diagnostics`
when selected, causes the automatic model selection process to search only over those models consistent with the series diagnostics.

`All autofit models in selection list`
when selected, causes the automatic model selection process to search over all models in the search list, without regard for the series diagnostics.

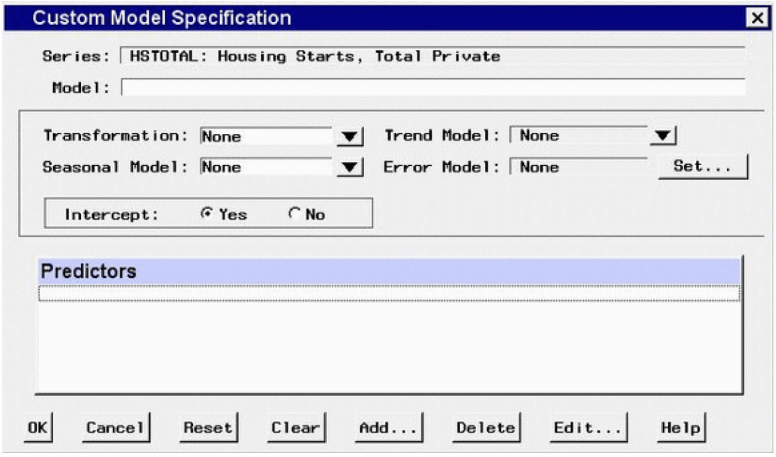
`Models to keep`
specifies how many of the models tried by the automatic model selection process are retained and added to the model list for the series. You can specify the best fitting model only, the best *n* models, where *n* can be 1 through 9, or all models tried.

`OK`
closes the window and saves the automatic model selection options you specified.

`Cancel`
closes the window without changing the automatic model selection options.

# Custom Model Specification Window

Use the Custom Model Specification window to specify and fit an ARIMA model with or without predictor effects as inputs. Access it from the Develop Models window, where it is invoked from the Fit Model item under the Edit menu, or from the pop-up menu when you click an empty area of the model table.



## Controls and Fields

`Series`
: is the name and variable label of the current series.

`Model`
: is a descriptive label for the model that you specify. You can type a label in this field or allow the system to provide a label. If you leave the label blank, a label is generated automatically based on the options you specify.

`Transformation`
: defines the series transformation for the model. When a transformation is specified, the model is fit to the transformed series, and forecasts are produced by applying the inverse transformation to the resulting forecasts. The following transformations are available:

  `Log`
  : specifies a logarithmic transformation.

  `Logistic`
  : specifies a logistic transformation.

  `Square Root`
  : specifies a square root transformation.

  `Box-Cox`
  : specifies a Box-Cox transform and opens a window to specify the Box-Cox $\lambda$ parameter.

  `None`
  : specifies no series transformation.

`Trend Model`
controls the model options to model and forecast the series trend. Select from the following:

`Linear Trend`
adds a Linear Trend item to the Predictors list.

`Trend Curve`
brings of a menu of different time trend curves and adds the curve you select to the Predictors list.

`First Difference`
specifies differencing the series.

`Second Difference`
specifies second-order differencing of the series.

`None`
specifies no model for the series trend.

`Seasonal Model`
controls the model options to model and forecast the series seasonality. Select from the following:

`Seasonal ARIMA`
opens the Seasonal ARIMA Model Options window to enable you to specify an ARIMA model for the seasonal pattern in the series.

`Seasonal Difference`
specifies differencing the series at the seasonal lag.

`Seasonal Dummy Regressors`
adds a Seasonal Dummies predictor item to the Predictors list.

`None`
specifies no seasonal model.

`Error Model`
displays the current settings of the autoregressive and moving-average terms, if any, for modeling the prediction error autocorrelation pattern in the series.

`Set` button
opens the Error Model Options window to enable you to set the autoregressive and moving-average terms for modeling the prediction error autocorrelation pattern in the series.

`Intercept`
specifies whether a mean or intercept parameter is included in the model. By default, the Intercept option is set to No when the model includes differencing and set to Yes when there is no differencing.

`Predictors`
is a list of the predictor effects included as inputs in the model.

`OK`
closes the Custom Model Specification window and fits the model.

`Cancel`
closes the Custom Model Specification window without fitting the model. Any options you specified are lost.

`Reset`
: resets all options to their initial values upon entry to the Custom Model Specification window. This might be useful when editing an existing model specification; otherwise, Reset has the same function as Clear.

`Clear`
: resets all options to their default values.

`Add`
: opens a menu of types of predictors to add to the Predictors list. Select from the following:

  `Linear Trend`
  : adds a Linear Trend item to the Predictors list.

  `Trend Curve`
  : opens a menu of different time trend curves and adds the curve you select to the Predictors list.

  `Regressors`
  : opens the Regressors Selection window to enable you to select other series in the input data set as regressors to predict the dependent series and add them to the Predictors list.

  `Adjustments`
  : opens the Adjustments Selection window to enable you to select other series in the input data set for use as adjustments to the forecasts and add them to the Predictors list.

  `Dynamic Regressor`
  : opens the Dynamic Regressor Selection window to enable you to select a series in the input data set as a predictor of the dependent series and also specify a transfer function model for the effect of the predictor series.

  `Interventions`
  : opens the Interventions for Series window to enable you to define and select intervention effects and add them to the Predictors list.

  `Seasonal Dummies`
  : adds a Seasonal Dummies predictor item to the Predictors list. This is unavailable if the series interval is not one which has a seasonal cycle.

`Delete`
: deletes the selected (highlighted) entry from the Predictors list.

`Edit`
: edits the selected (highlighted) entry in the Predictors list.

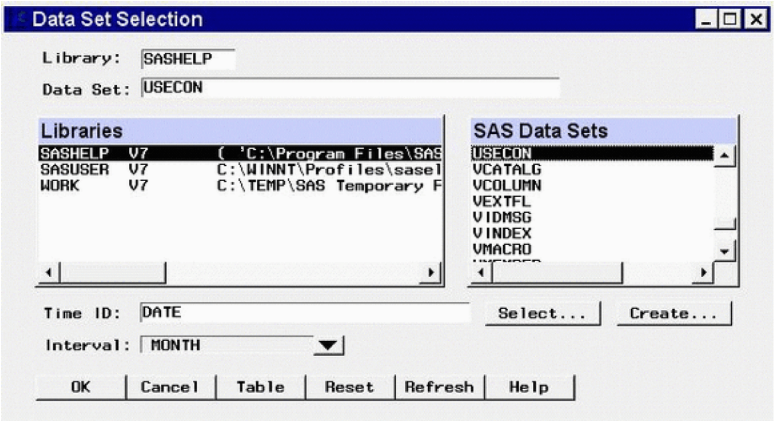
## Mouse Button Actions

You can select or deselect entries in the Predictors list by clicking them. The selected (highlighted) predictor effect is acted on by the Delete and Edit buttons. Double-clicking on a predictor in the list invokes an appropriate edit action for that predictor.

If you right-click an entry in the Predictors list and press the right mouse button, the system displays a menu of actions that encompass the features of the Add, Delete, and Edit buttons.

# Data Set Selection Window

Use this resizable window to select a data set to process by specifying a library and a SAS data set or view. These selections can be made by typing, by selecting from lists, or by a combination of the two. In addition, you can control the time ID variable and time interval, and you can browse the data set.



Access this window by using the Browse button to the right of the Data Set field in the Time Series Forecasting, Automatic Model Fitting, and Produce Forecasts windows. It functions in the same way as the Series Selection window, except that it does not allow you to select or view a time series variable.

## Controls and Fields

`Library`
: is a SAS libname assigned within the current SAS session. If you know the libname associated with the data set of interest, you can type it in this field. If it is a valid choice, it will appear in the libraries list and will be highlighted. The SAS Data Sets list will be populated with data sets associated with that libname. See also Libraries under Selection Lists.

`Data Set`
: is the name of a SAS data set (data file or data view) that resides under the selected libname. If you know the name, you can type it in and press Return. If it is a valid choice, it will appear in the SAS Data Sets list and will be highlighted.

`Time ID`
: is the name of the ID variable for the selected input data set. To specify the ID variable, you can type the ID variable name in this field or select the control arrows to the right of the field.

Time ID `Select` button
: opens the Time ID Variable Specification window.

Time ID `Create` button
: opens a menu of methods for creating a time ID variable for the input data set. Use this feature if the data set does not already contain a valid time ID variable.

`Interval`
: is the time interval between observations (data frequency) in the selected data set. If the interval is not automatically identified by the system, you can type in the interval name or select it from a list by

clicking the combo box arrow. For more information about intervals, see Chapter 5, "Date Intervals, Formats, and Functions," in this book.

`OK`
closes the Data Set Selection window and makes the selected data set the current input data set.

`Cancel`
closes the window without applying any selections made.

`Table`
opens a Viewtable window for browsing the selected data set.

`Reset`
resets the fields to their initial values upon entry to the window.

`Refresh`
updates all fields and lists in the window. If you assign a new libname without exiting the Data Set Selection window, use the refresh action to update the Libraries list so that it will include the newly assigned libname.

## Selection Lists

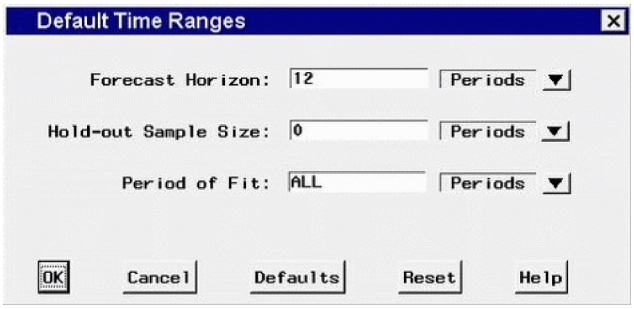
`Libraries`
displays a list of currently assigned libnames. You can select a libname by clicking it with the left mouse button, which is equivalent to typing its name in the Library field.

If you cannot locate the library or directory you are interested in, go to the SAS Explorer window, select "New" from the File menu, then select "Library" and "OK." This opens the New Library window. You also assign a libname by submitting a libname statement from the Editor window. Click the Refresh button to make the new libname available in the libraries list.

`SAS Data Sets`
displays a list of the SAS data sets (data files or data views) contained in the selected library. You can select one of these by clicking with the left mouse button, which is equivalent to typing its name in the Data set field. You can double-click a data set name to select it and exit the window.

# Default Time Ranges Window

Use the Default Time Ranges window to control how the period of fit and evaluation and the forecasting horizon are determined for each series when you do not explicitly set these ranges for a particular series. Invoke this window from the Options menu of the Develop Models, Automatic Model Fitting, Produce Forecasts, and Manage Forecasting Project windows. The settings you make in this window affect subsequently selected series; they do not alter the time ranges of series you have already selected.



## Controls and Fields

`Forecast Horizon`
specifies the forecast horizon as either a number of periods or years from the last nonmissing data value or as a fixed date. You can type a number or date value in this field. Date value must be entered in a form recognized by a SAS date informat. (For information about SAS date informats, see *SAS Programmers Guide: Essentials*.)

`Forecast Horizon Units`
indicates whether the value in the forecast horizon field represents periods or years or a date. Click the arrow and select one from the pop-up list.

`Hold-out Sample Size`
specifies that a number of observations, number of years, or percent of the data at the end of the data range be used for the period of evaluation with the remainder of data used as the period of fit.

`Hold-out Sample Size Units`
indicates whether the hold-out sample size represents periods or years or percent of data range.

`Period of Fit`
specifies how much of the data range for a series is to be used as the period of fit for models fit to the series. ALL indicates that all the available data is used. You can specify a number of periods, number of years, or a fixed date, depending on the value of the units field to the right. When you specify a date, the start of the period of fit is the specified date or the first nonmissing series value, whichever is more recent. Date value must be entered in a form recognized by a SAS date informat. (For information about SAS date informats, see *SAS Programmers Guide: Essentials*.) When you specify the number of periods or years, the start of the period of fit is computed as the date that number of periods or years from the end of the data.

`Period of Fit Units`
indicates whether the period-of-fit value represents periods or years or a date.

`OK`
: closes the window and stores the specified changes.

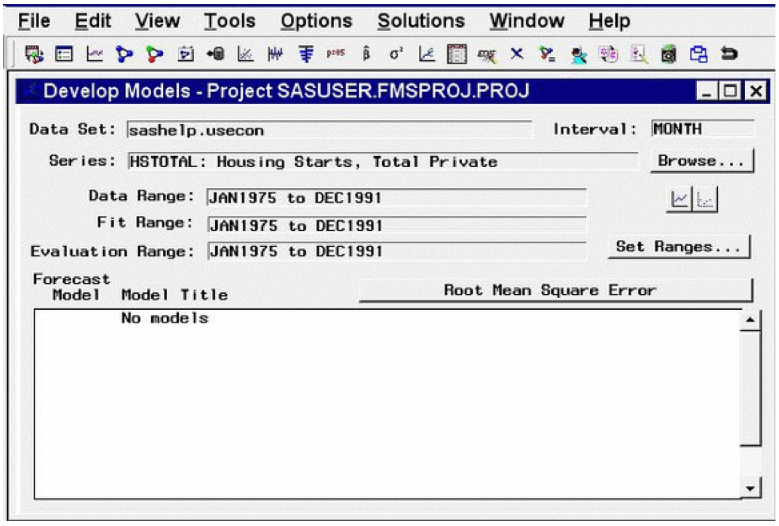
`Cancel`
: closes the window without saving changes. Any options you specified are lost.

`Defaults`
: resets all options to their default values.

`Reset`
: resets the options to their initial values upon entry to the window.

# Develop Models Window

This resizable window provides access to all of the Forecasting System's interactive model fitting and graphical tools. Use it to fit forecasting models to an individual time series and choose the best model to use to produce the final forecasts of the series. Invoke this window by using the Develop Models button in the Time Series Forecasting window.



## Controls and Fields

`Data Set`
: is the name of the current input data set.

`Interval`
: is the time interval (data frequency) for the input data set.

`Series`
: is the variable name and label of the current time series.

`Browse` button
: opens the Series Selection window to enable you to change the current input data set or series.

`Data Range`
is the date of the first and last nonmissing data values available for the current series in the input data set.

`Fit Range`
is the current period of fit setting. This is the range of data that will be used to fit models to the series.

`Evaluation Range`
is the current period of evaluation setting. This is the range of data that will be used to calculate the goodness-of-fit statistics for models fit to the series.

`Set Ranges` button
opens the Time Ranges Specification window to enable you to change the fit range or evaluation range. Note: A new fit range is applied when new models are fit or when existing models are refit. A new evaluation range is applied when new models are fit or when existing models are refit or reevaluated. Changing the ranges does not automatically refit or reevaluate any models in the table: Use the Refit Models or Reevaluate Models items under the Edit menu.

`View Series Graphically` icon
opens the Time Series Viewer window to display plots of the current series.

`View Selected Model Graphically` icon
opens the Model Viewer to display graphs and tables for the currently highlighted model.

`Forecast Model`
is the column of the model table that contains check boxes to select which model is used to produce the final forecasts for the current series.

`Model Title`
is the column of the model table that contains the descriptive labels of the forecasting models fit to the current series.

`Root Mean Square Error` (or other statistic name) button
is the button above the right side of the table. It displays the name of the current model selection criterion: a statistic that measures how well each model in the table fits the values of the current series for observations within the evaluation range. Clicking this button opens the Model Selection Criterion window to let you to select a different statistic. When you select a statistic, the model table the Develop Models window is updated to show current values of that statistic.

## Menu Bar

`File`

`New Project`
opens a dialog box that lets you create a new project, assign it a name and description, and make it the active project.

`Open Project`
opens a dialog box that lets you select and load a previously saved project.

`Save Project`
saves the current state of the system (including all the models fit to a series) to the current project catalog entry.

`Save Project as`
saves the current state of the system with a prompt for the name of the catalog entry in which to store the information.

`Clear Project`
clears the system, deleting all the models for all series.

`Save Forecast`
writes forecasts from the currently highlighted model to an output data set.

`Save Forecast As`
prompts for an output data set name and saves the forecasts from the currently highlighted model.

`Output Forecast Data Set`
opens a dialog box for specifying the default data set used when you select "Save Forecast."

`Import Data`
is available if you license SAS/ACCESS software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or database to a SAS data set for use in the Time Series Forecasting System.

`Export Data`
is available if you license SAS/ACCESS software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or data base.

`Print Setup`
opens the Print Setup window, which enables you to access your operating system print setup.

`Close`
closes the Develop Models window and returns to the main window.

`Edit`

`Fit Model`

`Automatic Fit`
invokes the automatic model selection process.

`Select From List`
opens the Models to Fit window.

`Smoothing Model`
opens the Smoothing Model Specification window.

`ARIMA Model`
opens the ARIMA Model Specification window.

`Custom Model`
opens the Custom Model Specification window.

`Combine Forecasts`
opens the Forecast Combination Model Specification window.

`External Forecasts`
opens the External Forecast Model Specification window.

Edit Model
: enables you to modify the specification of the currently highlighted model in the table and fit the modified model. The new model replaces the current model in the table.

Delete Model
: deletes the currently highlighted model from the model table.

Refit Models

  All Models
  : refits all models in the table by using data within the current fit range.

  Selected Model
  : refits the currently highlighted model by using data within the current fit range.

Reevaluate Models

  All Models
  : recomputes statistics of fit for all models in the table by using data within the current evaluation range.

  Selected Model
  : recomputes statistics of fit for the currently highlighted model by using data within the current evaluation range.

View

Project
: opens the Manage Forecasting Project window.

Data Set
: opens a Viewtable window to display the current input data set.

Series
: opens the Time Series Viewer window to display plots of the current series. This has the same function as the View Series Graphically icon.

Model Predictions
: opens the Model Viewer to display a predicted versus actual plot for the currently highlighted model. This has the same function as the View Selected Model Graphically icon.

Prediction Errors
: opens the Model Viewer to display the prediction errors for the currently highlighted model.

Prediction Error Autocorrelations
: opens the Model Viewer to display the prediction error autocorrelations, partial autocorrelations, and inverse autocorrelations for the currently highlighted model.

Prediction Error Tests
: opens the Model Viewer to display graphs of white noise and stationarity tests on the prediction errors of the currently highlighted model.

`Parameter Estimates`
: opens the Model Viewer to display the parameter estimates table for the currently highlighted model.

`Statistics of Fit`
: opens the Model Viewer window to display goodness-of-fit statistics for the currently highlighted model.

`Forecast Graph`
: opens the Model Viewer to graph the forecasts for the currently highlighted model.

`Forecast Table`
: opens the Model Viewer to display forecasts for the currently highlighted model in a table.

`Tools`

`Diagnose Series`
: opens the Series Diagnostics window to determine the kinds of forecasting models appropriate for the current series.

`Define Interventions`
: opens the Interventions for Series window to enable you to edit or add intervention effects for use in modeling the current series.

`Sort Models`
: sorts the models in the table by the values of the currently displayed fit statistic.

`Compare Models`
: opens the Model Fit Comparison window to display fit statistics for selected pairs of forecasting models. This is unavailable if there are fewer than two models in the table.

`Generate Data`
: opens the Time Series Simulation window. This window enables you to simulate ARIMA time series processes and is useful for educational exercises or testing the system.

`Options`

`Time Ranges`
: opens the Time Ranges Specification window to enable you to change the fit and evaluation time ranges and the forecast horizon. This has the same function as the Set Ranges button.

`Default Time Ranges`
: opens the Default Time Ranges window to enable you to control how the system sets the time ranges for series when you do not explicitly set time ranges with the Time Ranges Specification window. Settings made by using this window do not affect series you are already working with; they take effect when you select a new series.

`Model Selection List`
: opens the Model Selection List editor window. Use this action to edit the set of forecasting models considered by the automatic model selection process and displayed by the Models to Fit window.

`Model Selection Criterion`
: opens the Model Selection Criterion window, which presents a list of goodness-of-fit statistics and enables you to select the fit statistic that is displayed in the table and used by the automatic model selection process to determine the best fitting model. This has the same function as the button above the table that displays the name of the current model selection criterion.

`Statistics of Fit`
: opens the Statistics of Fit Selection window, which presents a list of statistics that the system can display. Use this action to customize the list of statistics shown in the Model Viewer, Automatic Model Fitting Results, and Model Fit Comparison windows and available for selection in the Model Selection Criterion menu.

`Forecast Options`
: opens the Forecast Options window, which enables you to control the widths of forecast confidence limits and control the kind of predicted values computed for models that include series transformations.

`Alignment of Dates`

  `Beginning`
  : aligns dates that the system generates to identify forecast observations in output data sets to the beginning of the time intervals.

  `Middle`
  : aligns dates that the system generates to identify forecast observations in output data sets to the midpoints of the time intervals.

  `End`
  : aligns dates that the system generates to identify forecast observations in output data sets to the end of the time intervals.

`Automatic Fit`
: opens the Automatic Model Selection Options window, which enables you to control the number of models retained by the automatic model selection process and whether the models considered for automatic selection are subset according to the series diagnostics.

`Include Interventions`
: controls whether intervention effects defined for the current series are automatically added as predictors to the models considered by the automatic selection process and displayed by the Models to Fit window. When the Include Interventions option is selected, the series interventions are also automatically added to the predictors list when you specify a model in the ARIMA and Custom Models Specification windows. A check mark or filled check box next to this item indicates that the option is turned on.

`Print Audit Trail`
: prints to the SAS log information about the models fit by the system. A check mark or filled check box next to this item indicates that the audit option is turned on.

`Show Source Statements`
: controls whether SAS statements submitted by the forecasting system are printed in the SAS log. When the Show Source Statements option is selected, the system sets the SAS system option SOURCE before submitting SAS statements; otherwise, the system uses the NOSOURCE option.

Note that only some of the functions performed by the forecasting system are accomplished by submitting SAS statements. A check mark or filled check box next to this item indicates that the option is turned on.

## Left Mouse Button Actions for the Model Table

When the mouse pointer is over the description of a model in the table, the left mouse button selects (highlights) or deselects that model. On some computer systems, you can double-click to open the Model Viewer window for the selected model.

When the mouse pointer is over an empty part of the model table, the left mouse button opens a menu of model fitting choices. These choices are the same as those on the Fit Model submenu of the Edit menu.

## Right Mouse Button Actions for the Model Table

When a model in the table is selected, the right mouse opens a menu of actions that apply to the highlighted model. The actions available from this menu are as follows.

`View Model`
: opens the Model Viewer for the selected model. This has the same function as the View Model Graphically icon.

`View Parameter Estimates`
: opens the Model Viewer to display the parameter estimates table for the currently highlighted model. This has the same function as the Parameter Estimates item on the View menu.

`View Statistics of Fit`
: opens the Model Viewer to display a table of goodness-of-fit statistics for the currently highlighted model. This has the same function as the Statistics of Fit item on the View menu.

`Edit Model`
: enables you to modify the specification of the currently highlighted model in the table and fit the modified model. This has the same function as the Edit Model item on the Edit menu.

`Refit Model`
: refits the highlighted model by using data within the current fit range. This has the same function as the Selected Model item on the Refit Models submenu of the Edit menu.

`Reevaluate Model`
: reevaluates the highlighted model by using data within the evaluation fit range. This has the same function as the Selected Model item on the Reevaluate Models submenu of the Edit menu.

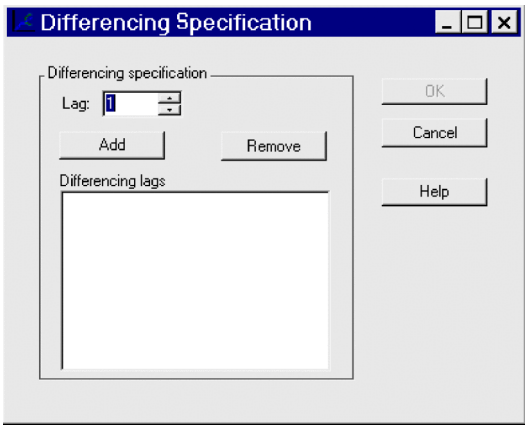
`Delete Model`
: deletes the currently highlighted model from the model table. This has the same function as the Delete Model item on the Edit menu.

`View Forecasts`
: opens the Model Viewer to display the forecasts for the currently highlighted model. This has the same function as the Forecast Graph item on the View menu.

When the model list is empty or when no model is selected, the right mouse button opens the same menu of model fitting actions as the left mouse button.

# Differencing Specification Window

Use the Differencing Specification window to specify the list of differencing lags `d=(lag, ..., lag)` in a factored ARIMA model. To specify a first difference, add the value 1 (`d=(1)`). To specify a second difference (difference twice at lag 1), add the value 1 again (`d=(1,1)`). For first differencing at lags 1 and 12, use the values 1 and 12 (`d=(1,12)`).



## Controls and Fields

`Lag`
: specifies a lag value to add to the list. Type in a positive integer or select one by clicking the spin box arrows. Duplicates are allowed.

`Add`
: adds the value in the `Lag` spin box to the list of differencing lags.

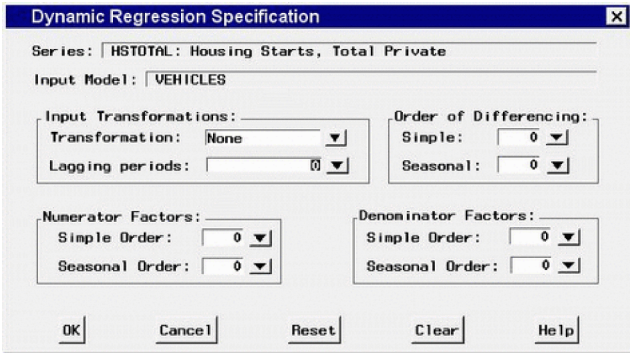
`Remove`
: deletes a selected lag from the list of differencing lags.

`OK`
: closes the window and returns the specified list to the Factored ARIMA Model Specification window.

`Cancel`
: closes the window and discards any lags added to the list.

# Dynamic Regression Specification Window

Use the Dynamic Regression Specification window to specify a dynamic regression or transfer function model for the effect of the predictor variable. It is invoked from the Dynamic Regressors Selection window.



## Controls and Fields

`Series`
: is the name and variable label of the current series.

`Input Model`
: is a descriptive label for the dynamic regression model. You can type a label in this field or allow the system to provide the label. If you leave the label blank, a label is generated automatically based on the options you specify. When no options are specified, the label is the name and variable label of the predictor variable.

`Input Transformation`
: displays the transformation specified for the predictor variable. When a transformation is specified, the transfer function model is fit to the transformed input variable.

`Lagging periods`
: is the pure delay in the effect of the predictor, $l$.

`Simple Order of Differencing`
: is the order of differencing, $d$. Set this field to 1 to use the changes in the predictor variable.

`Seasonal Order of Differencing`
: is the order of seasonal differencing, $D$. Set this field to 1 to difference the predictor variable at the seasonal lags—for example, to use the year-over-year or week-over-week changes in the predictor variable.

`Simple Order Numerator Factors`
: is the order of the numerator factor of the transfer function, $p$.

`Seasonal Order Numerator Factors`
: is the order of the seasonal numerator factor of the transfer function, $P$.

`Simple Order Denominator Factors`
: is the order of the denominator factor of the transfer function, $q$.

`Seasonal Order Denominator Factors`
is the order of the seasonal denominator factor of the transfer function, $Q$.

`OK`
closes the window and adds the dynamic regression model specified to the model predictors list.

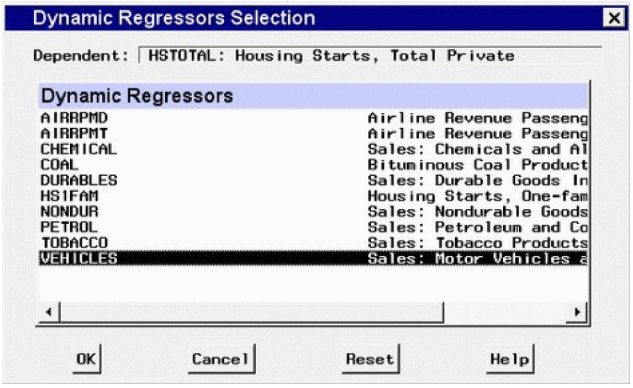
`Cancel`
closes the window without adding the dynamic regression model. Any options you specified are lost.

`Reset`
resets all options to their initial values upon entry to the window. This might be useful when editing a predictor specification; otherwise, Reset has the same function as Clear.

`Clear`
resets all options to their default values.

# Dynamic Regressors Selection Window

Use the Dynamic Regressors Selection window to select an input variable as a dynamic regressor. Access this window from the pop-up menu that appears when you click the Add button in the ARIMA Model Specification window or Custom Model Specification window.



## Controls and Fields

`Dependent`
is the name and variable label of the current series.

`Dynamic Regressors`
is a table listing the variables in the input data set. Select one variable in this list as the predictor series.

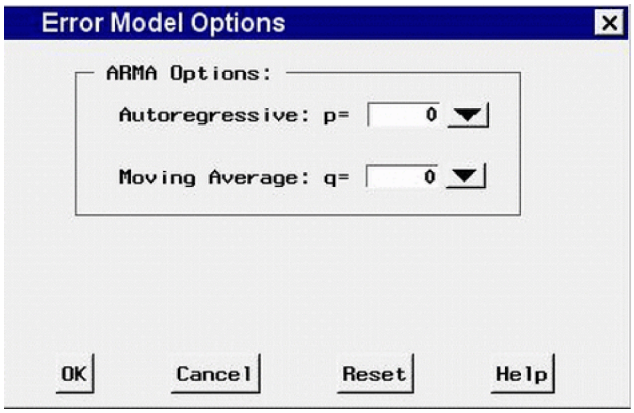
`OK`
opens the Dynamic Regression Specification window for you to specify the form of the dynamic regression for the selected predictor series, and then closes the Dynamic Regressors Selection window and adds the specified dynamic regression to the model predictors list.

`Cancel`
closes the window without adding the dynamic regression model. Any options you specified are lost.

`Reset`
resets all options to their initial values upon entry to the window.

# Error Model Options Window

Use the Error Model Options window to specify the autoregressive and moving-average orders for the residual autocorrelation part of a model defined by using the Custom Model Specification window. Access it by using the Set button in that window.



## Controls and Fields

`ARIMA Options`
Use these combo boxes to specify the orders of the ARIMA model. You can either type in a value or click the combo box arrow to select from a pop-up list.

`Autoregressive`
defines the order of the autoregressive part of the model.

`Moving Average`
defines the order of the moving-average term.

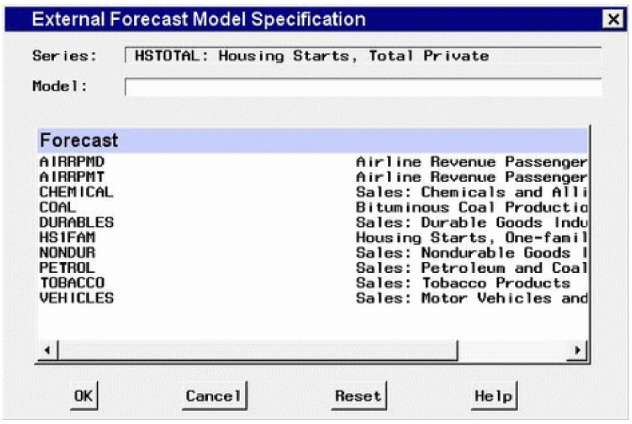
`OK`
closes the Error Model Options window and returns to the Custom Model Specification window.

`Cancel`
closes the Error Model Options window and returns to the Custom Model Specification window, discarding any changes made.

`Reset`
resets all options to their initial values upon entry to the window.

# External Forecast Model Specification Window

Use the External Forecast Model Specification window to add to the current project forecasts produced externally to the Time Series Forecasting System. To add an external forecast, select a variable from the selection list and click the OK button. The name of the selected variable will be added to the list of models fit, and the values of this variable will be used as the forecast. For more information, see "Incorporating Forecasts from Other Sources" in the "Specifying Forecasting Models" chapter.



## Controls and Fields

`OK`
: closes the window and adds the external forecast to the project.

`Cancel`
: closes the window without adding an external forecast to the project.

`Reset`
: deselects any selection made in the selection list.

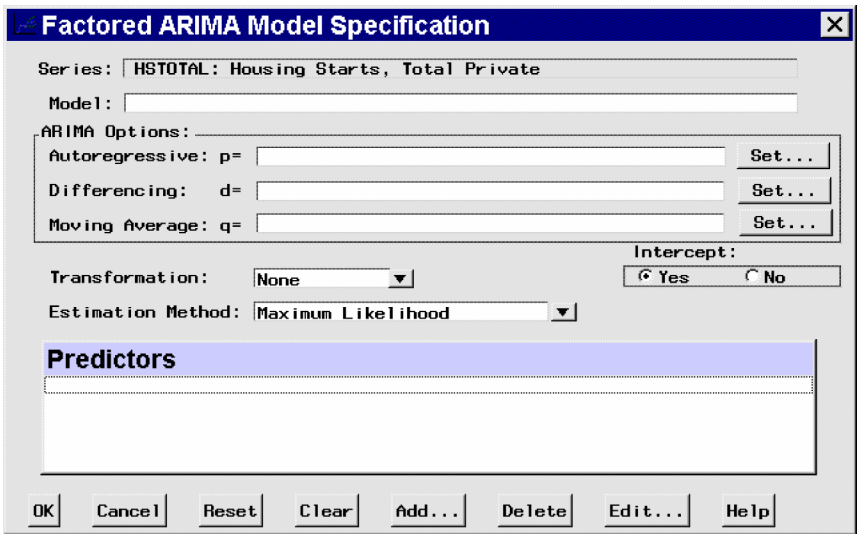
# Factored ARIMA Model Specification Window

Use the ARIMA Model Specification window to specify an ARIMA model by using the notation:

```
p = (lag, ..., lag) ...(lag, ..., lag)
d = (lag, ..., lag)
q = (lag, ..., lag) ...(lag, ..., lag)
```

where p, d, and q represent autoregressive, differencing, and moving-average terms, respectively.

Access it from the Develop Models menu, where it is invoked from the Fit Model item under Edit on the menu bar, or from the pop-up menu when you click an empty area of the model table.



The Factored ARIMA Model Specification window is identical to the ARIMA Model Specification window, except that the p, d, and q terms are specified in a more general and less limited way. Only those controls and fields that differ from the ARIMA Model Specification window are described here.

## Controls and Fields

`Model`
: is a descriptive label for the model. You can type a label in this field or allow the system to provide a label. If you leave the label blank, a label is generated automatically based on the p, d, and q terms that you specify. For example, if you specify `p=(1,2,3), d=(1), q=(12)` and no intercept, the model label is `ARIMA p=(1,2,3) d=(1) q=(12) NOINT`. For monthly data, this is equivalent to the model `ARIMA(3,1,0)(0,0,1)s NOINT` as specified in the ARIMA Model Specification window or the Custom Model Specification window.

`ARIMA Options`
: specifies the ARIMA model in terms of the autoregressive lags (p), differencing lags (d), and moving-average lags (q).

`Autoregressive`
: defines the autoregressive part of the model. Click the Set button to open the AR Polynomial Spec-

ification window, where you can add any set of autoregressive lags grouped into any number of factors.

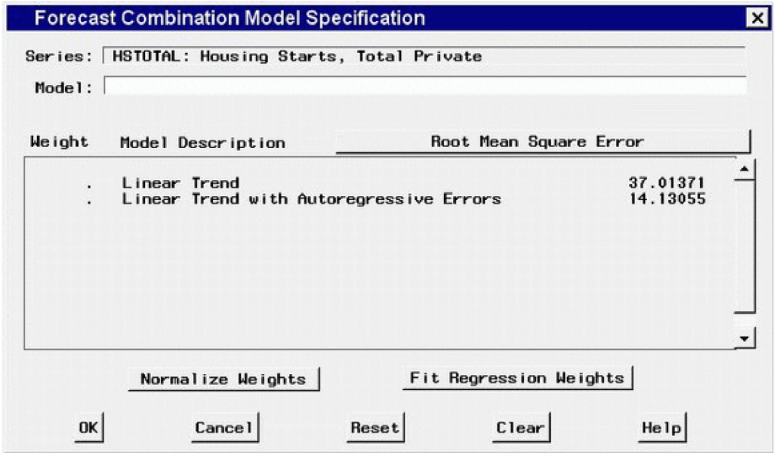
`Differencing`
specifies differencing to be applied to the input data. Click the Set button to open the Differencing Specification window, where you can specify any set of differencing lags.

`Moving Average`
defines the moving-average part of the model. Click the Set button to open the MA Polynomial Specification window, where you can add any set of moving-average lags grouped into any number of factors.

`Estimation Method`
specifies the method used to estimate the model parameters. The Conditional Least Squares and Unconditional Least Squares methods generally require fewer computing resources and are more likely to succeed in fitting complex models. The Maximum Likelihood method requires more resources but provides a better fit in some cases. See also the section "Estimation Details" in Chapter 8, "The ARIMA Procedure."

## Forecast Combination Model Specification Window

Use the Forecast Combination Model Specification window to produce forecasts by averaging the forecasts of two or more forecasting models. The specified combination of models is added to the model list for the series. Access this window from the Develop Models window whenever two or more models have been fit to the current series. It is invoked by selecting Combine Forecasts from the Fit Model submenu of the Edit menu, or from the pop-up menu which appears when you click an empty part of the model table.



## Controls and Fields

`Series`
is the name and variable label of the current series.

`Model`
is a descriptive label for the model that you specify. You can type a label in this field or allow the system to provide a label. If you leave the label blank, a label is generated automatically based on the options you specify.

`Weight`
is a column of the forecasting model table that contains the weight values for each model. The forecasts for the combined model are computed as a weighted average of the predictions from the models in the table that use these weights. Models with missing weight values are not included in the forecast combination. You can type weight values in these fields or you can use other features of the window to set the weights.

`Model Description`
is a column of the forecasting model table that contains the descriptive labels of the forecasting models fit to the current series that are available for combination.

`Root Mean Square Error` (or other statistic name) button
is the button above the right side of the table. It displays the name of the current model selection criterion: a statistic that measures how well each model in the table fits the values of the current series for observations within the evaluation range. Clicking this button opens the Model Selection Criterion window to enable you to select a different statistic.

`Normalize Weights` button
replaces each nonmissing value in the Weights column with the current value divided by the sum of the weights. The resulting weights are proportional to original weights and sum to 1.

`Fit Regression Weights` button
computes weight values for the models in the table by regressing the series on the predictions from the models. The values in the Weights column are replaced by the estimated coefficients produced by this linear regression. If some weight values are nonmissing and some are missing, only models with nonmissing weight values are included in the regression. If all weights are missing, all models are used.

`OK`
closes the Forecast Combination Model Specification window and fits the model.

`Cancel`
closes the Forecast Combination Model Specification window without fitting the model. Any options you specified are lost.

`Reset`
resets all options to their initial values upon entry to the Forecast Combination Model Specification window. This might be useful when editing an existing model specification; otherwise, Reset has the same function as Clear.

`Clear`
resets all options to their default values.

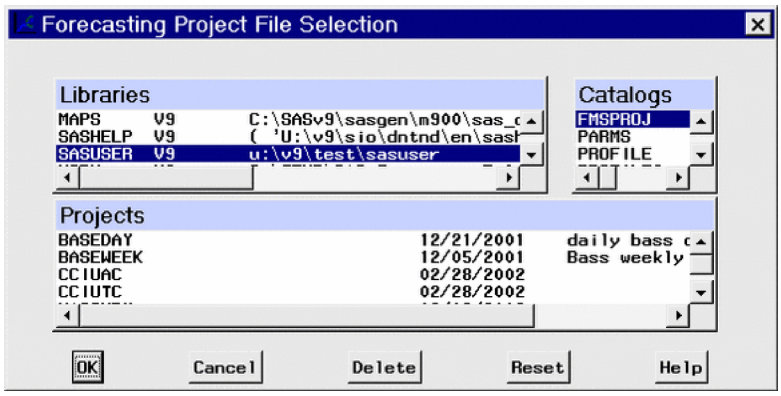
### Mouse Button Actions

You can select or deselect models for inclusion in the combination model by positioning the mouse pointer over the model description and pressing the left mouse button. When you select a model in this way, the weights are automatically updated.

The newly selected model is given a weight equal to the average weight of the previously selected models, and all the nonmissing weights are normalized to sum to 1. When you use the mouse to remove a model from the combination, the weight of the deselected model is set to missing and the remaining nonmissing weights are normalized to sum to 1.

## Forecasting Project File Selection Window

Use the Forecasting Project File Selection window to locate and load a previously stored forecasting project. Access it from the project Browse button in the Manage Forecasting Project window or the Time Series Forecasting window or from the Open Project item on the File menu of the Develop Models window.



### Selection Lists

`Libraries`
: is a list of currently assigned libraries. When you select a library from this list, the catalogs in that library are shown in the catalog selection list.

`Catalogs`
: is a list of catalogs contained in the currently selected library. When you select a catalog from this list, any forecasting project entries stored in that catalog are shown in the projects selection list.

`Projects`
: is a list of forecasting project entries contained in the currently selected catalog.

### Controls and Fields

`OK`
: closes the window and opens the selected project.

`Cancel`
: closes the window without selecting a project.

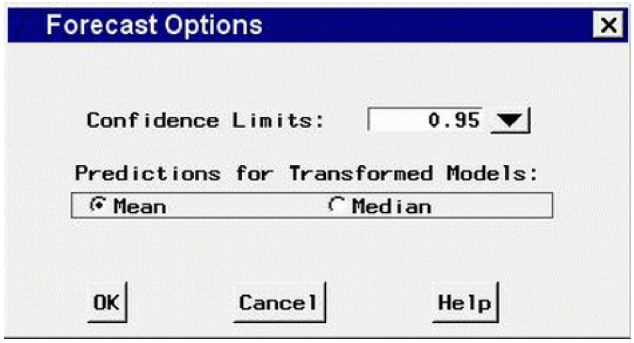
`Delete`
: deletes the selected project file.

`Reset`
: restores selections to those which were set before the window was opened.

---

## Forecast Options Window

Use the Forecast Options window to set options to control how forecasts and confidence limits are computed. It is available from the Forecast Options item in the Options menu of the Develop Models window, Automatic Model Fitting window, Produce Forecasts, and Manage Projects windows.



### Controls and Fields

`Confidence Limits`
: specifies the size of the confidence limits for the forecast values. For example, a value of 0.95 specifies 95% confidence intervals. You can type in a number or select from the pop-up list.

`Predictions for transformed models`
: controls how forecast values are computed for models that employ a series transformation. See the section Predictions for Transformed Models in Chapter 66, "Forecasting Process Details," for more information. The values are as follows.

  `Mean`
  : specifies that forecast values be predictions of the conditional mean of the series.

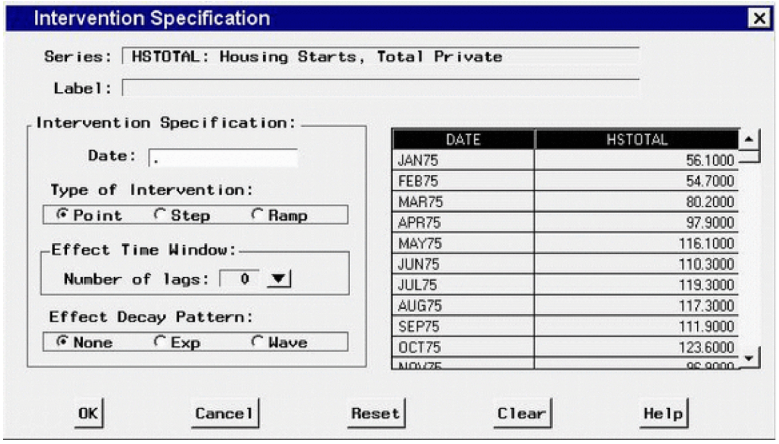
  `Median`
  : specifies that forecast values be predictions of the conditional median of the series.

`OK`
: closes the window and saves the option settings you specified.

Cancel
closes the window without changing the forecast options. Any options you specified are lost.

# Intervention Specification Window

Use the Intervention Specification window to specify intervention effects to model the impact on the series of unusual events. Access it from the Intervention for Series window. For more information, see the section "Interventions" on page 4051.



## Controls and Fields

Series
is the name and variable label of the current series.

Label
is a descriptive label for the intervention effect that you specify. You can type a label in this field or allow the system to provide the label. If you leave the label blank, a label is generated automatically based on the options you specify.

Date
is the date that the intervention occurs. You can type a date value in this field, or you can set the date by selecting a row of the data table on the right side of the window.

Type of Intervention

Point
specifies that the intervention variable is zero except for the specified date.

Step
specifies that the intervention variable is zero before the specified date and a constant 1.0 after the date.

`Ramp`
: specifies that the intervention variable is an increasing linear function of time after the date of the intervention and zero before the intervention date.

`Number of lags`
: specifies the numerator order for the transfer function model for the intervention effect. Select a value from the pop-up list.

`Effect Decay Pattern`
: specifies the denominator order for the transfer function model for the intervention effect. The value "Exp" specifies a single lag denominator factor; the value "Wave" specifies a two-lag denominator factor.

`OK`
: closes the window and adds the intervention effect specified to the series interventions list.

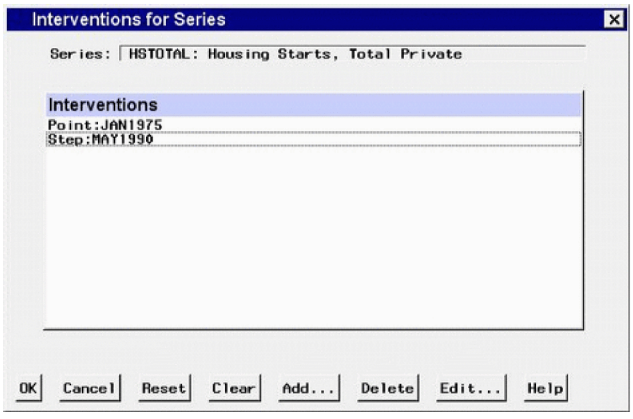
`Cancel`
: closes the window without adding the intervention. Any options you specified are lost.

`Reset`
: resets all options to their initial values upon entry to the window. This might be useful when editing an intervention specification; otherwise, Reset has the same function as Clear.

`Clear`
: resets all options to their default values.

## Interventions for Series Window

Use the Interventions for Series window to create and edit a list of intervention effects to model the impact on the series of unusual events and to select intervention effects as predictors for forecasting models. Access it from the Add button pop-up menu of the ARIMA Model Specification or Custom Model Specification window, or by selecting Define Interventions from the Tools in the Develop Models window. For more information, see the section "Interventions" on page 4051.



## Controls and Fields

`Series`
: is the name and variable label of the current series.

`OK`
: closes the window. If you access this window from the ARIMA Model Specification window or the Custom Model Specification window, any interventions that are selected (highlighted) in the list are added to the model. If you access this window from the Tools menu, all interventions in the list are saved for the current series.

`Cancel`
: closes the window without returning a selection or changing the interventions list. Any options you specified are lost.

`Reset`
: resets the list as it was on entry to the window.

`Clear`
: deletes all interventions from the list.

`Add`
: opens the Intervention Specification window to specify a new intervention effect and add it to the list.

`Delete`
: deletes the currently selected (highlighted) entries from the list.

`Edit`
: opens the Intervention Specification window to edit the currently selected (highlighted) intervention.

## Mouse Button Actions

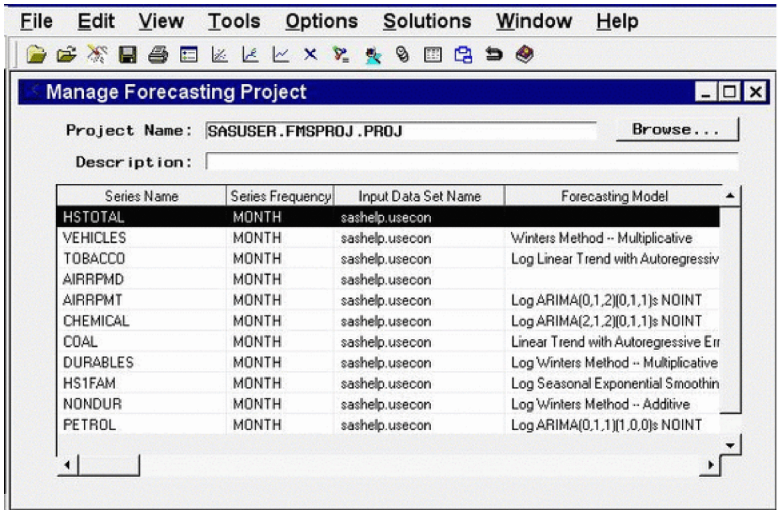
To select or deselect interventions, position the mouse pointer over the intervention's label in the Interventions list and press the left mouse button.

When you position the mouse pointer in the Interventions list and press the right mouse button, a menu containing the actions Add, Delete, and Edit appears. These actions are the same as clicking the Add, Delete, and Edit buttons.

Double-clicking on an intervention in the list invokes an Edit action for that intervention specification.

# Manage Forecasting Project Window

Use this resizable window to work with collections of series, models, and options called *projects*. The window contains a project name, a description field, and a table of information about all the series for which you have fit forecasting models. Access it by using the Manage Projects button in the Time Series Forecasting window.



## Controls and Fields

`Project Name`
: is the name of the SAS catalog entry in which forecasting models and other results will be stored and from which previously stored results are loaded into the forecasting system. You can specify the project by typing a SAS catalog entry name in this field or by selecting the Browse button to the right of this field. If you specify the name of an existing catalog entry, the information in the project file is loaded. If you specify a one-level name, it is assumed to be the name of a project in the "fmsproj" catalog in the "sasuser" library. For example, typing `samproj` is equivalent to typing `sasuser.fmsproj.samproj`.

project `Browse` button
: opens the Forecasting Project File Selection window to enable you to select and load the project from a list of previously stored project files.

`Description`
: is a descriptive label for the forecasting project. The description you type in this field will be stored with the catalog entry shown in the Project field if you save the project.

## Series List Table

The table of series for which forecasting models have been fit contains the following columns.

`Series Name`
is the name of the time series variable represented in the given row of the table.

`Series Frequency`
is the time interval (data frequency) for the time series.

`Input Data Set Name`
is the input data set that provided the data for the series.

`Forecasting Model`
is the descriptive label for the forecasting model selected for the series.

`Statistic Name`
is the statistic of fit for the forecasting model selected for the series.

`Number of Models`
is the total number of forecasting models fit to the series. If there is more than one model for a series, use the Model List window to see a list of models.

`Series Label`
is the variable label for the series.

`Time ID Variable Name`
is the time ID variable for the input data set for the series.

`Series Data Range`
is the time range of the nonmissing values of the series.

`Model Fit Range`
is the period of fit used for the series.

`Model Evaluation Range`
is the evaluation period used for the series.

`Forecast Range`
is the forecast period set for the series.

## Menu Bar

`File`

`New`
opens a dialog box that lets you create a new project, assign it a name and description, and make it the active project.

`Open`
opens a dialog box that lets you select and load a previously saved project.

`Close`
closes the Manage Forecasting Project window and returns to the main window.

`Save`
saves the current state of the system (including all the models fit to a series) to the current project catalog entry.

`Save As`
saves the current state of the system with a prompt for the name of the catalog entry in which to store the information.

`Save to Data Set`
saves the current project file information in a SAS data set. The contents of the data set are the same as the information displayed in the series list table.

`Delete`
deletes the current project file.

`Import Data`
is available if you license SAS/ACCESS software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or database to a SAS data set for use in the Time Series Forecasting System.

`Export Data`
is available if you license SAS/ACCESS software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or database.

`Print`
prints the current project file information.

`Print Setup`
opens the Print Setup window, which allows you to access your operating system print setup.

`Edit`

`Delete Series`
deletes all models for the selected (highlighted) row of the table and removes the series from the project.

`Clear`
resets the system, deleting all series and models from the project.

`Reset`
restores the Manage Forecasting Project window to its initial state.

`View`

`Data Set`
opens a Viewtable window to display the input data set for the selected (highlighted) series.

`Series`
opens the Time Series Viewer window to display plots of the selected (highlighted) series.

`Model`
opens the Model Viewer window to show the current forecasting model for the selected series.

Forecast
: opens the Model Viewer to display plots of the forecasts produced by the forecasting model for the selected (highlighted) series.

Tools

Diagnose Series
: opens the Series Diagnostics window to perform the automatic series diagnostic process to determine the kinds of forecasting models appropriate for the selected (highlighted) series.

List Models
: opens the Model List window for the selected (highlighted) series, which displays a list of all the models that you fit for the series. This action is the same as double-clicking the mouse on the table row.

Generate Data
: opens the Time Series Simulation window. This window enables you to simulate ARIMA time series processes and is useful for educational exercises or testing the system.

Refit Models

All Series
: refits all the models for all the series in the project by using data within the current fit range.

Selected Series
: refits all the models for the currently highlighted series by using data within the current fit range.

Reevaluate Models

All Series
: reevaluates all the models for all the series in the project by using data within the current evaluation fit range.

Selected Series
: reevaluates all the models for the currently highlighted series by using data within the current evaluation range.

Options

Time Ranges
: opens the Time Ranges Specification window to enable you to change the fit and evaluation time ranges and the forecast horizon.

Default Time Ranges
: opens the Default Time Ranges window to enable you to control how the system sets the time ranges for series when you do not explicitly set time ranges with the Time Ranges Specification window. Settings made by using this window do not affect series you are already working with; they take effect when you select a new series.

`Model Selection List`
: opens the Model Selection List editor window. Use this to edit the set of forecasting models considered by the automatic model selection process and displayed by the Models to Fit window.

`Statistics of Fit`
: opens the Statistics of Fit Selection window, which controls which of the available statistics will be displayed.

`Forecast Options`
: opens the Forecast Options window, which enables you to control the widths of forecast confidence limits and control the kind of predicted values computed for models that include series transformations.

`Column Labels`
: enables you to set long or short column labels. Long labels are used by default.

`Include Interventions`
: controls whether intervention effects defined for the current series are automatically added as predictors to the models considered by the automatic selection process and displayed by the Model Selection List editor window. When the Include Interventions option is selected, the series interventions are also automatically added to the predictors list when you specify a model in the ARIMA and Custom Models Specification windows.

`Print Audit Trail`
: prints to the SAS log information about the models fit by the system. A check mark or filled check box next to this item indicates that the audit option is turned on.

`Show Source Statements`
: controls whether SAS statements submitted by the forecasting system are printed in the SAS log. When the Show Source Statements option is selected, the system sets the SAS system option SOURCE before submitting SAS statements; otherwise, the system uses the NOSOURCE option. Note that only some of the functions performed by the forecasting system are accomplished by submitting SAS statements. A check mark or filled check box next to this item indicates that the option is turned on.

## Left Mouse Button Actions

If you select a series in the table by positioning the mouse pointer over the table row and clicking with the left mouse button once, that row of the table is highlighted. Menu bar actions such as Delete Series will apply to the highlighted row of the table.

If you select a series in the table by positioning the mouse pointer over the table row and double-clicking with the left mouse button, the system opens the Model List window for that series, which displays a list of all the models that you fit for the series. This has the same function as the List Models item under Tools on the menu bar.

## Right Mouse Button Actions

Clicking the right mouse button invokes a pop-up menu of actions applicable to the highlighted series. The actions in this menu are as follows:

`Delete Series`
: deletes the highlighted series and its models from the project. This has the same function as the Delete Series item on the Edit menu.

`Refit All Models`
: refits all models attached to the highlighted series by using data within the current fit range. This has the same function as the Selected Series item under Refit Models on the Tools menu.

`Reevaluate All Models`
: reevaluates all models attached to the highlighted series by using data within the current evaluation range. This has the same function as the Selected Series item under Reevaluate Models on the Tools menu.

`List Models`
: invokes the Model List window. This has the same function as List Models on the Tools menu.

`View Series`
: opens the Time Series Viewer window to display plots of the highlighted series. This has the same function as the Series item on the View menu.

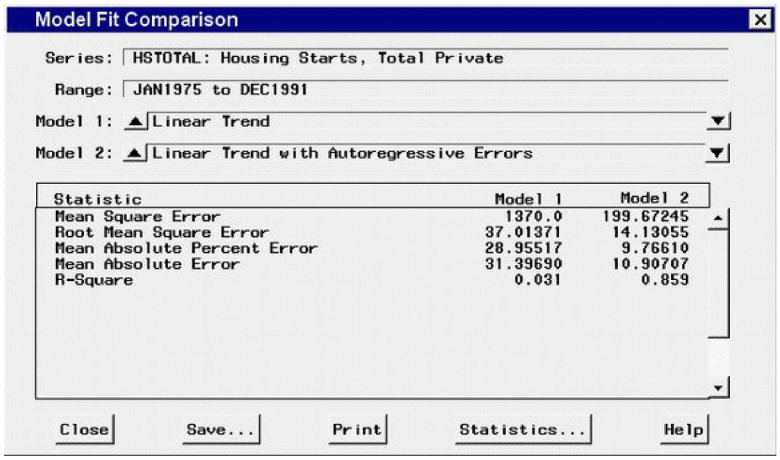
`View Forecasting Model`
: invokes the Model Viewer window to display the forecasting model for the highlighted series. This has the same function as the Model item on the View menu.

`View Forecast`
: opens the Model Viewer window to display the forecasts for the highlighted series. This has the same function as the Forecast item on the View menu.

`Refresh`
: updates information shown in the Manage Forecasting Project window.

# Model Fit Comparison Window

Use the Model Fit Comparison window to compare goodness-of-fit statistics for any two models fit to the current series. Access it from the Tools menu of the Develop Models window and the Automatic Model Fitting Results window whenever two or more models have been fit to the series.



## Controls and Fields

`Series`
identifies the current time series variable.

`Range`
displays the starting and ending dates of the series data range.

`Model 1`
shows the model currently identified as Model 1.

`Model 1` upward arrow button
enables you to change the model identified as Model 1 if it is not already the first model in the list of models associated with the series. Click this button to cycle upward through the list of models.

`Model 1` downward arrow button
enables you to change the model identified as Model 1 if it is not already the last model in the list of models. Click this button to cycle downward through the list of models.

`Model 2`
shows the model currently identified as Model 2.

`Model 2` upward arrow button
enables you to change the model identified as Model 2 if it is not already the first model in the list of models associated with the series. Click this button to cycle upward through the list of models.

`Model 2` downward arrow button
enables you to change the model identified as Model 2 if it is not already the last model in the list of models. Click this button to cycle downward through the list of models.

`Close`
closes the Model Fit Comparison window.

`Save`
: opens a dialog box for specifying the name and label of a SAS data set to which the statistics will be saved. The data set will contain all available statistics and their values for Model 1 and Model 2, as well as a flag variable that is set to 1 for those statistics that were displayed.

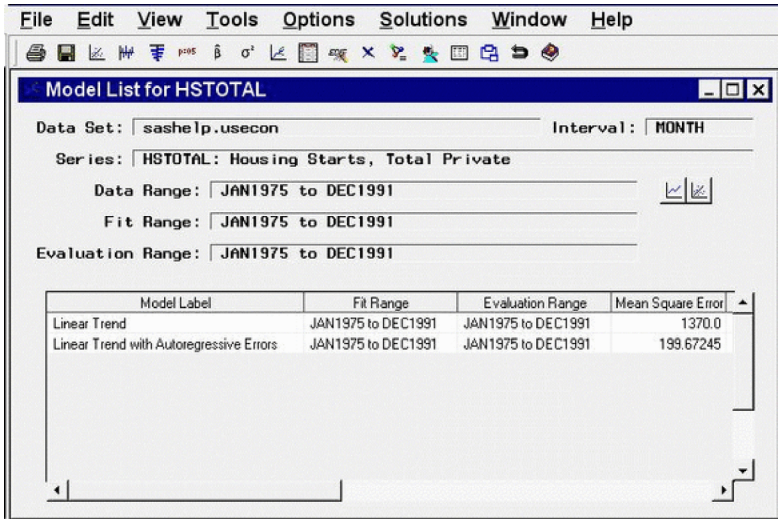
`Print`
: prints the contents of the table to the SAS Output window. If you find that the contents do not appear immediately in the Output window, you need to set scrolling options. Select “Preferences” under the Options submenu of the Tools menu. In the Preferences window, select the Advanced tab, then set output scroll lines to a number greater than zero.

  If you want to route the contents to a printer, go to the Output window and select “Print” from the File menu.

`Statistics`
: opens the Statistics of Fit Selection window for controlling which statistics are displayed.

# Model List Window

This resizable window shows all of the models that have been fit to a particular series in a project. Access it from the Manage Forecasting Project window by selecting a series in the series list table and choosing “List Models” from the Tools menu or by double-clicking the series.



## Controls and Fields

`Data Set`
: is the name of the current input data set.

`Interval`
: is the time interval (data frequency) for the input data set.

`Series`
: is the variable name and label of the current time series.

`Data Range`
: is the date of the first and last nonmissing data values available for the current series in the input data set.

`Fit Range`
: is the current period of fit setting. This is the range of data that will be used to fit models to the series. It might be different from the fit ranges shown in the table, which were in effect when the models were fit.

`Evaluation Range`
: is the current period of evaluation setting. This is the range of data that will be used to calculate the goodness-of-fit statistics for models fit to the series. It might be different from the evaluation ranges shown in the table, which were in effect when the models were fit.

`View Series Graphically` icon
: opens the Time Series Viewer window to display plots of the current series.

`View Model Graphically` icon
: opens the Model Viewer to display graphs and tables for the currently highlighted model.

## Model List Table

The table of models fit to the series contains columns that show the model label, the fit range and evaluation range used to fit the models, and all of the currently selected fit statistics. You can change the selection of fit statistics by using the Statistics of Fit Selection window.

Click on column headings to sort the table by a particular column. If a model is highlighted, clicking with the right mouse button invokes a pop-up menu that provides actions applicable to the highlighted model. It includes the following items.

`View Model`
: opens the Model Viewer on the selected model. This has the same function as "Model Predictions" on the View menu.

`View Parameter Estimates`
: opens the Model Viewer to display the parameter estimates table for the currently highlighted model. This has the same function as "Parameter Estimates" on the View menu.

`View Statistics of Fit`
: opens the Model Viewer to display the statistics of fit table for the currently highlighted model. This has the same function as "Statistics of Fit" on the View menu.

`Edit Model`
: opens the appropriate model specification window for changing the attributes of the highlighted model and fitting the modified model.

`Refit Model`
: refits the highlighted model using the current fit range.

`Reevaluate Model`
: reevaluates the highlighted model using the current evaluation range.

`Delete Model`
: deletes the highlighted model from the project.

`View Forecasts`
opens the Model Viewer to show the forecasts for the highlighted model. This has the same function as "Forecast Graph" on the View menu.

## Menu Bar

`File`

`Save`
opens a dialog box that lets you save the contents of the table to a specified SAS data set.

`Import Data`
is available if you license SAS/ACCESS software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or data base to a SAS data set for use in the Time Series Forecasting System.

`Export Data`
is available if you license SAS/ACCESS software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or database.

`Print`
sends the contents of the table to a printer as defined through Print Setup.

`Print Setup`
opens the Print Setup window, which allows you to access your operating system print setup.

`Close`
closes the window and returns to the Manage Forecasting Projects window.

`Edit`

`Edit Model`
enables you to modify the specification of the currently highlighted model in the table and fit the modified model. The new model replaces the current model in the table.

`Refit Model`
refits the currently highlighted model using data within the current fit range.

`Reevaluate Model`
recomputes statistics of fit for the currently highlighted model using data within the current evaluation range.

`Delete Model`
deletes the currently highlighted model from the model table.

`Reset`
restores the contents of the Model List window to the state initially displayed.

`View`

`Series`
: opens the Time Series Viewer window to display plots of the current series. This has the same function as the View Series Graphically icon.

`Model Predictions`
: opens the Model Viewer to display a predicted and actual plot for the currently highlighted model. This has the same function as the View Model Graphically icon.

`Prediction Errors`
: opens the Model Viewer to display the prediction errors for the currently highlighted model.

`Prediction Error Autocorrelations`
: opens the Model Viewer to display the prediction error autocorrelations, partial autocorrelations, and inverse autocorrelations for the currently highlighted model.

`Prediction Error Tests`
: opens the Model Viewer to display graphs of white noise and stationarity tests on the prediction errors of the currently highlighted model.

`Parameter Estimates`
: opens the Model Viewer to display the parameter estimates table for the currently highlighted model.

`Statistics of Fit`
: opens the Model Viewer window to display goodness-of-fit statistics for the currently highlighted model.

`Forecast Graph`
: opens the Model Viewer to graph the forecasts for the currently highlighted model.

`Forecast Table`
: opens the Model Viewer to display forecasts for the currently highlighted model in a table.

`Options`

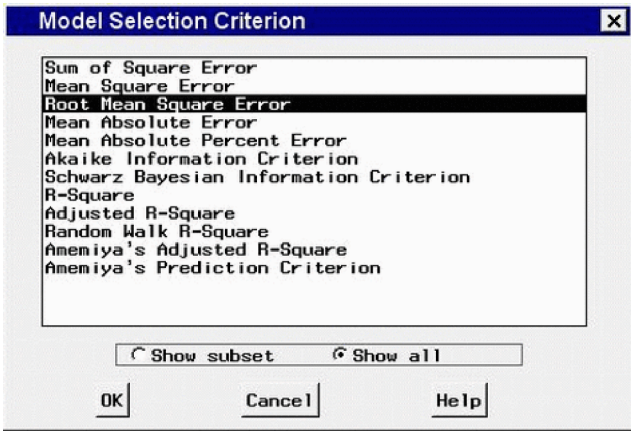
`Statistics of Fit`
: opens the Statistics of Fit Selection window, which presents a list of statistics that the system can display. Use this action to customize the list of statistics shown in the Model Viewer, Automatic Model Fitting Results, and Model Fit Comparison windows and available for selection in the Model Selection Criterion menu.

`Column Labels`
: enables you to set long or short column labels. Long labels are used by default.

# Model Selection Criterion Window

Use the Model Selection Criterion window to select the model selection criterion statistic used by the automatic selection process to determine the best fitting forecasting model. Model selection criterion statistics are a subset of those shown in the Statistics of Fit Selection window, since some statistics of fit, such as number of observations, are not useful for model selection.

This window is available from the Model Selection Criterion item of the Options menu of the Develop Models window, Automatic Model Fitting window, and Produce Forecasts window.



## Controls and Fields

`Show subset`
: when selected, lists only those model selection criterion statistics that are selected in the Statistics of Fit Selection window.

`Show all`
: when selected, lists all available model selection criterion statistics.

`OK`
: closes the window and sets the model selection criterion to the statistic you specified.

`Cancel`
: closes the window without changing the model selection criterion.

# Model Selection List Editor Window

Use the Model Selection List Editor window to edit the model selection list, including adding your own custom models, and to specify which models in the list are to be used in the automatic fitting process. Access it from the Options menu in the Develop Models, Automatic Model Fitting window, Produce Forecasts, and Manage Projects windows.

The window initially displays the current model list for your project. You can modify this set of models in several ways:

- Open one or more alternate model lists to replace or append to the current model list. These can be either model lists included with the software or model lists previously saved by you or other users.
- Turn the autofit option on or off for individual models. Those that are not flagged for autofit will be available by using the Models to Fit window but not by using automatic model fitting.
- Delete models from the list that are not needed for your project.
- Reorder the models in the list.
- Edit models in the list.
- Create a new empty list.
- Add new models to the list.

Having modified the current model list, you can save it for future use in several ways:

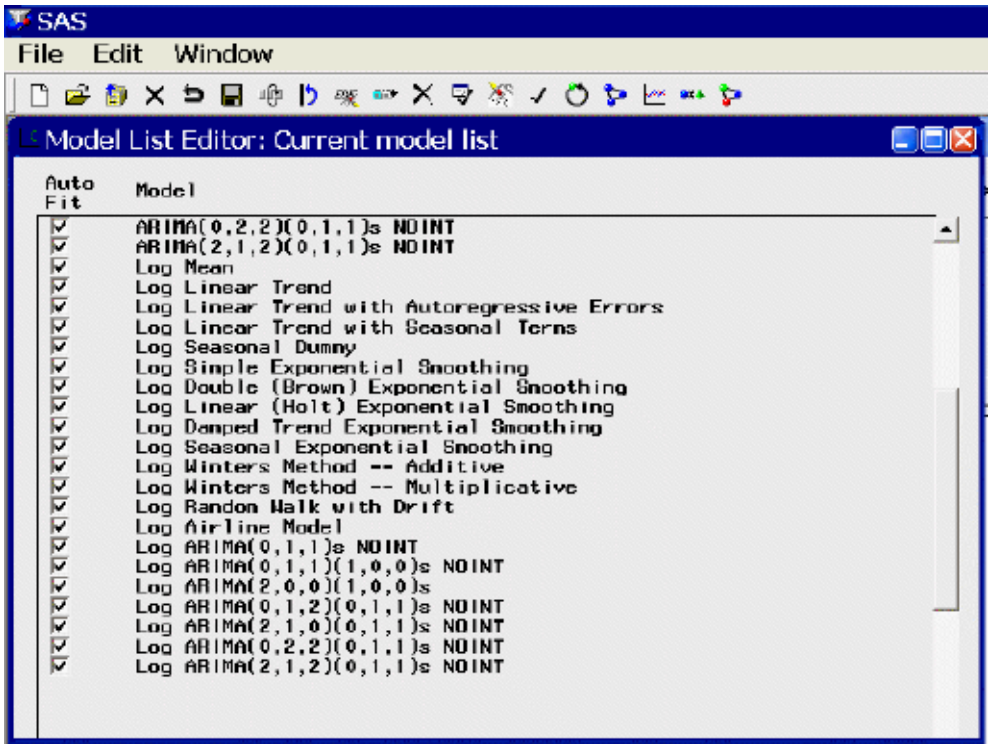
- Save it in a catalog so it can be opened later in the Model Selection List Editor.
- Save it as the user default to be used automatically when new projects are created.
- Select *close* to close the Model Selection List Editor and attach the modified model selection list to the current project.
- Select *cancel* to close the Model Selection List Editor without changing the current project's model selection list.

Since model selection lists are not bound to specific data sources, care must be taken when including data-specific features such as interventions and regressors. When you add an ARIMA, Factored ARIMA, or Custom model to the list, you can add regressors by selecting from the variables in the current data set. If there is no current data set, you will be prompted to specify a data set so you can select regressors from the series it contains.

If you use a model list that has models with a particular regressor name on a data set that does not contain a series of that name, model fitting will fail. However, you can make global changes to the regressor names in the model list by using *Set regressor names*. For example, you might use the list of dynamic regression models found in the sashelp.forcast catalog. It uses the regressor name "price." If your regressor series is

named “x,” you can specify “price” as the current regressor name and “x” as the “change to” name. The change will be applied to all models in the list that contain the specified regressor name.

Interventions cannot be defined for models defined from the Model Selection List Editor. However, you can define interventions by using the Intervention Specification Window and apply them to your models by turning on the Include Interventions option.



## Auto Fit

The auto fit column of check boxes enables you to eliminate some of the models from being used in the automatic fitting process without having to delete them from the list. By default, all models are checked, meaning that they are all used for automatic fitting.

## Model

This column displays the descriptions of all models in the model selection list. You can select one or more models by clicking them. Selected models are highlighted and become the object of the actions Edit, Move, and Delete.

## Menu Bar

`File`

`New`
creates a new empty model selection list.

`Open`
: opens a dialog box for selecting one or more existing model selection lists to open. If you select multiple lists, they are all opened at once as a concatenated list. This helps you build large specialized model lists quickly by mixing and matching various existing lists such as the various ARIMA model lists included in SASHELP.FORCAST. By default, the lists you open replace the current model list. Select the "append" radio button if you want to append them to the current model list.

`Open System Default`
: opens the default model list supplied with the product.

`Cancel`
: exits the window without applying any changes to the current project's model selection list.

`Close`
: closes the window and applies any changes made to the project's model selection list.

`Save`
: opens a dialog box for saving the edited model selection list in a catalog of your choice.

`Save as User Default`
: saves your edited model list as a default list for new projects. The location of this saved list is shown on the message line. When you create new projects, the system searches for this model list and uses it if it is found. If it is not found, the system uses the original default model list supplied with the product.

`Edit`

`Reset`
: restores the list to its initial state when the window was invoked.

`Add Model`
: enables you to add new models to the selection list. You can use the Smoothing Model Specification window, the ARIMA Model Specification window, the Factored ARIMA Model Specification window, or the Custom Model Specification window.

`Edit Selected`
: opens the appropriate model specification window for changing the attributes of the highlighted model and adding the modified model to the selection list. The original model is not deleted.

`Move Selected`
: enables you to reorder the models in the list. Select one or more models, then select Move Selected from the menu or toolbar. A note appears on the message line: "Select the row after which the selected models are to be moved." Then select any unhighlighted row in the table. The selected models will be moved after this row.

`Delete`
: deletes any highlighted models from the list. This item is not available if no models are selected.

`Set Regressor Names`
: opens a dialog box for changing all occurrences of a given regressor name in the models of the current model selection list to a name that you specify.

`Select All`
: selects all models in the list.

`Clear Selections`
: deselects all models in the list.

`Select All for Autofit`
: checks the autofit check boxes of all models in the list.

`Clear Autofit Selections`
: deselects the autofit check boxes of all models in the list.

### Mouse Button Actions

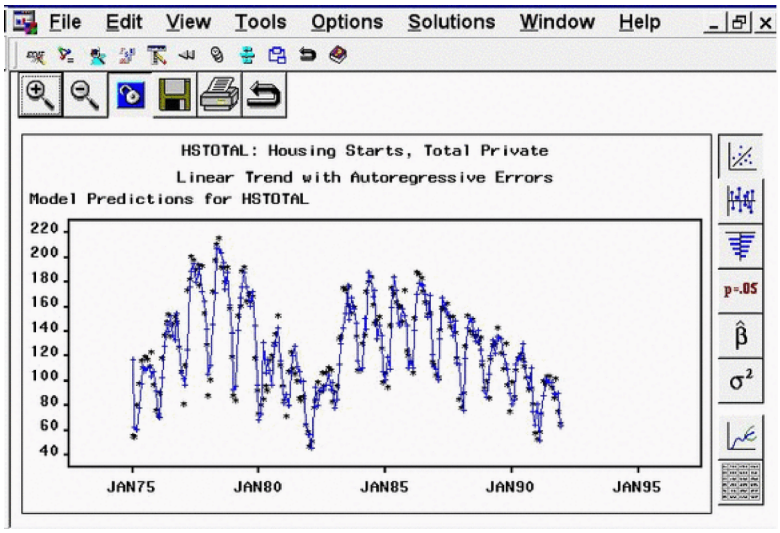
Clicking any model description in the table selects (highlights) that model. Clicking the same model again deselects it. Multiple selections are allowed.

Clicking the auto fit check box in any row toggles the associated model's eligibility for use in automatic model fitting.

Right-clicking the right mouse button opens a pop-up menu.

## Model Viewer Window

This resizable window provides plots and tables of actual values, model predictions, forecasts, and related statistics. The various plots and tables available are referred to as *views*. The section "View Selection Icons" on page 4129 explains how to change the view.



You can access Model Viewer in a number of ways, including the View Model Graphically icon of the Develop Models and Model List windows, the Graph button of the Automatic Model Fitting Results window, and the Model item under the View menu in the Manage Forecasting Project window. In addition, you can go directly to a selected view in the Model Viewer window by selecting Model Predictions, Prediction Errors, Statistics of Fit, Prediction Error Autocorrelations, Prediction Error Tests, Parameter Estimates, Forecast Graph, or Forecast Table from the View menu or corresponding toolbar icon or pop-up menu item in the Develop Models, Model List, or Automatic Model Fitting Results windows.

The state of the Model Viewer window is controlled by the current model and the currently selected view. You can resize this window, and you can use other windows without closing the Model Viewer window. By default, the Model Viewer window is automatically updated to display the new model when you switch to working with another model (that is, when you highlight a different model). You can unlink the Model Viewer window from the current model selection by selecting the Link/Unlink icon from the window's horizontal toolbar. See "Link/Unlink" in the section "Toolbar Icons" on page 4129.

For more information, see the section "Model Viewer" on page 3978.

## Toolbar Icons

The Model Viewer window contains a horizontal row of icons called the Toolbar. Corresponding menu items appear under various menus. The function of each icon is explained in the following list.

`Zoom in`
: In the Model Predictions, Prediction Errors, and Forecast Graph views, the Zoom In action changes the mouse pointer into cross hairs that you can use with the left mouse button to define a region of the graph to zoom in on. In the Prediction Error Autocorrelations and Prediction Error Tests views, Zoom In reduces the number of lags displayed.

`Zoom out`
: reverses the previous Zoom In action.

`Link/Unlink viewer`
: disconnects or connects the Model Viewer window to the model table (Develop Models window, Model List window, or Automatic Model Fitting Results window). When the viewer is linked, selecting another model in the model table causes the model viewer to be updated to show the selected model. When the Viewer is unlinked, selecting another model does not affect the viewer. This feature is useful for comparing two or more models graphically. You can display a model of interest in the Model Viewer, unlink it, then select another model and open another Model Viewer window for that model. Position the viewer windows side by side for convenient comparisons of models, or use the Next Viewer icon or F12 function key to switch between them.

`Save`
: saves the contents of the Model Viewer window. By default, an HTML page is created. This enables you to display graphs and tables by using the Results Viewer or publish them on the web or your intranet. See also "Save Graph As" and "Save Data As" under "Menu Bar" below.

`Print`
: prints the contents of the viewer window.

`Close`
: closes the Model Viewer window and returns to the window from which it was invoked.

## View Selection Icons

At the right hand side of the Model Viewer window is a vertical toolbar to select the view—that is, the kind of plot or table that the viewer displays. Corresponding menu items appear under View on the menu bar. The function of each icon is explained in the following list.

`Model Predictions`
: displays a plot of actual series values and model predictions over time. Click individual points in the graph to get a display of the type (actual or predicted), ID value, and data value in the upper right corner of the window.

`Prediction Errors`
: displays a plot of model prediction errors (residuals) over time. Click individual points in the graph to get a display of the prediction error value in the upper right corner of the window.

`Prediction Error Autocorrelations`
: displays horizontal bar charts of the sample autocorrelation, partial autocorrelation, and inverse autocorrelation functions for the model prediction errors. Overlaid line plots represent confidence limits computed at plus and minus two standard errors. Click any of the bars to display its value.

`Prediction Error Tests`
: displays horizontal bar charts that represent results of white noise and stationarity tests on the model prediction errors. The first bar chart shows the significance probability of the Ljung-Box chi-square statistic computed on autocorrelations up to the given lag. Longer bars favor rejection of the null hypothesis that the series is white noise. Click any of the bars to display an interpretation.

  The second bar chart shows tests of stationarity of the model prediction errors, where longer bars favor the conclusion that the series is stationary. Each bar displays the significance probability of the augmented Dickey-Fuller unit root test to the given autoregressive lag. Long bars represent higher levels of significance against the null hypothesis that the series contains a unit root. For seasonal data, a third bar chart appears for seasonal root tests. Click on any of the bars to display an interpretation.

`Parameter Estimates`
: displays a table showing model parameter estimates along with standard errors and *t* tests for the null hypothesis that the parameter is zero.

`Statistics of Fit`
: displays a table of statistics of fit for the selected model. The set of statistics shown can be changed by using the Statistics of Fit item under Options on the menu bar.

`Forecast Graph`
: displays a plot of actual and predicted values for the series data range, followed by a horizontal reference line and forecasted values with confidence limits. Click individual points in the graph to get a display of the type, date/time, and value of the data point in the upper right corner of the window.

`Forecast Table`
: displays a data table with columns containing the date/time, actual, predicted, error (residual), lower confidence limit, and upper confidence limit values, together with any predictor series.

## Menu Bar

`File`

`Save Graph`
: saves the plot displayed in viewer window as a SAS/GRAPH grseg catalog entry. When the current view is a table, this menu item is not available. See also "Save" in the section "Toolbar Icons" on page 4129. If a graphics catalog entry name has not already been specified, this action functions like "Save Graph As."

`Save Graph As`
saves the current graph as a SAS/GRAPH grseg catalog entry in a SAS catalog that you specify and/or as an Output Delivery System (ODS) object. By default, an HTML page is created, with the graph embedded as a gif image.

`Save Data`
saves the data displayed in the viewer window in a SAS data set, where applicable.

`Save Data As`
saves the data in a SAS data set that you specify and/or as an Output Delivery System (ODS) object. By default, an HTML page is created, with the data displayed as a table.

`Import Data`
is available if you license SAS/ACCESS software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or data base to a SAS data set for use in the Time Series Forecasting System.

`Export Data`
is available if you license SAS/ACCESS software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or database.

`Print Graph`
prints the contents of the viewer window if the current view is a graph. This has the same function as the Print toolbar icon. If the current view is a table, this menu item is not available.

`Print Data`
prints the data displayed in the viewer window, where applicable.

`Print Setup`
opens the Print Setup window, which allows you to access your operating system print setup.

`Print Preview`
opens a preview window to show how your plots will appear when printed.

`Close`
closes the Model Viewer window and returns to the window from which it was invoked.

`Edit`

`Edit Model`
enables you to modify the specification of the current model and to fit the modified model, which is then displayed in the viewer.

`Refit Model`
refits the current model by using data within the current fit range. This action also causes the ranges to be reset if the data range has changed.

`Reevaluate Model`
reevaluates the current model by using data within the current evaluation range. This action also causes the ranges to be reset if the data range has changed.

`View`
See "View Selection Icons" on page 4129. It describes each of the items available under "View," except "Zoom Way Out."

Zoom Way Out
: zooms the plot out as far as it will go, undoing all prior zoom in operations.

Tools

Link Viewer
: See “Link/Unlink” in the section “Toolbar Icons” on page 4129.

Options

Time Ranges
: opens the Time Ranges Specification window to enable you to change the period of fit, period of evaluation, or forecast horizon to be applied to subsequently fit models.

Statistics of Fit
: opens the Statistics of Fit Selection window, which presents a list of statistics that the system can display. Use this action to customize the list of statistics shown in the statistics of fit table and available for selection in the Model Selection Criterion menu.

Forecast Options
: opens the Forecast Options window, which enables you to control the widths of forecast confidence limits and control the kind of predicted values computed for models that include series transformations.

Residual Plot Options
: provides a choice of four methods of computing prediction errors for models which include a data transformation.

  Prediction Errors
  : computes the difference between the transformed series actual values and model predictions.

  Normalized Prediction Errors
  : computes prediction errors in normalized form.

  Model Residuals
  : computes the difference between the untransformed series values and the untransformed model predictions.

  Normalized Model Residuals
  : computes model residuals in normalized form.

Number of Lags
: opens a window to enable you to specify the number of lags shown in the Prediction Error Autocorrelations and Prediction Error Tests views. You can also use the Zoom In and Zoom Out actions to control the number of lags displayed.

Correlation Probabilities
: controls whether the bar charts in the Prediction Error Autocorrelations view represent significance probabilities or values of the correlation coefficient. A check mark or filled check box next to this item indicates that significance probabilities are displayed. In each case the bar graph horizontal axis label changes accordingly.

`Include Interventions`
: controls whether intervention effects defined for the current series are automatically added as predictors to the models considered by the automatic selection process. A check mark or filled check box next to this item indicates that the option is turned on.

`Print Audit Trail`
: prints to the SAS log information about the models fit by the system. A check mark or filled check box next to this item indicates that the audit option is turned on.

`Show Source Statements`
: controls whether SAS statements submitted by the forecasting system are printed in the SAS log. When the Show Source Statements option is selected, the system sets the SAS system option SOURCE before submitting SAS statements; otherwise, the system uses the NOSOURCE option. Note that only some of the functions performed by the forecasting system are accomplished by submitting SAS statements. A check mark or filled check box next to this item indicates that the option is turned on.

## Mouse Button Actions

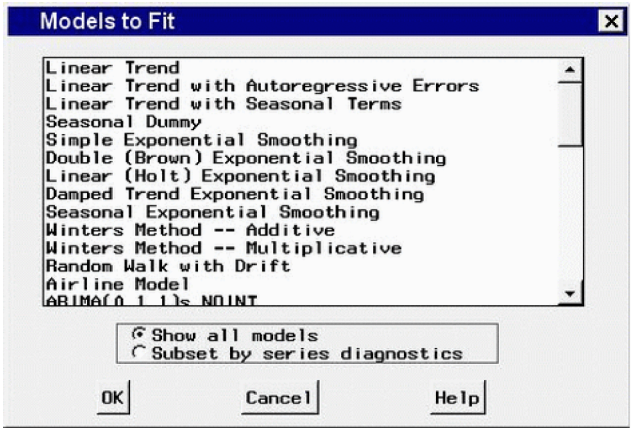
You can examine the data values of individual points in the Model Predictions, Model Prediction Errors, and Forecast Graph views of the Model Viewer by clicking the point. The date/time and data values as well as the type (actual, predicted, and so forth) are displayed in a box that appears in the upper right corner of the Viewer window. Click the mouse elsewhere or select any action to dismiss the data box.

Similarly, you can display values in the Prediction Error Autocorrelations view by clicking any of the bars. Clicking bars in the Prediction Error Tests view displays a Recommendation for Current View window which explains the test represented by the bar.

When you select the Zoom In action in the Predicted Values, Model Prediction Errors, and Forecasted Values views, you can use the mouse to define a region of the graph to zoom. Position the mouse pointer at one corner of the region, press the left mouse button, and move the mouse pointer to the opposite corner of the region while holding the left mouse button down. When you release the mouse button, the plot is redrawn to show an expanded view of the data within the region you selected.

# Models to Fit Window

Use the Models to Fit window to fit models by choosing them from the current model selection list. Access it by using "Fit Models from List" on the Fit Model submenu of the Edit menu in the Develop Models window, or the pop-up menu that appears when you click an empty area of the model table in the Develop Models window. If you want to alter the list of models that appears here, use the Model Selection List editor window.



To select a model to be fit, use the left mouse button. To select more than one model to fit, drag with the mouse, or select the first model, then press the shift key while selecting the last model. For noncontiguous selections, press the control key while selecting with the mouse. To begin fitting the models, double-click the last selection or select the OK button.

If series diagnostics have been performed, the radio box is available. If the Subset by series diagnostics radio button is selected, only those models in the selection list that fit the diagnostic criteria will be shown for selection. If you want to choose models that do not fit the diagnostic criteria, click the Show all models button.

## Controls and Fields

`Show all models`
: when selected, lists all available models, regardless of the setting of the series diagnostics options.

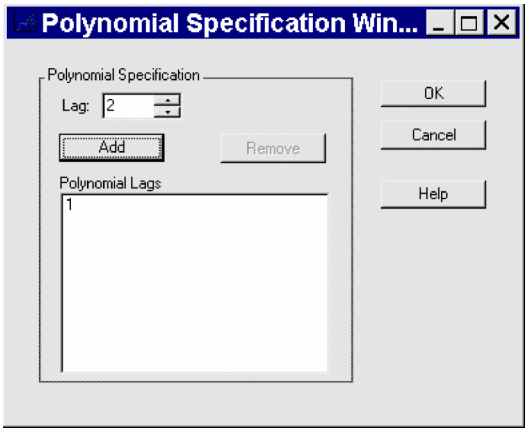
`Subset by series diagnostics`
: when selected, lists only the available models that are consistent with the series diagnostics options.

`OK`
: closes the Models to Fit window and fits the selected models.

`Cancel`
: closes the window without fitting any models. Any selections you made are lost.

# Polynomial Specification Window

Use the Polynomial Specification window to add a polynomial to an ARIMA model. The set of lags defined here become a polynomial factor, denoted by a list of lags in parentheses, when you click "OK." If you accessed this window from the AR Polynomial Specification window, then it is added to the autoregressive part of the model. If you accessed it from the MA Polynomial Specification window, it is added to the moving-average part of the model.



## Controls and Fields

`Lag`
: specifies a lag value to add to the list. Type in a positive integer or select one by clicking the spin box arrows.

`Add`
: adds the value in the Lag spin box to the list of polynomial lags. Duplicate values are not allowed.

`Remove`
: deletes a selected lag from the list of polynomial lags.

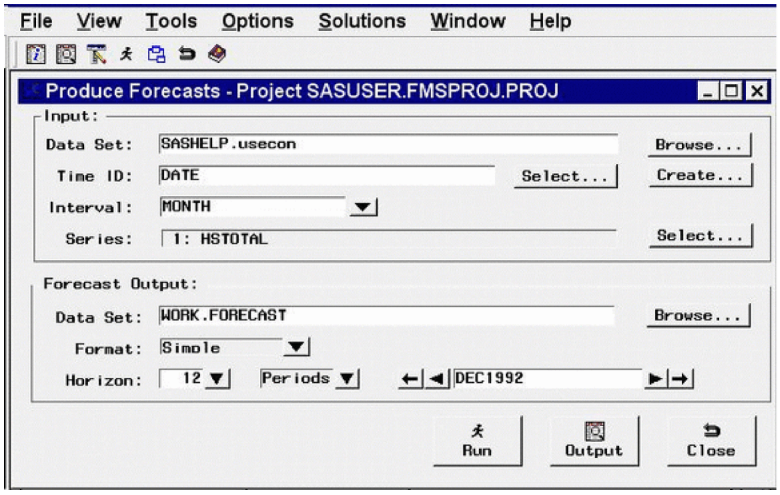
`Polynomial Lags`
: is a list of unique integers that represent lags to be added to the model.

`OK`
: closes the window and returns the specified polynomial to the AR or MA polynomial specification window.

`Cancel`
: closes the window and discards any polynomial lags added to the list.

# Produce Forecasts Window

Use the Produce Forecasts window to produce forecasts for the series in the current input data set for which you have fit forecasting models. Access it by using the Produce Forecasts button of the Time Series Forecasting window.



## Controls and Fields

Input `Data Set`
: is the name of the current input data set. To specify the input data set, you can type a one-level or two-level SAS data set name in this field or click the Browse button to the right of the field.

Input data set `Browse` button
: opens the Data Set Selection window to enable you to select the input data set.

`Time ID`
: is the name of the time ID variable for the input data set. To specify this variable, you can type the ID variable name in this field or use the Select button.

Time ID `Select` button
: opens the Time ID Variable Specification window.

`Create` button
: opens a menu of choices of methods for creating a time ID variable for the input data set. Use this feature if the input data set does not already contain a valid time ID variable.

`Interval`
: is the time interval between observations (data frequency) in the current input data set. If the interval is not automatically filled in by the system, you can type in an interval name here, or select one from the pop-up list.

`Series`
: indicates the number and names of time series variables for which forecasts will be produced.

Series `Select` button
: opens the Series to Process window to let you select the series for which you want to produce forecasts.

Forecast Output `Data Set`
: is the name of the output data set that will contain the forecasts. Type the name of the output data set in this field or click the Browse button.

Forecast Output `Browse` button
: opens a dialog box to let you locate an existing data set to which to save the forecasts.

`Format`
: enables you to select one of three formats for the forecast data set:

  `Simple`
  : specifies the simple format for the output data set. The data set contains the time ID variable and the forecast variables and contains one observation per time period. Observations for earlier time periods contain actual values copied from the input data set; later observations contain the forecasts.

  `Interleaved`
  : specifies the interleaved format for the output data set. The data set contains the time ID variable, the variable TYPE, and the forecast variables. There are several observations per time period, with the meaning of each observation identified by the TYPE variable.

  `Concatenated`
  : specifies the concatenated format for the output data set. The data set contains the variable SERIES, the time ID variable, and the variables ACTUAL, PREDICT, ERROR, LOWER, and UPPER. There is one observation per time period per forecast series. The variable SERIES contains the name of the forecast series, and the data set is sorted by SERIES and DATE.

`Horizon`
: is the number of periods or years to forecast beyond the end of the input data range. To specify the forecast horizon, you can type a value in this field or select one from the pop-up list.

`Horizon periods`
: selects the units to apply to the horizon. By default, the horizon value represents number of periods. For example, if the interval is month, the horizon represents the number of months to forecast. Depending on the interval, you can also select weeks or years, so that the horizon is measured in those units.

`Horizon date`
: is the ending date of the forecast horizon. You can type in a date that uses a form recognized by a SAS date informat, or you can increment or decrement the date shown by using the left and right arrows. The outer arrows change the date by a larger amount than the inner arrows. The date field and the horizon field reset each other, so you can use either one to specify the forecasting horizon.

`Run` button
: produces forecasts for the selected series and stores the forecasts in the specified output SAS data set.

`Output` button
: opens a Viewtable window to display the output data set. This button becomes available once the forecasts have been written to the data set.

`Close` button
: closes the Produce Forecasts window and returns to the Time Series Forecasting window.

## Menu Bar

File

Import Data
: is available if you license SAS/ACCESS software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or database to a SAS data set for use in the Time Series Forecasting System.

Export Data
: is available if you license SAS/ACCESS software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or database.

Print Setup
: opens the Print Setup window, which allows you to access your operating system print setup.

Close
: closes the Produce Forecasts window and returns to the Time Series Forecasting window.

View

Input Data Set
: opens a Viewtable window to browse the current input data set.

Output Data Set
: opens a Viewtable window to browse the output data set. This has the same function as the Output button.

Tools

Produce Forecasts
: produces forecasts for the selected series and stores the forecasts in the specified output SAS data set. This has the same function as the Run button.

Options

Default Time Ranges
: opens the Default Time Ranges window to enable you to control how the system sets the time ranges when new series are selected.

Model Selection List
: opens the Model Selection List editor window. Use this to edit the set of forecasting models considered by the automatic model selection process and displayed by the Models to Fit window.

Model Selection Criterion
: opens the Model Selection Criterion window, which presents a list of goodness-of-fit statistics and enables you to select the fit statistic that is displayed in the table and used by the automatic model selection process to determine the best fitting model.

`Statistics of Fit`
: opens the Statistics of Fit Selection window, which presents a list of statistics that the system can display. Use this action to customize the list of statistics shown in the Statistics of Fit table and available for selection in the Model Selection Criterion window.

`Forecast Options`
: opens the Forecast Options window, which enables you to control the widths of forecast confidence limits and control the kind of predicted values computed for models that include series transformations.

`Forecast Data Set`
: enables you to select one of three formats for the forecast data set. See `Format`, which is described previously in this section.

`Alignment of Dates`

`Beginning`
: aligns dates that the system generates to identify forecast observations in output data sets to the beginning of the time intervals.

`Middle`
: aligns dates that the system generates to identify forecast observations in output data sets to the midpoints of the time intervals.

`End`
: aligns dates that the system generates to identify forecast observations in output data sets to the end of the time intervals.

`Automatic Fit`
: opens the Automatic Model Selection Options window, which enables you to control the number of models retained by the automatic model selection process and whether the models considered for automatic selection are subset according to the series diagnostics.

`Set Toolbar Type`

`Image Only`
: displays the toolbar items as icons without text.

`Label Only`
: displays the toolbar items as text without icon images.

`Both`
: displays the toolbar items as both text and icon images.

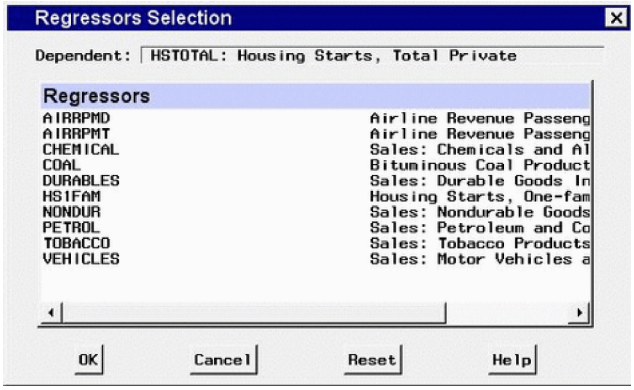
`Include Interventions`
: controls whether intervention effects defined for the current series are automatically added as predictors to the models considered by the automatic selection process. A check mark or filled check box next to this item indicates that the option is turned on.

`Print Audit Trail`
: prints to the SAS log information about the models fit by the system. A check mark or filled check box next to this item indicates that the audit option is turned on.

`Show Source Statements`
: controls whether SAS statements submitted by the forecasting system are printed in the SAS log. When the Show Source Statements option is selected, the system sets the SAS system option SOURCE before submitting SAS statements; otherwise, the system uses the NOSOURCE option. Note that only some of the functions performed by the forecasting system are accomplished by submitting SAS statements. A check mark or filled check box next to this item indicates that the option is turned on.

# Regressors Selection Window

Use the Regressors Selection window to select one or more time series variables in the input data set to include as regressors in the forecasting model to predict the dependent series. Access it from the pop-up menu that appears when you click the Add button in the ARIMA Model Specification window or Custom Model Specification window.



## Controls and Fields

`Dependent`
: is the name and variable label of the current series.

`Regressors`
: is a table listing the names and labels of the variables in the input data set available for selection as regressors. The variables that you select are highlighted. Selecting a highlighted row again deselects that variable.

`OK`
: closes the Regressors Selection window and adds the selected variables as regressors in the model.

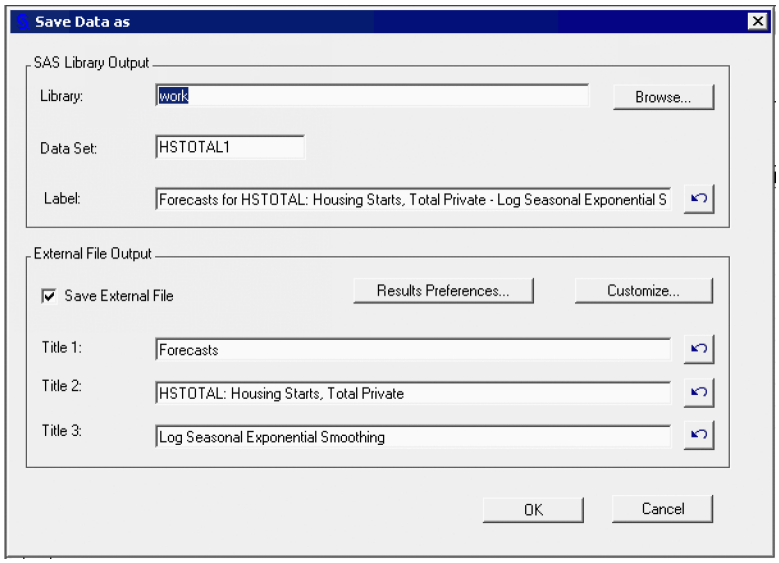
`Cancel`
: closes the window without adding any regressors. Any selections you made are lost.

`Reset`
: resets all options to their initial values upon entry to the window.

# Save Data As

Use Save Data As from the Time Series Viewer Window or the Model Viewer Window to save data displayed in a table to a SAS data set or external file.

Use Save Forecast As from the Develop Models Window to save forecasts and related data including the series name, model, and interval. It supports append mode, enabling you to accumulate the forecasts of multiple series in a single data set.



To save your data in a SAS data set, provide a library name or assign one by using the Browse button, then provide a data set name or accept the default. Enter a descriptive label for the data set in the Label field. Click OK to save the data set. If you specify an existing data set, it will be overwritten, except in the case of Save Forecast As.

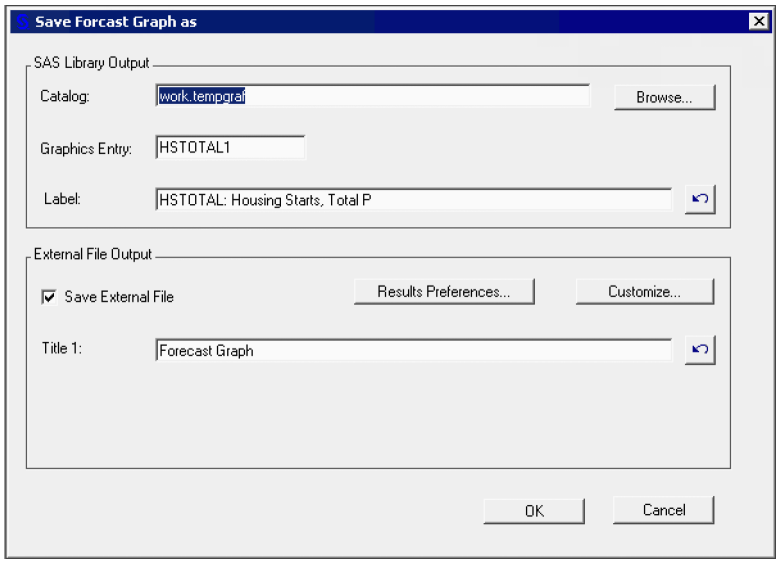
External file output takes advantage of the Output Delivery System (ODS) and is designed primarily for creating HTML tables for web reporting. You can build a set of web pages quickly and use the ODS Results window to view and organize them. To use this feature, check Save External File in the External File Output box. To set ODS options, click Results Preferences, and then select the Results tab in the Preferences dialog box.

If you have previously saved data of the current type, the system remembers your previous labels and titles. To reuse them, click the arrow button to the right of each of these window fields.

Use the Customize button if you need to specify the name of a custom macro that contains ODS statements. The default macro simply runs the PRINT procedure. A custom macro can be used to add PRINT procedure and/or ODS statements to customize the type and organization of output files produced.

# Save Graph As

Use Save Graph As from the Time Series Viewer Window or the Model Viewer Window to save any of the graphs in a catalog or external file.



To save your graph as a grseg catalog entry, enter a two level name for the catalog or select Browse to open an Open dialog box. Use it to select an existing library or assign a new one and then select a catalog to contain the graph. Click the Open button to open the catalog and close the dialog box. Then enter a graphics entry name (eight characters or less) and a label or accept the defaults and click the OK button to save the graph.

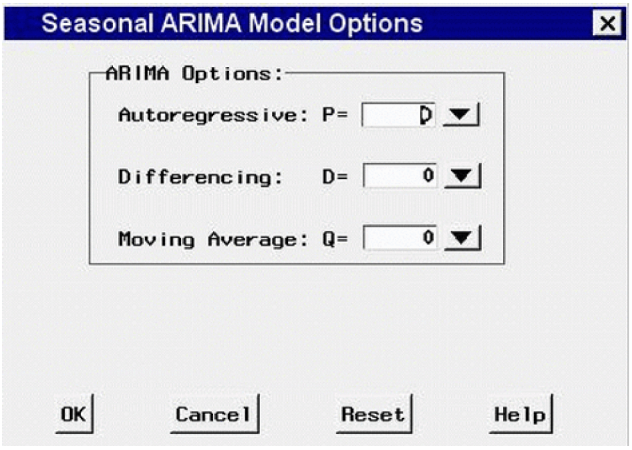
External file output takes advantage of the Output Delivery System (ODS) and is designed primarily for creating gif images and HTML for web reporting. You can build a set of web pages that contain graphs and use the Results window to view and organize them. To use this feature, check Save External File in the External File Output box. To set ODS options, click Results Preferences, and then select the Results tab in the Preferences dialog box.

If you have previously saved graphs of the current type, the system remembers your previous labels and titles. To reuse them, click the arrow button to the right of each of these window fields.

Use the Customize button if you need to specify the name of a custom macro that contains ODS statements. The default macro simply runs the GREPLAY procedure. Users familiar with ODS might want to add statements to the macro to customize the type and organization of output files produced.

# Seasonal ARIMA Model Options Window

Use the Seasonal ARIMA Model Options window to specify the autoregressive, differencing, and moving-average orders for the seasonal part of a model defined by using the Custom Model Specification window. Access it by selecting "Seasonal ARIMA. . . " from the Seasonal Model combo box of that window.



## Controls and Fields

`ARIMA Options`

Use these combo boxes to specify the orders of the ARIMA model. You can either type in a value or click the combo box arrow to select from a pop-up list.

`Autoregressive`

defines the order of the seasonal autoregressive part of the model.

`Differencing`

defines the order of seasonal differencing.

`Moving Average`

defines the order of the seasonal moving-average term.

`OK`

closes the Seasonal ARIMA Model Options window and returns to the Custom Model Specification window.

`Cancel`

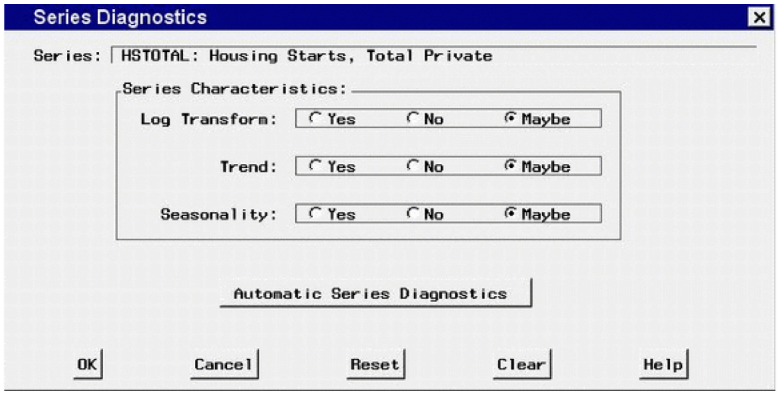
closes the Seasonal ARIMA Model Options window and returns to the Custom Model Specification window, discarding any changes made.

`Reset`

resets all options to their initial values upon entry to the window.

# Series Diagnostics Window

Use the Series Diagnostics window to set options to limit the kinds of forecasting models considered for the series according to series characteristics. Access it by selecting “Diagnose Series” from the Tools menu in the Develop Models, Manage Project, and Time Series Viewer window menu bars. You can let the system diagnose the series characteristics automatically or you can specify series characteristics according to your judgment by using the radio buttons.



For each of the options Log Transform, Trend, and Seasonality, the value “Yes” means that only models appropriate for series with that characteristic should be considered. The value “No” means that only models appropriate for series without that characteristic should be considered. The value “Maybe” means that models should be considered without regard for that characteristic.

## Controls and Fields

`Series`
: is the name and variable label of the current series.

`Series Characteristics`

`Log Transform`
: specifies whether forecasting models with or without a logarithmic series transformation are appropriate for the series.

`Trend`
: specifies whether forecasting models with or without a trend component are appropriate for the series.

`Seasonality`
: specifies whether forecasting models with or without a seasonal component are appropriate for the series.

`Automatic Series Diagnostics`
: performs the automatic series diagnostic process. The options Log Transform, Trend, and Seasonality are set according to the results of statistical tests.

`OK`
: closes the Series Diagnostics window.

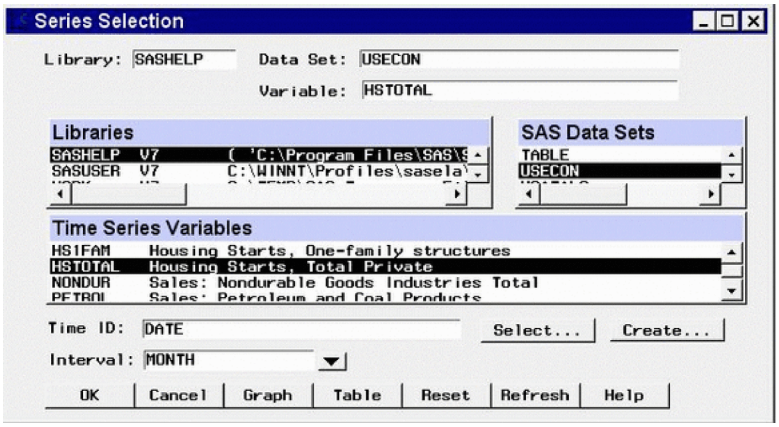
`Cancel`
: closes the Series Diagnostics window without changing the series diagnostics options. Any options you specified are lost.

`Reset`
: resets all options to their initial values upon entry to the Series Diagnostics window.

`Clear`
: resets all options to their default values.

## Series Selection Window

Use this resizable window to select a time series variable by specifying a library, a SAS data set or view, and a variable. These selections can be made by typing, by selecting from lists, or by a combination of the two. In addition, you can control the time ID variable and time interval, and you can browse the data set or view plots of the series from this window.



This window appears automatically when you click the View Series Graphically or Develop Models button in the Time Series Forecasting window and no series has been selected, and when you open the Time Series Viewer as a stand-alone tool. It is also invoked by using the Browse button in the Develop Models window.

The system requires that series names be unique for each frequency (interval) within the forecasting project. If you select a series from the current input data set that already exists in the project with the same interval but a different input data set name, the system warns you and gives you the option to cancel the selection, to refit all models associated with the series by using the data from the current input data set, to delete the models for the series, or to inherit the existing models.

## Controls and Fields

`Library`
is a SAS libname assigned within the current SAS session. If you know the libname associated with the data set of interest, you can type it in this field and press Return. If it is a valid choice, it will appear in the libraries list and will be highlighted. The SAS Data Sets list will be populated with data sets associated with that libname.

`Data Set`
is the name of a SAS data set (data file or data view) that resides under the selected libname. If you know the name, you can type it in and press Return. If it is a valid choice, it will appear in the SAS Data Sets list and will be highlighted, and the Time Series Variables list will be populated with the numeric variables in the data set.

`Variable`
is the name of a numeric variable contained in the selected data set. You can type the variable name in this field or you can select the variable with the mouse from the Time Series Variables list.

`Time ID`
is the name of the ID variable for the input data set. To specify the ID variable, you can type the ID variable name in this field or click the Select button.

`Select` button
opens the Time ID Variable Specification window to let you select an existing variable in the data set as the Time ID.

`Create` button
opens a menu of methods for creating a time ID variable for the input data set. Use this feature if the data set does not already contain a valid time ID variable.

`Interval`
is the time interval between observations (data frequency) in the selected data set. If the interval is not automatically filled in by the system, you can type in an interval name or select one from the pop-up list. For more information about intervals, see Chapter 5, "Date Intervals, Formats, and Functions," in this book.

`OK`
is a button that is present when you have selected "Develop Models" from the Time Series Forecasting window. It closes the Series Selection window and makes the selected series the current series.

`Close`
If you have selected the View Series Graphically icon from the Time Series Forecasting window, this button returns you to that window. If you have selected a series, it remains selected as the current series.

If you are using the Time Series Viewer as a stand-alone application, this button closes the application.

`Cancel`
is a button that is present when you have selected "Develop Models" from the Time Series Forecasting window. It closes the Series Selection window without applying any selections made.

`Reset`
resets the fields to their initial values at entry to the window.

`Table`
opens a Viewtable window for browsing the selected data set. This can assist you in locating the variable containing data you are looking for.

`Graph`
: opens the Time Series Viewer window to display the selected time series variable. You can switch to a different series in the Series Selection window without closing the Time Series Viewer window. Position the windows so they are both visible, or use the Next Viewer toolbar icon or F12 function key to switch between windows.

`Refresh`
: updates all fields and lists in the window. If you assign a new libname without exiting the Series Selection window, use the refresh action to update the Libraries list so that it will include the newly assigned libname. Also use the Refresh action to update the variables list if the input data set is changed.

### Selection Lists

`Libraries`
: displays a list of currently assigned libnames. You can select a libname by clicking it, which is equivalent to typing its name in the Library field. If you cannot locate the library or directory you are interested in, go to the SAS Explorer window, select "New" from the File menu, then select "Library" and "OK." This opens the New Library dialog box. You also assign a libname by submitting a libname statement from the Editor window. Click the Refresh button to make the new libname available in the libraries list.

`SAS Data Sets`
: displays a list of the SAS data sets (data files or data views) located under the selected libname. You can select one of these by clicking it, which is equivalent to typing its name in the Data Set field.

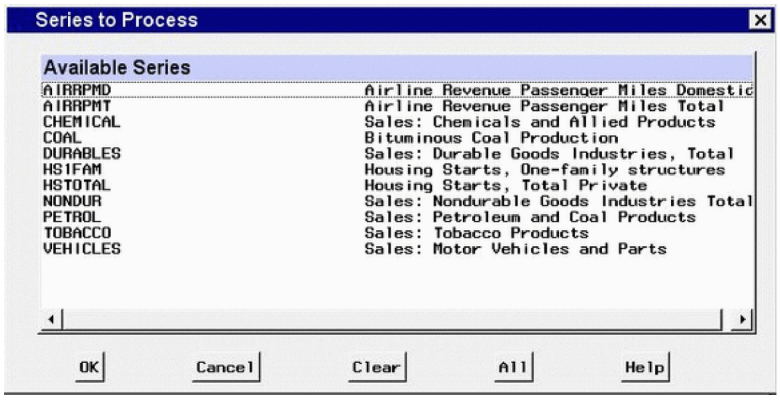
`Time Series Variables`
: displays a list of numeric variables contained within the selected data set. You can select one of these by clicking it, which is equivalent to typing its name in the Variable field. You can double-click a series to select it and exit the window.

## Series to Process Window

Use the Series to Process window to select series for model fitting or forecasting. Access it by using the Select button in the Automatic Model Fitting and Produce Forecasts windows. Hold down the shift key or drag with the left mouse button for multiple selections. Use the control key for noncontiguous multiple selections. Once you make selections and click OK, the number of selected series and their names are listed in the Series to Process field of the calling window (with ellipses if not all the names will fit).

When invoked from Automatic Model Fitting, the Series to Process window shows all the numeric variables in the input data set except the time ID variable. These are the series which are currently available for model fitting.

When invoked from Produce Forecasts, the Series to Process window shows all the series in the input data set for which models have been fit. These are the series which are currently available for forecasting.



### Controls and Fields

`OK`
: closes the window and applies the series selection(s) which have been made. At least one series must be selected.

`Cancel`
: closes the window, ignoring series selections which have been made, if any.

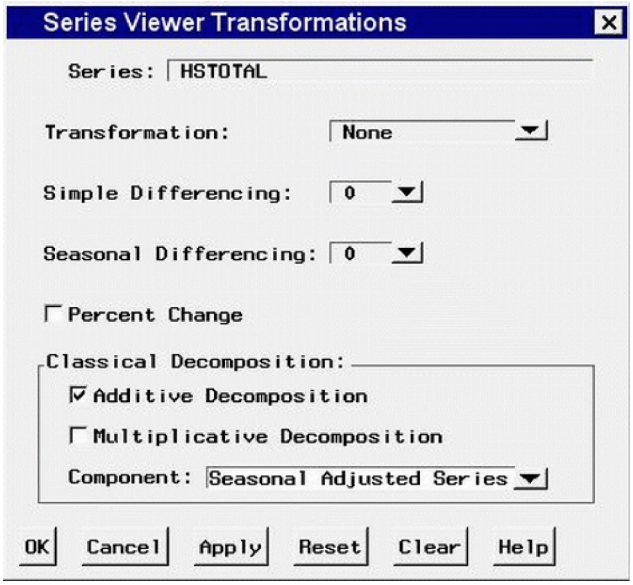
`Clear`
: deselects all series in the selection list.

`All`
: selects all series in the selection list.

## Series Viewer Transformations Window

Use the Series Viewer Transformations window to view plots of transformations of the current series in the Time Series Viewer window. It provides a larger set of transformations than those available from the viewer window's toolbar. It is invoked by using "Other Transformations" under the Tools menu of the Time Series Viewer window. The options that you specify in this window are applied to the series displayed in the Time Series Viewer window when you select "OK" or "Apply."

Use the Apply button if you want to make repeated transformations to a series without having to close and reopen the Series Viewer Transformations window each time.



## Controls and Fields

`Series`
is the variable name for the current time series.

`Transformation`
is the transformation applied to the time series displayed in the Time Series Viewer window. Select Log, Logistic, Square Root, Box-Cox, or none from the pop-up list.

`Simple Differencing`
is the order of differencing applied to the time series displayed in the Time Series Viewer window. Select a number from 0 to 5 from the pop-up list.

`Seasonal Differencing`
is the order of seasonal differencing applied to the time series displayed in the Time Series Viewer window. Select a number from 0 to 3 from the pop-up list.

`Percent Change`
is a check box that if selected displays the series in terms of percent change from the previous period.

`Additive Decomposition`
is a check box that produces a display of a selected series component derived by using additive decomposition.

`Multiplicative Decomposition`
is a check box that produces a display of a selected series component derived using multiplicative decomposition.

`Component`
selects a series component to display when either additive or multiplicative decomposition is turned on. You can display the seasonally adjusted component, the trend-cycle component, the seasonal component, or the irregular component—that is, the residual that remains after removal of the other components. The heading in the viewer window shows which component is currently displayed.

`OK`
: applies the transformation options you selected to the series displayed in the Time Series Viewer window and closes the Series Viewer Transformations window.

`Cancel`
: closes the Series Viewer Transformations window without changing the series displayed by the Time Series Viewer window.

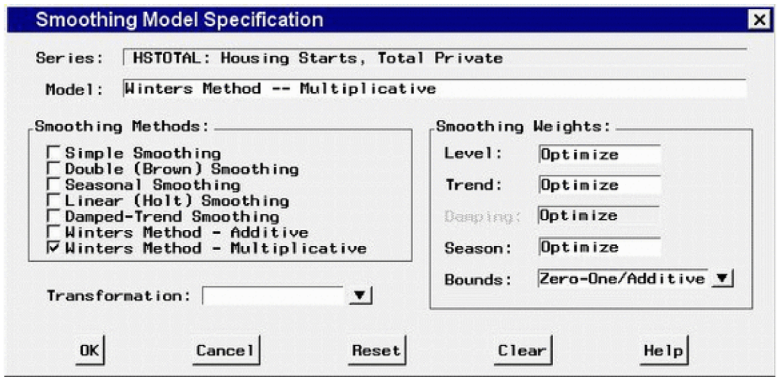
`Apply`
: applies the transformation options you selected to the series displayed in the Time Series Viewer window without closing the Series Viewer Transformations window.

`Reset`
: resets the transformation options to their initial values upon entry to the Series Viewer Transformations window.

`Clear`
: resets the transformation options to their default values (no transformations).

# Smoothing Model Specification Window

Use the Smoothing Model Specification window to specify and fit exponential smoothing and Winters method models. Access it from the Develop Models window by using the Fit Model submenu of the Edit menu or from the pop-up menu when you click an empty area of the model table.



## Controls and Fields

`Series`
: is the name and variable label of the current series.

`Model`
: is a descriptive label for the model that you specify. You can type a label in this field or allow the system to provide a label. If you leave the label blank, a label is generated automatically based on the options you specify.

`Smoothing Methods`

`Simple Smoothing`
specifies simple (single) exponential smoothing.

`Double (Brown) Smoothing`
specifies double exponential smoothing by using Brown's one parameter model (single exponential smoothing applied twice).

`Seasonal Smoothing`
specifies seasonal exponential smoothing. (This is like Winters method with the trend term omitted.)

`Linear (Holt) Smoothing`
specifies exponential smoothing of both the series level and trend (Holt's two parameter model).

`Damped-Trend Smoothing`
specifies exponential smoothing of both the series level and trend with a trend damping weight.

`Winters Method - Additive`
specifies Winters method with additive seasonal factors.

`Winters Method - Multiplicative`
specifies Winters method with multiplicative seasonal factors.

`Smoothing Weights`
displays the values used for the smoothing weights. By default, the Smoothing Weights fields are set to "optimize," which means that the system will compute the weight values that best fit the data. You can also type smoothing weight values in these fields.

`Level`
is the smoothing weight used for the level of the series.

`Trend`
is the smoothing weight used for the trend of the series.

`Damping`
is the smoothing weight used by the damped-trend method to damp the forecasted trend towards zero as the forecast horizon increases.

`Season`
is the smoothing weight used for the seasonal factors in Winters method and seasonal exponential smoothing.

`Transformation`
displays the series transformation specified for the model. When a transformation is specified, the model is fit to the transformed series, and forecasts are produced by applying the inverse transformation to the model predictions. Select `Log`, `Logistic`, `Square Root`, `Box-Cox`, or `None` from the pop-up list.

`Bounds`
displays the constraints imposed on the fitted smoothing weights. Select one of the following from the pop-up list:

`Zero-One/Additive`
sets the smoothing weight optimization region to the intersection of the region bounded by the intervals from zero (0.001) to one (0.999) and the additive invertible region. This is the default.

`Zero-One Boundaries`
: sets the smoothing weight optimization region to the region bounded by the intervals from zero (0.001) to one (0.999).

`Additive Invertible`
: sets the smoothing weight optimization region to the additive invertible region.

`Unrestricted`
: sets the smoothing weight optimization region to be unbounded.

`Custom`
: opens the `Smoothing Weights` window to enable you to customize the constraints for smoothing weights optimization.

`OK`
: closes the Smoothing Model Specification window and fits the model you specified.

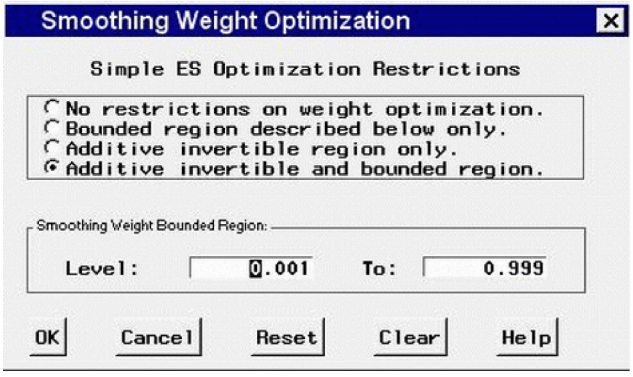
`Cancel`
: closes the Smoothing Model Specification window without fitting the model. Any options you specified are lost.

`Reset`
: resets all options to their initial values upon entry to the window. This might be useful when editing an existing model specification; otherwise, Reset has the same function as Clear.

`Clear`
: resets all options to their default values.

## Smoothing Weight Optimization Window

Use the Smoothing Weight Optimization window to specify constraints for the automatic fitting of smoothing weights for exponential smoothing and Winters method models. Access it from the Smoothing Models Specification window when you select “Custom” in the “Bounds” combo box.



### Controls and Fields

`No restrictions`
: when selected, specifies unrestricted smoothing weights.

`Bounded region`
: when selected, restricts the fitted smoothing weights to be within the bounds that you specify with the "Smoothing Weight Bounded Region" options.

`Additive invertible region`
: when selected, restricts the fitted smoothing weights to be within the additive invertible region of the parameter space of the ARIMA model equivalent to the smoothing model. (For more information, see the section "Smoothing Models" on page 4178.)

`Additive invertible and bounded region`
: when selected, restricts the fitted smoothing weights to be both within the additive invertible region and within bounds that you specify.

`Smoothing Weight Bounded Region`
: is a group of numeric entry fields that enable you to specify lower and upper limits on the fitted value of each smoothing weight. The fields that appear in this part of the window depend on the kind of smoothing model that you specified.

`OK`
: closes the window and sets the options that you specified.

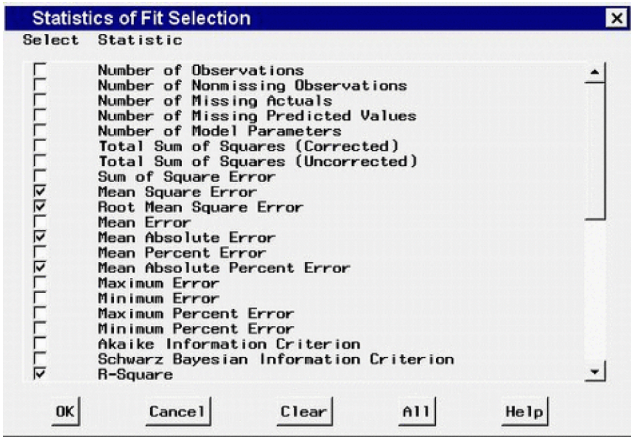
`Cancel`
: closes the window without changing any options. Any values you specified are lost.

`Reset`
: resets all options to their initial values upon entry to the window.

`Clear`
: resets all options to their default values.

## Statistics of Fit Selection Window

Use the Statistics of Fit Selection window to specify which of the available goodness-of-fit statistics are reported for models you fit and are available for selection as the model selection criterion used by the automatic selection process. This window is available under the Options menu in the Develop Models, Automatic Model Fitting, Produce Forecasts, and Model List windows, and from the Statistics button in the Model Fit Comparison window and Automatic Model Fitting results windows.



### Controls and Fields

`Select Statistics Table`
: list the available statistics. Select a row of the table to select or deselect the statistic shown in that row.

`OK`
: closes the window and applies the selections made.

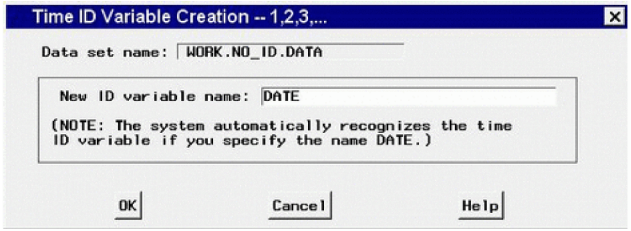
`Cancel`
: closes the window without applying any selections.

`Clear`
: deselects all statistics.

`All`
: selects all statistics.

## Time ID Creation – 1,2,3 Window

Use the Time ID Creation – 1,2,3 window to add a time ID variable to an input data set with observation numbers as the ID values. The interval for the series will be 1. Use this approach if the data frequency does not match any of the system's date or date-time intervals, or if other methods of assigning a time ID do not work. To access this window, select "Create from observation numbers" from the Create pop-up list in any window where you can select a Time ID variable. For more information, see Chapter 5, "Date Intervals, Formats, and Functions," in this book.



### Controls and Fields

`Data set name`
: is the name of the input data set.

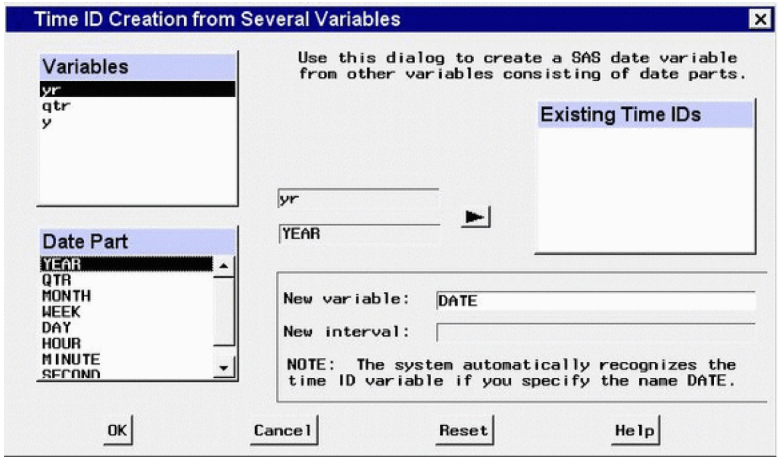
`New ID variable name`
: is the name of the time ID variable to be created. You can type any valid SAS variable name in this field.

`OK`
: closes the window and proceeds to the next step in the time ID creation process.

`Cancel`
: closes the window without creating a Time ID variable. Any options you specified are lost.

## Time ID Creation from Several Variables Window

Use the Time ID Creation from Several Variables window to add a SAS date valued time ID variable to an input data set when the input data set already contains several dating variables, such as day, month, and year. To access this window, select "Create from existing variables" from the Create pop-up list in any window where you can select a Time ID variable. For more information, see Chapter 60, "Creating Time ID Variables."



### Controls and Fields

`Variables`
: is a list of variables in the input data set. Select existing ID variables from this list.

`Date Part`
: is a list of date parts that you can specify for the selected ID variable. For each ID variable that you select from the Variables list, select the Date Part value that describes what the values of the ID variable represent.

`arrow button`

moves the selected existing ID variable and date part specification to the "Existing Time IDs" list. Once you have done this, you can select another ID variable from the Variables list.

`New variable`
is the name of the time ID variable to be created. You can type any valid SAS variable name in this field.

`New interval`
is the time interval between observations in the input data set implied by the date part ID variables you have selected.

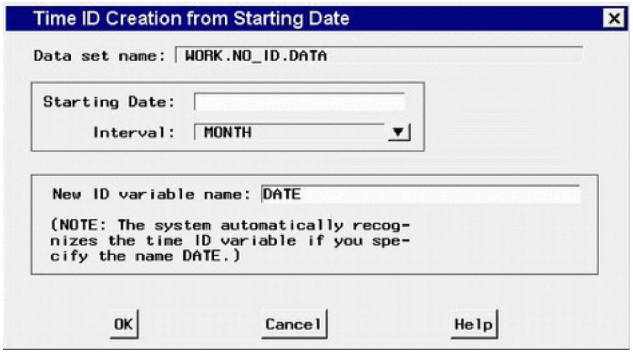
`OK`
closes the window and proceeds to the next step in the time ID creation process.

`Cancel`
closes the window without creating a time ID. Any options you specified are lost.

`Reset`
resets the options to their initial values upon entry to the window.

# Time ID Creation from Starting Date Window

Use the Time ID Creation from Starting Date window to add a SAS date valued time ID variable to an input data set. This is a convenient way to add a time ID of any interval as long as you know the starting date of the series. To access this window, select "Create from starting date and frequency" from the Create pop-up list in any window where you can select a Time ID variable. For more information, see Chapter 60, "Creating Time ID Variables."



## Controls and Fields

`Data set name`
is the name of the input data set.

`Starting Date`
is the starting date for the time series in the data set. Enter a date value in this field, using a form recognizable by a SAS date informat, for example, 1998:1, feb1997, or 03mar1998.

`Interval`
: is the time interval between observations in the data set. Select an interval from the pop-up list.

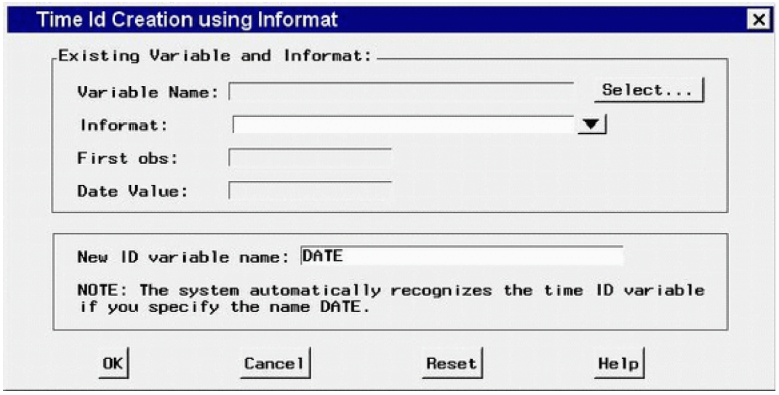
`New ID variable name`
: is the name of the time ID variable to be created. You can type any valid SAS variable name in this field.

`OK`
: closes the window and proceeds to the next step in the time ID creation process.

`Cancel`
: closes the window without changing the input data set. Any options you specified are lost.

# Time ID Creation Using Informat Window

Use the Time ID Creation using Informat window to add a SAS date valued time ID variable to an input data set. Use this window if your data set contains a date variable that is stored as a character string. Using the appropriate SAS date informat, the date string is read in and used to create a date or date-time variable. To access this window, select "Create from existing variable/informat" from the Create pop-up list in any window where you can select a Time ID variable.



## Controls and Fields

`Variable Name`
: is the name of an existing ID variable in the input data set. Click the Select button to select a variable.

`Select button`
: opens a list of variables in the input data set for you to select from.

`Informat`
: is a SAS date or datetime informat for reading date or datetime value from the values of the specified existing ID variable. You can type in an informat or select one from the pop-up list.

`First Obs`
: is the value of the variable you selected from the first observation in the data set, displayed here for convenience.

`Date Value`
is the SAS date or datetime value read from the first observation value that uses the informat that you specified.

`New ID variable name`
is the name of the time ID variable to be created. You can type any valid SAS variable name in this field.

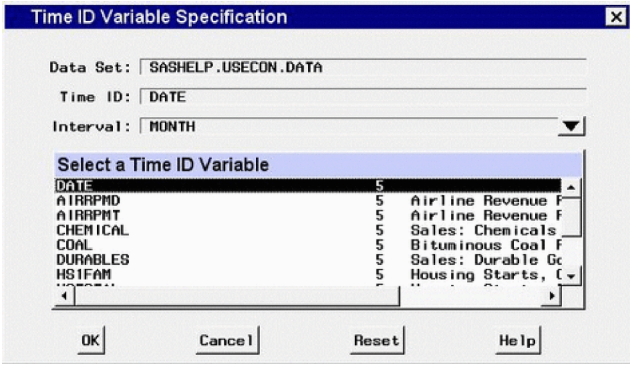
`OK`
closes the window and proceeds to the next step in the time ID creation process.

`Cancel`
closes the window without changing the input data set. Any options you specified are lost.

`Reset`
resets the options to their initial values upon entry to the window.

## Time ID Variable Specification Window

Use the Time ID Variable Specification window to specify a variable in the input data set that contains the SAS date or datetime value of each observation. You do not need to use this window if your time ID variable is named `date`, `time`, or `datetime`, since these are picked up automatically. Invoke the window from the Select button to the right of the Time ID field in the Data Set Selection, Automatic Model Fitting, Produce Forecasts, Series Selection, and Time Series Forecasting windows.



### Controls and Fields

`Data Set`
is the name of the current input data set.

`Time ID`
is the name of the currently selected Time ID variable, if any.

`Interval`
is the time interval between observations (data frequency) in the input data set.

`Select a Time ID Variable`
is a selection list of variables in the input set. Select one variable to assign it as the Time ID variable.

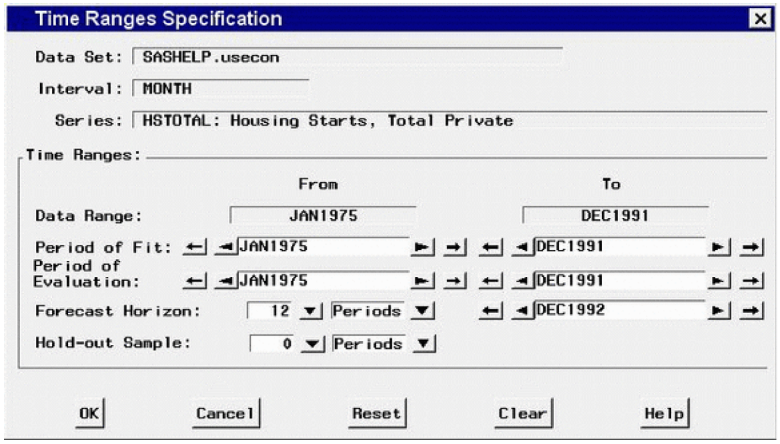
`OK`
: closes the window and retains the selection made, if it is a valid time ID.

`Cancel`
: closes the window and ignores any selection made.

`Reset`
: restores the time ID variable to the one assigned when the window was initially opened, if any.

# Time Ranges Specification Window

Use the Time Ranges Specification window to control the period of fit and evaluation and the forecasting horizon. Invoke this window from the Options menu in the Develop Models, Manage Forecasting Project, and Model Viewer windows or the Set Ranges button in the Develop Models window.



## Controls and Fields

`Data Set`
: is the name of the current input data set.

`Interval`
: is the time interval (data frequency) for the input data set.

`Series`
: is the variable name and label of the current time series.

`Data Range`
: gives the date of the first and last nonmissing data values available for the current series in the input data set.

`Period of Fit`
: gives the starting and ending dates of the period of fit. This is the time range used for estimating model parameters. By default, it is the same as the data range. You can type dates in these fields, or you can use the arrow buttons to the left and right of the date fields to decrement or increment the date values shown. Date values must be entered in a form recognized by a SAS date informat. (See

*SAS Programmers Guide: Essentials* for information about SAS date informats.) The inner arrows increment by periods, the outer arrows increment by larger amounts, depending on the data interval.

`Period of Evaluation`
gives the starting and ending dates of the period of evaluation. This is the time range used for evaluating models in terms of statistics of fit. By default, it is the same as the data range. You can type dates in these fields, or you can use the control arrows to the left and right of the date fields to decrement or increment the date values shown. Date values must be entered in a form recognized by a SAS date informat. (See *SAS Programmers Guide: Essentials* for information about SAS date informats.) The inner arrows increment by periods, the outer arrows increment by larger amounts, depending on the data interval.

`Forecast Horizon`
is the forecasting horizon expressed as a number of forecast periods or number of years (or number of weeks for daily data). You can type a number or select one from the pop-up list. The ending date for the forecast period is automatically updated when you change the number of forecasts periods.

`Forecast Horizon - Units`
indicates whether the Forecast Horizon value represents periods or years (or weeks for daily data).

`Forecast Horizon Date Value`
is the date of the last forecast observation. You can type a date in this field, or you can use the arrow buttons to the left and right of the date field to decrement or increment the date values shown. Date values must be entered in a form recognized by a SAS date informat. (For information about SAS date informats, see *SAS Programmers Guide: Essentials*.) The Forecast Horizon is automatically updated when you change the ending date for the forecast period.

`Hold-out Sample`
specifies that a number of observations or years (or weeks) of data at the end of the data range be used for the period of evaluation with the remainder of data used as the period of fit. You can type a number in this field or select one from the pop-up list. When the hold-out sample value is changed, the Period of Fit and Period of Evaluation ranges are changed to reflect the hold-out sample specification.

`Hold-out Sample - Units`
indicates whether the hold-out sample field represents periods or years (or weeks for daily data).

`OK`
closes the window and stores the specified changes.

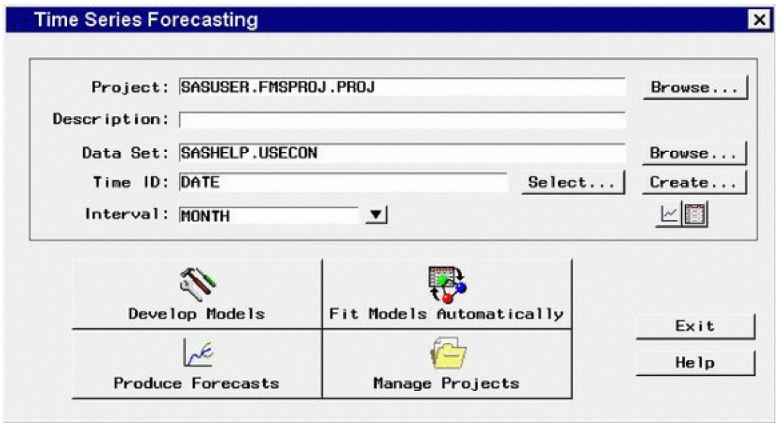
`Cancel`
closes the window without saving changes. Any options you specified are lost.

`Reset`
resets the options to their initial values upon entry to the window.

`Clear`
resets all options to their default values.

# Time Series Forecasting Window

The Time Series Forecasting window is the main application window that appears when you invoke the Time Series Forecasting System. It enables you to specify a project file and an input data set and provides access to the other windows described in this chapter.



## Controls and Fields

`Project`
: is the name of the SAS catalog entry in which forecasting models and other results will be stored and from which previously stored results are loaded into the forecasting system. You can specify the project by typing a SAS catalog entry name in this field or by clicking the Browse button to right of this field. If you specify the name of an existing catalog entry, the information in the project file is loaded. If you specify a one-level name, the catalog name is assumed to be `fmsproj` and the library is assumed to be `sasuser`. For example, `samproj` is equivalent to `sasuser.fmsproj.samproj`.

Project `Browse` button
: opens the Forecasting Project File Selection window to enable you to select and load the project from a list of previously stored projects.

`Description`
: is a descriptive label for the forecasting project. The description you type in this field will be stored with the catalog entry shown in the Project field.

`Data Set`
: is the name of the current input data set. To specify the input data set, you can type the data set name in this field or use the Browse button to the right of the field.

Data set `Browse` button
: opens the Data Set Selection window to enable you to select the input data set.

`Time ID`
: is the name of the ID variable for the input data set. To specify the ID variable, you can type the ID variable name in this field or use the Select button. If the time ID variable is named `date`, `time`, or `datetime`, it is automatically picked up by the system.

`Select` button
: opens the Time ID Variable Specification window.

`Create` button
: opens a menu of choices of methods for creating a time ID variable for the input data set. Use this feature if the input data set does not already contain a valid time ID variable.

`Interval`
: is the time interval between observations (data frequency) in the current input data set. If the interval is not automatically filled in, you can type an interval name or select one from the pop-up list. For more information about intervals, see the section "Time Series Data Sets, ID Variables, and Time Intervals" on page 3955.

`View Series Graphically` icon
: opens the Time Series Viewer window to display plots of series in the current input data set.

`View Data as a Table`
: opens a Viewtable window for browsing the selected input data set.

`Develop Models`
: opens the Develop Models window to enable you to fit forecasting models to individual time series and choose the best models to use to produce the final forecasts of each series.

`Fit Models Automatically`
: opens the Automatic Model Fitting window for applying the automatic model selection process to all series or to selected series in an input data set.

`Produce Forecast`
: opens the Produce Forecasts window for producing forecasts for the series in the current input data set for which you have fit forecasting models.

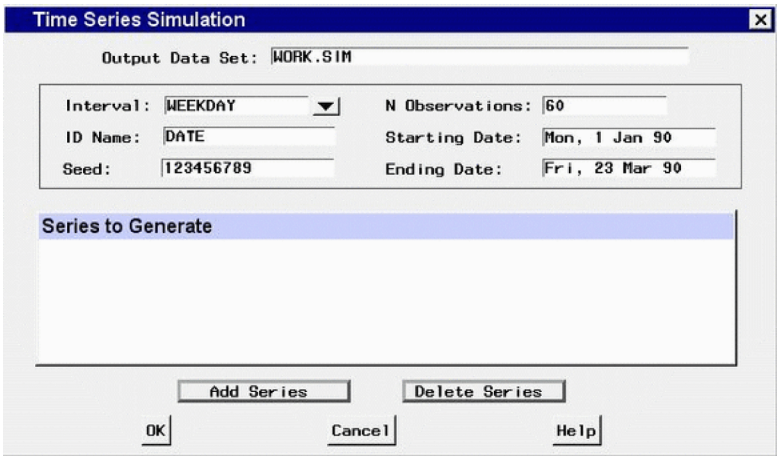
`Manage Projects`
: opens the Manage Forecasting Project window for viewing or editing information stored in projects.

`Exit`
: closes the Time Series Forecasting system.

`Help`
: accesses the help system.

# Time Series Simulation Window

Use the Time Series Simulation window to create a data set of simulated series generated by ARIMA processes. Access this window from the Tools menu in the Develop Models and Manage Forecasting Project windows.



## Controls and Fields

`Output Data Set`
: is the name of the data set to be created. Type in a one-level or two-level SAS data set name.

`Interval`
: is the time interval between observations (data frequency) in the simulated data set. Type in an interval name or select one from the pop-up list.

`Seed`
: is the seed for the random number generator used to produce the simulated time series.

`N Observations`
: is the number of time periods to simulate.

`Starting Date`
: is the starting date for the simulated observations. Type in a date in a form recognizable by a SAS data informat, for example, 1998:1, feb1997, or 03mar1998.

`Ending Date`
: is the ending date for the simulated observations. Type in a date in a form recognizable by a SAS data informat.

`Series to Generate`
: is the list of variable names and ARIMA processes to simulate.

`Add Series`
: opens the ARIMA Process Specification window to enable you to add entries to the Series to Generate list.

`Delete Series`
: deletes selected (highlighted) entries from the Series to Generate list.

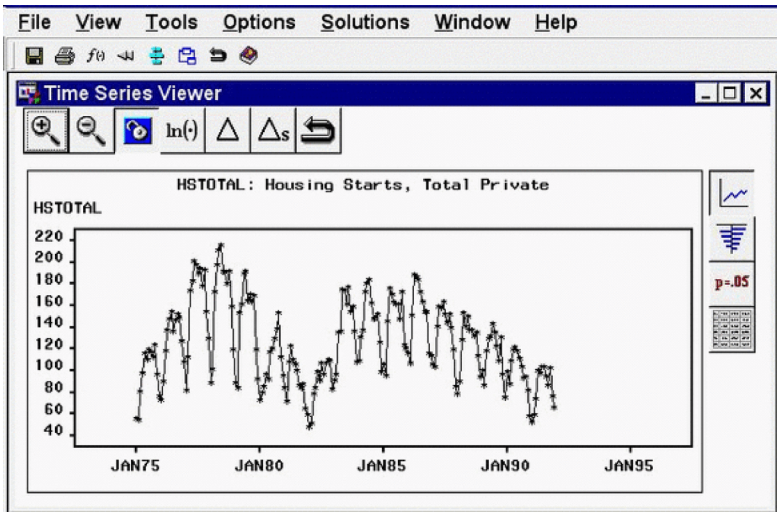
`OK`
: closes the Time Series Simulation window and performs the specified simulations and creates the specified data set.

`Cancel`
: closes the window without creating a simulated data set. Any options you specified are lost.

## Time Series Viewer Window

Use the Time Series Viewer window to explore time series data using plots, transformations, statistical tests, and tables. It is available as a stand-alone application and as part of the Time Series Forecasting System. To use it as a stand-alone application, select it from the Analysis submenu of the Solutions menu, or use the `tsview` command (see Chapter 64, "Command Reference," in this book). To use it within the Time Series Forecasting System, select the View Series Graphically icon in the Time Series Forecasting, Develop Models, or Model List window, or select "Series" from the View menu of the Develop Models, Manage Project, or Model List window.

The various plots and tables available are referred to as *views*. The section "View Selection Icons" on page 4129 explains how to change the view.



The state of the Time Series Viewer window is controlled by the current series, the current series transformation specification, and the currently selected view. You can resize this window, and you can use other windows without closing the Time Series Viewer window. You can explore a number of series conveniently by keeping the Series Selection window open. Each time you make a selection, the viewer window is updated to show the selected series. Keep both windows visible, or switch between them by using the Next Viewer toolbar icon or the F12 function key.

You can open multiple Time Series Viewer windows. This enables you to "freeze"a plot so you can come back to it later, or compare two plots side by side on your screen. To do this, unlink the viewer by using the Link/Unlink icon on the window's toolbar or the corresponding item in the Tools menu. While the viewer window remains unlinked, it is not updated when other selections are made in the Series Selection window.

Instead, when you select a series and click the Graph button, a new Time Series Viewer window is invoked. You can continue this process to open as many viewer windows as you want. The Next Viewer icon and corresponding F12 function key are useful for navigating between windows when they are not simultaneously visible on your screen.

A wide range of series transformations is available. Basic transformations are available from the window's horizontal toolbar, and others are available by selecting "Other Transformations" from the Tools menu.

## Horizontal Tool Bar

The Time Series Viewer window contains a horizontal toolbar with the following icons:

`Zoom in`
: changes the mouse pointer into cross hairs that you can use with the left mouse button to drag out a region of the time series plot to zoom in on. In the Autocorrelations view and the White Noise and Stationarity Tests view, Zoom In reduces the number of lags displayed.

`Zoom out`
: reverses the previous Zoom In action and expands the time range of the plot to show more of the series. In the Autocorrelations view and the White Noise and Stationarity Tests view, Zoom Out increases the number of lags displayed.

`Link/Unlink viewer`
: disconnects or connects the Time Series Viewer window to the window in which the series was selected. When the Viewer is linked, it always shows the current series. If you select another series, linked Viewers are updated. Unlinking a Viewer freezes its current state, and changing the current series has no effect on the Viewer's display. The View Series action creates a new Series Viewer window if there is no linked Viewer. By using the unlink feature, you can open several Time Series Viewer windows and display several different series simultaneously.

`Log Transform`
: applies a log transform to the current view. This can be combined with other transformations; the current transformations are shown in the title.

`Difference`
: applies a simple difference to the current view. This can be combined with other transformations; the current transformations are shown in the title.

`Seasonal Difference`
: applies a seasonal difference to the current view. For example, if the data are monthly, the seasonal cycle is one year. Each value has subtracted from it the value from one year previous. This can be combined with other transformations; the current transformations are shown in the title.

`Close`
: closes the Time Series Viewer window and returns to the window from which it was invoked.

## Vertical Toolbar View Selection Icons

At the right-hand side of the Time Series Viewer window is a vertical toolbar used to select the kind of plot or table that the Viewer displays.

`Series`
: displays a plot of series values over time.

`Autocorrelations`
: displays plots of the sample autocorrelations, partial autocorrelation, and inverse autocorrelation functions for the series, with lines overlaid at plus and minus two standard errors.

`White Noise and Stationarity Tests`
: displays horizontal bar charts that represent results of white noise and stationarity tests. The first bar chart shows the significance probability of the Ljung-Box chi-square statistic computed on autocorrelations up to the given lag. Longer bars favor rejection of the null hypothesis that the series is white noise. Click any of the bars to display an interpretation.

  The second bar chart shows tests of stationarity, where longer bars favor the conclusion that the series is stationary. Each bar displays the significance probability of the augmented Dickey-Fuller unit root test to the given autoregressive lag. Long bars represent higher levels of significance against the null hypothesis that the series contains a unit root. For seasonal data, a third bar chart appears for seasonal root tests. Click any of the bars to display an interpretation.

`Data Table`
: displays a data table containing the values in the input data set.

## Menu Bar

`File`

`Save Graph`
: saves the current plot as a SAS/GRAPH grseg catalog entry in a default or most recently specified catalog. This item is unavailable in the Data Table view.

`Save Graph as`
: saves the current graph as a SAS/GRAPH grseg catalog entry in a SAS catalog that you specify and/or as an Output Delivery System (ODS) object. By default, an HTML page is created, with the graph embedded as a gif image. This item is unavailable in the Data Table view.

`Save Data`
: saves the data displayed in the viewer window to an output SAS data set. This item is unavailable in the Series view.

`Save Data as`
: saves the data in a SAS data set that you specify and/or as an Output Delivery System (ODS) object. By default, an HTML page is created, with the data displayed as a table.

`Import Data`
: is available if you license SAS/ACCESS software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or database to a SAS data set for use in the Time Series Forecasting System.

`Export Data`
: is available if you license SAS/ACCESS software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or database.

`Print Graph`
: prints the plot displayed in the viewer window. This item is unavailable in the Data Table view.

`Print Data`
: prints the data displayed in the viewer window. This item is unavailable in the Series view.

`Print Setup`
: opens the Print Setup window, which allows you to access your operating system print setup.

`Print Preview`
: opens a preview window to show how your plots will look when printed.

`Close`
: closes the Time Series Viewer window and returns to the window from which it was invoked.

`View`

`Series`
: displays a plot of series values over time. This has the same function as the Series icon on the vertical toolbar.

`Autocorrelations`
: displays plots of the sample autocorrelation, partial autocorrelation, and inverse autocorrelation functions for the series. This has the same function as the Autocorrelations icon on the vertical toolbar.

`White Noise and Stationarity Tests`
: displays horizontal bar charts representing results of white noise and stationarity tests. This has the same function as the White Noise and Stationarity Tests icon on the vertical toolbar.

`Data Table`
: displays a data table containing the values in the input data set. This has the same function as the Data Table icon on the vertical toolbar.

`Zoom In`
: zooms the display. This has the same function as the Zoom In icon on the window's horizontal toolbar.

`Zoom Out`
: undoes the last zoom in action. This has the same function as the Zoom Out icon on the window's horizontal toolbar.

`Zoom Way Out`
: reverses all previous Zoom In actions and expands the time range of the plot to show all of the series, or shows the maximum number of lags in the Autocorrelations View or the White Noise and Stationarity Tests view.

`Tools`

`Log Transform`
: applies a log transformation. This has the same function as the Log Transform icon on the window's horizontal toolbar.

`Difference`
: applies simple differencing. This has the same function as the Difference icon on the window's horizontal toolbar.

`Seasonal Difference`
: applies seasonal differencing. This has the same function as the Seasonal Difference icon on the window's horizontal toolbar.

`Other Transformations`
: opens the Series Viewer Transformations window to enable you to apply a wide range of transformations.

`Diagnose Series`
: opens the Series Diagnostics window to determine the kinds of forecasting models appropriate for the current series.

`Define Interventions`
: opens the Interventions for Series window to enable you to edit or add intervention effects for use in modeling the current series.

`Link Viewer`
: connects or disconnects the Time Series Viewer window to the window from which series are selected. This has the same function as the Link item on the window's horizontal toolbar.

`Options`

`Number of Lags`
: opens a window to let you specify the number of lags shown in the Autocorrelations view and the White Noise and Stationarity Tests view. You can also use the Zoom In and Zoom Out actions to control the number of lags displayed.

`Correlation Probabilities`
: controls whether the bar charts in the Autocorrelations view represent significance probabilities or values of the correlation coefficient. A check mark or filled check box next to this item indicates that significance probabilities are displayed. In each case the bar graph horizontal axis label changes accordingly.

## Mouse Button Actions

You can examine the data value and date of individual points in the Series view by clicking them. The date and value are displayed in a box that appears in the upper right corner of the Viewer window. Click the mouse elsewhere or select any action to dismiss the data box.

You can examine the values of the bars and confidence limits at different lags in the Autocorrelations view by clicking individual bars in the vertical bar charts.

You can display an interpretation of the tests in the White Noise and Stationarity Tests view by clicking the bars.

When you select the Zoom In action, you can use the mouse to define a region of the graph to take a closer look at. Position the mouse pointer at one corner of the region, press the left mouse button, and move the mouse pointer to the opposite corner of the region while holding the left mouse button down. When you release the mouse button, the plot is redrawn to show an expanded view of the data within the region you selected.

This chapter provides computational details about several aspects of the Time Series Forecasting System.

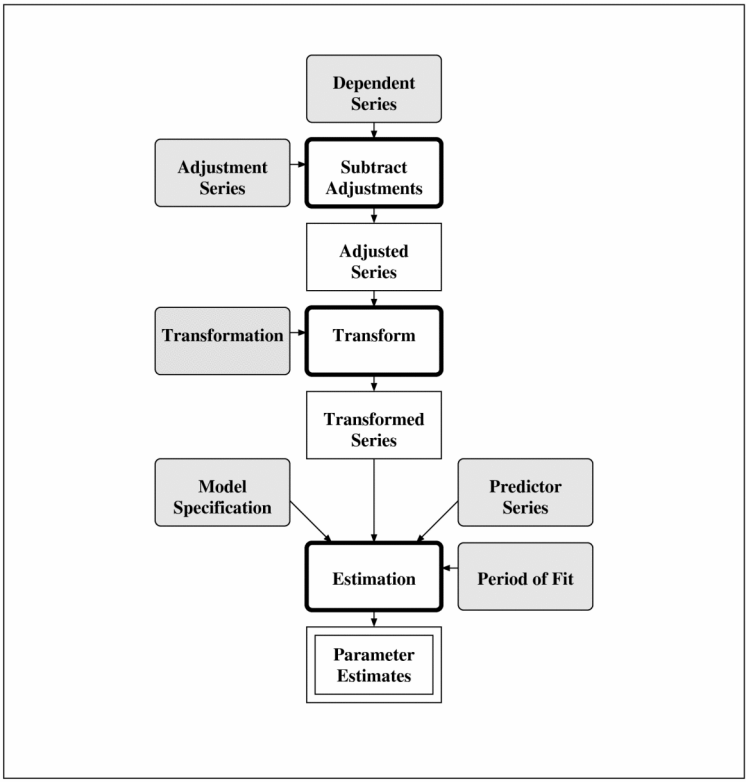
# Forecasting Process Summary

This section summarizes the forecasting process.

## Parameter Estimation

The parameter estimation process for ARIMA and smoothing models is described graphically in Figure 66.1.

**Figure 66.1** Model Fitting Flow Diagram

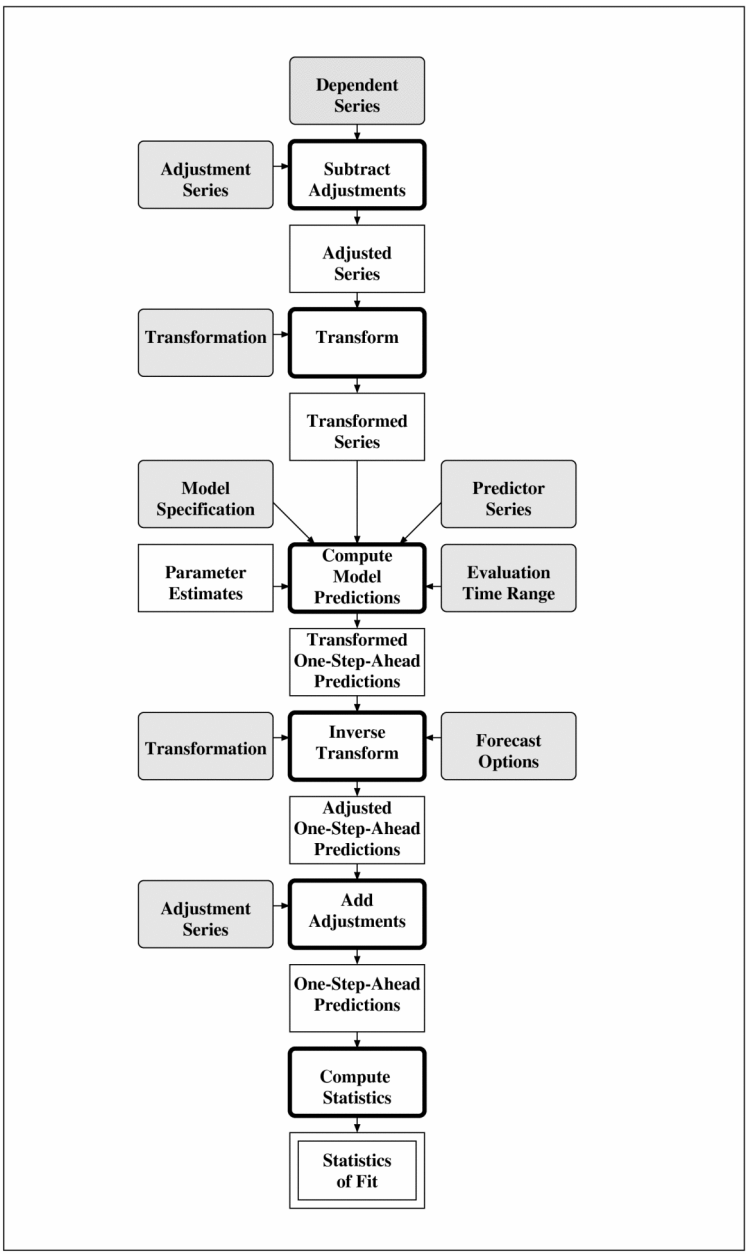


The specification of smoothing and ARIMA models is described in Chapter 61, "Specifying Forecasting Models." Computational details about these kinds of models are provided in the sections "Smoothing Models" on page 4178 and "ARIMA Models" on page 4189. The results of the parameter estimation process are displayed in the Parameter Estimates table of the Model Viewer windows along with the estimate of the model variance and the final smoothing state.

## Model Evaluation

The model evaluation process is described graphically in Figure 66.2.

**Figure 66.2** Model Evaluation Flow Diagram

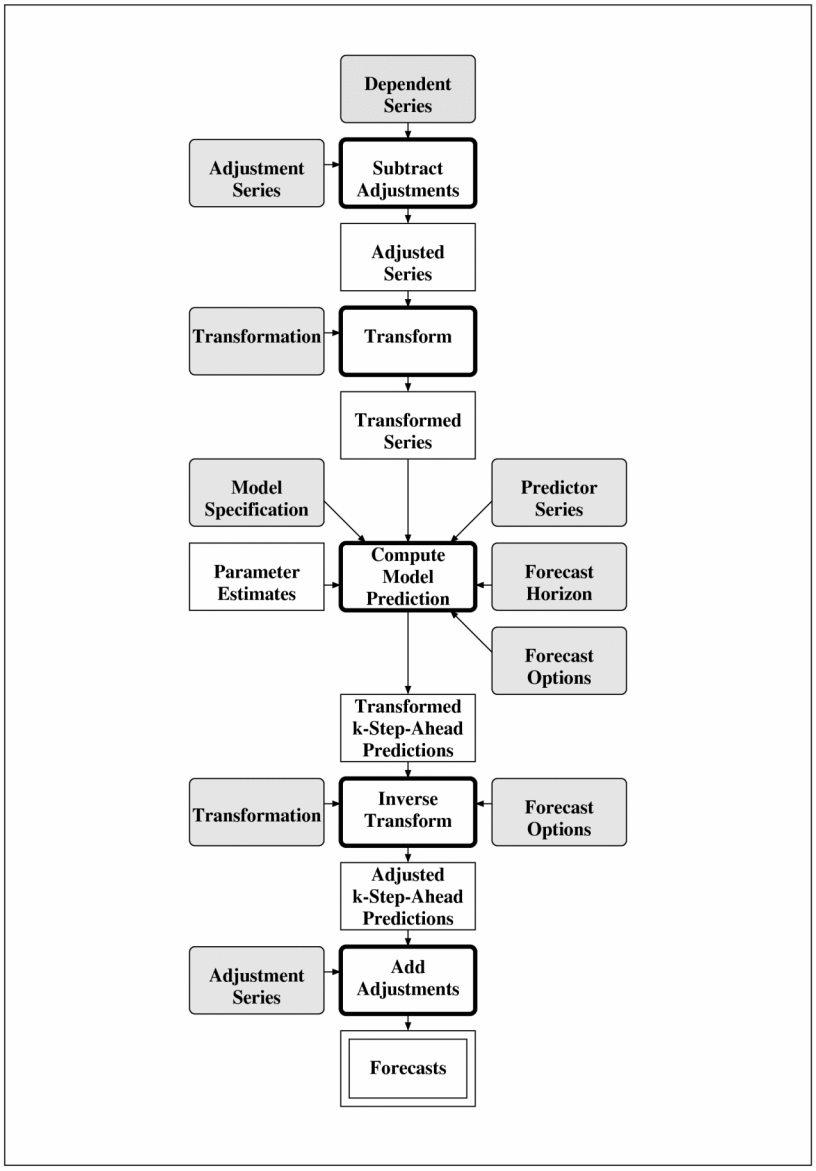


Model evaluation is based on the one-step-ahead prediction errors for observations within the period of evaluation. The one-step-ahead predictions are generated from the model specification and parameter estimates. The predictions are inverse transformed (median or mean) and adjustments are removed. The prediction errors (the difference of the dependent series and the predictions) are used to compute the statistics of fit, which are described in the section "Series Diagnostic Tests" on page 4196. The results generated by the evaluation process are displayed in the Statistics of Fit table of the Model Viewer window.

## Forecasting

The forecasting generation process is described graphically in Figure 66.3.

**Figure 66.3** Forecasting Flow Diagram



The forecasting process is similar to the model evaluation process described in the preceding section, except that *k*-step-ahead predictions are made from the end of the data through the specified forecast horizon, and prediction standard errors and confidence limits are calculated. The forecasts and confidence limits are displayed in the Forecast plot or table of the Model Viewer window.

## Forecast Combination Models

This section discusses the computation of predicted values and confidence limits for forecast combination models. For information about how to specify forecast combination models and their combining weights, see Chapter 61, "Specifying Forecasting Models."

Given the response time series $\{y_t : 1 \leq t \leq n\}$ with previously generated forecasts for the $m$ component models, a combined forecast is created from the component forecasts as follows:

| | |
|---|---|
| Predictions: | $\hat{y}_t = \sum_{i=1}^{m} w_i \hat{y}_{i,t}$ |
| Prediction errors: | $\hat{e}_t = y_t - \hat{y}_t$ |

where $\hat{y}_{i,t}$ are the forecasts of the component models and $w_i$ are the combining weights.

The estimate of the root mean square prediction error and forecast confidence limits for the combined forecast are computed by assuming independence of the prediction errors of the component forecasts, as follows:

| | |
|---|---|
| Standard errors: | $\hat{\sigma}_t = \sqrt{\sum_{i=1}^{m} w_i^2 \hat{\sigma}_{i,t}^2}$ |
| Confidence limits: | $\pm \hat{\sigma}_t Z_{\alpha/2}$ |

where $\hat{\sigma}_{i,t}$ are the estimated root mean square prediction errors for the component models, $\alpha$ is the confidence limit width, $1 - \alpha$ is the confidence level, and $Z_{\alpha/2}$ is the $\frac{\alpha}{2}$ quantile of the standard normal distribution.

Since, in practice, there might be positive correlation between the prediction errors of the component forecasts, these confidence limits may be too narrow.

## External or User-Supplied Forecasts

This section discusses the computation of predicted values and confidence limits for external forecast models.

Given a response time series $y_t$ and external forecast series $\hat{y}_t$, the prediction errors are computed as $\hat{e}_t = y_t - \hat{y}_t$ for those $t$ for which both $y_t$ and $\hat{y}_t$ are nonmissing. The mean squared error (MSE) is computed from the prediction errors.

The variance of the $k$-step-ahead prediction errors is set to $k$ times the MSE. From these variances, the standard errors and confidence limits are computed in the usual way. If the supplied predictions contain so many missing values within the time range of the response series that the MSE estimate cannot be computed, the confidence limits, standard errors, and statistics of fit are set to missing.

## Adjustments

Adjustment predictors are subtracted from the response time series prior to model parameter estimation, evaluation, and forecasting. After the predictions of the adjusted response time series are obtained from the forecasting model, the adjustments are added back to produce the forecasts.

If $y_t$ is the response time series and $X_{i,t}$, $1 \leq i \leq m$ are $m$ adjustment predictor series, then the adjusted response series $w_t$ is

$$w_t = y_t - \sum_{i=1}^{m} X_{i,t}$$

Parameter estimation for the model is performed by using the adjusted response time series $w_t$. The forecasts $\hat{w}_t$ of $w_t$ are adjusted to obtain the forecasts $\hat{y}_t$ of $y_t$.

$$\hat{y}_t = \hat{w}_t + \sum_{i=1}^{m} X_{i,t}$$

Missing values in an adjustment series are ignored in these computations.

## Series Transformations

For pure ARIMA models, transforming the response time series can aid in obtaining stationary noise series. For general ARIMA models with inputs, transforming the response time series or one or more of the input time series can provide a better model fit. Similarly, the fit of smoothing models can improve when the response series is transformed.

There are four transformations available, for strictly positive series only. Let $y_t > 0$ be the original time series, and let $w_t$ be the transformed series. The transformations are defined as follows:

Log — is the logarithmic transformation,

$$w_t = \ln(y_t)$$

Logistic — is the logistic transformation,

$$w_t = \ln(c y_t / (1 - c y_t))$$

where the scaling factor $c$ is

$$c = (1 - 10^{-6}) 10^{-\text{ceil}(\log_{10}(\max(y_t)))}$$

and $\text{ceil}(x)$ is the smallest integer greater than or equal to $x$.

Square Root — is the square root transformation,

$$w_t = \sqrt{y_t}$$

Box-Cox is the Box-Cox transformation,

$$w_t = \begin{cases} \frac{y_t^{\lambda}-1}{\lambda}, & \lambda \neq 0 \\ \ln(y_t), & \lambda = 0 \end{cases}$$

Parameter estimation is performed by using the transformed series. The transformed model predictions and confidence limits are then obtained from the transformed time series and these parameter estimates.

The transformed model predictions $\hat{w}_t$ are used to obtain either the minimum mean absolute error (MMAE) or minimum mean squared error (MMSE) predictions $\hat{y}_t$, depending on the setting of the forecast options. The model is then evaluated based on the residuals of the original time series and these predictions. The transformed model confidence limits are inverse-transformed to obtain the forecast confidence limits.

## Predictions for Transformed Models

Since the transformations described in the previous section are monotonic, applying the inverse-transformation to the transformed model predictions results in the *median* of the conditional probability density function at each point in time. This is the minimum mean absolute error (MMAE) prediction.

If $w_t = \mathrm{F}(y_t)$ is the transform with inverse-transform $y_t = \mathrm{F}^{-1}(w_t)$, then

$$\mathrm{median}(\hat{y}_t) = \mathrm{F}^{-1}(E\left[w_t\right]) = \mathrm{F}^{-1}(\hat{w}_t)$$

The minimum mean squared error (MMSE) predictions are the *mean* of the conditional probability density function at each point in time. Assuming that the prediction errors are normally distributed with variance $\sigma_t^2$, the MMSE predictions for each of the transformations are as follows:

Log is the conditional expectation of inverse-logarithmic transformation,

$$\hat{y}_t = E\left[e^{w_t}\right] = \exp\left(\hat{w}_t + \sigma_t^2/2\right)$$

Logistic is the conditional expectation of inverse-logistic transformation,

$$\hat{y}_t = E\left[\frac{1}{c(1+\exp(-w_t))}\right]$$

where the scaling factor $c = (1-e^{-6})10^{-\mathrm{ceil}(\log_{10}(\max(y_t)))}$.

Square Root is the conditional expectation of the inverse-square root transformation,

$$\hat{y}_t = E\left[w_t^2\right] = \hat{w}_t^2 + \sigma_t^2$$

Box-Cox is the conditional expectation of the inverse Box-Cox transformation,

$$\hat{y}_t = \begin{cases} E\left[(\lambda w_t + 1)^{1/\lambda}\right], & \lambda \neq 0 \\ E\left[e^{w_t}\right] = \exp(\hat{w}_t + \frac{1}{2}\sigma_t^2), & \lambda = 0 \end{cases}$$

The expectations of the inverse logistic and Box-Cox ( $\lambda \neq 0$ ) transformations do not generally have explicit solutions and are computed by using numerical integration.

# Smoothing Models

This section details the computations performed for the exponential smoothing and Winters method forecasting models.

## Smoothing Model Calculations

The descriptions and properties of various smoothing methods can be found in Gardner (1985); Chatfield (1978); Bowerman and O'Connell (1979). The following section summarizes the smoothing model computations.

Given a time series $\{Y_t : 1 \leq t \leq n\}$, the underlying model assumed by the smoothing models has the following (additive seasonal) form,

$$Y_t = \mu_t + \beta_t t + s_p(t) + \epsilon_t$$

where

| | |
|---|---|
| $\mu_t$ | represents the time-varying mean term. |
| $\beta_t$ | represents the time-varying slope. |
| $s_p(t)$ | represents the time-varying seasonal contribution for one of the $p$ seasons. |
| $\epsilon_t$ | are disturbances. |

For smoothing models without trend terms, $\beta_t = 0$; and for smoothing models without seasonal terms, $s_p(t) = 0$. Each smoothing model is described in the following sections.

At each time $t$, the smoothing models estimate the time-varying components described above with the *smoothing state*. After initialization, the smoothing state is updated for each observation using the *smoothing equations*. The smoothing state at the last nonmissing observation is used for predictions.

### Smoothing State and Smoothing Equations

Depending on the smoothing model, the *smoothing state* at time $t$ consists of the following:

$L_t$ is a smoothed level that estimates $\mu_t$.

$T_t$ is a smoothed trend that estimates $\beta_t$.

$S_{t-j}$, $j = 0, \ldots, p-1$, are seasonal factors that estimate $s_p(t)$.

The smoothing process starts with an initial estimate of the smoothing state, which is subsequently updated for each observation by using the *smoothing equations*.

The smoothing equations determine how the smoothing state changes as time progresses. Knowledge of the smoothing state at time $t-1$ and that of the time series value at time $t$ uniquely determine the smoothing state at time $t$. The *smoothing weights* determine the contribution of the previous smoothing state to the current smoothing state. The smoothing equations for each smoothing model are listed in the following sections.

### Smoothing State Initialization

Given a time series $\{Y_t : 1 \leq t \leq n\}$, the smoothing process first computes the smoothing state for time $t = 1$. However, this computation requires an initial estimate of the smoothing state at time $t = 0$, even though no data exist at or before time $t = 0$.

An appropriate choice for the initial smoothing state is made by backcasting from time $t = n$ to $t = 1$ to obtain a prediction at $t = 0$. The initialization for the backcast is obtained by regression with constant and linear terms and seasonal dummies (additive or multiplicative) as appropriate for the smoothing model. For models with linear or seasonal terms, the estimates obtained by the regression are used for initial smoothed trend and seasonal factors; however, the initial smoothed level for backcasting is always set to the last observation, $Y_n$.

The smoothing state at time $t = 0$ obtained from the backcast is used to initialize the smoothing process from time $t = 1$ to $t = n$ (Chatfield and Yar 1988).

For models with seasonal terms, the smoothing state is normalized so that the seasonal factors $S_{t-j}$ for $j = 0, \ldots, p-1$ sum to zero for models that assume additive seasonality and average to one for models (such as Winters method models) that assume multiplicative seasonality.

## Missing Values

When a missing value is encountered at time $t$, the smoothed values are updated using the *error-correction form* of the smoothing equations with the one-step-ahead prediction error, $e_t$, set to zero. The missing value is estimated using the one-step-ahead prediction at time $t-1$—that is, $\hat{Y}_{t-1}(1)$ (Aldrin and Damsleth 1989). The error-correction forms of each of the smoothing models are listed in the following sections.

## Predictions and Prediction Errors

Predictions are made based on the last known smoothing state. Predictions made at time $t$ for $k$ steps ahead are denoted $\hat{Y}_t(k)$ and the associated prediction errors are denoted $e_t(k) = Y_{t+k} - \hat{Y}_t(k)$. The *prediction equation* for each smoothing model is listed in the following sections.

The *one-step-ahead predictions* refer to predictions made at time $t-1$ for one time unit into the future—that is, $\hat{Y}_{t-1}(1)$. The *one-step-ahead prediction errors* are more simply denoted $e_t = e_{t-1}(1) = Y_t - \hat{Y}_{t-1}(1)$. The one-step-ahead prediction errors are also the model residuals, and the sum of squares of the one-step-ahead prediction errors is the objective function used in smoothing weight optimization.

The *variance of the prediction errors* are used to calculate the confidence limits (Sweet 1985; McKenzie 1986; Yar and Chatfield 1990; Chatfield and Yar 1991). The equations for the variance of the prediction errors for each smoothing model are listed in the following sections.

Note: $\mathrm{var}(\epsilon_t)$ is estimated by the mean square of the one-step-ahead prediction errors.

## Smoothing Weights

Depending on the smoothing model, the smoothing weights consist of the following:

| | |
|---|---|
| $\alpha$ | is a level smoothing weight. |
| $\gamma$ | is a trend smoothing weight. |
| $\delta$ | is a seasonal smoothing weight. |
| $\phi$ | is a trend damping weight. |

Larger smoothing weights (less damping) permit the more recent data to have a greater influence on the predictions. Smaller smoothing weights (more damping) give less weight to recent data.

### Specifying the Smoothing Weights

Typically the smoothing weights are chosen to be from zero to one. (This is intuitive because the weights associated with the past smoothing state and the value of current observation would normally sum to one.) However, each smoothing model (except Winters method—multiplicative version) has an ARIMA equivalent. Weights chosen to be within the ARIMA additive-invertible region will guarantee stable predictions (Archibald 1990; Gardner 1985). The ARIMA equivalent and the additive-invertible region for each smoothing model are listed in the following sections.

### Optimizing the Smoothing Weights

Smoothing weights are determined so as to minimize the sum of squared, one-step-ahead prediction errors. The optimization is initialized by choosing from a predetermined grid the initial smoothing weights that result in the smallest sum of squared, one-step-ahead prediction errors. The optimization process is highly dependent on this initialization. It is possible that the optimization process will fail due to the inability to obtain stable initial values for the smoothing weights (Greene 1993; Judge et al. 1980), and it is possible for the optimization to result in a local minima.

The optimization process can result in weights to be chosen outside both the zero-to-one range and the ARIMA additive-invertible region. By restricting weight optimization to additive-invertible region, you can obtain a local minimum with stable predictions. Likewise, weight optimization can be restricted to the zero-to-one range or other ranges. It is also possible to fix certain weights to a specific value and optimize the remaining weights.

#### *Standard Errors*

The standard errors associated with the smoothing weights are calculated from the Hessian matrix of the sum of squared, one-step-ahead prediction errors with respect to the smoothing weights used in the optimization process.

#### *Weights Near Zero or One*

Sometimes the optimization process results in weights near zero or one.

For simple or double (Brown) exponential smoothing, a level weight near zero implies that simple differencing of the time series might be appropriate.

For linear (Holt) exponential smoothing, a level weight near zero implies that the smoothed trend is constant and that an ARIMA model with deterministic trend might be a more appropriate model.

For damped-trend linear exponential smoothing, a damping weight near one implies that linear (Holt) exponential smoothing might be a more appropriate model.

For Winters method and seasonal exponential smoothing, a seasonal weight near one implies that a nonseasonal model might be more appropriate and a seasonal weight near zero implies that deterministic seasonal factors might be present.

## Equations for the Smoothing Models

### Simple Exponential Smoothing

The model equation for simple exponential smoothing is

$$Y_t = \mu_t + \epsilon_t$$

The smoothing equation is

$$L_t = \alpha Y_t + (1-\alpha)L_{t-1}$$

The error-correction form of the smoothing equation is

$$L_t = L_{t-1} + \alpha e_t$$

(Note: For missing values, $e_t = 0$.)

The $k$-step prediction equation is

$$\hat{Y}_t(k) = L_t$$

The ARIMA model equivalency to simple exponential smoothing is the ARIMA(0,1,1) model

$$(1-B)Y_t = (1-\theta B)\epsilon_t$$
$$\theta = 1-\alpha$$

The moving-average form of the equation is

$$Y_t = \epsilon_t + \sum_{j=1}^{\infty} \alpha\epsilon_{t-j}$$

For simple exponential smoothing, the additive-invertible region is

$$\{0 < \alpha < 2\}$$

The variance of the prediction errors is estimated as

$$\mathrm{var}(e_t(k)) = \mathrm{var}(\epsilon_t)\left[1 + \sum_{j=1}^{k-1} \alpha^2\right] = \mathrm{var}(\epsilon_t)(1 + (k-1)\alpha^2)$$

## Double (Brown) Exponential Smoothing

The model equation for double exponential smoothing is

$$Y_t = \mu_t + \beta_t t + \epsilon_t$$

The smoothing equations are

$$L_t = \alpha Y_t + (1-\alpha)L_{t-1}$$
$$T_t = \alpha(L_t - L_{t-1}) + (1-\alpha)T_{t-1}$$

This method can be equivalently described in terms of two successive applications of simple exponential smoothing,

$$S_t^{[1]} = \alpha Y_t + (1-\alpha)S_{t-1}^{[1]}$$
$$S_t^{[2]} = \alpha S_t^{[1]} + (1-\alpha)S_{t-1}^{[2]}$$

where $S_t^{[1]}$ are the smoothed values of $Y_t$, and $S_t^{[2]}$ are the smoothed values of $S_t^{[1]}$. The prediction equation then takes the following form:

$$\hat{Y}_t(k) = (2 + \alpha k/(1-\alpha))S_t^{[1]} - (1 + \alpha k/(1-\alpha))S_t^{[2]}$$

The error-correction forms of the smoothing equations are

$$L_t = L_{t-1} + T_{t-1} + \alpha e_t$$
$$T_t = T_{t-1} + \alpha^2 e_t$$

(Note: For missing values, $e_t = 0$.)

The $k$-step prediction equation is

$$\hat{Y}_t(k) = L_t + ((k-1) + 1/\alpha)T_t$$

The ARIMA model equivalency to double exponential smoothing is the ARIMA(0,2,2) model,

$$(1-B)^2 Y_t = (1-\theta B)^2 \epsilon_t$$
$$\theta = 1 - \alpha$$

The moving-average form of the equation is

$$Y_t = \epsilon_t + \sum_{j=1}^{\infty} (2\alpha + (j-1)\alpha^2)\epsilon_{t-j}$$

For double exponential smoothing, the additive-invertible region is

$$\{0 < \alpha < 2\}$$

The variance of the prediction errors is estimated as

$$\mathrm{var}(e_t(k)) = \mathrm{var}(\epsilon_t)\left[1 + \sum_{j=1}^{k-1} (2\alpha + (j-1)\alpha^2)^2\right]$$

### Linear (Holt) Exponential Smoothing

The model equation for linear exponential smoothing is

$$Y_t = \mu_t + \beta_t t + \epsilon_t$$

The smoothing equations are

$$L_t = \alpha Y_t + (1-\alpha)(L_{t-1} + T_{t-1})$$
$$T_t = \gamma(L_t - L_{t-1}) + (1-\gamma)T_{t-1}$$

The error-correction form of the smoothing equations is

$$L_t = L_{t-1} + T_{t-1} + \alpha e_t$$
$$T_t = T_{t-1} + \alpha\gamma e_t$$

(Note: For missing values, $e_t = 0$.)

The $k$-step prediction equation is

$$\hat{Y}_t(k) = L_t + kT_t$$

The ARIMA model equivalency to linear exponential smoothing is the ARIMA(0,2,2) model,

$$(1-B)^2 Y_t = (1 - \theta_1 B - \theta_2 B^2)\epsilon_t$$
$$\theta_1 = 2 - \alpha - \alpha\gamma$$
$$\theta_2 = \alpha - 1$$

The moving-average form of the equation is

$$Y_t = \epsilon_t + \sum_{j=1}^{\infty} (\alpha + j\alpha\gamma)\epsilon_{t-j}$$

For linear exponential smoothing, the additive-invertible region is

$$\{0 < \alpha < 2\}$$
$$\{0 < \gamma < 4/\alpha - 2\}$$

The variance of the prediction errors is estimated as

$$\text{var}(e_t(k)) = \text{var}(\epsilon_t)\left[1 + \sum_{j=1}^{k-1} (\alpha + j\alpha\gamma)^2\right]$$

## Damped-Trend Linear Exponential Smoothing

The model equation for damped-trend linear exponential smoothing is

$$Y_t = \mu_t + \beta_t t + \epsilon_t$$

The smoothing equations are

$$L_t = \alpha Y_t + (1-\alpha)(L_{t-1} + \phi T_{t-1})$$
$$T_t = \gamma(L_t - L_{t-1}) + (1-\gamma)\phi T_{t-1}$$

The error-correction form of the smoothing equations is

$$L_t = L_{t-1} + \phi T_{t-1} + \alpha e_t \; T_t = \phi T_{t-1} + \alpha\gamma e_t$$

(Note: For missing values, $e_t = 0$.)

The $k$-step prediction equation is

$$\hat{Y}_t(k) = L_t + \sum_{i=1}^{k} \phi^i T_t$$

The ARIMA model equivalency to damped-trend linear exponential smoothing is the ARIMA(1,1,2) model,

$$(1-\phi B)(1-B)Y_t = (1-\theta_1 B - \theta_2 B^2)\epsilon_t$$
$$\theta_1 = 1 + \phi - \alpha - \alpha\gamma\phi$$
$$\theta_2 = (\alpha - 1)\phi$$

The moving-average form of the equation (assuming $|\phi| < 1$) is

$$Y_t = \epsilon_t + \sum_{j=1}^{\infty} (\alpha + \alpha\gamma\phi(\phi^j - 1)/(\phi - 1))\epsilon_{t-j}$$

For damped-trend linear exponential smoothing, the additive-invertible region is

$$\{0 < \alpha < 2\}$$
$$\{0 < \phi\gamma < 4/\alpha - 2\}$$

The variance of the prediction errors is estimated as

$$\mathrm{var}(e_t(k)) = \mathrm{var}(\epsilon_t)\left[1 + \sum_{j=1}^{k-1} (\alpha + \alpha\gamma\phi(\phi^j - 1)/(\phi - 1))^2\right]$$

## Seasonal Exponential Smoothing

The model equation for seasonal exponential smoothing is

$$Y_t = \mu_t + s_p(t) + \epsilon_t$$

The smoothing equations are

$$L_t = \alpha(Y_t - S_{t-p}) + (1-\alpha)L_{t-1}$$
$$S_t = \delta(Y_t - L_t) + (1-\delta)S_{t-p}$$

The error-correction form of the smoothing equations is

$$L_t = L_{t-1} + \alpha e_t$$
$$S_t = S_{t-p} + \delta(1-\alpha)e_t$$

(Note: For missing values, $e_t = 0$.)

The $k$-step prediction equation is

$$\hat{Y}_t(k) = L_t + S_{t-p+k}$$

The ARIMA model equivalency to seasonal exponential smoothing is the ARIMA(0,1,$p$+1)(0,1,0)$_p$ model,

$$(1-B)(1-B^p)Y_t = (1-\theta_1 B - \theta_2 B^p - \theta_3 B^{p+1})\epsilon_t$$
$$\theta_1 = 1-\alpha$$
$$\theta_2 = 1-\delta(1-\alpha)$$
$$\theta_3 = (1-\alpha)(\delta-1)$$

The moving-average form of the equation is

$$Y_t = \epsilon_t + \sum_{j=1}^{\infty} \psi_j \epsilon_{t-j}$$
$$\psi_j = \begin{cases} \alpha & \text{for } j \mod p \neq 0 \\ \alpha + \delta(1-\alpha) & \text{for } j \mod p = 0 \end{cases}$$

For seasonal exponential smoothing, the additive-invertible region is

$$\{\max(-p\alpha, 0) < \delta(1-\alpha) < (2-\alpha)\}$$

The variance of the prediction errors is estimated as

$$\text{var}(e_t(k)) = \text{var}(\epsilon_t)\left[1 + \sum_{j=1}^{k-1} \psi_j^2\right]$$

## Multiplicative Seasonal Smoothing

In order to use the multiplicative version of seasonal smoothing, the time series and all predictions must be strictly positive.

The model equation for the multiplicative version of seasonal smoothing is

$$Y_t = \mu_t s_p(t) + \epsilon_t$$

The smoothing equations are

$$L_t = \alpha(Y_t / S_{t-p}) + (1-\alpha)L_{t-1}$$
$$S_t = \delta(Y_t / L_t) + (1-\delta)S_{t-p}$$

The error-correction form of the smoothing equations is

$$L_t = L_{t-1} + \alpha e_t / S_{t-p}$$
$$S_t = S_{t-p} + \delta(1-\alpha)e_t / L_t$$

(Note: For missing values, $e_t = 0$.)

The $k$-step prediction equation is

$$\hat{Y}_t(k) = L_t S_{t-p+k}$$

The multiplicative version of seasonal smoothing does not have an ARIMA equivalent; however, when the seasonal variation is small, the ARIMA additive-invertible region of the additive version of seasonal described in the preceding section can approximate the stability region of the multiplicative version.

The variance of the prediction errors is estimated as

$$\mathrm{var}(e_t(k)) = \mathrm{var}(\epsilon_t)\left[\sum_{i=0}^{\infty}\sum_{j=0}^{p-1}(\psi_{j+ip}S_{t+k}/S_{t+k-j})^2\right]$$

where $\psi_j$ are as described for the additive version of seasonal method, and $\psi_j = 0$ for $j \geq k$.

## Winters Method—Additive Version

The model equation for the additive version of the Winters method is

$$Y_t = \mu_t + \beta_t t + s_p(t) + \epsilon_t$$

The smoothing equations are

$$L_t = \alpha(Y_t - S_{t-p}) + (1-\alpha)(L_{t-1} + T_{t-1})$$
$$T_t = \gamma(L_t - L_{t-1}) + (1-\gamma)T_{t-1}$$
$$S_t = \delta(Y_t - L_t) + (1-\delta)S_{t-p}$$

The error-correction form of the smoothing equations is

$$L_t = L_{t-1} + T_{t-1} + \alpha e_t$$
$$T_t = T_{t-1} + \alpha\gamma e_t$$
$$S_t = S_{t-p} + \delta(1-\alpha)e_t$$

(Note: For missing values, $e_t = 0$.)

The $k$-step prediction equation is

$$\hat{Y}_t(k) = L_t + kT_t + S_{t-p+k}$$

The ARIMA model equivalency to the additive version of the Winters method is the ARIMA(0,1,$p$+1)(0,1,0)$_p$ model,

$$(1-B)(1-B^p)Y_t = \left[1 - \sum_{i=1}^{p+1} \theta_i B^i\right]\epsilon_t$$

$$\theta_j = \begin{cases} 1-\alpha-\alpha\gamma & j = 1 \\ -\alpha\gamma & 2 \le j \le p-1 \\ 1-\alpha\gamma-\delta(1-\alpha) & j = p \\ (1-\alpha)(\delta-1) & j = p+1 \end{cases}$$

The moving-average form of the equation is

$$Y_t = \epsilon_t + \sum_{j=1}^{\infty} \psi_j \epsilon_{t-j}$$

$$\psi_j = \begin{cases} \alpha + j\alpha\gamma & \text{for} j \mod p \neq 0 \\ \alpha + j\alpha\gamma + \delta(1-\alpha), & \text{for} j \mod p = 0 \end{cases}$$

For the additive version of the Winters method (Archibald 1990), the additive-invertible region is

$$\{\max(-p\alpha, 0) < \delta(1-\alpha) < (2-\alpha)\}$$
$$\{0 < \alpha\gamma < 2-\alpha-\delta(1-\alpha)(1-\cos(\vartheta)\}$$

where $\vartheta$ is the smallest nonnegative solution to the equations listed in Archibald (1990).

The variance of the prediction errors is estimated as

$$\text{var}(e_t(k)) = \text{var}(\epsilon_t)\left[1 + \sum_{j=1}^{k-1} \psi_j^2\right]$$

## Winters Method—Multiplicative Version

In order to use the multiplicative version of the Winters method, the time series and all predictions must be strictly positive.

The model equation for the multiplicative version of the Winters method is

$$Y_t = (\mu_t + \beta_t t)s_p(t) + \epsilon_t$$

The smoothing equations are

$$L_t = \alpha(Y_t/S_{t-p}) + (1-\alpha)(L_{t-1} + T_{t-1})$$
$$T_t = \gamma(L_t - L_{t-1}) + (1-\gamma)T_{t-1}$$
$$S_t = \delta(Y_t/L_t) + (1-\delta)S_{t-p}$$

The error-correction form of the smoothing equations is

$$L_t = L_{t-1} + T_{t-1} + \alpha e_t/S_{t-p}$$
$$T_t = T_{t-1} + \alpha\gamma e_t/S_{t-p}$$
$$S_t = S_{t-p} + \delta(1-\alpha)e_t/L_t$$

**NOTE:** For missing values, $e_t = 0$.

The $k$-step prediction equation is

$$\hat{Y}_t(k) = (L_t + kT_t)S_{t-p+k}$$

The multiplicative version of the Winters method does not have an ARIMA equivalent; however, when the seasonal variation is small, the ARIMA additive-invertible region of the additive version of the Winters method described in the preceding section can approximate the stability region of the multiplicative version.

The variance of the prediction errors is estimated as

$$\mathrm{var}(e_t(k)) = \mathrm{var}(\epsilon_t)\left[\sum_{i=0}^{\infty}\sum_{j=0}^{p-1}(\psi_{j+ip}S_{t+k}/S_{t+k-j})^2\right]$$

where $\psi_j$ are as described for the additive version of the Winters method and $\psi_j = 0$ for $j \geq k$.

# ARIMA Models

Autoregressive integrated moving-average (ARIMA) models predict values of a dependent time series with a linear combination of its own past values, past errors (also called shocks or innovations), and current and past values of other time series (predictor time series).

The Time Series Forecasting System uses the ARIMA procedure of SAS/ETS software to fit and forecast ARIMA models. The maximum likelihood method is used for parameter estimation. For more information about ARIMA model estimation and forecasting, see Chapter 8, "The ARIMA Procedure."

This section summarizes the notation used for ARIMA models.

## Notation for ARIMA Models

A dependent time series that is modeled as a linear combination of its own past values and past values of an error series is known as a (pure) ARIMA model.

### Nonseasonal ARIMA Model Notation

The order of an ARIMA model is usually denoted by the notation ARIMA($p$,$d$,$q$), where

| | |
|---|---|
| $p$ | is the order of the autoregressive part. |
| $d$ | is the order of the differencing (rarely should $d > 2$ be needed). |
| $q$ | is the order of the moving-average process. |

Given a dependent time series $\{Y_t : 1 \leq t \leq n\}$, mathematically the ARIMA model is written as

$$(1 - B)^d Y_t = \mu + \frac{\theta(B)}{\phi(B)} a_t$$

where

| | |
|---|---|
| $t$ | indexes time. |
| $\mu$ | is the mean term. |
| $B$ | is the backshift operator; that is, $BX_t = X_{t-1}$. |
| $\phi(B)$ | is the autoregressive operator, represented as a polynomial in the backshift operator: $\phi(B) = 1 - \phi_1 B - \cdots - \phi_p B^p$. |
| $\theta(B)$ | is the moving-average operator, represented as a polynomial in the backshift operator: $\theta(B) = 1 - \theta_1 B - \cdots - \theta_q B^q$. |
| $a_t$ | is the independent disturbance, also called the random error. |

For example, the mathematical form of the ARIMA(1,1,2) model is

$$(1 - B)Y_t = \mu + \frac{(1 - \theta_1 B - \theta_2 B^2)}{(1 - \phi_1 B)} a_t$$

## Seasonal ARIMA Model Notation

Seasonal ARIMA models are expressed in factored form by the notation ARIMA$(p,d,q)(P,D,Q)_s$, where

| | |
|---|---|
| $P$ | is the order of the seasonal autoregressive part. |
| $D$ | is the order of the seasonal differencing (rarely should $D > 1$ be needed). |
| $Q$ | is the order of the seasonal moving-average process. |
| $s$ | is the length of the seasonal cycle. |

Given a dependent time series $\{Y_t : 1 \leq t \leq n\}$, mathematically the ARIMA seasonal model is written as

$$(1-B)^d(1-B^s)^D Y_t = \mu + \frac{\theta(B)\theta_s(B^s)}{\phi(B)\phi_s(B^s)}a_t$$

where

| | |
|---|---|
| $\phi_s(B^s)$ | is the seasonal autoregressive operator, represented as a polynomial in the backshift operator: $\phi_s(B^s) = 1 - \phi_{s,1}B^s - \cdots - \phi_{s,P}B^{sP}$. |
| $\theta_s(B^s)$ | is the seasonal moving-average operator, represented as a polynomial in the backshift operator: $\theta_s(B^s) = 1 - \theta_{s,1}B^s - \cdots - \theta_{s,Q}B^{sQ}$. |

For example, the mathematical form of the ARIMA$(1,0,1)(1,1,2)_{12}$ model is

$$(1-B^{12})Y_t = \mu + \frac{(1-\theta_1 B)(1-\theta_{s,1}B^{12} - \theta_{s,2}B^{24})}{(1-\phi_1 B)(1-\phi_{s,1}B^{12})}a_t$$

## Abbreviated Notation for ARIMA Models

If the differencing order, autoregressive order, or moving-average order is zero, the notation is further abbreviated as follows:

| | |
|---|---|
| I$(d)(D)_s$ | integrated model or ARIMA$(0,d,0)(0,D,0)$ |
| AR$(p)(P)_s$ | autoregressive model or ARIMA$(p,0,0)(P,0,0)$ |
| IAR$(p,d)(P,D)_s$ | integrated autoregressive model or ARIMA$(p,d,0)(P,D,0)_s$ |
| MA$(q)(Q)_s$ | moving average model or ARIMA$(0,0,q)(0,0,Q)_s$ |
| IMA$(d,q)(D,Q)_s$ | integrated moving average model or ARIMA$(0,d,q)(0,D,Q)_s$ |
| ARMA$(p,q)(P,Q)_s$ | autoregressive moving-average model or ARIMA$(p,0,q)(P,0,Q)_s$ |

## Notation for Transfer Functions

A transfer function can be used to filter a predictor time series to form a dynamic regression model.

Let $Y_t$ be the dependent series, let $X_t$ be the predictor series, and let $\Psi(B)$ be a linear filter or transfer function for the effect of $X_t$ on $Y_t$. The ARIMA model is then

$$(1-B)^d(1-B^s)^D Y_t = \mu + \Psi(B)(1-B)^d(1-B^s)^D X_t + \frac{\theta(B)\theta_s(B^s)}{\phi(B)\phi_s(B^s)}a_t$$

This model is called a *dynamic regression* of $Y_t$ on $X_t$.

### Nonseasonal Transfer Function Notation

Given the $i$th predictor time series $\{X_{i,t} : 1 \leq t \leq n\}$, the transfer function is written as

$$\mathrm{Dif}(d_i)\mathrm{Lag}(k_i)\mathrm{N}(q_i)/\mathrm{D}(p_i)$$

where

| | |
|---|---|
| $d_i$ | is the simple order of the differencing for the $i$th predictor time series, $(1-B)^{d_i} X_{i,t}$ (rarely should $d_i > 2$ be needed). |
| $k_i$ | is the pure time delay (lag) for the effect of the $i$th predictor time series, $X_{i,t} B^{k_i} = X_{i,t-k_i}$. |
| $p_i$ | is the simple order of the denominator for the $i$th predictor time series. |
| $q_i$ | is the simple order of the numerator for the $i$th predictor time series. |

The mathematical notation used to describe a transfer function is

$$\Psi_i(B) = \frac{\omega_i(B)}{\delta_i(B)}(1-B)^{d_i} B^{k_i}$$

where

| | |
|---|---|
| $B$ | is the backshift operator; that is, $BX_t = X_{t-1}$. |
| $\delta_i(B)$ | is the denominator polynomial of the transfer function for the $i$th predictor time series: $\delta_i(B) = 1 - \delta_{i,1}B - \cdots - \delta_{i,p_i}B^{p_i}$. |
| $\omega_i(B)$ | is the numerator polynomial of the transfer function for the $i$th predictor time series: $\omega_i(B) = 1 - \omega_{i,1}B - \cdots - \omega_{i,q_i}B^{q_i}$. |

The numerator factors for a transfer function for a predictor series are like the MA part of the ARMA model for the noise series. The denominator factors for a transfer function for a predictor series are like the AR part of the ARMA model for the noise series. Denominator factors introduce exponentially weighted, infinite distributed lags into the transfer function.

For example, the transfer function for the $i$th predictor time series with

| | |
|---|---|
| $k_i = 3$ | time lag is 3 |
| $d_i = 1$ | simple order of differencing is one |
| $p_i = 1$ | simple order of the denominator is one |
| $q_i = 2$ | simple order of the numerator is two |

would be written as [Dif(1)Lag(3)N(2)/D(1)]. The mathematical notation for the transfer function in this example is

$$\Psi_i(B) = \frac{(1 - \omega_{i,1}B - \omega_{i,2}B^2)}{(1 - \delta_{i,1}B)}(1-B)B^3$$

### Seasonal Transfer Function Notation

The general transfer function notation for the $i$th predictor time series $X_{i,t}$ with seasonal factors is [Dif($d_i$)($D_i$)$_s$ Lag($k_i$) N($q_i$)($Q_i$)$_s$/ D($p_i$)($P_i$)$_s$], where

| | |
|---|---|
| $D_i$ | is the seasonal order of the differencing for the $i$th predictor time series (rarely should $D_i > 1$ be needed). |
| $P_i$ | is the seasonal order of the denominator for the $i$th predictor time series (rarely should $P_i > 2$ be needed). |
| $Q_i$ | is the seasonal order of the numerator for the $i$th predictor time series, (rarely should $Q_i > 2$ be needed). |
| $s$ | is the length of the seasonal cycle. |

The mathematical notation used to describe a seasonal transfer function is

$$\Psi_i(B) = \frac{\omega_i(B)\omega_{s,i}(B^s)}{\delta_i(B)\delta_{s,i}(B^s)}(1-B)^{d_i}(1-B^s)^{D_i}B^{k_i}$$

where

| | |
|---|---|
| $\delta_{s,i}(B^s)$ | is the denominator seasonal polynomial of the transfer function for the $i$th predictor time series: $\delta_{s,i}(B) = 1 - \delta_{s,i,1}B - \cdots - \delta_{s,i,P_i}B^{sP_i}$. |
| $\omega_{s,i}(B^s)$ | is the numerator seasonal polynomial of the transfer function for the $i$th predictor time series: $\omega_{s,i}(B) = 1 - \omega_{s,i,1}B - \cdots - \omega_{s,i,Q_i}B^{sQ_i}$. |

For example, the transfer function for the $i$th predictor time series $X_{i,t}$ whose seasonal cycle $s = 12$ with

| | |
|---|---|
| $d_i = 2$ | simple order of differencing is two |
| $D_i = 1$ | seasonal order of differencing is one |
| $q_i = 2$ | simple order of the numerator is two |
| $Q_i = 1$ | seasonal order of the numerator is one |

would be written as [Dif(2)(1)$_s$ N(2)(1)$_s$]. The mathematical notation for the transfer function in this example is

$$\Psi_i(B) = (1 - \omega_{i,1}B - \omega_{i,2}B^2)(1 - \omega_{s,i,1}B^{12})(1-B)^2(1-B^{12})$$

Note: In this case, [Dif(2)(1)$_s$ N(2)(1)$_s$] = [Dif(2)(1)$_s$Lag(0)N(2)(1)$_s$/D(0)(0)$_s$].

# Predictor Series

This section discusses time trend curves, seasonal dummies, interventions, and adjustments.

## Time Trend Curves

When you specify a time trend curve as a predictor in a forecasting model, the system computes a predictor series that is a deterministic function of time. This variable is then included in the model as a regressor, and the trend curve is fit to the dependent series by linear regression, in addition to other predictor series.

Some kinds of nonlinear trend curves are fit by transforming the dependent series. For example, the exponential trend curve is actually a linear time trend fit to the logarithm of the series. For these trend curve specifications, the series transformation option is set automatically, and you cannot independently control both the time trend curve and transformation option.

The computed time trend variable is included in the output data set in a variable named in accordance with the trend curve type. Let $t$ represent the observation count from the start of the period of fit for the model, and let $X_t$ represent the value of the time trend variable at observation $t$ within the period of fit. The names and definitions of these variables are as follows. (Note: These deterministic variables are reserved variable names.)

| | |
|---|---|
| Linear trend | variable name _LINEAR_, with $X_t = t - c$ |
| Quadratic trend | variable name _QUAD_, with $X_t = (t - c)^2$. Note that a quadratic trend implies a linear trend as a special case and results in two regressors: _QUAD_ and _LINEAR_. |
| Cubic trend | variable name _CUBE_, with $X_t = (t - c)^3$. Note that a cubic trend implies a quadratic trend as a special case and results in three regressors: _CUBE_, _QUAD_, and _LINEAR_. |
| Logistic trend | variable name _LOGIT_, with $X_t = t$. The model is a linear time trend applied to the logistic transform of the dependent series. Thus, specifying a logistic trend is equivalent to specifying the logistic series transformation and a linear time trend. A logistic trend predictor can be used only in conjunction with the logistic transformation, which is set automatically when you specify logistic trend. |
| Logarithmic trend | variable name _LOG_, with $X_t = \ln(t)$ |
| Exponential trend | variable name _EXP_, with $X_t = t$. The model is a linear time trend applied to the logarithms of the dependent series. Thus, specifying an exponential trend is equivalent to specifying the log series transformation and a linear time trend. An exponential trend predictor can be used only in conjunction with the log transformation, which is set automatically when you specify exponential trend. |
| Hyperbolic trend | variable name _HYP_, with $X_t = 1/t$ |
| Power curve trend | variable name _POW_, with $X_t = \ln(t)$. The model is a logarithmic time trend applied to the logarithms of the dependent series. Thus, specifying a power curve is equivalent to specifying the log series transformation and a logarithmic time |

| | |
|---|---|
| | trend. A power curve predictor can be used only in conjunction with the log transformation, which is set automatically when you specify a power curve trend. |
| EXP(A+B/TIME) trend | variable name _ERT_, with $X_t = 1/t$. The model is a hyperbolic time trend applied to the logarithms of the dependent series. Thus, specifying this trend curve is equivalent to specifying the log series transformation and a hyperbolic time trend. This trend curve can be used only in conjunction with the log transformation, which is set automatically when you specify this trend. |

## Intervention Effects

Interventions are used for modeling events that occur at specific times. That is, they are known changes that affect the dependent series or outliers.

The *i*th intervention series is included in the output data set with variable name _INTV*i*_, which is a reserved variable name.

### Point Interventions

The point intervention is a one-time event. The *i*th intervention series $X_{i,t}$ has a point intervention at time $t_{int}$ when the series is nonzero only at time $t_{int}$—that is,

$$X_{i,t} = \begin{cases} 1, & t = t_{int} \\ 0, & \text{otherwise} \end{cases}$$

### Step Interventions

Step interventions are continuing, and the input time series flags periods after the intervention. For a step intervention, before time $t_{int}$, the *i*th intervention series $X_{i,t}$ is zero and then steps to a constant level thereafter—that is,

$$X_{i,t} = \begin{cases} 1, & t \geq t_{int} \\ 0, & \text{otherwise} \end{cases}$$

### Ramp Interventions

A ramp intervention is a continuing intervention that increases linearly after the intervention time. For a ramp intervention, before time $t_{int}$, the *i*th intervention series $X_{i,t}$ is zero and increases linearly thereafter—that is, proportional to time.

$$X_{i,t} = \begin{cases} t - t_{int}, & t \geq t_{int} \\ 0, & \text{otherwise} \end{cases}$$

### Intervention Effect

Given the *i*th intervention series $X_{i,t}$, you can define how the intervention takes effect by filters (transfer functions) of the form

$$\Psi_i(B) = \frac{1 - \omega_{i,1}B - \cdots - \omega_{i,q_i}B^{q_i}}{1 - \delta_{i,1}B - \cdots - \delta_{i,p_i}B^{p_i}}$$

where $B$ is the backshift operator $By_t = y_{t-1}$.

The denominator of the transfer function determines the decay pattern of the intervention effect, whereas the numerator terms determine the size of the intervention effect time window.

For example, the following intervention effects are associated with the respective transfer functions:

| | |
|---|---|
| Immediately | $\Psi_i(B) = 1$ |
| Gradually | $\Psi_i(B) = 1/(1 - \delta_{i,1}B)$ |
| 1 lag window | $\Psi_i(B) = 1 - \omega_{i,1}B$ |
| 3 lag window | $\Psi_i(B) = 1 - \omega_{i,1}B - \omega_{i,2}B^2 - \omega_{i,3}B^3$ |

#### *Intervention Notation*

The notation used to describe intervention effects has the form *type* :$t_{int}$ $(q_i)/(p_i)$, where *type* is point, step, or ramp; $t_{int}$ is the time of the intervention (for example, OCT87); $q_i$ is the transfer function numerator order; and $p_i$ is the transfer function denominator order. If $q_i = 0$, the part "$(q_i)$" is omitted; if $p_i = 0$, the part "$/(p_i)$" is omitted.

In the Intervention Specification window, the `Number of Lags` option specifies the transfer function numerator order $q_i$, and the `Effect Decay Pattern` option specifies the transfer function denominator order $p_i$. In the `Effect Decay Pattern options`, values and resulting $p_i$ are as follows: `None`, $p_i = 0$ `Exp`, $p_i = 1$ `Wave`, $p_i = 2$

For example, a step intervention with date 08MAR90 and effect pattern `Exp` is denoted "Step:08MAR90/(1)" and has a transfer function filter $\Psi_i(B) = 1/(1 - \delta_1 B)$. A ramp intervention immediately applied on 08MAR90 is denoted "Ramp:08MAR90" and has a transfer function filter $\Psi_i(B) = 1$.

## Seasonal Dummy Inputs

For a seasonal cycle of length $s$, the seasonal dummy regressors include

$$\{X_{i,t} : 1 \le i \le (s-1), 1 \le t \le n\}$$

for models that include an intercept term and

$$\{X_{i,t} : 1 \le i \le s, 1 \le t \le n\}$$

for models that exclude an intercept term. Each element of a seasonal dummy regressor is either zero or one, based on the following rule:

$$X_{i,t} = \begin{cases} 1, & \text{when } i = t \mod s \\ 0, & \text{otherwise} \end{cases}$$

Note that if the model includes an intercept term, the number of seasonal dummy regressors is one less than $s$ to ensure that the linear system is full rank.

The seasonal dummy variables are included in the output data set with variable names prefixed with "SDUMMY$i$" and sequentially numbered. They are reserved variable names.

## Series Diagnostic Tests

This section describes the diagnostic tests that are used to determine the kinds of forecasting models appropriate for a series.

The series diagnostics are a set of heuristics that provide recommendations on whether or not the forecasting model should contain a log transform, trend terms, and seasonal terms. These recommendations are used by the automatic model selection process to restrict the model search to a subset of the model selection list. (You can disable this behavior by using the Automatic Model Selection Options window.)

The tests that are used by the series diagnostics do not always produce the correct classification of the series. They are intended to accelerate the process of searching for a good forecasting model for the series, but you should not rely on them if finding the very best model is important to you.

If you have information about the appropriate kinds of forecasting models (perhaps from studying the plots and autocorrelations shown in the Series Viewer window), you can set the series diagnostic flags in the Series Diagnostics window. Select the YES, NO, or MAYBE values for the `Log Transform`, `Trend`, and `Seasonality` options in the Series Diagnostics window as you think appropriate.

The series diagnostics tests are intended as a heuristic tool only, and no statistical validity is claimed for them. These tests might be modified and enhanced in future releases of the Time Series Forecasting System. The testing strategy is as follows:

1. **Log transform test.** The log test fits a high-order autoregressive model to the series and to the log of the series and compares goodness-of-fit measures for the prediction errors of the two models. If this test finds that log transforming the series is suitable, the `Log Transform` option is set to YES, and the subsequent diagnostic tests are performed on the log transformed series.

2. **Trend test.** The resultant series is tested for presence of a trend by using an augmented Dickey-Fuller test and a random walk with drift test. If either test finds that the series appears to have a trend, the `Trend` option is set to YES, and the subsequent diagnostic tests are performed on the differenced series.

3. **Seasonality test.** The resultant series is tested for seasonality. A seasonal dummy model with AR(1) errors is fit and the joint significance of the seasonal dummy estimates is tested. If the seasonal dummies are significant, the AIC statistic for this model is compared to the AIC for and AR(1) model without seasonal dummies. If the AIC for the seasonal model is lower than that of the nonseasonal model, the `Seasonal` option is set to YES.

# Statistics of Fit

This section explains the goodness-of-fit statistics reported to measure how well different models fit the data. The statistics of fit for the various forecasting models can be viewed or stored in a data set by using the Model Viewer window.

Statistics of fit are computed by using the actual and forecasted values for observations in the period of evaluation. One-step forecasted values are used whenever possible, including the case when a hold-out sample contains no missing values. If a one-step forecast for an observation cannot be computed due to missing values for previous series observations, a multi-step forecast is computed, using the minimum number of steps as the previous nonmissing values in the data range permit.

The various statistics of fit reported are as follows. In these formulas, $n$ is the number of nonmissing observations and $k$ is the number of fitted parameters in the model.

*Number of Nonmissing Observations*
The number of nonmissing observations used to fit the model.

*Number of Observations*
The total number of observations used to fit the model, including both missing and nonmissing observations.

*Number of Missing Actuals*
The number of missing actual values.

*Number of Missing Predicted Values*
The number of missing predicted values.

*Number of Model Parameters*
The number of parameters fit to the data. For combined forecast, this is the number of forecast components.

*Total Sum of Squares (Uncorrected)*
The total sum of squares for the series, SST, uncorrected for the mean: $\sum_{t=1}^{n} y_t^2$.

*Total Sum of Squares (Corrected)*
The total sum of squares for the series, SST, corrected for the mean: $\sum_{t=1}^{n} (y_t - \overline{y})^2$, where $\overline{y}$ is the series mean.

*Sum of Square Errors*
The sum of the squared prediction errors, SSE. $\mathrm{SSE} = \sum_{t=1}^{n} (y_t - \hat{y}_t)^2$, where $\hat{y}$ is the one-step predicted value.

*Mean Squared Error*
The mean squared prediction error, MSE, calculated from the one-step-ahead forecasts. $\mathrm{MSE} = \frac{1}{n}\mathrm{SSE}$. This formula enables you to evaluate small hold-out samples.

*Root Mean Squared Error*
The root mean square error (RMSE), $\sqrt{\mathrm{MSE}}$.

*Mean Absolute Percent Error*
The mean absolute percent prediction error (MAPE), $\frac{100}{n} \sum_{t=1}^{n} |(y_t - \hat{y}_t)/y_t|$.
The summation ignores observations where $y_t = 0$.

*Mean Absolute Error*
The mean absolute prediction error, $\frac{1}{n} \sum_{t=1}^{n} |y_t - \hat{y}_t|$.

*R-Square*
The $R^2$ statistic, $R^2 = 1 - \mathrm{SSE}/\mathrm{SST}$. If the model fits the series badly, the model error sum of squares, SSE, can be larger than SST and the $R^2$ statistic will be negative.

*Adjusted R-Square*
The adjusted $R^2$ statistic, $1 - (\frac{n-1}{n-k})(1 - R^2)$.

*Amemiya's Adjusted R-Square*
Amemiya's adjusted $R^2$, $1 - (\frac{n+k}{n-k})(1 - R^2)$.

*Random Walk R-Square*
The random walk $R^2$ statistic (Harvey's $R^2$ statistic by using the random walk model for comparison), $1 - (\frac{n-1}{n})\mathrm{SSE}/\mathrm{RWSSE}$, where $\mathrm{RWSSE} = \sum_{t=2}^{n} (y_t - y_{t-1} - \mu)^2$, and $\mu = \frac{1}{n-1} \sum_{t=2}^{n} (y_t - y_{t-1})$.

*Akaike's Information Criterion*
Akaike's information criterion (AIC), $n \ln(\mathrm{MSE}) + 2k$.

*Schwarz Bayesian Information Criterion*
Schwarz Bayesian information criterion (SBC or BIC),
$n \ln(\mathrm{MSE}) + k \ln(n)$.

*Amemiya's Prediction Criterion*
Amemiya's prediction criterion, $\frac{1}{n}\mathrm{SST}(\frac{n+k}{n-k})(1 - R^2) = (\frac{n+k}{n-k})\frac{1}{n}\mathrm{SSE}$.

*Maximum Error*
The largest prediction error.

*Minimum Error*
The smallest prediction error.

*Maximum Percent Error*
The largest percent prediction error, $100 \max((y_t - \hat{y}_t)/y_t)$. The summation ignores observations where $y_t = 0$.

*Minimum Percent Error*
The smallest percent prediction error, $100 \min((y_t - \hat{y}_t)/y_t)$. The summation ignores observations where $y_t = 0$.

*Mean Error*
The mean prediction error, $\frac{1}{n} \sum_{t=1}^{n} (y_t - \hat{y}_t)$.

*Mean Percent Error*
The mean percent prediction error, $\frac{100}{n} \sum_{t=1}^{n} \frac{(y_t - \hat{y}_t)}{y_t}$. The summation ignores observations where $y_t = 0$.
